A book for which Gardeners—amateur and professional—have been waiting, and one which will fill a gap in many a garden lover's library. Mr. Dyke is an authority and treats his subject in a lucid and simple style that will without doubt convince the reader of its great importance. What he has to say on manures and fertilisers is the outcome of profound study, and long and practical experience. From this work you may learn why manures are needed, and obtain practical information in regard to the food of plants, the constituents and properties of natural and artificial manures and their application, with the object of increasing the quantity and quality of plants, flowers, and all garden and farm crops.

latter may certainly have "picked up" a few trifles of the practical work of horticulture, but it can safely be said that few of the gardening institutions or colleges in the country teach the art and practice of horticulture as it should be taught. Of course, they demonstrate some of the principal gardening operations, but as for the student ever showing himself or herself a capable worker—this is a matter which, as a rule, is left entirely out of consideration.

Theory is usually a matter well taught at most educational institutions, but, as a rule, the practice is a mere sham. The inevitable result is that when in after life the student becomes engaged under a skilful employer, he quickly proves himself to be, in many cases, an utter failure. Some teachers who possess unquestionable qualifications for imparting knowledge to children in the theory of agriculture and horticulture, also claim to possess a practical acquaintance with one or the other, or even both, of these professions. Hence, we find schoolmasters occupying positions that should properly be filled by bona fide horticulturists. It is a noticeable fact that school gardens, and other forms of purely horticultural work, throughout the country, are in many instances inspected by men of the above class. Consequently, in spite of his qualifications, the gardener is made subordinate to the theorist.

### The Social Status

of the gardener is a vexed question, which many people have been tempted to write upon with much heat and a great deal of altogether unnecessary argument. To my mind, the subject is scarcely worth discussion, for a gardener who rises to the top of his profession and can prove his worth as a citizen and a man amongst men, need never concern himself with class distinctions and the difficult social questions that arise therefrom. Usually it will be found that the loudest complaints on this matter emanate from men who, although aspiring to great heights in their profession, have not the necessary ability or resourcefulness to enable them to attain their desires.

To achieve something great in the domain of horticulture is the aim of every ambitious gardener. Many gardeners, however, can claim to have done nothing beyond growing a few large cabbages, onions, carrots, etc., or maybe they have produced healthy specimens of the common types of barn-door plants under glass. In this they have scarcely even rivalled the performances of many allotment-holders or amateur gardeners. Hundreds of such men are to be found in the rank and file of "single-handed gardeners," and no doubt many of them are very capable cultivators. Exceptions there must, of course, be, but still the fact remains that experienced plant growers can be obtained at anything from £1 to £1 10s. per week, which is the standard rate of pay. No legislation or agitation is ever likely to compel employers to pay more.

The greatest possible ambition must be the premier attribute of any gardener who wishes eventually to manage a large and well-equipped establishment. The attainment of his desires can only be properly secured through the medium of a carefully-thought-out plan of study and preparation, such as will make him an efficient manager when the time arrives for him to put his skill to the test. J. C. Newsham.

Old Basing

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## AUBRIETIAS.

Quite two centuries have elapsed since the now well-known Aubrietia deltoidea was first brought to the notice of horticulturists, and in the interval it has given birth to a numerous progeny, in which the original floriferousness of the type has been accentuated in a marked degree, while the increase in the size of flowers, and the rich, brilliant shades of colour, place the newer varieties among the most exclusive of hardy plants for garden decoration.

It is as spring-flowering subjects that aubrietias become prominent in gardens; the low-growing, trailing stems, when allowed to develop naturally, as in permanent planting, become strikingly modified when grown under what one might call annual treatment; then, growth becomes fairly regular, so that the plants make rounded masses that later, when in bloom, present an aspect of low mounds, all aglow with blossom. It is this distinctive character that renders them, to a great extent, popular in spring gardening. Other factors are also present; for example, they are all easy to propagate, while their cultural requirements are readily understood, and not difficult to comply with. It follows that even a tyro in things horticultural may readily attain a high degree of success with these fine subjects. However tractable aubrietias are in level planting, it is courting certain disaster to allow them to remain in the same position for an indefinite number of years with little or no attention, as, sooner or later, they deteriorate. I believe this is primarily due to the long-continued wet of the winter and spring months that maintains the soil temperature at a low level, whereby the constitution of the plants suffer, and they begin to degenerate. It is certain that similar varieties, planted on a sharp slope, or on a dry wall, awake earlier, and with greater vigour in spring, and are also perennial in the strictest sense, exhibiting no visible sign of deterioration over a great number of years.

The fact has been noted that aubrietias attain to their greatest vigour when planted on dry walls, or upon the rock garden, and this is fortunate, inasmuch as these positions disclose their highest capacity for scenic effect, for whatever degree of beauty this lovely genus attains to in level planting, it suffers in comparison with the splendour exhibited by the various varieties as they fling themselves in wildest riot from depression and promontory, the glowing purples and blues, the rich rose, and intense violet of the flowers, softened and subdued by the soft grey tone of the weathered rock masses.

None of the varieties of aubrietia present any difficulty in cultivation, as, provided the position is well drained, they grow in practically all kinds of ordinary garden soil. Neither are they difficult to propagate, as the majority produce seeds, and if sown either when ripe or in spring, in pans of prepared soil, these germinate freely, the subsequent plants being transplanted into boxes, and either potted up singly or planted in nursery rows in the open, ultimately to take their place in the autumn planting for spring display, or permanently on the rock garden.

The various colour forms that have originated in gardens, in some considerable numbers, during recent years, marking a great advance over the type, are best propagated by means of cuttings, in order to perpetuate the variety true. Cuttings should be taken when the shoots become soft, toward the end of April or May, inserting them in a prepared bed of sandy soil, under a hand-light, and keeping them close until they emit roots freely. When well rooted, the cuttings are potted up singly in small pots, and plunged out of doors, exposing them to the weather, where they make hard, firm growths, and an abundant root system that eminently fits them either for bedding or permanent planting. Those employed for bedding will, if lifted in May, bear dividing at that season, and if replanted in good soil will do service for a number of years.

Aubrietia deltoidea is the type from whence originated the older forms, græca, purpurea, and Campbelli, coloured respectively light purple, purple, and violet; the latter, also known as Hendersoni, is still a plant of great merit, holding its position easily among the new-comers. Dr. Mules is a compact variety with flowers of a rich violet-purple. I have never obtained lustre in the petals of this variety to equal Hendersoni at its best. Prichard's A1 and Mrs. Lloyd Edwards are violets of exceptional merit; while Violet Queen is, to my idea, the last word in violet-coloured aubrietias, the flowers being large, of intense colour, and the plant of exceptional vigour. In pink varieties, Leichtlini is one of the oldest, but when fully open, little, if any, rose colour is left. Moerheimi and Souv. de W. Ingram are both more decided, and retain the colour better in the fully-expanded flowers. Fire King is, however, deepest in colour; the flowers are brilliant in bud, and maintain their colour all through the flowering season.

In addition to the foregoing, the variety Lavender has delightful large flowers of the same shade as the name betokens, and in A. deltoidea variegata aurea the foliage is coloured soft yellow and green; while there is also a form having leaves variegated white and green. The two last-named varieties are much prized subjects in spring and carpet bedding, where their distinctive leaf-colouring renders them specially valuable, in contrast to the richer hues of flowers. Thomas Smith.

Coombe Court Gardens

## COREOPSIS GRANDIFLORA.

Among the various hardy plants suitable for the mixed border this subject is one of the most delightful when planted in large masses, for it commences to bloom in June, and continues throughout the summer. It is also especially valuable used in a cut state, for its large, rich yellow flowers are produced on long, erect stalks. This coreopsis can be treated as an annual by sowing seeds under glass early in the spring and transplanting the seedlings to their flowering quarters later on. But the best results are obtained by treating it as a biennial. For this purpose seeds should be sown in a box at the present time, and placed in a cold frame to germinate. When the seedlings are large enough transfer them separately to 60-sized pots in which they will make sturdy plants, ready to plant in their permanent positions in the autumn. J. Gardner.

**Philesia buxifolia.**—The flowers of this philesia are an exact counterpart, except in size, of the well-known and popular Lapageria rosea. The philesia, however, forms a dense tuft of upright stems, pushed up from suckers, and they never assume a climbing character. Like the lapageria, it needs a peaty soil. A hybrid has been raised between the two, and named Philageria Veitchi, but it has proved difficult to cultivate.—K.

# WORK FOR THE WEEK.

◆

## STOVE PLANTS.

EUPHORBIA JACQUINIÆFLORA.—To be successful in the cultivation of this euphorbia great care must be exercised in potting and watering. The later-struck plants will by now have received their final shift, and should be kept in a genial temperature of about 70 deg. until well established, when a cooler and more airy structure should be accorded them. By this it must not be understood that I recommend a cold unheated structure, for this plant will not thrive in a temperature below 60 deg. A certain amount of warmth should be maintained in the hot-water pipes during spells of dull weather. A stagnant atmosphere will produce soft unripened wood that cannot give long racemes of closely-packed flowers in due season, therefore keep the air moving freely about the plants, closing and damping the floors and stages fairly early in the afternoon, and reopen the top ventilators a couple of hours afterwards for the night if mild weather prevails. High feeding should not be practised, and whatever kind of manure is used should be applied in small quantities, and only when the pots are well filled with healthy roots. Commence with liquid cow manure, to which has been added a little soot, and later on an occasional application of mild artificial manure may be given.

GLORIOSAS.—Few climbing stove plants surpass these when well grown. Attend closely to tying in the growths, as they are rapid growers and quickly become entangled. Not only are gloriosas objects of beauty when seen on the roof or pillars of warm houses, but the flowers are of great use for cutting. A good length of flower stem will be produced if liberal culture is given. Afford frequent applications of liquid manure, alternated with an approved artificial manure from now onwards.

HEXACENTRIS MYSORENSIS. — This twining plant is a good companion to the foregoing, the pendent racemes of rich yellow and red flowers blending well with the orange and yellow of the gloriosas. As the plants are very susceptible to attacks of red-spider and scale, it is well to occasionally sponge the foliage with a weak solution of insecticide to keep it in check. Propagation is readily effected at any time by cuttings of the half-ripe shoots. The plants should be flowered in pots or a restricted border, and see that ample drainage and an open compost is given at all times.—H. T. Martin, Warren Wood Gardens, Hatfield.

## THE ORCHID HOUSES.

THE COOL HOUSE.—At this time of the year it is often a difficult matter, owing to the hot and dry atmosphere out of doors, to keep the temperature of this house as cool and moist as desirable, but with a little care and discretion it can be made suitable for the plants. With the absence of the sun, and the heavy showers of rain which we have lately experienced, no great trouble has been experienced so far this season—a great contrast to that of last year. With an outside temperature of 55 to 60 deg., and a moist, humid atmosphere, such as we experienced for some time, little fear need be entertained of affording too much ventilation, providing there are no high winds. At such times we have both the top and bottom ventilators open on the lee side of the houses, especially so whenever the air is mild. But when the weather becomes hot, and we have an external day temperature, ranging from 70 to 80 deg., as of late, and a bright sun drying the atmosphere and the ground more and more every day, it is a mistake to open the ventilators to such an extent, and thus admit more air than can be kept humid and moist. Should the grower attempt to counteract the dry air thus admitted to the house by frequently damping the stages and floors, and syringing the plants overhead, the plants will soon show by the loss of foliage, and in other ways, how they resent such treatment. The best practice, therefore, is to admit only as much air as can be kept well charged with moisture. By day, no matter how hot the outside temperature may be, keep all the top ventilators closed, leaving the bottom ventilators wide open, but at sunset the top ventilators should be raised two or three inches, and on mild, dewy nights they may be left wide open throughout the night. Early in the morning, when the sun begins to shine on the roof of the house, the top ventilators must again be closed, and the shading employed. The excessive heat must be kept back by the use of shading; in some districts thicker and heavier shading will be necessary than in others. After closing the house it should be thoroughly damped down, syringing well between the pots and under the stages, and, if the sun is bright, the plants may be slightly sprayed overhead, but care must be taken that the water does not run down into the axils of the leaves, and only soft, tepid rain water should be used. Under such treatment it is possible to maintain a temperature even lower than that of the outside air in the shade. Taking the cool house plants generally as a whole, they are at this particular season more or less inactive. The young growths of many are only just pushing from the base of the last-made pseudo-bulbs, so that for a few weeks to come only sufficient water must be afforded to keep the pseudo-bulbs plump and healthy.

THE WARMER HOUSES.—Owing to the cold, sunless weather, it is essential for the well-being of the inmates of the warmer houses that the temperatures, especially at night, be fully maintained. The whole of the plants must be kept thoroughly on the move, and not be allowed to receive a check at this season. Therefore it is wise to carefully heat the pipes at night, so that a genial temperature and moist atmosphere is maintained in each department. Houses in which plants in flower only are staged may be kept dryer than those in which only growing plants are placed, as with a low temperature and a humid atmosphere there is a danger of every flower becoming spotted and spoilt. —J. T. Barker, The West Hill Gardens.

## FRUITS UNDER GLASS.

FRUITING POT VINES.—Probably in the majority of places fruiting vines in pots are grown chiefly for early supplies of ripe grapes, but in many instances they are grown and allowed to fruit for later supplies. We usually grow from eighteen to twenty-four vines in pots to supply ripe grapes at the latter end of this month. We have a twofold object in fruiting these vines late in the season; not only do they help to maintain a quantity of good bunches for the dessert table, but they are also used here for table decoration, trained to a light construction of ironwork made in the shape of an umbrella. Two vines are also fruited in 12-inch pots to cover a large arch made with light ironwork; this is fixed to a board one foot wide, and the fruiting vines in the pots are placed one at either end; the rods and laterals are then trained over the ironwork, and the bunches are allowed to hang through. In the first place the vines are grown in a span, or lean-to, house, and the fruit is allowed to become ripe before they are trained to the umbrella or arch. Great care must be exercised to detach the vines from the wires of the house in which they have been grown; the pot and the vine is then removed bodily, and carefully placed in position upon the arch, or trained to the umbrella. This may seem to the uninitiated a great amount of trouble, but it is surprising how expeditiously it can be done after a little experience. Unquestionably fruiting vines trained in this way always create a great interest, and it is also a novel and pleasing feature to be able to exhibit vines grown in pots in the house.

FRUIT TREES IN POTS.—Exercise judicious care and attention in stopping and regulating the young growths on these trees; expose the fruit to the sun and air as much as possible, and give stimulating manures to trees that are carrying heavy crops; a little top-dressing with a rich loam will be beneficial to the development of good fruits. Do not on any account allow the soil in the pots to become dry at any time, or failure will sure to follow. Keep a sharp look-out for insect pests, and take means at once for their eradication. Trees from which all the fruit has been gathered should be removed from the house, and the pots plunged in ashes in the open quarters to well ripen their wood.

EARLY VINES.—Continue to admit plenty of air at the top and side ventilators night and day; maintain the foliage in a clean, healthy condition with the aid of the garden engine. Keep a sharp look-out for red-spider, and if syringing will not dislodge the pests, sponge the affected leaves with soapy water and sulphur; give plenty of water to the roots as required.—H. R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

THE HERBACEOUS BORDER. — When well arranged and embellished with the more ornamental hardy plants, this is one of the most attractive features in the garden, and at the present time it is unusually bright and gay with bloom. The campanulas contribute very largely to its floral beauty, and among these C. lactiflora, C. latifolia, C. pyramidalis, C. persicifolia, and their varieties are very striking; while C. carpatica and its white variety are charming for the front of the border. Achillea filipendula makes a fine display of yellow when planted in a bold mass. Anchusa italica, Dropmore variety and Opal are very desirable acquisitions, and remain in flower over a long period. The latter is especially free-flowering, and rather a paler-blue than the Dropmore variety. Cimicifuga racemosa is a splendid plant with racemes of white flowers, and C. cordifolia is also effective. Clematis erecta makes a fine bushy specimen, and C. integrifolia is an attractive species with small, deep blue flowers. Dictamnus fraxinella, Francoa ramosa, Heuchera sanguinea, Lychnis chalcedonica, Tradescantia virginica, Œnothera Youngi, Œ. Fraseri, potentillas and phloxes in variety, all form pleasing objects when in flower. Several of the sea hollies are attractive plants, especially Eryngium Oliverianum and E. giganteum; while subjects like gaillardias, gypsophilas, veronicas, heleniums, rudbeckias, helianthuses, and Chrysanthemum maximum in variety, add not a little charm to the border. Plants like pæonies and delphiniums that have passed out of flower must have their flower stems removed, and every encouragement should be given to the later subjects to develop and display their blooms to advantage.

VIOLETS.—The recent showery weather has suited these admirably, and they are already developing into sturdy plants. Remove any runners that may form on them as growth proceeds, and, after sunny days, spray them over with the syringe to keep red-spider in check. It is a good plan to dust a little soot around them occasionally, and to work this in with the Dutch hoe.

PINKS.—These have now passed out of flower, and must have the dead flower stalks removed. The present is a good time to increase the stock of plants by inserting cuttings or layering, but, owing to their thin growths, the former method is recommended. They usually root well on a partially shady border, such as one near a north wall.

PENTSTEMONS.—These are fast developing their flower spikes, and due attention must be given to tying when further support is necessary. Pentstemons are valuable subjects for bedding, and they never fail to repay the cultivator for liberal treatment. Keep the soil between the plants stirred with the Dutch hoe, and upon the least sign of dryness afford liberal soakings of liquid manure at the roots.—J. Gardner, Batsford Park Gardens.

## SUMMER BEDDING AT HAMPTON COURT.

The copious rains that we have experienced of late have greatly assisted in the establishment of the various newly-planted subjects at Hampton Court, while the large limes and yews, as well as the surrounding grass, are, from the same cause, decidedly richer in colour than was the case last year. Beautiful as the flower beds are, they owe not a little to their surroundings, hence the perfect condition of the trees and grass combine to render the entire picture a charming one.

A visitor to Hampton Court during the summer season may be sure of two things, firstly, that he will see many of the old-established favourites at their very best; and, secondly, some marked novelties, either in the plants or their arrangements. The casual observer, while admiring the floral display, can have no idea of the deep thought and study required to maintain the high reputation which Hampton Court Gardens already possess, and, if possible, to surpass it, for the able superintendent, Mr. J. Marlow, is by no means content to let well alone.

A particularly striking feature this season is the somewhat free use of the various coloured forms of astilbe, in the production of which the Chinese Astilbe Davidi has played a part. One of the most successful raisers of these beautiful plants is Mr. George Arends, of Rondsdorf, Germany. Of his varieties represented at Hampton Court I was most struck with Venus, a stately-habited plant with lilac-pink flowers. It plays a very important part in the composition of quite a unique and much admired bed. This has a groundwork of the white variegated Holcus mollis, and dwarf Nigella; above this are well-flowered examples of Verbena Miss Willmott, while overtopping the whole are the feathery plumes of Astilbe Venus. An edging of Echeveria secunda glauca completes this remarkable bed. Another noteworthy for its delicate colouring has quite a carpet of Kœniga maritima; over this are dotted plants of the pretty double pink Begonia Major Hope, with a few tall plants of Leucophyta Browni.

A showy bed is planted with Begonia Triomphe de Lorraine, one of the semperflorens section, with crimson leaves, and double flowers of the same tint. The effect is lightened by a free use of Fuchsia gracilis variegata, Arundo donax variegata, Centaurea candidissima, variegated Pelargonium White Pet, and Kœniga maritima. Particularly pleasing, when viewed from above, is a bed thickly planted with dwarf blue and white lobelia, interspersed with compact plants of a double white lobelia, and dotted over with Centaurea candidissima, Eulalia japonica variegata, flowering examples of Sutherlandia frutescens, and a few Kochia scoparia. One more delightful bed of lowly stature must be mentioned, though it cannot be regarded as a gorgeous one. The groundwork consists of dwarf plants of Leucophyta Browni, overtopped by Major Hope begonia, with a few taller specimens of Phlox Comtesse de Jarnac, and erect plants of Leucophyta Browni. Did space permit, this list of pleasing and unique combinations might be indefinitely extended.

Of course, many of the beds are filled with larger subjects, such as Streptosolen Jamesoni, heliotropes, fuchsias, pelargoniums, swainsonias, calceolarias, and others, all of them being in good condition. The tall-growing Humea elegans, which last year formed such a notable feature of the display in these gardens, is again well represented, a number of stately plants springing from a groundwork of the double marguerite Mrs. F. Sander, forming a much-admired feature. Those to whom a blaze of colour appeals more than anything else will see much to admire in the masses of zonal pelargoniums, which are still "geraniums" to the average visitor. The brilliant scarlet Paul Crampel is still the most prominent of its class, while the old Queen of the Belgians is still one of the best of the white-flowered forms. The comparatively new variety, Maxime Kovalevsky, arrests attention when in a mass, by reason of its peculiar orange tint.

Some of the beds are filled with hardy subjects, among which the roses are, as everywhere else, particularly fine. In some instances such varieties as La France and Richmond occupy an entire bed, with a carpeting of dark and light coloured violas respectively. Some large mixed beds are, however, much admired. They are for the most part planted with dwarf kinds, while weeping standards of the rambler varieties, being full of flower, are very striking, and, overtopping as they do the dwarfer kinds, have a very pleasing effect. Of the newer kinds there were at the time of my visit particularly good flowers of Juliet. Other hardy subjects that occupy entire beds, and must be especially mentioned, are the Canterbury Bells and delphiniums, these last being represented by shafts of blue in a great variety of shades. Beds of sweet peas are also there, a good selection of varieties being represented.

The choice collection of water lilies in the round pond is eminently satisfactory, most of them being flowering with great freedom; while the bright tints of some of them are very striking.

The long herbaceous border, which extends from the Palace to the river, and is for a considerable distance backed up by the wall on which many of the rambling roses are just now in good condition, has already many features of interest, though a greater display may be reasonably anticipated later on. The Dropmore variety of Anchusa italica well maintains the reputation it already possesses of being almost indispensable in any collection of herbaceous plants, while another comparatively new plant, namely, Geum Mrs. Bradshaw, gains many admirers. Besides these other noteworthy herbaceous plants in flower are antirrhinums, Gazania splendens, Salvia pratensis, Salvia virgata, potentillas, Helenium cupreum, campanulas, veronicas, phlox, blue and white galegas, pentstemons, etc.

The corresponding border at the other side of the Palace is, as usual, planted with tender subjects, many good-sized specimens among them, and all disposed in clumps or masses made up of a sufficient number of plants to show the prominent characteristics of each. Especially noteworthy among the different kinds are fuchsias in considerable variety, pelargoniums of many sorts, Cassia corymbosa, lantanas, Calceolarias amplexicaulis and Burbidgei, astilbes, Cuphea ignea, Bougainvillea glabra, Salvia patens, Bouvardia Humbaldti corymbiflora, Salvia Pride of Zurich, Begonia ascotensis, Asclepias curassavica, verbenas, hydrangeas, etc. Annuals of different kinds play such an important part that they well merit a paragraph to themselves. An extensive use is made of Lychnis Cœli-rosea, in its several varieties, which differ in colour from white, or nearly so, to deep crimson. This, which is popularly termed the Rose of Heaven, is more frequently met with in catalogues as Viscaria oculata, while it is also known as Agrostemma Cœli-rosea. Other annuals just now conspicuous are chrysanthemums, coreopsis, nemesias, schizanthus, salpiglossis, and sweet peas.

While the above enumerate many of the more striking features, tastes vary so much that, in the opinion of some, I may have omitted several that should have been included. Such being the case, the best advice to all flower-lovers is to use a slightly modified version of a now well-known saying—go and see.

W. Truelove.

---

**Rheum Alexandrae.**—This, one of the many introductions that we have of late years received from China, is a decidedly ornamental member of the Rhubarb family, and a very distinct one. Its main feature is the large leaf-like bracts with which the flower stems are furnished. These bracts are of a pale yellow colour, with a pinkish suffusion.—S. W.

GRAND ROSE AND SWEET PEA SHOW
AT THE
DEVON ROSERY, TORQUAY.
*JULY 31st and AUGUST 1st.*
ADMISSION FREE.
£10
FOR THE BEST
BUNCH OF SWEET PEAS
(OPEN TO ALL ENGLAND) and numerous other Prizes.
Schedules free on application.
DEVON ROSERY AND FRUIT FARM, LTD., TORQUAY.

LEICESTER.—ABBEY PARK FLOWER SHOW, 6th and 7th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

## EXHIBITIONS AND MEETINGS.

◆

### Royal Horticultural Society.

In spite of the heat, the conditions prevailing at the Royal Horticultural Hall, Westminster, on Tuesday, July 16, were quite pleasant. The electric fans were in full use, and the doors of each annexe were thrown wide open, consequently there was a pleasant movement in the air, even though the thermometer kept steadily at 87 degrees. The exhibition was a comparatively small one, hence there was ample space for the somewhat few visitors to move about. It seemed as though everyone who could had gone for holiday, and most of those who could not were at home using the water-pot or the hose. Hardy flowers were fairly well shown, orchids were not numerous, but greenhouse plants and fruits were well displayed.

#### FLORAL COMMITTEE.

A display of hardy flowers from Messrs. Barr and Sons had a central mass of the purple Salvia virgata nemorosa, a very effective plant, and masses of phloxes, Malva moschata alba, Lilium testaceum, Galega officinalis compacta, Inula helenium, Helenium autumnale pumilum, Sidalcea Listeri, Iris Kæmpferi, and some new heleniums obtained from H. cupreum. Well-grown phloxes from Messrs. W. Wells and Co., Merstham, were both fragrant and beautiful; we noticed fine heads of Belvedere, Derviche, Dennis Peuch, Flora Horning, Fort du France, Rose Queen, a new, large-flowered seedling, and Tragedy, a rich crimson-scarlet variety of great beauty and effectiveness. The same firm showed the rose-pink perpetual carnation, Dorothy Gordon.

An interesting group of succulent plants from Messrs. H. Cannell and Sons, Swanley, had a backing of tall spikes of Yucca recurvifolia. Opuntia paraguayensis, and the white Phyllocactus Pfersdorfi, were shown in bloom; and, in addition, there were capital plants of Mamillaria Donati, Cereus candicans, Pilocereus senilis, Mamillaria Nicholsoni, Echinocactus Leconti, bristling with spikes, E. Grussoni (very fine), Gasteria verrucosa, and the curious Astrophytum myriostigma.

Handsome spikes of gladioli from Messrs. J. Kelway and Son, Langport, were nicely set up with sprays of common asparagus among them, and the effect was quite good. Lord Curzon, the pink Earl Compton, King of Gladioli, the dark crimson Faust, Miletun, and Hon. R. Guinness were varieties with large flowers and good form. The bluish-purple Lieutenant Hallswell and the Langprim hybrids were also of special interest;

the latter strain (A.M.) were obtained by crossing G. gandavensis and others with G. primulinus. G. primulinus maculatus, deep yellow with red-brown blotches, was very charming, and the race is promising; Ella Kelway, Queen of Fairies, and Wraith were all very pretty.

Mr. Maurice Prichard, Christchurch, was a large exhibitor of hardy flowers, and put up a quantity of perennial phloxes, and goodly bunches of Delphinium cineraria, Carnation Oldown Yellow, Heliopsis scabra excelsa, Crinum Powelli, and C. P. alba. Dainty little plants of Lysimachia Henryi, Campanla pumila alba, C. garganica, Stachys corsica, Campanula Isabel, C. Zoysi, and Primula Monroi were also shown. A bold and effective group of hardy flowers from Messrs. T. S. Ware, Feltham, was a source of interest. Here were fine bunches of good phloxes, coreopsis, campanulas, achilleas, heleniums, delphiniums, etc.

Several score of stately spikes of Eremurus Olgæ, and E. O. alba, staged by the King's Acre Nursery Company, were greatly admired. The spikes of E. Olgæ showed some considerable variation in form and shade, and the plants producing them were collected from 3,000 to 6,000 feet above sea level on the Elbury Range in the Persian province of Khorasan. The deep pink forms were very charming. Messrs. Stuart Low and Co., Enfield, presented stands of such lovely roses as Lyon, Rayon d'Or, Frau Karl Druschki, Molly Sharman Crawford, Pink Liberty, and Dean Hole.

The phloxes from Messrs. Gunn and Sons, Olton, were set up in tall stands, and the varieties Cybele, L'Aiglon, George A. Stroehlin, Elizabeth Campbell, Le Mahdi (gorgeous), Border Beacon, and Duke of Westminster, were among the best. The display from the Guildford Hardy Plant Company included Romneya Coulteri, Spiræa venusta, Buddleia Veitchi, and Campanula grandiflora.

The little water and bog garden arranged by Mr. Amos Perry, Enfield, was delightfully cooling. Nymphæa, Marliacea carnea, N. Jas. Brydon, N. Froebelli, and N. Marliacea albida, were quite plentiful on the water, while in the background were Senecio macrophyllus with a dozen and a-half of its massive golden spikes. In the foreground were Japanese irises, Lilium Humboldti, L. H. magnificum, L. pardalinum, L. canadense, and L. Browni; while spiræas and grasses formed flanking groups. Seedling gloxinias exhibited by Messrs. J. Peed and Son, West Norwood, represented an excellent strain; the netted and spotted varieties were especially good. Streptocarpuses, too, were good, and showed a wide range of colouring.

A bold and showy group of carnations, grouped with palms, bamboos, and ferns, by Messrs. Wm. Cutbush and Son, Highgate, stood opposite the doorway. In tall stands were large sheaves of White Enchantress, R. F. Felton, Mrs. W. Ward, Mrs. L. Mackinnon, Winsor, May Day, Rose Doré, and Beacon. In the centre of the group were pot plants of several popular malmaison and perpetual carnations.

The exhibit from Messrs. Jas. Veitch and Sons, Chelsea, was composed of bright hued rhododendrons of the Javanico-jasminiflorum group, Solanum Wendlandi, the brilliant Clianthus Dampieri, Hibiscus magnificus, carnations, Thalictrum dipterocarpum, and a very fine selection of cannas. Messrs. H. J. Jones, Ryecroft, Lewisham, displayed phloxes, and in the collection submitted we made note of G. A. Stroehlin, Distinction, Frau Ant. Buckner, Antoine Mercier, Gen. Hentz, Dr. Charcot, and Mrs. John Harkness, as being very distinct and beautiful.

Messrs. Phillips and Taylor, Lily Hill, Bracknell, provided a pool of nymphæas with a background of reeds, rushes, bamboos, grasses, and Alisma plantago. In one corner of the pool the double form of Sagittaria japonica plena was shown. This firm also displayed a bank of hardy flowers wherein galegas were well represented. A charming new astilbe named A. Rhenania (A.M.) was exhibited by Mr. W. Profittlich, Twickenham. This is the result of crossing A. Queen Alexandra with A. Arendsi Ceres; it has erect spikes of pink flowers, each flower tipped with purple.

Plagianthus Lyalli (A.C.C.), a white-flowered shrub that succeeds in warm spots, was shown by Messrs. Robert Veitch and Sons, Exeter; this grows well at Kew against a wall; the same firm showed the pretty creamy Rosa Souleiana and Dorycnium hirsutum. Mr. Phillip Ladds, Swanley Junction, brought up some good pelargoniums, notably Salmon Paul Crampel, White Queen, Champion, and double Paul Crampel. Messrs. W. Fells and Son, Hitchin, exhibited a collection of phloxes, and showed all the popular sorts.

Some very fine border carnations were shown in vases by Mr. Chas. Blick, Hayes, Kent; particularly effective and beautiful were Linkman, August, Daffodil, the rich Cyclops, the deep purple edged picotee named Her Majesty, Hercules, Father O'Flynn, Dora Blick, and Herbert Chapman. There were in all thirty-seven varieties, and they made up a most interesting exhibit. Messrs. H. B. May and Sons, Edmonton, brought up the new double marguerite, Mrs. Sander, Campanula Mayi, some examples of Ixora macrothyrsa, and a number of elegant ferns, chiefly the plumose, nephrolepis, and adiantums.

Two beautiful nymphæas, N. Attraction (A.M.), with crimson colouring, and N. Formosa (A.M.), lovely pink with red flushes on the back of the petals; both come from Mr. Jas. Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton.

Patrinia palmata, a rare hardy plant with neat palmate leaves clustering near the ground, and branching spikes of small, sweetly-scented and clear yellow flowers, was shown by Miss Willmott, V.M.H. (gardener, Mr. C. Fielder, V.M.H.), Warley Place, Essex, and gained an A.M.

## ORCHID COMMITTEE.

Orchids were by no means largely staged, but there were several distinct novelties.

Messrs. Stuart Low and Co., Enfield, had a quite good group of orchids, and the chief features of the display were Dendrobium Dalhousianum, Oncidium macranthum, Miltonia Bleuana, Cattleya Mendeli, Odontoglossum Williamsi, Stanhopea tigrina, Odontioda Charlesworthi, and Bulbophyllum Godseffianum.

A fine form of Cattleya Hardyana Dell var., from Mr. Shill, gardener to Baron Bruno Schroder, Egham, was greatly admired; it carried three glorious blooms. Mr. R. G. Thwaites, Streatham, contributed an interesting little colection of odontiodas, O. Charlesworthi and O. Thwaitsi were those mostly represented. Miltonia vaxillaria Queen Alexandra was also included. From Burford Lodge, Dorking, Mr. White, grower to Sir Trevor Lawrence, Bart., brought up Eria rhyncostyloides, with dense arching spikes of pink flowers; and Lælio-cattleya Adolph-Harrisoniæ, with purple-spotted flowers.

M. Firmin Lambeau, Brussels, showed the finest plant of the day, and gained a F.C.C. for his Cattleya Warscewiczi alba var. Firmin Lambeau, which oarried three large, exquisitely beautiful, pure white flowers, each with a soft lemon-yellow throat to the lip. Messrs. Hassall and Co., Southgate, exhibited Cattleya Thurgoodiana and L.-c. rubens. From Messrs. Charlesworth and Co., Haywards Heath, came Zygopetalum Brewi (A.M.), a pretty plant obtained by crossing Z. Perrenondi with Z. rostratum; it has a deep purplish rose area on the lip. Odontoglossum Epicaste (A.M.), also from Haywards Heath, has deep black-purple flowers, with rose-purple edging; this comes from O. Clytie and O. crispum.

## FRUIT AND VEGETABLE COMMITTEE.

A particularly fine exhibit was one entirely of gooseberries, staged in fine style by Messrs. Jas. Veitch and Sons, Chelsea. As a background the firm staged freely cropped standards and cordons of popular varieties, but the chief interest centred in the baskets of one hundred varieties of these useful fruits. All the fruits were ripe, and ranged in colour from white to deepest crimson-red. In size, too, there was a wide difference between the tiny Pitmaston Gage and the big Speedwell, Leveller, and Fearless. In the matter of flavour there is also a wide range, but probably the finest in this respect are Langley Gage, Langley Beauty, Golden Gem, Ironmonger, Warrington, Pitmaston Greengage, Green Gascoyne, Broomgirl, Whitesmith, and Keen's Seedling. Very fine sorts are Whinham's Industry, Ironmonger, May Duke, Trumpeter, Whitesmith, Sulphur, Lancashire Lad, White Champagne, Mount Pleasant, Leveller, Marlborough, Careless, Gipsy Queen, London, Monarch, and Dan's Mistake, and these were splendidly represented in a collection that well deserved the Gold Medal awarded it.

Very fragrant and enticing were the twenty handsome fruits of Queen pineapples, staged by that master of fruit culture, Mr. Thos. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth. Messrs. S. Spooner and Sons, Hounslow, submitted trays of bright fruits of Early Red Margaret and Mr. Gladstone apples.

Collections of peas and lettuces from Messrs. John K. King and Sons, Coggeshall, proved interesting. The lettuces included fourteen cabbage varieties, and of these Yellow Market, Sutton's Favourite, May King, All the Year Round, and the bronze-leaved Eclipse, were the most notable. Over fifty dishes of peas were shown, and here a good selection was Thos. Laxton, Twentieth Century, Essex Star, Pioneer, Telephone, Quite Content, Senator, Gradus, Sutton's Seedling, Pilot, and Telegraph.

Mr. Baines, gardener to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, exhibited an old peach named Royal Charlotte (A.M.), which resembles Noblesse in size, form, and flavour, but is very highly coloured instead of being light-skinned. Mr. Hills, gardener to E. M. Kennedy, Esq., Leaves Green, Keston, sent a crop of 286 shallots, obtained from fifteen sets. Fruiting sprays of a small, dark-fruited hybrid between the black currant and gooseberry came from Mr. R. Nicholls, Dunstable; the flavour was not particularly attractive. Mr. Walker, Oak Hill Park Gardens, Enfield, sent some fine samples of red currants.

## CERTIFICATES AND AWARDS.

First-class Certificate.—To Cattleya Warscewiczi alba var. Firmin Lambeau (a Gold Medal was also awarded for this beautiful orchid), from M. Firmin Lambeau, Brussels; to Plagianthus Lyalli, from Messrs. Robert Veitch and Sons, Exeter; to Nephrolepis exaltata muscosa, from Messrs. H. B. May and Sons, Edmonton.

Award of Merit.—To strain of Gladiolus primulinus hybrids, from Messrs. J. Kelway and Sons, Langport; to Patrinia palmata, from Miss Willmott, V.M.H., Warley Place, Great Warley; to Crossandra undulæfolia, from Sir Trevor Lawrence, Bart. (gardener, Mr. Baines), Burford Lodge, Dorking; to Astilbe Rhenania, from Mr. W. Profittlich, Twickenham; to Nymphæas Attraction and Formosa, from Leopold de Rothschild (gardener, Mr. Jas. Hudson, V.M.H.), Gunnersbury House, Acton; to Zygopetalum Brewi, and to Odontoglossum Epicaste, from Messrs. Charlesworth and Co., Haywards Heath; and to Peach Royal Charlotte, from Sir Trevor Lawrence, Bart., Dorking.

## MEDALS.

Gold.—To Mr. T. Coomber, V.M.H., gardener to Lord Llangattock, The Hendre, Monmouth, for pineapples; to Messrs. Jas. Veitch and Sons, Chelsea, for gooseberries; and to M. Firmin Lambeau, Brussels, for a fine white form of Cattleya Warscewiczi.

Silver-gilt Banksian.—To Messrs. H. B. May and Sons, Edmonton, for ferns, etc.; to Messrs. Jas. Veitch and Sons, Chelsea, for flowering plants.

Silver Flora.—To Messrs. H. Cannell and

Sons, Swanley, for succulent plants; to Messrs. J. Kelway and Son, Langport, for gladioli; to Messrs. Carter Page and Co., London Wall, for antirrhinums, etc.; to Messrs. J. Peed and Son, West Norwood, for gloxinias ,etc.; to Messrs. Stuart Low and Co., Enfield, for orchids.

Silver Banksian.—To Mr. R. G. Thwaites, Streatham, for orchids; to Messrs. Wm. Cutbush and Son, Highgate, for carnations; to Messrs. H. J. Jones, Lewisham, for phloxes; to the King's Acre Nurseries, Hereford, for eremuri; to Mr. Amos Perry, Enfield, for water lilies, etc.; to Mr. Chas. Blick, Hayes, for carnations; to Messrs. Gunn and Sons, Olton, for phloxes; to Messrs. John K. King and Sons, Coggeshall, for lettuces and peas.

Bronze Flora.—To Messrs. Stuart Low, and Co., Enfield, for roses; to Mr. M. Prichard, Christchurch, for hardy flowers; to Mr. Reuthe, Keston, for hardy flowers; to Messrs. Thos. S. Ware, Feltham, for hardy flowers.

## Manchester Rose and Sweet Pea Show.

JULY 12 and 13.

After the lapse of a few years it is a pleasure to record the revival of one of the most popular northern exhibitions, but whether the dates were unsuitable, or exhibitors have lost interest in the work of the Royal Botanical and Horticultural Society of Manchester, the entries were not numerous as compared with those made a few years ago, when the chief growers, both amateur and nurserymen, were present in strong force.

### ROSES.

In the class for thirty-six distinct varieties Messrs. W. and J. Brown, of Peterborough, were the only exhibitors. They were awarded the first prize for finely developed, fresh blooms, the best being Avoca, Mildred Grant, Mrs. J. H. Welsh, Ben Cant, Mrs. M. Lenton, Edward Mawley, Mrs. A. C. Coxhead, Dean Hole, Leslie Holland, Horace Vernet, Madame C. Metz, and Claudius.

In competition for the prizes for twelve teas or noisettes Messrs. Brown were again first, and staged good blooms of Maman Cochet, Mrs. E. Mawley, Mrs. M. Kennedy, Souv. de P. Notting, and other good varieties. The same firm also obtained premier honours in the class for twelve trusses of any white or yellow rose, with good blooms of Frau Karl Druschki, and for twelve of any crimson variety with Mrs. A. G. Coxhead.

There was a spirited contest for the prizes in the amateurs' class for twenty-four trusses. Mr. R. Foley Hobbs, of Worcester, occupied the premier position with fine blooms of Frau Karl Druschki, Gloire de Chenedane Guinoisseau, J. B. Clarke, Lady Helen Vincent, Ulster, etc.; Mr. R. Park, of Bedale, was a capital second. For twelve distinct trusses the positions were reversed, Mr. Park having Mrs. Theo. Roosevelt and Hugh Dickson in splendid form.

In the class for eighteen teas or noisettes, Mr. R. Foley Hobbs was first with a box in which were excellent blooms of Mrs. F. Hobbs, Mrs. E. Mawley, Mme. Cusin, Mme. Nadillac, and other varieties of merit; Mr. R. Park was second. In competition for the prizes for twelve teas or noisettes the same order was observed.

For twelve blooms of any white or yellow rose Mr. R. Foley Hobbs won with splendid flowers of Bessie Brown; Mr. R. Park followed for second place, and Mr. J. Holt was third, both staging Mme. Jules Gravereaux in fine form. For twelve blooms of any light rose Mr. Foley Hobbs was first with charming blooms of Her Majesty. For twelve blooms of crimson variety Mr. Park was first with A. K. Williams.

In the class for twenty-four distinct varieties, the blooms to be grown in the Manchester district, Mr. A. G. Hogg, of Altrincham, and Mr. W. Coley were first and second. For twelve trusses the prize-takers were Messrs. J. Holt, A. M. Buxton, and C. E. Marshall. For six trusses Messrs. C. Burgess, P. Wilkinson, and J. Holt were the prizetakers in the order named.

In competition for the prizes for twelve bunches suitable for button-holes Messrs. W. and J. Brown secured premier honours with a pleasing lot, Richmond, Dorothy Page Roberts, and E. Meyer being especially good. For a display of roses the same firm was again first with an arrangement in which the Lyon was most conspicuous.

For a basket of roses the winners were Messrs. O. Robinson, A. Adshead, and A. J. A. Bruce, with pretty exhibits. For three baskets Messrs. A. Adshead and W. and J. Brown were first and second. Mr. R. Foley Hobbs was awarded the Silver Medal for the best H.P. or H.T. with Gloire de Chenedane Guinoisseau; and for the best tea or noisette with Mrs. R. Foley Hobbs.

### SWEET PEAS.

For the best collection, not less than fifty or more than one hundred vases, Mr. F. A. Robinson was a splendid first with finely developed sprays, especially good being Vermilion, Brilliant, Rosabelle, Mrs. W. J. Unwin, Melba, Maud Holmes, Nubian, Edna Unwin; Messrs. Castle Bros., Warton, was second; and Messrs. Faulkner and Aitkin third. In the class for twelve vases Messrs. C. Burgess, J. S. Procter, Altrincham, and S. T. Brittain were the prizetakers, Edna Unwin, Mrs. W. P. Wright, Constance Oliver, being conspicuous in the leading collection.

For twenty-five vases Mr. A. Bieth, Knutsford, was the winner of the first prize, having good sprays of Marjory Villiers, Sunproof, Crimson, Mrs. Hugh Dickson, and others. Mr. O. Robinson had the best bouquet, followed by Mr. Adshead for second place.

### MISCELLANEOUS.

For the best group of miscellaneous plants occupying a space not less than 300 square feet superficial, Messrs. J. Cypher and Son, of Cheltenham, was a capital first with a collection of choice plants arranged in his usual tasteful manner; especially noteworthy were the ixoras, miltonias, cattleyas, and heaths. Mr. J. Sharp, of Huddersfield, was second with an effective arrangement. In the class for a group occupying a space of not less than 100 square feet superficial Mr. J. Kaullmann, of Fallowfield, secured the chief award, his crotons, begonias, and gloxinias being especially meritorious.

The best display of herbaceous cut flowers was contributed by Messrs. Caldwell and Sons, of Knutsford, who staged liliums, spiræas, and phloxes in fine style.

### NON-COMPETITIVE.

Mr. H. Eckford was awarded a Gold Medal for a very fine collection of sweet peas; Mr. A. J. A. Bruce, of Chorlton-cum-Hardy, for a miscellaneous group, including insectivorous plants in variety; and Messrs. Dicksons, of Chester, for cut roses.

The Cowan Nursery Company secured a Silver Medal for a collection of orchids; and the Hopwood Alpine Garden Company for rockery and alpines. Mr. H. Middlehurst, of Liverpool, had a pleasing collection of sweet peas.

## Wolverhampton Floral Fete.

The exhibition held at Wolverhampton on the 9th inst., and two following days, was, from all points of view, one of the most successful of those held in this great centre. There was a strong competition in the leading classes, the exhibits were of high quality, and the arrangements such as to reflect the highest credit upon all concerned. Additional interest was given to the proceedings at the luncheon by the presentation to Mr. W. E. Barnett, on behalf of the exhibitors and judges, of a silver tea and coffee service with an address and a set of vases for Mrs. Barnett. This recognition of Mr. Barnett's services during the twenty years is very pleasant to those who are fully acquainted with the admirable manner in which he performed his duties. It is gratifying to know that in Mr. Councillor Amphlett the committee found an excellent successor to Mr. Barnett in the office of secretary.

As from the earliest days in the history of the floral fêtes at Wolverhampton, groups arranged for effect formed an important and immensely attractive feature. In the display of miscellaneous foliage and flowering plants, Messrs. J. Cypher and Sons, of Cheltenham, were successful in winning the premier award of £40, with an arrangement in their best style. Sir George Kendrick, Edgbaston, Birmingham, followed for second place with a display of rare beauty, and Mr. W. A. Holmes, Chesterfield, and Mr. W. A. Vause, Leamington, who were third and fourth, had displays that were highly meritorious. For a group of ornamental-leaved plants, including palms and ferns, Messrs. J. Cypher and Sons were again first, and Sir G. H. Kendrick second, Mr. W. A. Holmes and Mr. W. Manning being third and fourth. Messrs. J. Cypher and Sons were first also for twenty plants and for six heaths. Mr. R. H. Mander, Tryill, Sir Charles Mander, Mr. T. Mander, and Mr. J. A. Kendrick, Edgbaston, were also successful exhibitors in these classes. In competition for the prizes for a collection of flowering plants (one kind only) Messrs. Blackmore and Langdon, Twerton Hill, Bath, were first with splendidly flowered plants of tuberous begonias.

Cut roses constituted a large and attractive feature. In the open classes Messrs. D. Prior and Sons, Colchester, were first for seventy-two blooms; the King's Acre Nurseries, Hereford, were second, and Messrs. Harkness and Co., Hitchin, third. The King's Acre Nurseries obtained premier honours for thirty-six blooms, with Mr. W. T. Mattock and Mr. W. H. Frettingham, Beeston, Notts., second and third. The last-named scored for nine baskets of roses, staging blooms of high quality. Messrs. Harkness and Co. were first for eighteen perpetual flowering roses, and Mr. W. T. Mattock was first for a similar number of blooms of tea-scented varieties. Hardy flowers were well shown by Messrs. Harkness and Sons, Bedale; Messrs. G. Gibson and Co., Bedale; Messrs. F. Smith and Co., Woodbridge; and Messrs. Blackmore and Langdon. Sweet peas were plentiful and of high quality, and the more successful of the exhibitors of these fragrant flowers were Messrs. Castle.

There was a spirited contest in the majority of the plant classes that were limited to amateurs and gardeners, and in competition for the awards for groups arranged for effect Mr. J. A. Kendrick and Mr. B. Howson, Market Drayton, were first and second with tasteful arrangements. Tuberous-rooted begonias in collections of twelve were splendidly shown by Mr. J. Taylor, Pershore; Mr. B. H. Mander, and Captain Simpson.

Roses formed a distinct feature in the cut flower classes that were limited to private growers, and chief among the competitors were Mr. R. Foley Hobbs, of Worcester, and the Rev. J. A. L. Fellowes, of Attleboro. These exhibitors were first and second in the open classes for thirty-six, six, twenty-four, and twelve blooms, and also for twelve teas. Mr. Edgington, Wolverhampton, and Mr. W. F. Burford, Tettenhall, were the most successful exhibitors in the district classes for roses.

Fruits and vegetables were well shown, and in the leading classes for the former, Mr. Doe, gardener to Lord Saville, Rufford Abbey, and Mr. Barker, gardener to the Duke of Newcastle, Clumber, Worksop, were especially successful. The Earl of Harrington, Elvaston Castle, was also very successful. The premier award for a decorated dinner-table was won by Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, and the second award was made in favour of Mr. J. H. Goodacre.

In the vegetable section the Marquis of

W. H. Smith, Stourbridge, was first in a second class for six kinds.

Miscellaneous collections were, as usual, numerous, and of a high order of merit. The following awards were made to the exhibitors of these:

Gold Medals.—Messrs. Webb and Sons, Wordsley, for miscellaneous flowers and fruit; Messrs. Baker, Codsall, for floral display; Mr. W. Lowe, Beeston, Notts, for roses; and Messrs. Sutton and Sons, Reading, for sweet peas.

Small Gold Medals.—Mr. A. F. Dutton, Iver, Bucks, for carnations; Messrs. Dickson, Lim., Chester, for roses and herbaceous plants; Lady Grey, Enville, for carnations; Messrs. Dobbie and Co., Edinburgh, for roses, dahlias, and violas; and Messrs. Cutbush and Son, London, for examples of topiary.

Silver-gilt Medals.—Messrs. Clibrans, of Altrincham, for sweet peas, etc.; Messrs. W. H. Simpson and Sons, Birmingham, for sweet peas; and Messrs. Hewitt and Co., Lim., of Solihull, for herbaceous plants.

Silver Medals.—Messrs. H. N. Ellison, West Bromwich, for ferns; Mr. F. A. Haage, jun., for cacti; Mr. C. H. Herbert, of Acock's Green, for herbaceous pinks; Messrs. Seagrave and Co., of Sheffield, for violas; Mr. C. F. Waters, Balcombe, for carnations; Messrs. Jarman and Co., of Chard, for roses, centaureas, and carnations; Messrs. B. Ladham's, Lim., Shirley, Southampton, for gaillardias; Messrs. Dickson and Robinson, of Manchester, for annuals; and Messrs. W. Cutbush and Son, London, for carnations.

Bronze Medals.—Messrs. H. Mosters, of Hansdworth, for violas; Messrs. F. Cross, of Arnold, Nottingham, for floral exhibit; and Messrs. A. H. Welham, of Bridgnorth, for miscellaneous flowers.

Award of Merit.—J. Bastock, of Moseley, for the perpetual-flowering free carnation, Mrs. A. F. Dutton.

## Dundee Horticultural Association.

The annual excursion of the members of this association took place on the 6th inst., when Pittercrieff Park, Dunfermline, was visited. Upwards of 50 members availed themselves of the opportunity to inspect the world-famous works of the Carnegie Trust.

The party was met on arrival by the genial park superintendent, Mr. James Dunagan, and conducted to the Central Baths and Gymnasium, which are said to be the best equipped establishments of their kind in Great Britain. After a general survey the members of the party, which was augmented by a considerable number of district horticulturists, sat down to tea, thoughtfully provided by the Carnegie Trust, one of the directors, Mr. Macrea, acting as host.

After a few words of appropriate thanks the party proceeded to inspect a district bowling-green and library, en route to the park, where there was much to interest all, and Mr. Dunagan and his staff spared no effort to make the guests thoroughly enjoy themselves. A splendid range of glass structures, with teak framework and well furnished with healthy-growing foliage and flowering plants, was the admiration of all. A new flower garden of several acres, only recently laid down in grass, was bright with summer bedding and permanent occupants. The rockwork in the glen, representing an outlay of £6,000, is of massive construction, and few gardeners could attempt anything so elaborate, even if they had the unique site afforded in this charming park.

After inspecting the palace ruins the party adjourned to the Royal Hotel, where, under the chairmanship of Mr. Dunagan, they were again hospitably entertained, a pleasant hour being spent in song and sentiment. When the president, Mr. Wm. Christeson, and Mr. Wm. Grant and others had expressed the thanks of the party to all who had contributed to their enjoyment, the meeting broke up with three ringing cheers for Dr. Andrew Carnegie on the call of Mr. James Bethel.

## Elstree and Boreham Wood Horticultural Society.

The summer show of the above society was held on July 10, in the grounds of Aldenham House, and the weather conditions were ideal. The park was placed at the disposal of the society through the kindness of Lord Aldenham, and the President, the Hon. V. Gibbs, kindly allowed the visitors to see the gardens. Consequently, the society owe much to the kindly interest these two gentlemen take in the welfare of the society. The competitive classes were well filled, and the entries exceeded in number those of any previous show. The honorary and trade exhibits were placed in a separate marquee. At one end the Hon. Vicary Gibbs exhibited one of the largest collections ever staged by Mr. E. Beckett, V.M.H., and included a number of varieties of excellent merit, whilst at the extreme end was a model water garden with a winding stream, planted with water lilies and choice aquatics, and a background of typhas, bamboos, etc., and other suitable flowering subjects. These exhibits were awarded a gold medal. E. Greenwood, Esq. (gardener, Mr. G. Capell), was awarded a silver medal for a particularly good group of hydrangeas, coleus, and ferns. The silver rose bowl was won this year by Messrs. Frank Cant and Co., of Colchester, with a grand exhibit, which defeated a very fine collection of roses from Messrs. Harkness, last year's winners.

Mr. R. F. Felton, of Hanover Square, journeyed down, and arranged a table of carnations to practically demonstrate the effect to be obtained without the use of elaborate stands, etc. This non-competitive exhibit was much admired. He also assisted in judging the table decorations and other classes of flowers.

Trade exhibits were staged by Messrs. Cutbush of roses; Messrs. H. Newman and Sons, Watford, sweet peas and violas; Messrs. Gleeson and Co., herbaceous plants; and Messrs. Thomson and Charman, a small rockery, planted with a variety of choice alpines and shrubs.

## The London Vacant Land Cultivation Society.

The fourth annual meeting of the above society was held at the residence of Baron de Forest, M.P., Spencer House, St. James Place, W., on Friday, July 12, Frank Smith, Esq., L.C.C., in the chair. It was stated that the 500 plot-holders have in four years raised over £7,000 worth of vegetables, and in the present season the lines of vegetables reach a total length exceeding 100 miles, while the rows of flowers would be equal to ten miles. Exhibits of the vegetables grown on waste land were much admired by those present. The hon. secretary is Mr. Joseph Fels, and the superintendent Mr. R. L. Castle. More land is urgently needed for 600 applicants.

**Ripe Grapes.** — Up to the present time, in this locality, it has not been necessary to use shade of any kind upon the roof of houses that contain ripe grapes, but no doubt it will be necessary ere long. Abundance of air must be admitted both at night and in the daytime; dispense with artificial heat as much as possible, using only a little at night, and on cold, wet days to maintain a free circulation in the atmosphere of the house. Look over the bunches occasionally, and remove at once all berries that show signs of decay. Stop all laterals as required, although a little more freedom of growth can be allowed at this stage. Where the foliage is very thick, and when Muscats are ripening, the leaves should be carefully tied from immediately over the bunch to allow the sun the shine upon the bunches; this will assist the berries to mature, and give them that deep golden colour so much admired in this particular variety.—Henry Farmer, Cardiff Castle Gardens.

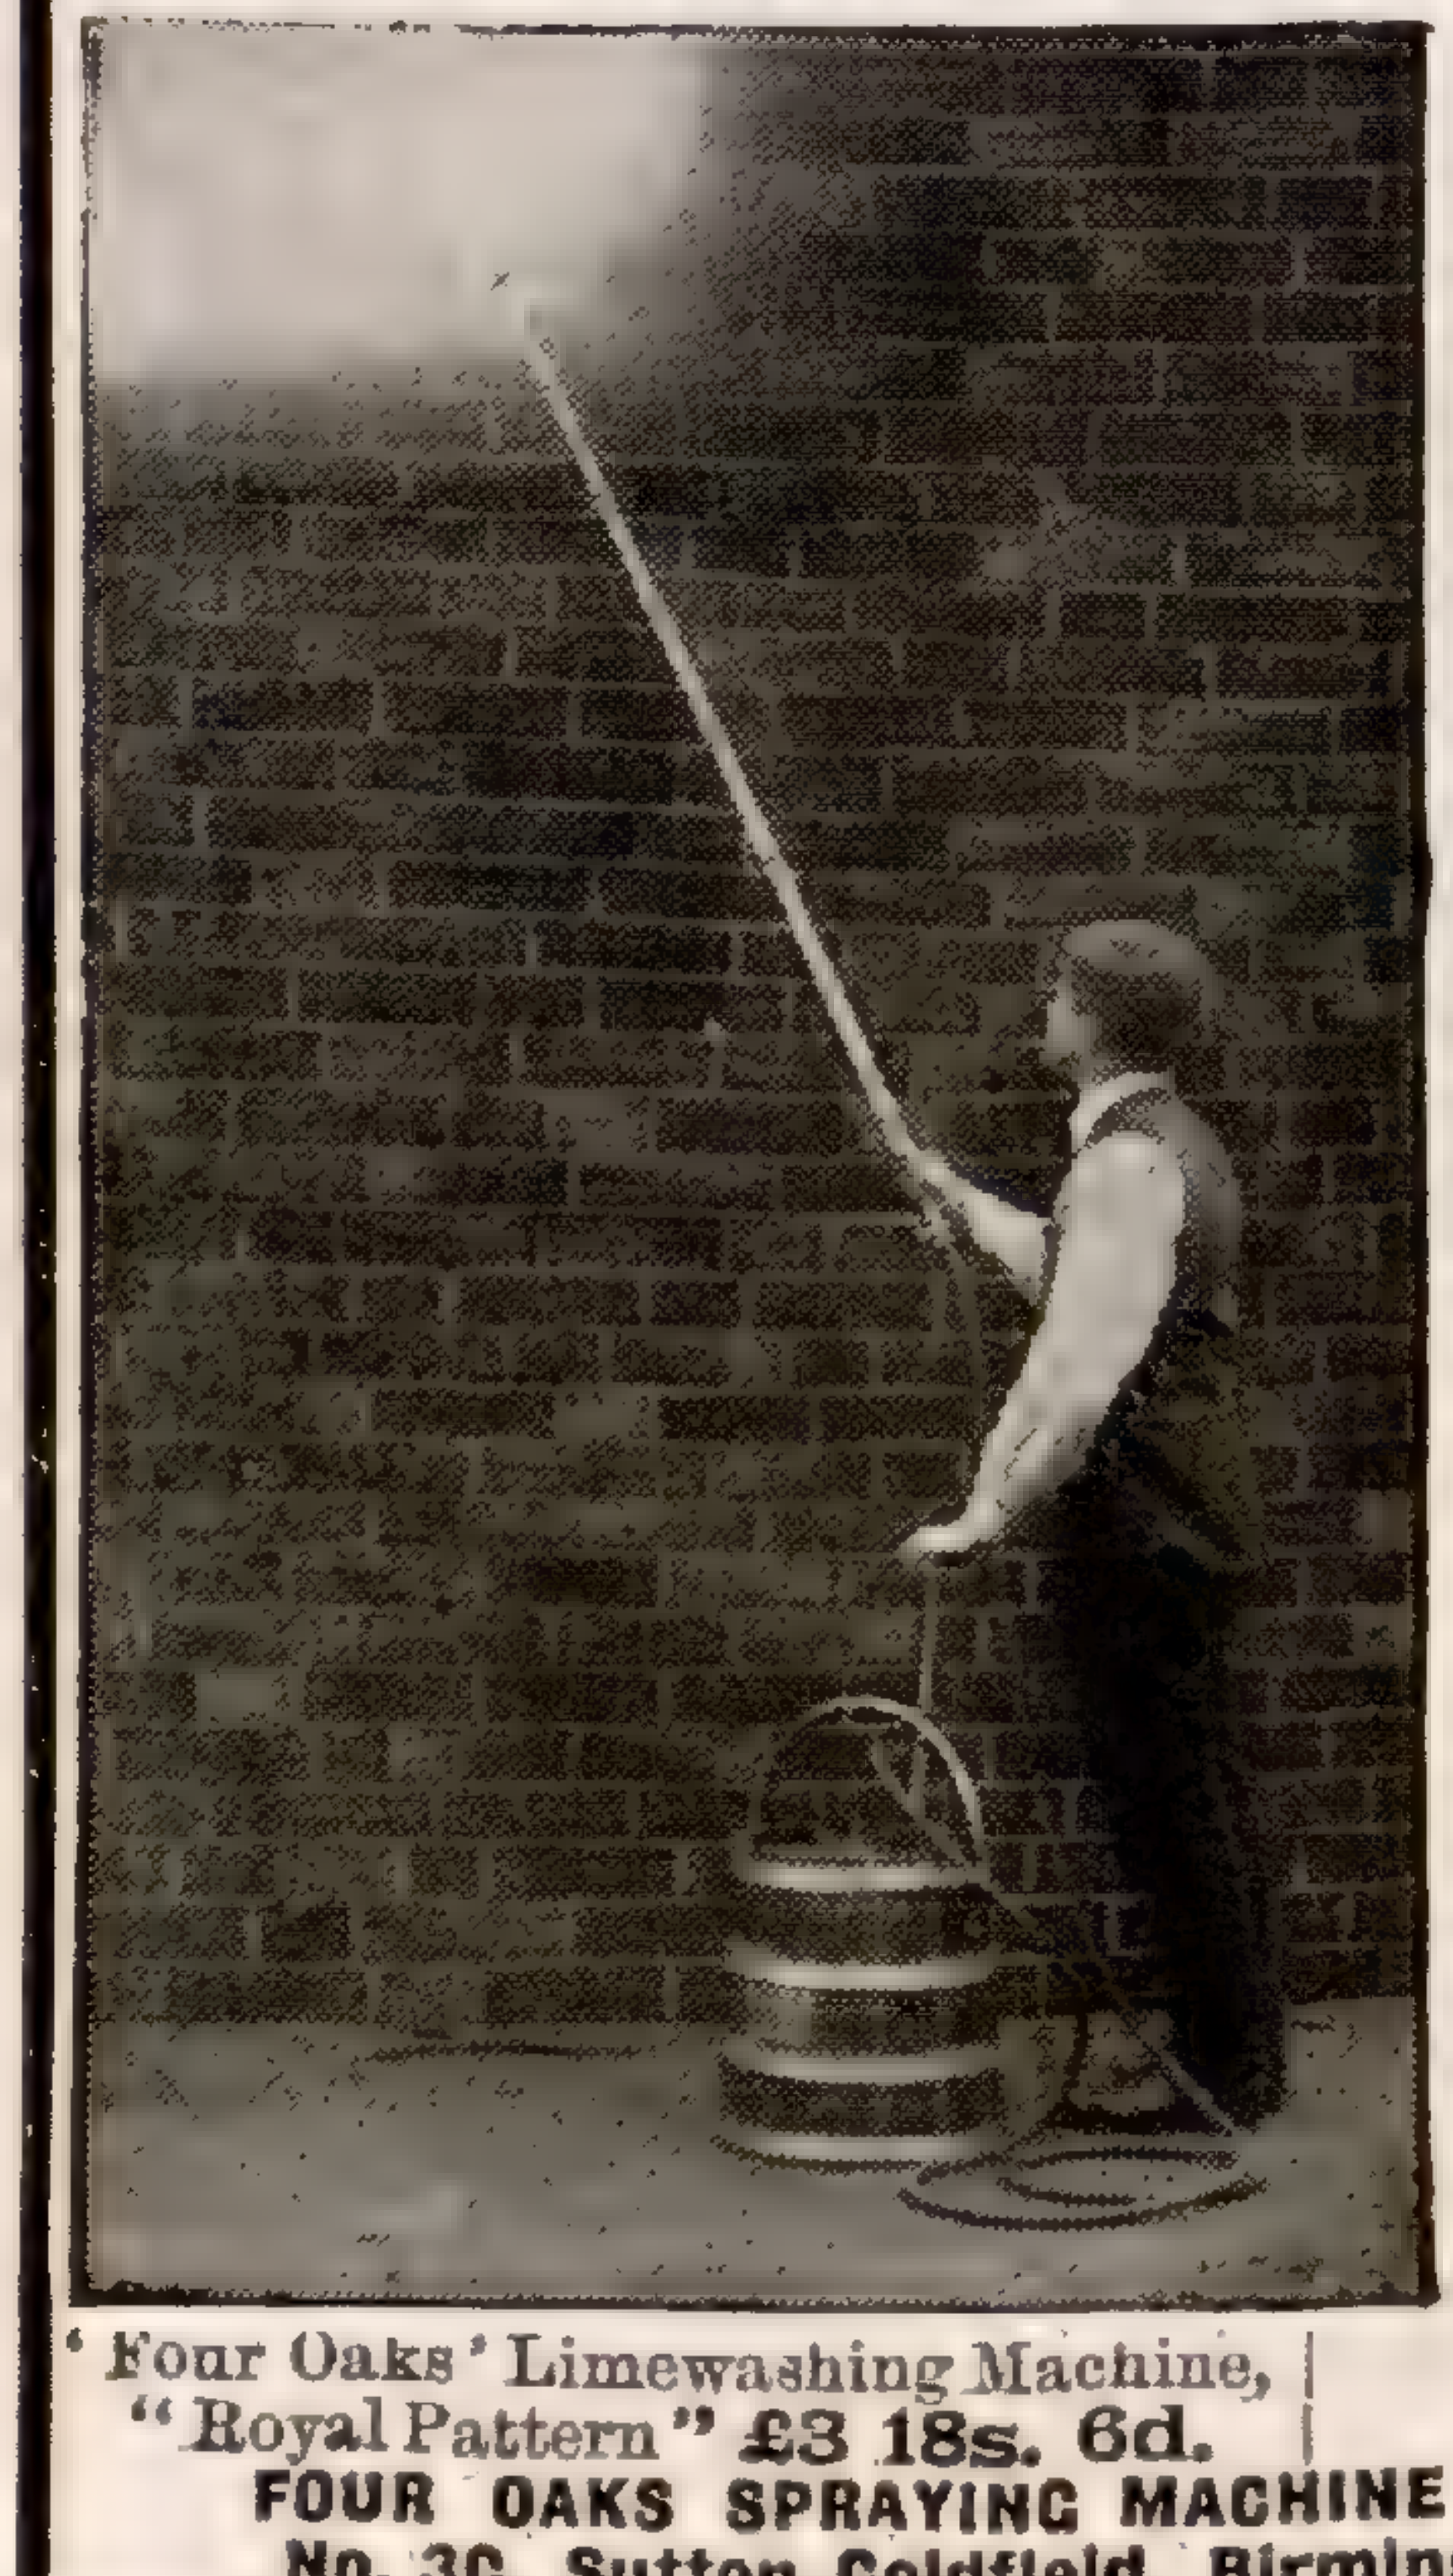
## ANSWERS TO CORRESPONDENTS.

SLUG WORM ON ROSES.—J. G., Ingatestone: Our roses are being eaten up by tiny maggots, and we seem to be unable to find a means of removing the pest. We have not suffered in this way previously, and as our roses have always been considered good, we are, naturally, troubled. If you can help us we shall be very grateful.—We hope you have seen the answer to "H. S., Chelsfield," which appeared in our issue of July 13, and acted upon the advice therein given, because if you have done so a week will have been saved. The pest is the rose slug-worm (Eriocampa rosæ), and it appears to be working a great deal of mischief in various districts this season. You will find full particulars of life history, remedy, and cure on p. 546.

SPECIES OF CHINA ASTER. — N. J., Warminster: Kindly tell me how many species of the China Aster there are?—The China Aster is Callistephus hortensis, and the genus contains but the one species. The specialists and raisers have, however, raised a large number of distinct races or florists' groups, probably from twenty to thirty, notably the Victoria, Quilled, Pæony-flowered, Ostrich Plume, Comet, and Anemone sections. These groups do not represent distinct species, but they show what can be accomplished with a flower, when careful selection and cross-fertilisation are conducted by experts.

SWEET PEAS AND CUPRESSUS.—F. F., Bletchley.—Do you think that if sweet peas were planted upon a site previously occupied by an old cypress hedge, they would prove a failure? We have a row of sweet peas on such a site, and though the soil was dug deeply and old manure was added, the plants have made scarcely any growth, and consequently have produced practically no flowers. My gardener believes the failure is due to the previous crop of cupressus.—We regret you did not see fit to give your name and address. Bletchley was the post mark, but, of course, it does not follow that you live there. By a curious coincidence, we saw three rows of Elfrida Pearson sweet pea at Burbage Experimental Station last week, occupying a site from which cupressus were recently removed; the three rows were failures, and Major Hurst, who owns and manages the station, considers that the failure is due to the influence of the cupressus, which have evidently removed in a very

->Spraying<-
And Limewashing Machines



In every garden and on every estate one of these 'Four Oaks' machines are indispensable.

Will spray the Fruit Trees, Limewash the Stables, Kennels, Outbuildings, &c., in a fraction of the time taken by brushes.

FOUR OAKS SPRAYING MACHINE CO.,
No. 3C, Sutton Coldfield, Birmingham.

large degree some soil constituents necessary to sweet peas, or it may be that the roots leave behind them some acid excretion that does not agree with sweet peas.

PROPAGATION OF ROSEMARY. — M. E. J., St. Neots: I wish to work up a little stock of a few dozen plants of rosemary for planting close to the top of a low retaining wall at the end of a terrace. I have one large plant now growing freely. Please tell me the best way to proceed?—Rosemary may be propagated at once from cuttings about six inches long. Select a position on a shady border, and prepare a sufficient quantity of fine sandy soil; place the cuttings firmly in the soil, and cover with a hand light or small frame. The cuttings should root freely and quickly, and, after due exposure, should be ready to plant out in the autumn.

HYBRID CATTLEYA.—C. H. F., Abergavenny: We have in bloom what we consider to be good varieties of both Cattleya Dowiana aurea and C. gigas. We propose to pollinate the former with the latter; what sort of hybrid would result if seeds and seedlings eventuate?—It is refreshing to find so many taking up the cultivation of orchids in a general rather than in a special sense, because we have always contended that orchids should find a place in every well-equipped garden, just as carnations, chrysanthemums, and ferns do. It is evident your experience is not large, so far as orchid hybridisation is concerned, because one of the earliest cattleya hybrids recognised was C. Hardyana; this was imported, and was supposed to be a natural hybrid between C. Dowiana and C. Warscewiczi (gigas), a supposition that was subsequently proved to be correct. C. Hardyana varies considerably, but generally it has the size and form of C. Warscewiczi, with the golden and crimson colouring of C. Dowiana especially noticeable in the lip.

## NAMES OF PLANTS.

L. M. A., Lewes.—Indigofera Gerardiana.

E. M. C., Bicester.—Brachycome iberidifolia.

W. A. R., Hellifield.—1, Rosa bracleata; 2, R. sericea pteracantha.

J. F. W. H., Sunderland.—A species of cratægus, but insufficient for identification.

F. S., Horsley. — 1, Anchusa italica; 2, Hebenstreitia comosa; 3, Ginkgo biloba; 4, Liriodendron tulipifera.

R. P., Devonport.—1, Fuchsia gracilis; 2, Gasteria verrucosa; 3, Kleinia repens; 4, Costus igneus; 5, Nepenthes Burkei.

C. B. M., Northampton. — 1, Ligustrum chinensis; 2, Diplopappus chrysophyllus; 3, Phlomis fruticosus; 4, Erigeron speciosa; 5, Astilbe Davidi.

J. J. C., Manningham.—1, Linum perenne; 2, Scabiosa caucasica; 3, Gilia tricolor; 4, Achillea Ageratum; 5, Santolina incana; 6, Hypericum calycinum.

L. B., Taplow.—1, Spartium junceum; 2, Trifolium repens purpureum; 3, Polemonium cœruleum variegatum; 4, Hemerocallis Thunbergi; 5, Clematis recta.

## FORTHCOMING ENGAGEMENTS.

TUESDAY, July 23. — National Carnation and Picotee Society.
Brighton Rose and Sweet Pea Show; two days.
WEDNESDAY, July 24.—Crawley Horticultural Society.
Leamington Horticultural Society; two days.
Bishop's Waltham Horticultural Society.
Haywards Heath Horticultural Society.
Lyndhurst Horticultural Society.
Ickleton Horticultural Society.
Normanby Horticultural Society.
THURSDAY, July 25.—St. Ives (Hunts) Horticultural Society.
FRIDAY, July 26.—Huddersfield Horticultural Society; two days.
Cheadle Horticultural Society; two days.
SATURDAY, July 27.—Derby Gardeners' Association Summer Show.
Fife and Kinross Horticultural Society.
Gourock Horticultural Society.
TUESDAY, July 30.—Royal Horticultural Society: Floral, Fruit, and Orchid Committees meet at noon. General meeting with lecture by Mr. Cecil Hooper on "Pollination of Fruit Blossoms," 3 p.m. Scientific Committee, 4 p.m.

An edition of "SWEET PEAS AND THEIR CULTIVATION," by C. H. Curtis, has been issued for 1912, and consequently this is an up-to-date work on the subject. The price, by post, is 1s. 2d. (cloth, 1s. 9d.) from the Publishers, 148-9, Aldersgate Street, London, E.C.

## OBITUARY.

◆

### REV. F. D. HORNER, M.A., V.M.H.

We regret to record the death of this great florist, which occurred at his residence, Greeta House, Burton-in-Lonsdale, on the 11th inst.

For upwards of forty-five years the Rev. F. D. Horner, V.M.H., occupied a leading position among florists, and during this long period accomplished so much useful work in the improvement of florists' flowers, and in stimulating an interest in their culture, that it would not be easy to make a proper estimate of the services he rendered in the cause of floriculture. Under the guidance, and with the example of his father, the late Dr. Horner, of Hull, who was one of the foremost florists of his day, Mr. Horner began to take an interest in florists' flowers at a very early age, and when Dr. Horner died in 1862 he regarded it as a sacred trust to carry on the work he had laid down. To the work that was taken up in 1862 Mr. Horner devoted himself to within a few years of his death with a zeal that is quite beyond praise. He was so exceptionally successful as a raiser and cultivator of show auriculas that his accomplishments in connection with the tulip did not, perhaps, receive the attention they so fully deserved. Each season for over forty-five years he cross-fertilised the varieties of the tulip and raised seedlings, and throughout he worked with but one object in view, and that was the improvement of the old type in its varied colours. Need it be said that this devotion to a good cause had its full reward. It was with the show auricula, however, that Mr. Horner's name was best known, and as the result of his well-directed efforts in the raising of seedlings he enriched the lists with numerous varieties of the highest class. For some years Mr. Horner, without allowing his interest in florists' flowers to slacken, devoted considerable attention to the cross-fertilisation of maize, with a view to raise a race well suited for culture in this country for culinary purposes. Here also the results fully justified the endeavour. While paying unremitting attention to the flowers so dear to the florist, Mr. Horner fully appreciated the charms of other classes of plants, and in the glass structures in the gardens of Greeta House visitors found many choice orchids, numerous uncommon greenhouse and stove plants, and a collection of succulent plants in robust health. As a writer and speaker, Mr. Horner ranked high among florists, and he was ever welcome at gatherings of florists to whatever rank of life they belonged. Mr. Horner was one of the earliest recipients of the Victorian Medal of Honour in Horticulture.

THE LATE REV. F. D. HORNER, M.A., V.M.H.

---

With reference to the death of this distinguished florist, Mr. Alderman J. W. Bentley writes:

Mr. Horner died at his home, Greeta House, Burton-in-Lonsdale, on Thursday evening, July 11. He had been laid aside by illness for a few years, and most of his older friends have gone before, but there will be grief in the hearts of all who knew him and appreciated his work when they realise their loss. He was the son of Dr. Horner, of Hull, a notable grower of tulips, ranunculuses, and other flowers in his day, and an able writer in the older floricultural papers, such as the "Gossip of the Garden." The latter's love of flowers, and the ability to write about them were transmitted to his son, and well he used both, for his knowledge was great and his writings inimitable.

Whilst he had a catholic love for all flowers, his favourites were auriculas and tulips, and it is by them he will be best remembered. In conjunction with his friend Mr. B. Simonite he did great things for the auricula, and it is largely due to their efforts that our auriculas are so good to-day.

He was the secretary of the Northern Auricula Society from its commencement, for over twenty years, performing similar duty for the Northern Carnation Society for many years, and when the Victorian Medal of Honour in Horticulture was instituted he was worthily chosen as one of the first recipients.

I fain would write of his kindliness of heart, his love for all living things, of his humour and rare power of expressing his thoughts by voice and pen, but for the present these few inadequate lines must suffice as a tribute to the memory of my dead friend.

## To be Sold.

IN CHANCERY.
MESSRS. H. CANNELL AND SON, SWANLEY, ST. MARY CRAY, AND EYNSFORD.

THESE OLD-ESTABLISHED NURSERIES, universally known as the "Home for Flowers," may be acquired by private treaty as a going concern, either as a whole or in three lots. The properties comprise:—

A. The Home Nurseries, Swanley, about 15 acres, with all the glasshouses, seed warehouse, office, trade buildings, and residence.
B. Eynsford Nursery, part 1, 40 acres, glasshouses, and residence.
B. Part 2, 229 acres of land, with a very extensive stock of young fruit trees and part also permanently planted as orchard. Farmhouse and numerous buildings.
C. St. Mary Cray, the Cockmanning's Nursery, 35 acres. Conifers, ornamental trees and general nursery stock. Farmhouse and buildings.

The nurseries at Swanley and Eynsford abut to a considerable extent upon the railway, and this offers exceptional advantages for advertising the business.

The firm have been successful exhibitors at the most important shows for many years, and obtained a Gold Medal for their exhibit of Cannas, Pelargoniums, Calceolarias, etc., at the recent International Show at Chelsea.

Full particulars may be obtained from Messrs. Stone, Morris, and Stone, Solicitors, 5, Finsbury Circus, E.C.; Messrs. T. P. Child and Son, C.A.'s, 8, Frederick Place, Old Jewry, E.C.; and Messrs. Protheroe and Morris, Auctioneers and Estate Agents, 67 and 68, Cheapside, E.C.

FOR SALE, cheap, 400 Standard and Pyramid Bay Trees, suitable for balconies or planting out; also 100 tall Dracæna indivisa and lineata, all established in tubs and pots. Can be seen at STROUD and CO., Florists, 182, Green Lanes, Finsbury Park, N.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Horticultural Societies.

In a careful examination of the lengthy list of horticultural societies which forms so important a feature of the "Gardening Year Book," the mind becomes so impressed by their numbers that the question arises whether all or any considerable proportion of these organisations are fulfilling their mission in such manner as to render substantial service in the advancement of horticulture. The primary object of all societies that hold one or more exhibitions during the year should be the encouragement of horticulture generally, or some branch of the gardening art, and the means by which this object can be attained is the presentation to public notice of the plants, flowers, fruits, and vegetables most worthy of cultivation for various purposes, and the demonstration of the highest example of cultural skill. Societies that have not such object in view have no reason for their existence, and if they desire to have it as an essential part of their foundation, but fail to either educate their members and the visitors generally in the art of selection and cultivation, there is full justification for enquiring whether they are really serving a useful purpose. A satisfactory answer to such an enquiry as this cannot be obtained by staying at home. The exhibitions of a considerable number of societies that may be regarded as fairly representing the whole must be visited, and in an examination of the products the powers of observation should be exercised to the fullest extent. Writing with a wide knowledge of what is being done by large numbers of societies in various parts of the United Kingdom, we are well assured that those who act upon out suggestion and investigate the matter for themselves with an open mind, will agree with us that the present position of large numbers of horticultural societies should have the most careful consideration. We have had the matter in mind for some time past, and we have, as the result of observation over a wide area, irresistibly come to the conclusion that the time has arrived when an endeavour should be made to so reorganise horticultural societies as a whole as to effect a great improvement in their scheme of work. For a very long time the number has been very large, and of this number a considerable proportion have become more or less moribund and incapable of serving a really useful purpose. Some began in a small way, and have so failed to improve their position as to suggest that their foundation was due more to the desire to provide offices for individuals than to the hope that the organisations would assist in the development of horticultural enterprise in their respective districts. It is a very laudable desire to become the chairman, vice-chairman, secretary, and so forth of a society, provided there is scope for good work, but when the opportunities do not exist, and the ability is not forthcoming to make them, the society is unquestionably a hindrance to progress. At the present time, as for many years past, there is a great redundancy of societies associated with gardening, and before they can do work in proportion to the time and money devoted to them there must be a considerable reduction in their number. Leaving cottagers' societies out of consideration, all the small bodies that fail to fully justify their existence should be abolished, for they represent a waste of energy, time, and money, inasmuch as their exhibitions do not properly represent the present position of horticulture, and they have little educational value. When these have been abolished horticulturists should concentrate their efforts upon establishing a series of societies that shall be associated, not with villages and small towns, but with districts having a sufficient area to enable them to give the societies sufficient support without any considerable sacrifice on the part of individuals, and to undertake work of a higher degree of importance than is usually attempted. Strong district societies distributed over the whole of the country are the great need of the present day, and their foundation may be readily accomplished with the money that is now being wasted on the small, effete bodies that are so numerous. The district societies should be managed by committees whose members are drawn from relatively wide areas, and therefore are representative in character. To avoid the appearance of being especially associated with any particular part of the districts, the exhibitions should, as far as practicable, be movable, and be held in a different place each year, until the really suitable places have been exhausted. In some cases it will be advisable to hold the shows in the same place annually, as, for example, where the chief town occupies a central position, and there are railway or other facilities for reaching it readily from all parts. It will not be advisable to adopt a hard-and-fast rule with reference to the holding of the exhibition, but strenuous endeavour should be made to show in the clearest manner that the societies are not specially associated with particular towns, but belong to the several districts. Were this suggestion to be acted upon we should once more see at the majority of the exhibitions produce of so high a quality as to properly represent present-day skill. Societies that are

MR. E. HARRISS.

specially engaged in the encouragement of the cultivation of the products of cottage gardens and allotments are a class by themselves, and we do not suggest that they should be altered except as far as may be necessary to avoid the products of the cottagers' skill being overpowered by exhibits from great gardens, which are usually sent with the best possible, if mistaken, intentions. Neither do we suggest there should be any change in the competitions at the meetings of the gardeners' associations, for, as at present conducted, they do much good at a small cost. What we are anxious to see accomplished is the large sum of money annually absorbed by bodies incapable of useful work utilised in the creation and maintenance of societies possessing sufficient strength and vitality to exercise a decided influence for good upon the advancement of high-class gardening.

---

**Mr. E. Harriss,** who has succeeded his father-in-law, the late Mr. Fyfe, as head gardener to Lady Wantage, at Lockinge Park, is quite familiar with the famous gardens now under his charge. His first gardening experience was gained at Impney Hall Gardens, Droitwich, where he served for nearly six years under Mr. Richard Parker. In 1894 he went to Lockinge as journeyman, and remained three years under Mr. Fyfe, leaving to take a charge in the fruit houses, under Mr. Owen Thomas, at the Royal Gardens, Windsor. A year or so later Mr. Fyfe offered him the position of general foreman at Lockinge, and this he accepted, filling it for three years, when, at the request of Mr. Owen Thomas, he returned to Windsor to take charge of the fruit department under glass. This onerous position Mr. Harriss filled to the great satisfaction of Mr. Thomas, and subsequently to Mr. Mackellar, for a period of twelve years, and now, for the third time, he has gone to Lockinge. It is remarkable that as journeyman, foreman, and as head gardener, Mr. Harriss has entered service at Lockinge upon invitation. Mr. Harriss's ability is of such a high order, and his knowledge of Lockinge so considerable, that we are quite certain the high position Lady Wantage's beautiful garden occupies in the horticultural world will be fully maintained under his management.

**Saltaire Rose Show,** held on July 17, was a great success. The leading rosarians were present in large numbers, and both roses and sweet peas were well and extensively shown. There was a brilliant assemblage for the opening ceremony, performed by the Lady Mayoress of Bradford, Miss Moorhouse, who was accompanied by the Lord Mayor, Alderman J. B. Moorhouse. The receipts amounted to £294, rather less than last year, and it is estimated that 8,308 persons paid for admission.

**The Clarence Elliott Trophy for Rock Garden Plants.**—Mr. Clarence Elliott, Stevenage, has presented a silver trophy to the Council of the Royal Horticultural Society, and this is to be offered to amateurs for an exhibit of alpines and plants suitable for a rock garden. The plants to be arranged with rock work, as a small rock garden, on a space 6ft. by 3ft. There must be not less than 18, or more than 24 species or varieties. Herbaceous plants, ordinarily exceeding 12in. in height, bulbs, and variegated or double plants to be excluded. The subjects shown need not all be actually in flower. The competition will take place on Wednesday, May 14, 1913, and all the plants exhibited must have been grown by the exhibitor since March 1 at least. Beauty of arrangement, the real suitability of the plants to rock work, rarity, culture, and correct naming, will be most taken into consideration by the judges. It is suggested that the plants should be grown in pots, not lifted from the open ground, but the pots should in all cases be removed before staging. A background of dwarf shrubs and conifers may be added. The Council will award a suitable medal according to merit, at their discretion, to the exhibitor adjudged second, and possibly also to the third.

**Proposed Rose Show for the City of London.**—Mr. A. E. Protheroe, of 67, 68, Cheapside, writes: "It has been suggested to me by several amateur rose growers that a rose society should be formed exclusively for City people. The primary object would be to hold an annual show in the heart of the City. I am convinced that there is ample room for such a society. There must be a very large number of keen rosarians amongst our City workers, as, indeed, a casual examination of 'buttonholes' during the rose season amply testifies. They would, I am sure, welcome an exhibition of roses in their midst, for only a comparatively small number can afford the time to attend the metropolitan exhibition of the National Rose Society or similar shows. The schedule would naturally include classes to suit the smaller as well as the larger growers, and, I think, should also have special ones for those dwelling within five and ten miles of the City boundary. Thus exhibitors would be competing against those who have to cultivate their roses under similar conditions, and this would foster a spirit of keen but friendly rivalry between the various suburbs. I shall be very pleased to receive names and City addresses of those who would be willing to join in the formation of such a society, from which a committee could be formed to carry out the working details."

**Food Value of Potato Haulm for Cattle.**—Mr. C. Bathurst, M.P., recently asked the President of the Board of Agriculture, whether potato tops were as useful food as hay for farm stock, and, if so, what treatment was necessary to render the 2,000,000 tons of haulm annually thrown away, fit for food. The reply was that green potato tops are edible, and sometimes fed to stock, but the use of such tops would injure the crop of tubers. Potato haulm, fully ripened, is quite unfit for stock feeding.

**Variation in Boskoop Giant Black Currant.**—Mr. Chas. Pearson sent shoots of black currant Boskoop Giant to the recent meeting of the R.H.S. Scientific Committee, to illustrate a variation which had apparently suddenly arisen in several localities. The leaves become much more dentate and the bushes fail to fruit. Sometimes only a portion of the bush is so affected, but frequently the whole, and in one plantation 50 per cent. of the bushes showed the variation. The Committee will welcome any observations that would throw light upon the phenomenon. It has been suggested that possibly hard pruning may have brought about the result, but there is no record so far of reversion.

**Development of Pollen.**—In a communication read at the recent monthly meeting of the Royal Microscopical Society, Lord Avebury gave a short account of the development of pollen and of recent researches on fertilisation. Lord Avebury divided pollen into: aërial pollen carried by the wind, aërial pollen carried by insects, and subaqueous pollen. The various forms of pollen were described and their distribution in the different orders enumerated. The most common form of pollen is elliptical, with three ribs, for which Lord Avebury believes there is as yet no explanation. Such pollen was originally spherical, and only assumed the elliptical three-ribbed form after leaving the anthers and losing a certain amount of moisture by desiccation. Compositæ for the most part have spiny pollen and are entomophilous, but the Edelweiss and some allied species are anemophilous and smooth. The Rosaceæ are almost all entomophilous, with elliptic pollen, but Poterium is anemophilous with spherical pollen. The willow is entomophilous, with elliptic three-ribbed pollen; the poplars are anemophilous with spherical pollen. Though the size of pollen does not depend entirely on the length of the pistil, and the length therefore which the pollen tube has to traverse, still, as a general rule, the longer the pistil the larger the grains.

**Carlisle Show and the Northern Fruit Congress,** to be held conjointly on September 4 and 5, promise to be of great interest, and the exhibition should be unusually large. The Speaker of the House of Commons, the Rt. Hon. J. W. Lowther, will open the exhibition and congress.

**Gardeners and the U.H.B.P.S.**—We are glad to learn that so many readers have acted upon our advice and applied for particulars of the benefits offered during sickness to those who become members of the United Horticultural Benefit and Provident Society. This society has now become approved by the National Health Commissioners, and there were no fewer than a hundred and thirteen applications for membership at the recent special meeting of the committee; at the previous meeting eighty-two new members joined.

**Carpenteria californica at Sherfield Manor.**—This handsome flowering shrub has seldom been seen to such advantage as during the present summer, and wherever there are established specimens there has been a wonderful wealth of its beautiful white blooms. At Sherfield Manor, near Basingstoke, two plants are growing against a south wall, and each is clothed in blossom. The unusual freedom with which the flowers are produced is probably due to the great heat of 1911, and the consequent ripening of the growth. Possibly many lovers of flowering shrubs may be induced to plant this Carpenteria because of its good behavious this year, but they must not expect to see such a profusion of flowers each season, unless the preceding summer is a hot and bright one.

**M. Lucien Chaure,** editor of the French "Moniteur d'Horticulture," has recently been awarded the rosette of an Officer of the Legion of Honour.

**Exhibition of Forced Spring Bulbs in** 1913.—A special exhibition of forced spring bulbs will be held at the Royal Horticultural Hall on March 4 and 5, 1913, the object being to demonstrate the varieties most suitable for gentle forcing. Exhibits of small and large collections are invited from amateurs and the trade, and R.H.S. medals will be awarded according to merit. The General Bulb Growers' Society of Haarlem have presented prizes totalling 21 guineas for eighteen hyacinths; 15 guineas for twelve hyacinths; £5 3s. for six hyacinths; and 11 guineas for four pans of hyacinths, ten roots of one variety in each pan. The blooms in each pan to be of distinctly different colour to those of the other three pans. For trade growers there will be a class for the finest decorative display of hyacinths grown from first-size bulbs, and the prize will be the gold medal of the General Bulb Growers' Society of Haarlem.

# NATONAL CARNATION SOCIETY.

The exhibition of this society, held at the Royal Horticultural Hall on Tuesday, July 23, was not quite so extensive as some the society has held in London; it was, nevertheless, an excellent one, and the fine quality of a very large number of the blooms staged considerably surprised many of the specialists. The brilliant and hot weather of early July, followed by many days of quite cool conditions, must have proved very trying to carnations, and the growers are to be congratulated upon the successful manner in which they overcame these climatic difficulties.

## BLOOMS SHOWN ON CARDS.

In the premier division, and in the leading class for show carnations, Mr. C. F. Thurston, Wolverhampton, led for a dozen flakes and bizarres, with full-sized, clean examples of Gordon Lewis, Admiral Curzon, Recorder, J. S. Hedderley, Ophelia, Merton, Master Fred, Flamingo, Ethel MacRae, and Torchlight; Mr. J. Douglas came second, and Mr. H. Mathias third. Five entries. There were also five competitors in the class for a dozen selfs, and here Mr. Hayward Mathias, Medstead, led with fine specimens of Maud Allen (Premier Self), E. Shiffner, Wyatt, Theodore, Gatton, Irma, Titan, etc.; Mr. C. F. Thurston came a good second, and Mr. J. Douglas had to be content with third place.

In the class for a dozen fancy carnations there were again five entries, and here Mr. H. Mathias was well to the front with a particularly beautiful box of grand examples of Donald McDonald, Becky Sharp (premier fancy, a variety raised by Messrs. A. R. Brown, Lim.), Mrs. Leo Hunter, Bombardier, Linkman, Hecla, Queen Eleanor, Erl King, Devonian, Hercules, and D. O'Connell; Mr. C. F. Thurston second, and Mr. J. Douglas third. Messrs. Arthur R. Brown, Lim., King's Norton, Birmingham, led the way for a dozen white-ground picotees out of five competitors, and their flowers were very clean examples of Mrs. W. H. Twist, Edmund Shorthouse, Janet, Mrs. H. Hoskier, Myra, Lady Maud, Dorothy, Violet, and Thos. Williams; Mr. J. Douglas second, but scoring a premier with his picotee Amy Robsart, with deep purple edge; Mr. H. Mathias third.

In the remaining large class, for a dozen yellow-ground picotees Mr. Hayward Mathias again scored a first, with Ariel, Corona, F. W. Goodfellow, Onward, Gloria, Puck, Santa Claus, and several seedlings; Mr. J. Douglas came second, and his example of Mrs. J. J. Keen was given the award as the best heavy-edged, yellow-ground picotee; Messrs. A. R. Brown, Lim., third.

## FLOWERS SHOWN AS GROWN.

Five classes were provided in the first division for flowers shown as grown, in vases. The first of these was for four vases of selfs, three blooms of each, and here Mr. J. Douglas led with Daffodil, Mrs. G. Jones, Bob Acres, and Mrs. G. Marshall, all finely staged; Mr. F. W. Goodfellow, Walsall, second, and Messrs. A. R. Brown, Lim., third. For four trebles of fancies, Mr. J. Douglas scored with grand specimens of Liberté, Lord Steyne, Edenside, and Pasquin; Messrs. A. R. Brown, Lim., second, and Mr. H. Mathias third. In the class for trebles of white-ground fancies, Mr. J. Douglas once more led, and this time scored with Delicia, Pearl, The Bride, and Montrose. Messrs. A. R. Brown, Lim., second.

Yellow-ground fancies, four trebles, brought out four competitors, and premier award fell to Mr. J. Douglas for Her Majesty, Onward, Exquisite, and Mrs. J. J. Keen; Mr. H. Mathias second, and Messrs. A. R. Brown, Lim., third. The best set of nine trebles, of selfs, fancies, and yellow-ground picotees came from Mr. J. Douglas, whose Linkman, Mrs. G. A. Reynolds, Pasquin, and Ilene were very fine; Mr. H. Mathias and Messrs. A. R. Brown, Lim., followed in the order named.

In this section Mr. J. Douglas won the trophy for the highest aggregate of points.

## SECOND DIVISION.

In this division there were numerous competitors in the classes for flowers on boards. Mr. H. R. Taylor, Cheam, scored for half a dozen flakes and bizarres, and his Black Diamond was the premier bloom of its class; Mr. W. Walker, Kilmarnock, second, and Mr. G. W. Ford, Acock's Green, third. For six selfs the prizes went in order of mention to the Rev. C. A. Gottzwaltz, Droitwich; Mr. W. H. Parton, King's Norton; and Mr. H. R. Taylor; while for half a dozen fancies Mr. Taylor led, and was followed in order by Mr. E. J. Price, Bournville, and Mr. G. D. Ford. Six white-ground picotees was a class that brought out seven entries, and here the awards were made in favour of Mr. H. R. Taylor, Mr. G. D. Ford, and Mr. J. A. Fort, Winchester; Mr. Price had the premier white-ground picotee—Fair Maiden—in this class, and Mr. H. R. Taylor, who was first for six yellow-ground picotees, had a premier bloom in Eclipse; Mr. Parton and Mr. Ford came second and third.

A quite good number competed in the division for flowers shown as grown, in vases. Mr. W. Walker led for three pink or rose selfs with Lady Hermione, and Mr. Parton was a good second. For a white self, three blooms, Mr. R. Morton, Woodside Park, scored with Mrs. Eric Hambro, Mr. Ford and Mr. W. Walker closely following. Mr. Morton was easily first for three crimson selfs, showing grand blooms of Mrs. G. Marshall; Miss Shiffner, Wallands House, Lewes, second, and Mr. A. Spurling, Borough Green, third. Daffodil was the variety shown nine times out of eleven in the class for three yellow selfs, and with this Mr. Morton came first; Captain A. G. Russell, Wheatley, Oxon, second, and Miss Shiffner third.

The class for three scarlet selfs found Mr. Parton to the front with Etna, Mr. W. Walker and Mr. Morton coming second and third respectively with Cardinal. Mr. Morton had the best three yellow-ground picotees, and Exquisite was his winning variety; Miss Shiffner second, and Mr. Parton third. For a buff or terra-cotta self Mr. Robert Morton scored with fine flowers of Elizabeth Shiffner; Mr. G. D. Ford second, and Mr. Parton third; eleven competitors. The yellow or buff-ground fancies class found fourteen competitors, and here Mr. Ford scored with Mrs. Penton; Mr. Parton second with Lord Steyne,

MR. ROBERT MORTON'S FIRST PRIZE TWELVE BUNCHES OF CARNATIONS,
With which he won the Martin-Smith Cup at the National Carnation Society's Show.

and Miss Shiffner third with Wallands. For fancies of any other ground colour Mr. Parton led with Ivo Sebright, while Mr. H. R. Taylor came second and Captain Russell third, with the same variety.

Mr. Morton continued his successes in the class for the white-ground fancies, scoring with The Nizam; Mr. H. D. Taylor second and Mr. J. A. Fort third. For three selfs of any other colour than specified Mr. D. Walker led with the deep heliotrope Jim Bludzo; Mr. L. Hart, Hertford, second, and Mr. J. A. Fort, third. The class for six trebles of selfs, fancies, or yellow-ground picotees brought out eleven competitors, and the chief prize-winner was Mr. R. Morton, who staged finely; Mr. W. H. Parton second, and Mr. E. J. Price third.

CARNATION MRS. G. JONES.

The first prize bunch of a buff or terra-cotta self carnation at the National Carnation Society's Show; exhibited by Mr. Jas. Douglas.

### THIRD DIVISION.

In the third division the classes were arranged for smaller growers, and the leading prize-winners were Mr. J. B. Willetts, Yardley; Mr. A. E. Chambers, Wellingbrough; Mr. E. W. Painter, Brentford; and Mr. C. Brown, Hatfield Peverel.

### MARTIN SMITH CUP CLASS.

Great interest always centres in this class, which is for a dozen distinct varieties, three blooms of each, selfs, fancies, and yellow-ground picotees to be represented. There were two entries, and the handsome cup fell to Mr. Robert Morton, Grange Dene, Woodside Park, for a grand lot of blooms of Lord Steyne, Daffodil, Linkman, Mrs. G. A. Reynolds, Mrs. George Marshall, Togo, Renown, Elva, John Ruskin, Margaret Lennox, Cyclops, and F. W. Goodfellow. Mr. W. H. Parton, Moseley, was second prize-winner with good vases of Soltaferre, Etna, Lord Steyne, Linkman, and Queen Eleanor.

### OPEN CLASSES.

This division required a bunch of nine blooms in each class. For a pink or rose self, Mr. J. Douglas scored with Rosy Morn; Messrs. A. R. Brown, Lim., second; and Mr. H. Mathias third. Mr. H. Mathias scored for a white self with good flowers of Titan; the Messrs. Brown and Mr. J. Douglas following. Mr. Lakeman, Thornton Heath, led for a crimson self with Mrs. G. Marshall, finely shown; Mr. H. Mathias second, and Messrs. A. R. Brown, Lim., third. In the class for a yellow self, Mr. Lakeman led among five entries with a grand bunch of Daffodil that contained the premier self flower; Mr. J. Douglas second, and Mr. H. Mathias third. Mr. J. Douglas, with Bob Acres, and Messrs. A. R. Brown, Lim., with Cardinal, were first and second respectively in the class for scarlet selfs. Among buff or terra cotta selfs, Mr. J. Douglas scored with a lovely bunch of Mrs. G. Jones; Messrs. A. R. Brown, Lim., second, and Miss Shiffner third. For any self variety of a colour not specified Mr. H. Mathias led with Helen, plum colour; Messrs. A. R. Brown, Lim., second with Clarice, and Mr. J. Douglas third with the violet-purple Purple Emperor.

In the yellow-ground picotee class Mr. J. Douglas annexed the first prize with John Ruskin; Mr. J. H. Lakeman second, with Margaret Lennox, and Mr. H. Mathias third with Gloria. Yellow-ground fancies found Mr. Douglas to the front again with Pasquin, followed by Mr. H. Mathias, who showed M. Thurston, and Messrs. A. R. Brown, Lim., who staged Linkman. Nine blooms of any other than a yellow or buff-ground fancy found Mr. Douglas once more to the front, with fine blooms of The Bride; Mr. Lakeman second with The Stoker, a dark crimson flower; and Messrs. A. R. Brown, Lim., third with Droitwich.

Mr. J. Douglas won the Cartwright Cup in this division, for "the best exhibits of any one exhibitor."

### SEEDLINGS.

In the seedling classes Messrs. A. R. Brown, Lim., scored for a scarlet bizarre or flake with Joseph Lister. Mr. Mathias had the best self with Irma. In the fancy class Mr. H. R. Taylor led with a big crimson-marked yellow ground, unnamed; Messrs. A. R. Brown, Lim., second with the pretty My Fancy. Mr. H. Mathias' Bill was the best white-ground picotee.

### CERTIFICATES.

Certificates were granted to Peggy, a white ground picotee, with light red edge, from Mr. Hayward Mathias; to Eclipse, a yellow-ground, red-edged picotee, from Mr. H. R. Taylor; to Gloria, a yellow-ground picotee with heavy rose edge, from Mr. H. Mathias; to Dago, yellow-ground picotee, with heavy bright crimson edge, from Mr. H. Mathias.

### NON-COMPETITIVE.

Several interesting exhibits from traders added to the extent and attractiveness of the show. Messrs. Webb and Brand, Saffron Walden, astonished everyone with their splendid spikes of double hollyhocks. The choice ferns from Messrs. H. B. May and Sons, Edmonton, were greatly admired. Mr. Maurice Prichard, Christchurch, contributed a host of phloxes, carnations, gladioli, etc. Mr. Chas. Turner, Slough, put up a bold exhibit of hardy flowers, and Messrs. Phillips and Taylor, Bracknell, arranged banks of hardy flowers around a water lily pool, as well as staging a collection of carnations and picotees. Mr. H. Lakeman, Thornton Heath, put up a fine lot of popular varieties of border and perpetual carnations.

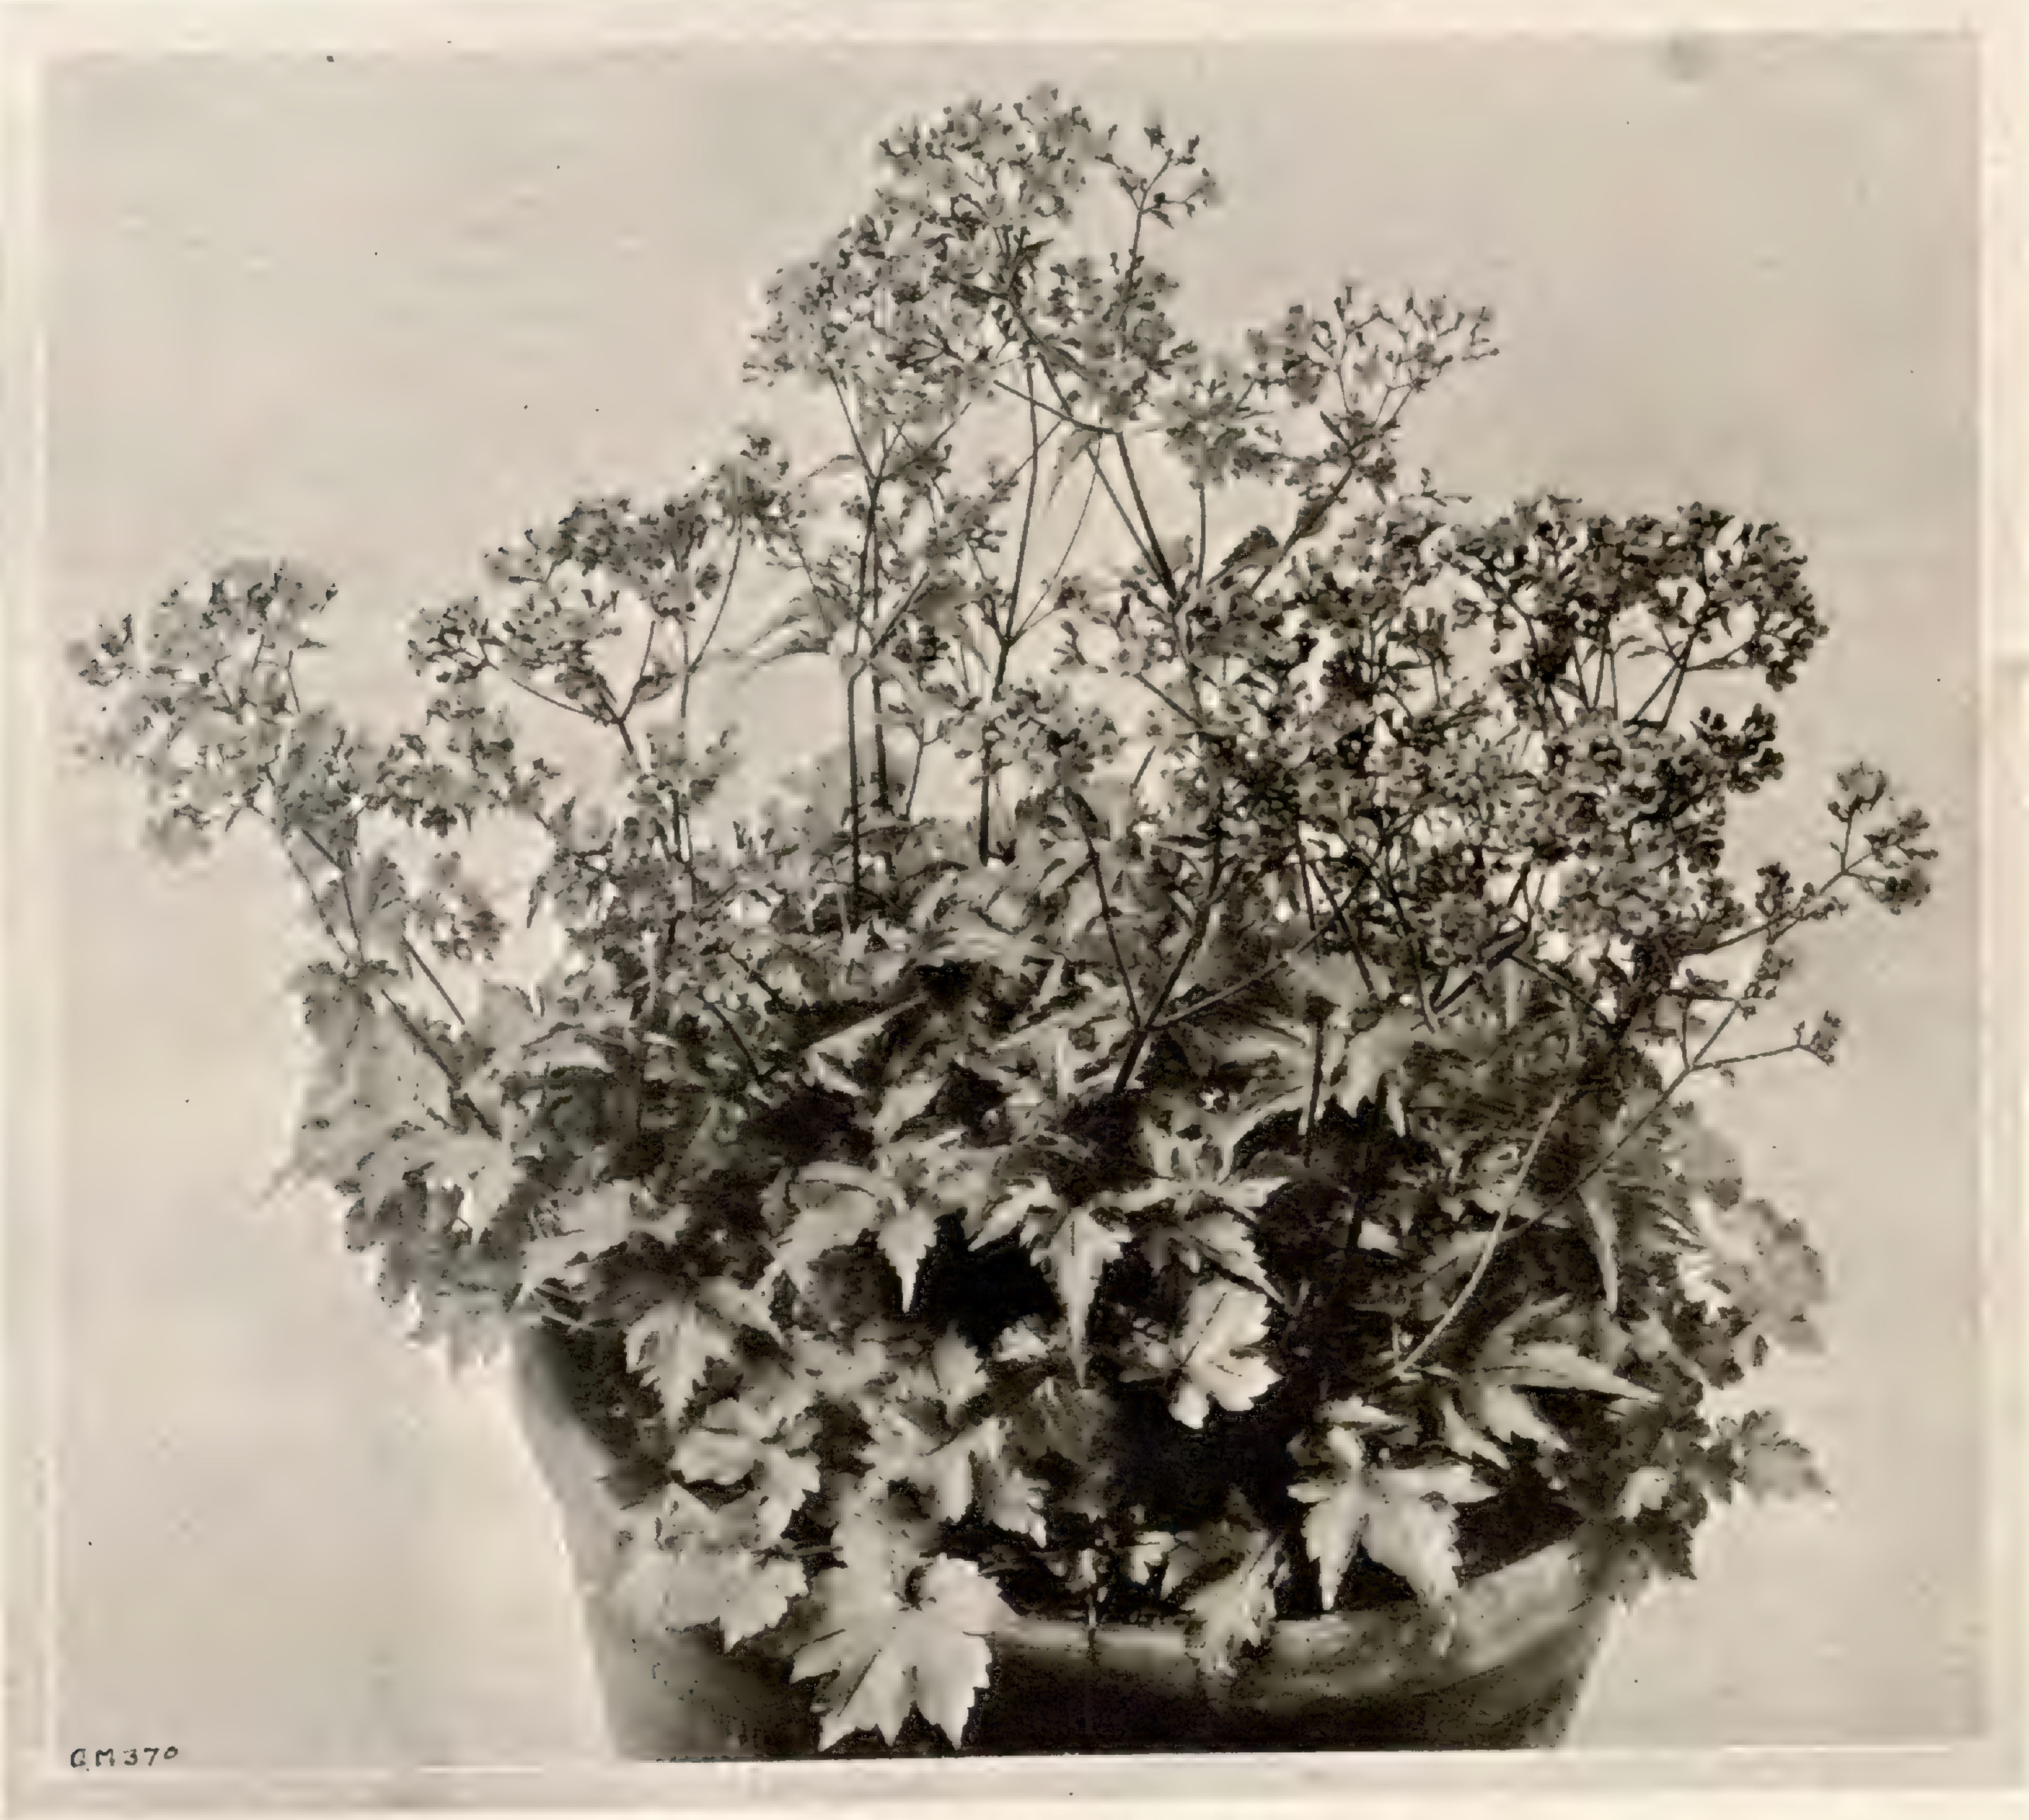
## GOLDEN-LEAVED IVIES.

Among hardy shrubs at Holland Park, a display second to none was furnished by the golden-leaved tree ivies, both grown as bushes and as standards. They are of high ornamental value, but, owing to the length of time necessary to build up an effective specimen, they always realise good prices. There is more than one golden-leaved form, but all are beautiful. Grown in pots or tubs they are exceedingly useful for various decorative purposes, especially in draughty spots where tender subjects would be liable to quickly suffer. Of climbing forms there are several whose leaves are more or less golden, notably angularis aurea, chrysophylla, digitata aurea, palmata aurea, and spectabilis aurea. Of variegated rather than golden-suffused kinds one of the newest is Hedera dentata variegata, a large-leaved, bold-growing variety, with clearly variegated leaves. Apart from their well-recognised value for the clothing of walls and similar purposes, ivies of different kinds are of considerable value as screen plants. Grown in large pots or tubs, and trained fan fashion, they are exceedingly useful for screening any unsightly feature. The fact that, grown in this way, they may be moved to wherever required is a great point in their favour.—T.

## NEW PLANTS, ETC.

### CATTLEYA WARSCEWICZI ALBA VAR. FIRMIN LAMBEAU.

This unique and extremely beautiful orchid appeared first in the United States, and there created a great sensation among orchid lovers. Quick to appreciate its beauty and worth, Messrs. Stuart Low and Co., of Enfield, purchased it, and eventually sold it to Mons. Firmin Lambeau, whose gardener, Mons. De Munter, has cultivated it most successfully. A figure appeared on p. 549 of our issue of July 20. The specimen carried three large flowers, wholly pure white save for pale lemon-yellow shading in the throat of the lip. First-class Certificate and Gold Medal, R.H.S., July 16. Mons. Firmin Lambeau, Brussels.



NEPHROLEPIS EXALTATA MUSCOSA.

An elegant, dwarf variety, with sturdy, somewhat erect, light green fronds. F.C.C., R.H.S., July 16. Messrs. H. B. May and Sons, Upper Edmonton.

### PLAGIANTHUS LYALLI.

This beautiful summer-flowering shrub, also known as Gaya Lyalli, is hardier than many people imagine, and this year it appears to be flowering with unusual freedom. As the illustration shows, the white, semi-pendulous, hibiscus-like flowers are crowded together. Each bloom is about an inch and a half across, and saucer-shaped. A note on the cultivation of this New Zealand plant appears elsewhere in this issue. F.C.C., R.H.S., July 16. Messrs. Robert Veitch and Son, Exeter.

### GLADIOLUS LANG-PRIM STRAIN.

By crossing the soft yellow Gladiolus primulinus, which hails from the falls of the Zambesi, with forms of Gladiolus gandavensis, etc., the Langport firm has evolved a new strain of graceful habit and form. The new varieties show in a marked degree the influence of G. primulinus, and, as we have already noted, Ella Kelway, Wraith, and Queen of Fairies are particularly good varieties of this new strain. A.M., R.H.S., July 16. Messrs. James Kelway and Son, Langport, Somerset.

### NEPHROLEPIS EXALTATA MUSCOSA.

Many of the newer plumose forms of Nephrolepis exaltata differ so little from each other that only experts can distinguish them, but this new-comer is very distinct, and promises to take a place among the very best of the long series of varieties we now have. It is of dwarf, compact habit, its light green, stiff fronds being well divided, but not so finely cut up or so soft to the touch as in the case of many other forms. If it maintains its present habit it will be very useful, as there is room for a small and beautiful fern that will last a long time in the house, as well as for the larger fronded sorts. F.C.C., R.H.S., July 16. Messrs. H. B. May and Sons, Upper Edmonton.

### PATRINIA PALMATA.

An interesting hardy perennial that promises to be a useful plant for the rock garden. It is of lowly growth, the palmate or trilobate leaves rising but a few inches above the ground. The small clear yellow flowers are produced in branched, flattish corymbs, and are fairly numerous. A.M., R.H.S., July 16. Miss Willmott, V.M.H. (gardener, Mr. C. Fielder, V.M.H.), Warley Place, Great Warley, Essex.

### CROSSANDRA UNDULAEFOLIA.

This old stove plant is rarely seen in such fine condition as shown from the Burford Lodge Gardens. It is easily grown, and produces fairly large, brilliant salmon-coloured flowers in succession along an erect spike. Such a useful summer-flowering stove plant deserves wider cultivation. It is a native of India and the Malaya. A.M., R.H.S., July 16. Sir Trevor Lawrence, Bart. (gardener, Mr. W. Bain), Burford Lodge, Dorking.

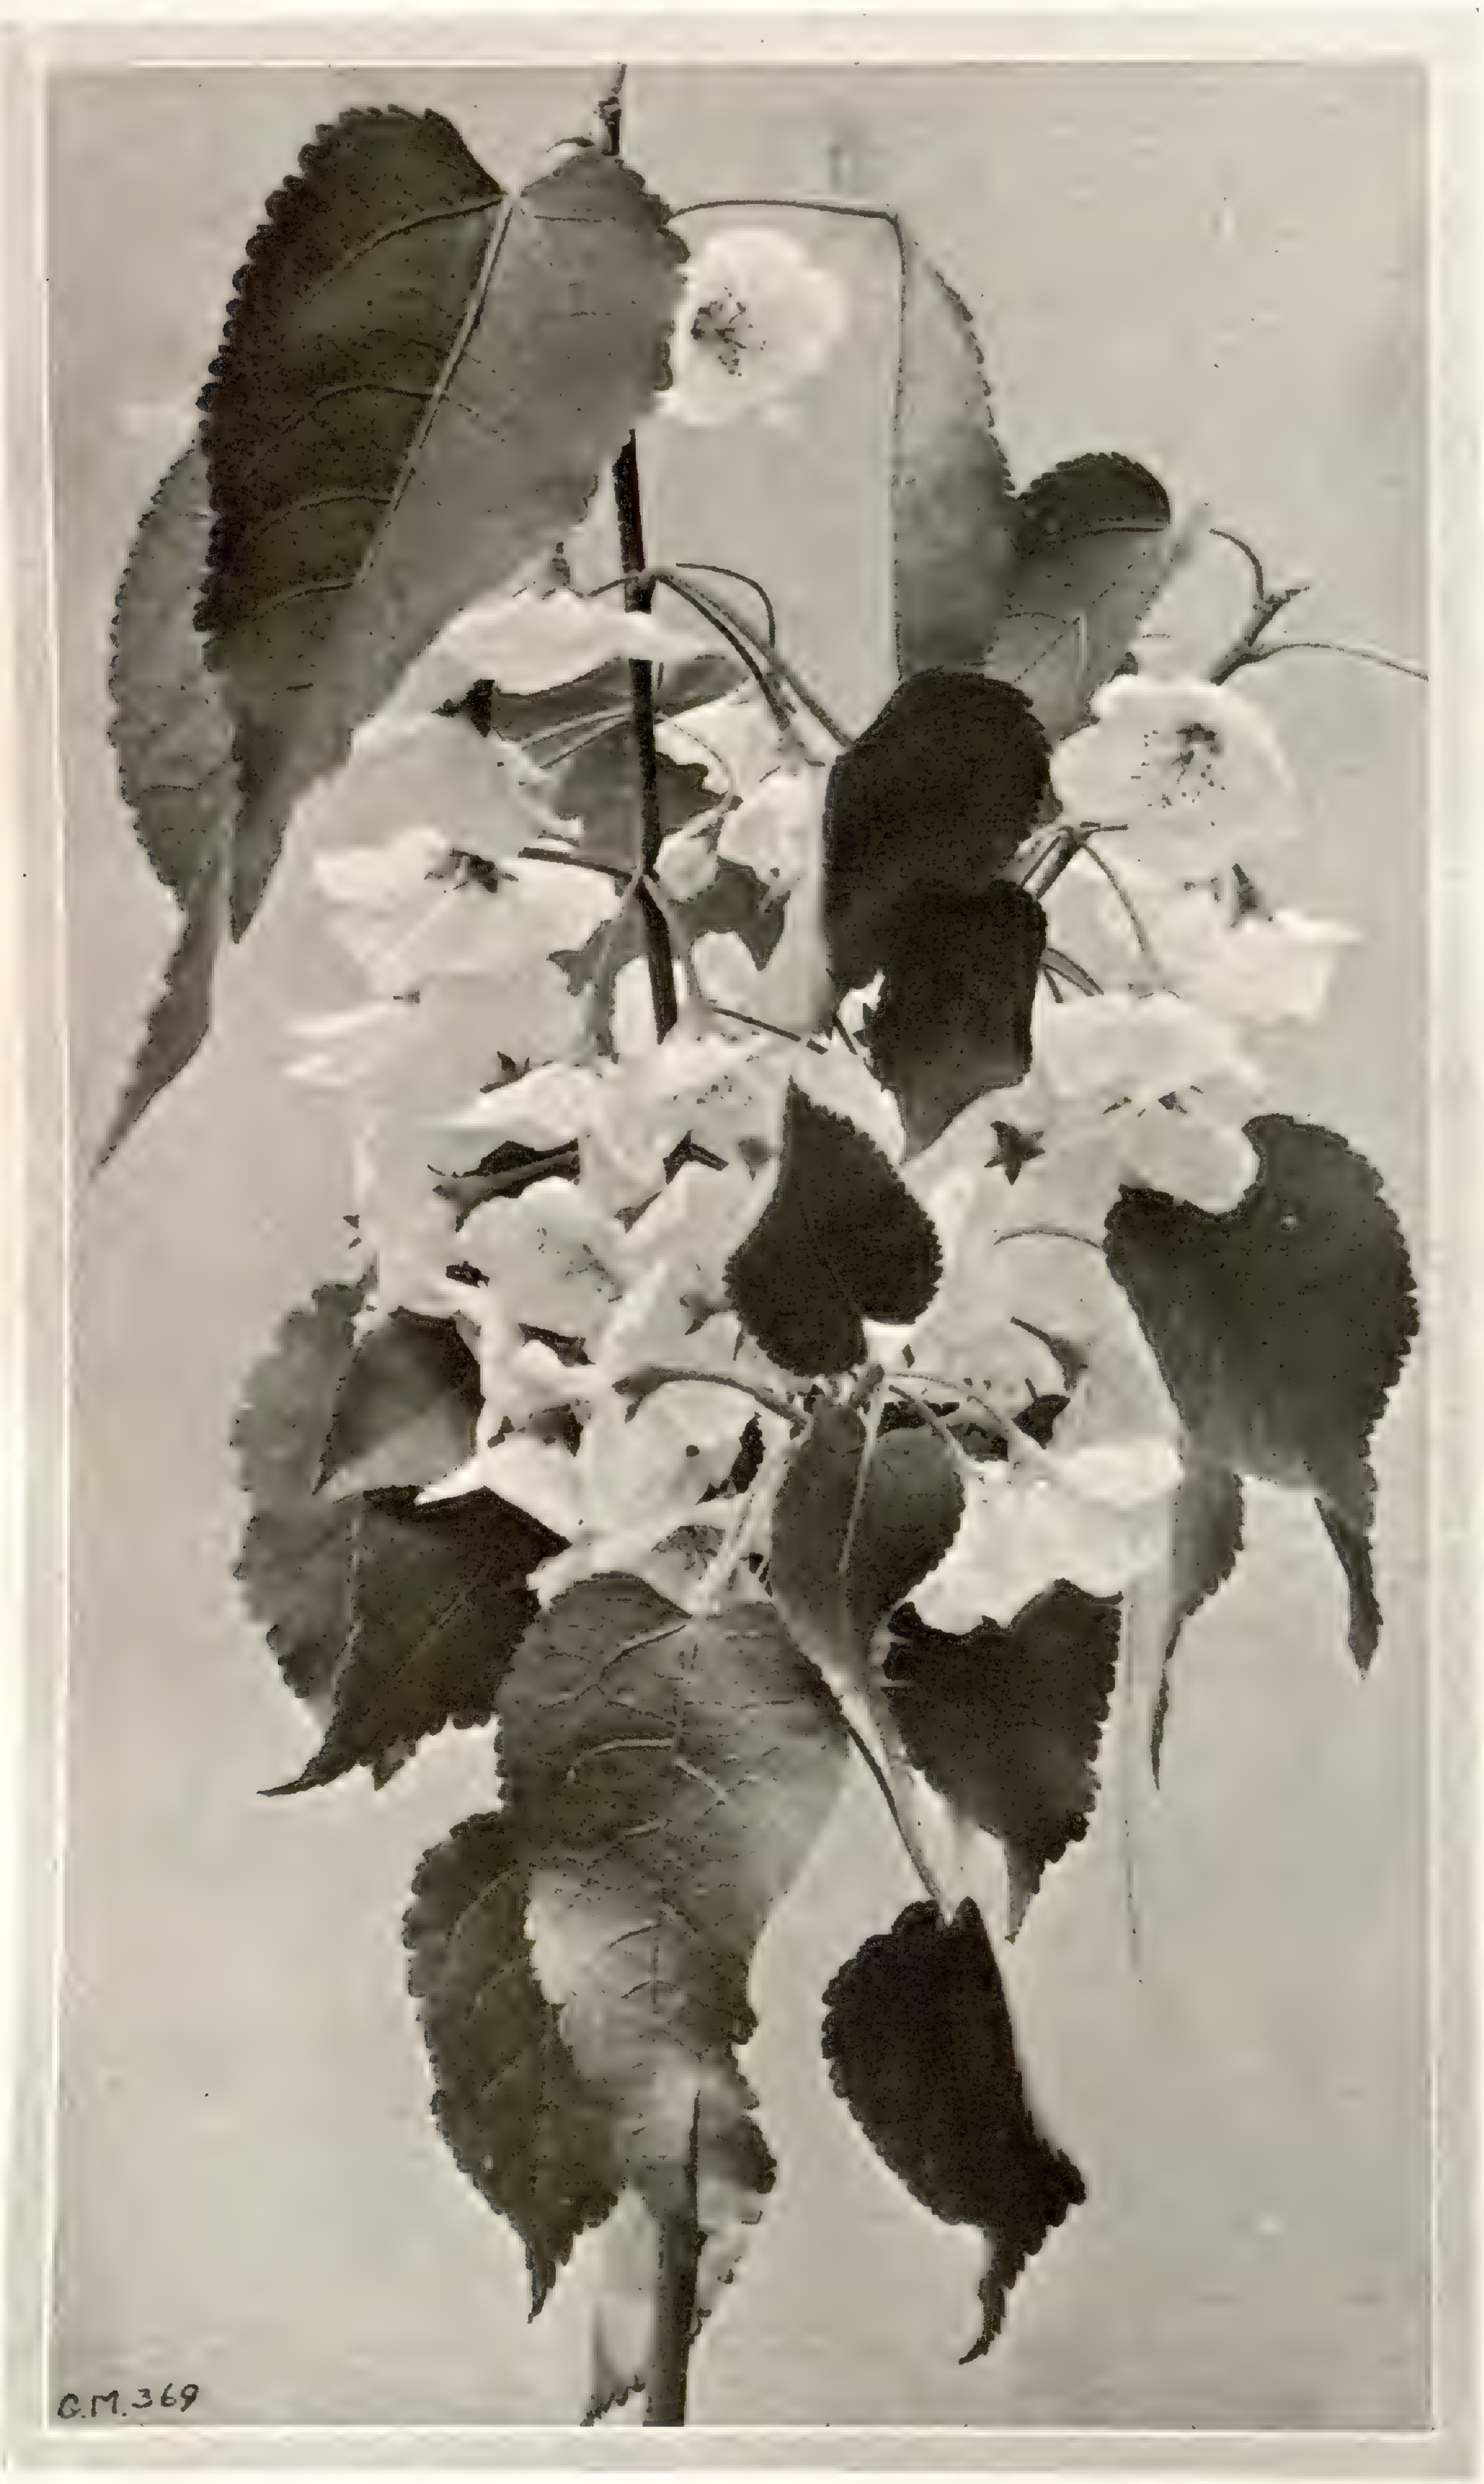
### ASTILBE RHENANIA.

A pretty variety obtained by crossing A. Arendsi Ceres and A. Queen Alexandra. It bears elegant, erect spikes of pink flowers, the tiny petals being violet-purple at the tips. A.M., R.H.S., July 16. Mr. W. Profittlich, Twickenham.

### NYMPHÆAS.

Attraction.—A very fine water lily with flowers fully nine inches across, bright crimson, shading to deep rose at the tips, and with a central cluster of orange stamens. A.M., R.H.S., July 16. Leopold de Rothschild, Esq. (gardener, Mr. James Hudson, V.M.H.), Gunnersbury House, Acton.

Formosa.—This beautiful variety is deep rose-pink, the back of the segments being flushed with crimson; stamens yellow. A.M., R.H.S., July 16. Leopold de Rothschild, Esq.



PLAGIANTHUS LYALLI.

A New Zealand shrub, producing white flowers freely during the summer. F.C.C., R.H.S., July 16. Messrs. Robert Veitch and Son, Exeter.

### ZYGOPETALUM BREWI.

A pretty, low-growing hybrid derived from Z Perrenondi and Z. rostratum. The flowers are of fair size, the sepals and petals green, tinged with purple, and the large lip cream-coloured, with a large rich rosy area and a bluish crest. A.M., R.H.S., July 16. Messrs. Charlesworth and Co., Hayward's Heath.

### ODONTOGLOSSUM EPICASTE.

The parents of this hybrid are O. Clytie and O. crispum, consequently the flowers bear a close resemblance to those of O. Thompsonianum. The flowers are rounded, of moderate size, and of intense blackish-purple colouring, probably the darkest hue yet seen in an odontoglossum; each segment has a fine edging of rose-purple. A.M., R.H.S., July 16. Messrs. Charlesworth and Co., Hayward's Heath.

### PEACH ROYAL CHARLOTTE.

This may be briefly described as a highly coloured Noblesse peach. It is an old, richly-flavoured, and useful variety that has borne numerous titles. A.M., R.H.S., July 16. Sir Trevor Lawrence, Bart. (gardener, Mr. W. Bain), Burford Lodge, Dorking.

"Carnations, Picotees, and Pinks" will tell you plainly how to grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## CAULIFLOWER DWARF MAMMOTH.

That there are many varieties of cauliflower goes without saying, but they are all, at times, unsatisfactory. Seasons are not always quite what these plants delight in, and other reasons there may be for them not producing good heads of flower. It is the practice with many gardeners to sow in the autumn to have plants come in to follow the late broccoli. For my own part I have never yet been able to see what is gained by such procedure. It may be that I have not been so successful with autumn-sown plants as with spring-sown. My objection to sowing in the autumn is that the plants, more often than otherwise, become stunted in growth through frequent checks, and often, when placed in their open quarters, prematurely form "heads" before they make sufficient growth. A cauliflower, to be succulent and good, should make a steady progress from the time the young plants are formed until the "heads" are fit for cutting. Plants, therefore, from seed sown early in the year have a much better chance of continuous growth than do those from seed sown in the autumn.

The advantages of sowing seed early in the year is fully demonstrated at Hackwood. I fancy some of the wiseacres thought that with the arrival of a new gardener onion growing might cease, but it has not done so. Onions still flourish there, as do other vegetables, notably cauliflowers. There is at the time of writing, several fine quarters of the cauliflower under notice. Mr. West informed me that the seed was sown the second week in January, and he is now cutting "heads" fit for any exhibition table. The variety is correctly described as dwarf, for there is practically little stem. The stock of Carter's Dwarf Mammoth is evidently a good one, and is evidence of what selection and re-selection will do in producing good strains of vegetables.

Paul T. More.

## PLAGIANTHUS LYALLI.

There is ample reason why more use should be made of this shrub for it is very showy, and blossoms during late June and early July after the greater number of flowering shrubs are over. A native of New Zealand, it is found wild in mountainous districts at altitudes of 2,000 to 4,000ft., where it grows into a large bush, sometimes 30ft. high. In this country it forms a wide-spreading bush in the open, 6 or 8ft. high, although under very favourable conditions it will probably grow larger. The ovate leaves are 4 to 5in. long, and the white flowers are borne three to five together in axillary clusters, each flower measuring from 1 to 1½in. across. Its nearest relative amongst hardy shrubs is the well-known Hibiscus syriacus, and similar culture is required by both shrubs. Rather light, well-drained, loamy soil and a sunny position offer suitable conditions, and in the warmer parts of the country open border culture is quite satisfactory. In colder districts, however, it is advisable to give it a place against a wall. It will pass through ordinary winters without injury, but a spell of severe frost may injure the younger branches; a vigorous plant, however, is rarely killed outright. Cuttings of half-ripened wood inserted in sandy soil in a close frame in July may be rooted, although there are many easier shrubs to propagate.

W. Dallimore.

Kew.

## SOME USEFUL BORDER FLOWERS.

### COREOPSIS GRANDIFLORA.

Although this plant is perennial, yet the most satisfactory results are obtained when it is treated as a biennial. It is a beautiful subject for a summer display in the flower borders, and deserves to be extensively grown. The fine yellow blossoms are borne in great abundance on wiry stems, and produce a grand effect when several plants are massed in good-sized groups. The flowers are extremely useful for table decoration, and a goodly number should be grown in the reserve garden for the supply of cut flowers.

Seeds are best sown during July, in pans or boxes, and placed in a cold frame to germinate. When the seedlings are of sufficient size to allow handling, transplant them into boxes, and afford frame treatment until established. When ready plant into nursery beds, where they make good stock for the following spring planting. April is the most suitable time for transferring them to their permanent quarters, and, if lifting and replanting are carefully accomplished, there is little fear regarding their future welfare.

Supporting the plants is necessary to maintain them in an upright position, for their beauty is altogether lost when the growths are allowed to fall over. A neat, slender stake, placed to each central growth, will be found to provide all that is required to keep the plants erect.

### PERENNIAL GAILLARDIAS.

These may be numbered amongst the most showy of all the summer border flowers. Brilliant effects are obtained by grouping several plants together in the foreground of the borders. The flowers are of immense value for room decoration, especially if used with some light material, such as gypsophila, and they are very lasting in a cut state. Although of perennial habit, the plants frequently die out when grown in wet, cold borders. A rich soil, in a warm, sunny position, is necessary for their successful cultivation; and, given this, the plants will survive two or three seasons, and sometimes longer. After flowering for three years they usually show signs of deterioration, and a fresh stock of young, vigorous plants should take their place.

Gaillardias are readily raised from seeds sown in July, and the young plants treated in the same manner as biennials, when they will flower well the following season.

If seeds are sown early in February, and the plants put out into their permanent quarters when large enough, a few flowers are obtained the first season. A good strain of seeds should be procured from a reliable source.

When it is desired to increase the stock of the named varieties, propagation by cuttings must be resorted to. To accomplish this successfully, the cuttings must be taken either in the spring or autumn. If taken during the former season, a little artificial heat is necessary to root them; while, if early autumn propagation is followed, they will root in a close cold frame. Plants rooted in the early part of the year should be put out into nursery beds, where they will make fine clumps for planting out either in the following autumn or spring. Autumn-struck cuttings should be potted up and wintered in cold frames. There are many lovely named varieties now obtainable, yet splendid results are to be had from a packet of seeds.

### PAPAVER NUDICAULE.

During late years a great improvement has taken place among the Iceland poppies, and, instead of only having the white, yellow, and orange forms, there are now many beautiful shades of colour. The flowers are extremely light and graceful, resembling crimped tissue paper when first opening from the buds. They have fairly good lasting properties, and are very effective when used for filling small glasses. A well-drained soil suits the plants best, and a sunny position should always be selected for their cultivation. Plants raised from seeds sown in February will flower the following summer, but the most satisfactory results are obtained from those raised from seeds sown in July. The seeds should be sown in pans, and germinated in a cold frame. The seedlings must be pricked off into boxes as soon as they are large enough to handle, and afforded cold-frame treatment until established, after which they must be gradually hardened off. In favoured districts, where the atmosphere is fairly dry during the winter, these poppies should be put into their permanent quarters during the autumn; but when there is any doubt regarding their hardihood, cold-frame protection should be afforded through the winter, planting them out in the following spring.

MR. F. DENNISON'S FIRST PRIZE SET OF TWENTY-FOUR ROSES at the Belfast Show. These flowers won the Amateur's Trophy.

In many gardens these beautiful little poppies reproduce themselves freely from seeds, and seedlings are frequently met with springing up in hard gravel walks at the base of a rockery. In less favoured gardens it is a difficult matter to keep the plants alive through the winter, owing to so much dampness. Where this trouble is experienced, it is advisable to protect the plants through the wet winter months.

### PYRETHRUMS.

The double and single pyrethrums are highly appreciated both for the adornment of the flower borders and for room decoration. The chrysanthemum-like flowers and light, feathery foliage, produce an effective display, either when growing in the border or in a cut state. There are many beautiful named varieties, both in the doubles and singles, but undoubtedly the latter are prettiest. Propagation is accomplished by dividing up the old plants and by seed-sowing. When it is desired to increase the stock of named varieties, division has to be resorted to. This operation should receive attention immediately the flowering season is over. The plants are lifted and carefully split up into small pieces, with roots attached to each piece, and planted in well-prepared nursery beds, where they will make good plants for putting out in the following early spring. If autumn-planting is preferred, the strongest plants may be selected and put out at such a time, leaving the small ones until the turn of the year in early spring.

It is an easy matter to raise a stock from seeds, and fine varieties may be obtained if seed from a good strain is sown. The seeds should be sown and the seedlings transplanted as advised for the poppies, eventually planting the latter into nursery beds when they attain sufficient size. Flowers are produced the following summer, according to the size of the crowns. The greatest enemies the pyrethrums have are slugs. These pests quickly destroy the young shoots before they appear above ground, and every endeavour should be made to prevent this. E. C. POOLEY.

Gnaton Gardens.

## SAWDUST MANURE.

I was much interested in the note on this subject which appeared on page 502 of the GARDENERS' MAGAZINE for July 6. In several large towns, to my knowledge, it has been a difficult matter to obtain manure free from sawdust and shavings and chips. Scores of tons of wood chips are used every year for bedding down cattle and horses, chiefly the latter. Undoubtedly, the sawdust retains practically all the valuable manurial liquid. There is, however, one matter connected with the use of sawdust and chips which is, to my mind, disturbing, namely, the danger of fungus trouble in the coming years where such material is used regularly. I would like to have some assurance on this point before using the wood in soil generally. Quite recently I remarked on the vastly improved appearance of the shrubs, trees, etc., in a nursery to a foreman in the said nursery, and he replied, "Yes; they are all looking well. We have stopped the use of sawdust and wood chips in the manure."

In Cheshire, my father used to bed down the cattle with "roach," i.e., the sandy portion sifted from the chipping from a neighbouring quarry. The bed was dry, the cattle warm and very clean; scarcely any liquid ran away, but was absorbed by the sandy roach. The manure, as collected, was duly stored, and, in time, used on the farm fields, both for grass and root crops, and it proved better than any of the manures with straw litter. The grit also improved the soil, which was very clayey.

# GARDENERS AND GARDENING.

## A Gardener's Education.

The recent conference at the International Horticultural Exhibition on the "Education of a Gardener" appears to have set many minds at work upon this all-important subject. Many and varied are the opinions expressed by writers, and many have criticised the present-day, haphazard system of educating the gardener. It is haphazard; in fact, there is no system in it. Mr. Hales aptly described it in his paper as "drift." Many writers have also come down hard on the purely college-trained man, and doubtless with good reason.

While we have had much criticism, we have had no serious attempt to outline or construct a scheme of training that will be any better than the present method. Now, I think there is very little good done by criticism unless something constructive is also suggested. We must be very, very careful as to what system we adopt if we are to bring practice and theory closer together. There is, and perhaps always will be, a tendency for practice and science, or theory, to diverge. I think most will agree that it is impossible for one man to be expert in practice and also expert in science. The two are so widely different that the thing is impossible. I admit that science and theory might be brought much closer together than they are at present, but that one man can be expert in both I deny. The whole tendency of progress is to separate them.

It is suggested that there should be some system of examinations, and that a National Diploma in Horticulture should be established. An excellent idea, but one which our severely practical friends will regret. One writer has referred to the fact that many gardeners are not too well educated. Now, the establishment of a N.D.H. will bring an entirely different class of men into the profession, provided it is anything similar to the National Diploma of Agriculture. The establishment of a N.D.H. means that gardeners who wish to obtain the honour must go through a college course. Horticulture is advancing, so much so that instead of recruits coming solely from the working classes, we shall find the middle classes taking up the profession.; The establishment of the N.D.H. will mean that only those holding the diploma will be able to secure good positions. The remuneration of these positions may not be very high at present, but the establishment of a criterion of ability will soon alter that.

We have a National Diploma in Agriculture, but we do not find the working classes studying for it. The holders are almost entirely middle-class men, and, what is more, they are mostly University or college-trained. Why, the courses at our agricultural colleges are arranged entirely for students studying for the N.D.A. Horticulturists look askance at college-trained men, yet this diploma for the establishment of which they are clamouring will be gained almost entirely by college-trained men, unless means are taken to prevent it. This may be rather a nasty pill to swallow for our severely practical friends, but, nevertheless, I believe it to be true, and I cannot say I am sorry. The better educated the men are who enter the profession the better will it be for horticulture.

It is all very well to sneer at a knowledge of classics, or of mathematics, but to do so is to show that we have not grasped the real meaning of education. It is education that has made the difference between the classes, and this difference is not only that one man has a knowledge of Greek or mathematics, while the other lacks it. The difference is something deeper and more difficult to grasp than that, and to deny it is to deny the whole benefits of education. Some say that the distinction between the classes is more marked at the present day than it has been before, but it is not. Class distinction was never less prominent, and education is the reason.

Now it must be admitted that anything which will debar the son of a working man from the honours of the profession of horticulture is not desirable. Most of the great horticulturists are, or have been, the sons of working men, and at the present day the majority of the best positions in the profession are filled by men who began in the humblest or lowest ranks, and have risen to their present status solely through their grit and individuality. Now, if we establish a N.D.H., and do not devise some means to place the honour within reach of working men's sons, we shall, as I have already stated, find the best positions filled with men from the middle classes.

Perhaps, as I have already exceeded the space limit, I may be allowed at some date in the near future to give my views as to how the N.D.H. could be established so as to eliminate the disadvantages mentioned above. J. C. W.

Kingston, Derby.

## The Head Gardener's Responsibility.

"H. C. P." very truly states that, considering the many and varied qualifications a gardener should possess ere he can take a responsible position as head gardener, his remuneration is very poor indeed. How are we to raise the status of the rising generation of gardeners? I suggest two things. Firstly, a National Union of gardeners; secondly, that head gardeners should take more interest in their journeymen.

At present, in a great many establishments, a journeyman inside has very little opportunity of learning the rudiments of outdoor gardening. His place is inside, and on no account must he go into the kitchen garden unless sent, which is very seldom. How then are our young men to gain the knowledge necessary to obtain a head gardener's post? Some head gardeners of my acquaintance never worked outside at all in their early days. Why not let the young men take an interest in all departments, and help all round occasionally? I know it might be difficult to arrange this in some gardens, but it would encourage those that really take an interest in their work, and enable us to weed out the wasters.

Consider the second man, or foreman. Let him take his place as second, not as first journeyman or foreman inside only. My idea of that post is that the man should take rank next to the head. How can he improve his knowledge of kitchen garden, pleasure grounds, and general work outside, if he is always tied to the houses, as so many are? Unless he has had several situations and been given a charge in one or more (which is unlikely), he is lost if the head is ill or called away, and he can look in vain for respect from those supposed to be under him.

In many places journeymen regard the head gardener as someone to stand in awe of, and they have to be practically their own tutors. Should they desire a change from one department to another, they, through no fault of their own, have to start a long way down the ladder again, and are no better off whatever. Among the half-dozen or so large establishments I have been in, only one of the head gardeners made a real attempt to improve the all-round condition of those under him. He was a man among men. Many are in similar positions, I regret to say, who seem to care little or nothing for the improvement or welfare of the young men. Let us then help, and do all we can to lay a good foundation of knowledge, as well as discipline, in those under us. When there is more sympathy between the head gardener and his subordinates, then, and not till then, shall we raise the status of gardeners and gardening. B. W. H.

Witley.

# NEW HYDRANGEAS.

An interesting series of new hydrangeas was shown in the French section of the International. They were exhibited by M. Moullière, of Vendome, who will be remembered as the raiser of that white variety, with huge heads of bloom, Madame E. Moullière, which, first brought forward two years ago, is now extensively grown in this country.

Of the new varieties shown the following were especially noteworthy: Ronsard, a light flower, which a markedly pink centre, and the large sterile blooms much serrated at the edges; La Perle, white, deeply toothed; President Fallieres, huge heads of bright pink flowers; Lilie Moullière, rich rose flowers, with a light centre; and Directeur Vuillermet, rich pink, much serrated. Some richly-coloured blue hydrangeas were also exhibited by M. Farjelon.

Beside these garden varieties one notable species was shown, and given an Award of Merit. This was Hydrangea Sargenti, a native of China. It is a robust grower, with very large velvety leaves, curious scale-like hairs on the stems, and widespreading heads of blossoms. The large sterile ones are, however, very few in number, so that it is not particularly showy. The small fertile blooms are bluish. K.

# GENISTA VIRGATA.

This is one of the most effective of those flowering shrubs that are at their best during June and July. It attains a height of over twelve feet, and is as far through, while its bright yellow flowers, produced in racemes at the end of the shoots, render it an especially handsome object. It is perfectly hardy, and succeeds in almost any situation, excepting where the soil is very wet and heavy, but a position sheltered from the high winds is desirable.

This genista is probably seen at its best when planted as an isolated specimen on the grass, where it has ample space to develop its dense, bushy habit. It is necessary for it to attain a fair size before it displays its full beauty. Like the other members of the genus it is most readily propagated from seeds, and the young plants should be grown in pots in a cool frame until, as good-sized specimens, they are ready to plant in their permanent quarters. J. Gardner.

# THE SPANISH BROOM.

In any selection of flowering shrubs that can be depended upon to maintain a display of blossoms during the latter half of the summer, the Spanish Broom (Spartium junceum) must be included. It is fairly well known, and cheap, yet at the same time it might with advantage be more often met with than is at the present time the case. This broom is too well known to need any detailed description, therefore it will suffice to say that its comparatively large pea-shaped blooms are of the richest golden-yellow tint, and borne freely on the long deep green rush-like shoots. It will run up to a height of six feet to eight feet or more, and when overtopping a bank of low-growing shrubs it has a very pretty effect. Beside this, when standing singly so that the long, slender shoots are allowed to dispose themselves at will, it forms a decidedly graceful specimen. It will succeed better in town gardens than it is generally given credit for. This broom is readily raised from seeds, and favourably situated the young plants grow away freely. Like most of its allies, the root system consists of a few deep descending ones with scarcely any fibres, so that established specimens transplant very badly. S. W.

## HYACINTHS IN POTS.

The first essential to success with hyacinths is good bulbs. If they are bought at auction sales at three or four shillings a hundred only disappointment will result, for though such bulbs, when planted about in shrubberies and wild gardens will yield a certain proportion of flower spikes, when we take the trouble of growing them in pots we want every bulb to be at least good, if not of the best. The next most important point is early potting, the middle of September being a good time to begin, and by making two or three pottings at intervals of a fortnight from then a longer succession of flowering may be obtained. They like a rich sandy loam, and the compost may consist of three parts turfy loam and one part leaf-mould, with the addition of some rotted manure, sharp sand, and bone-meal, the latter at the rate of a quarter of a pound to the peck of soil. The bulbs should be so potted that the crown of the bulb is just level with the surface of the soil, which latter should be a good half-inch below the rim of the pot, hyacinths needing a good deal of water when flowering.

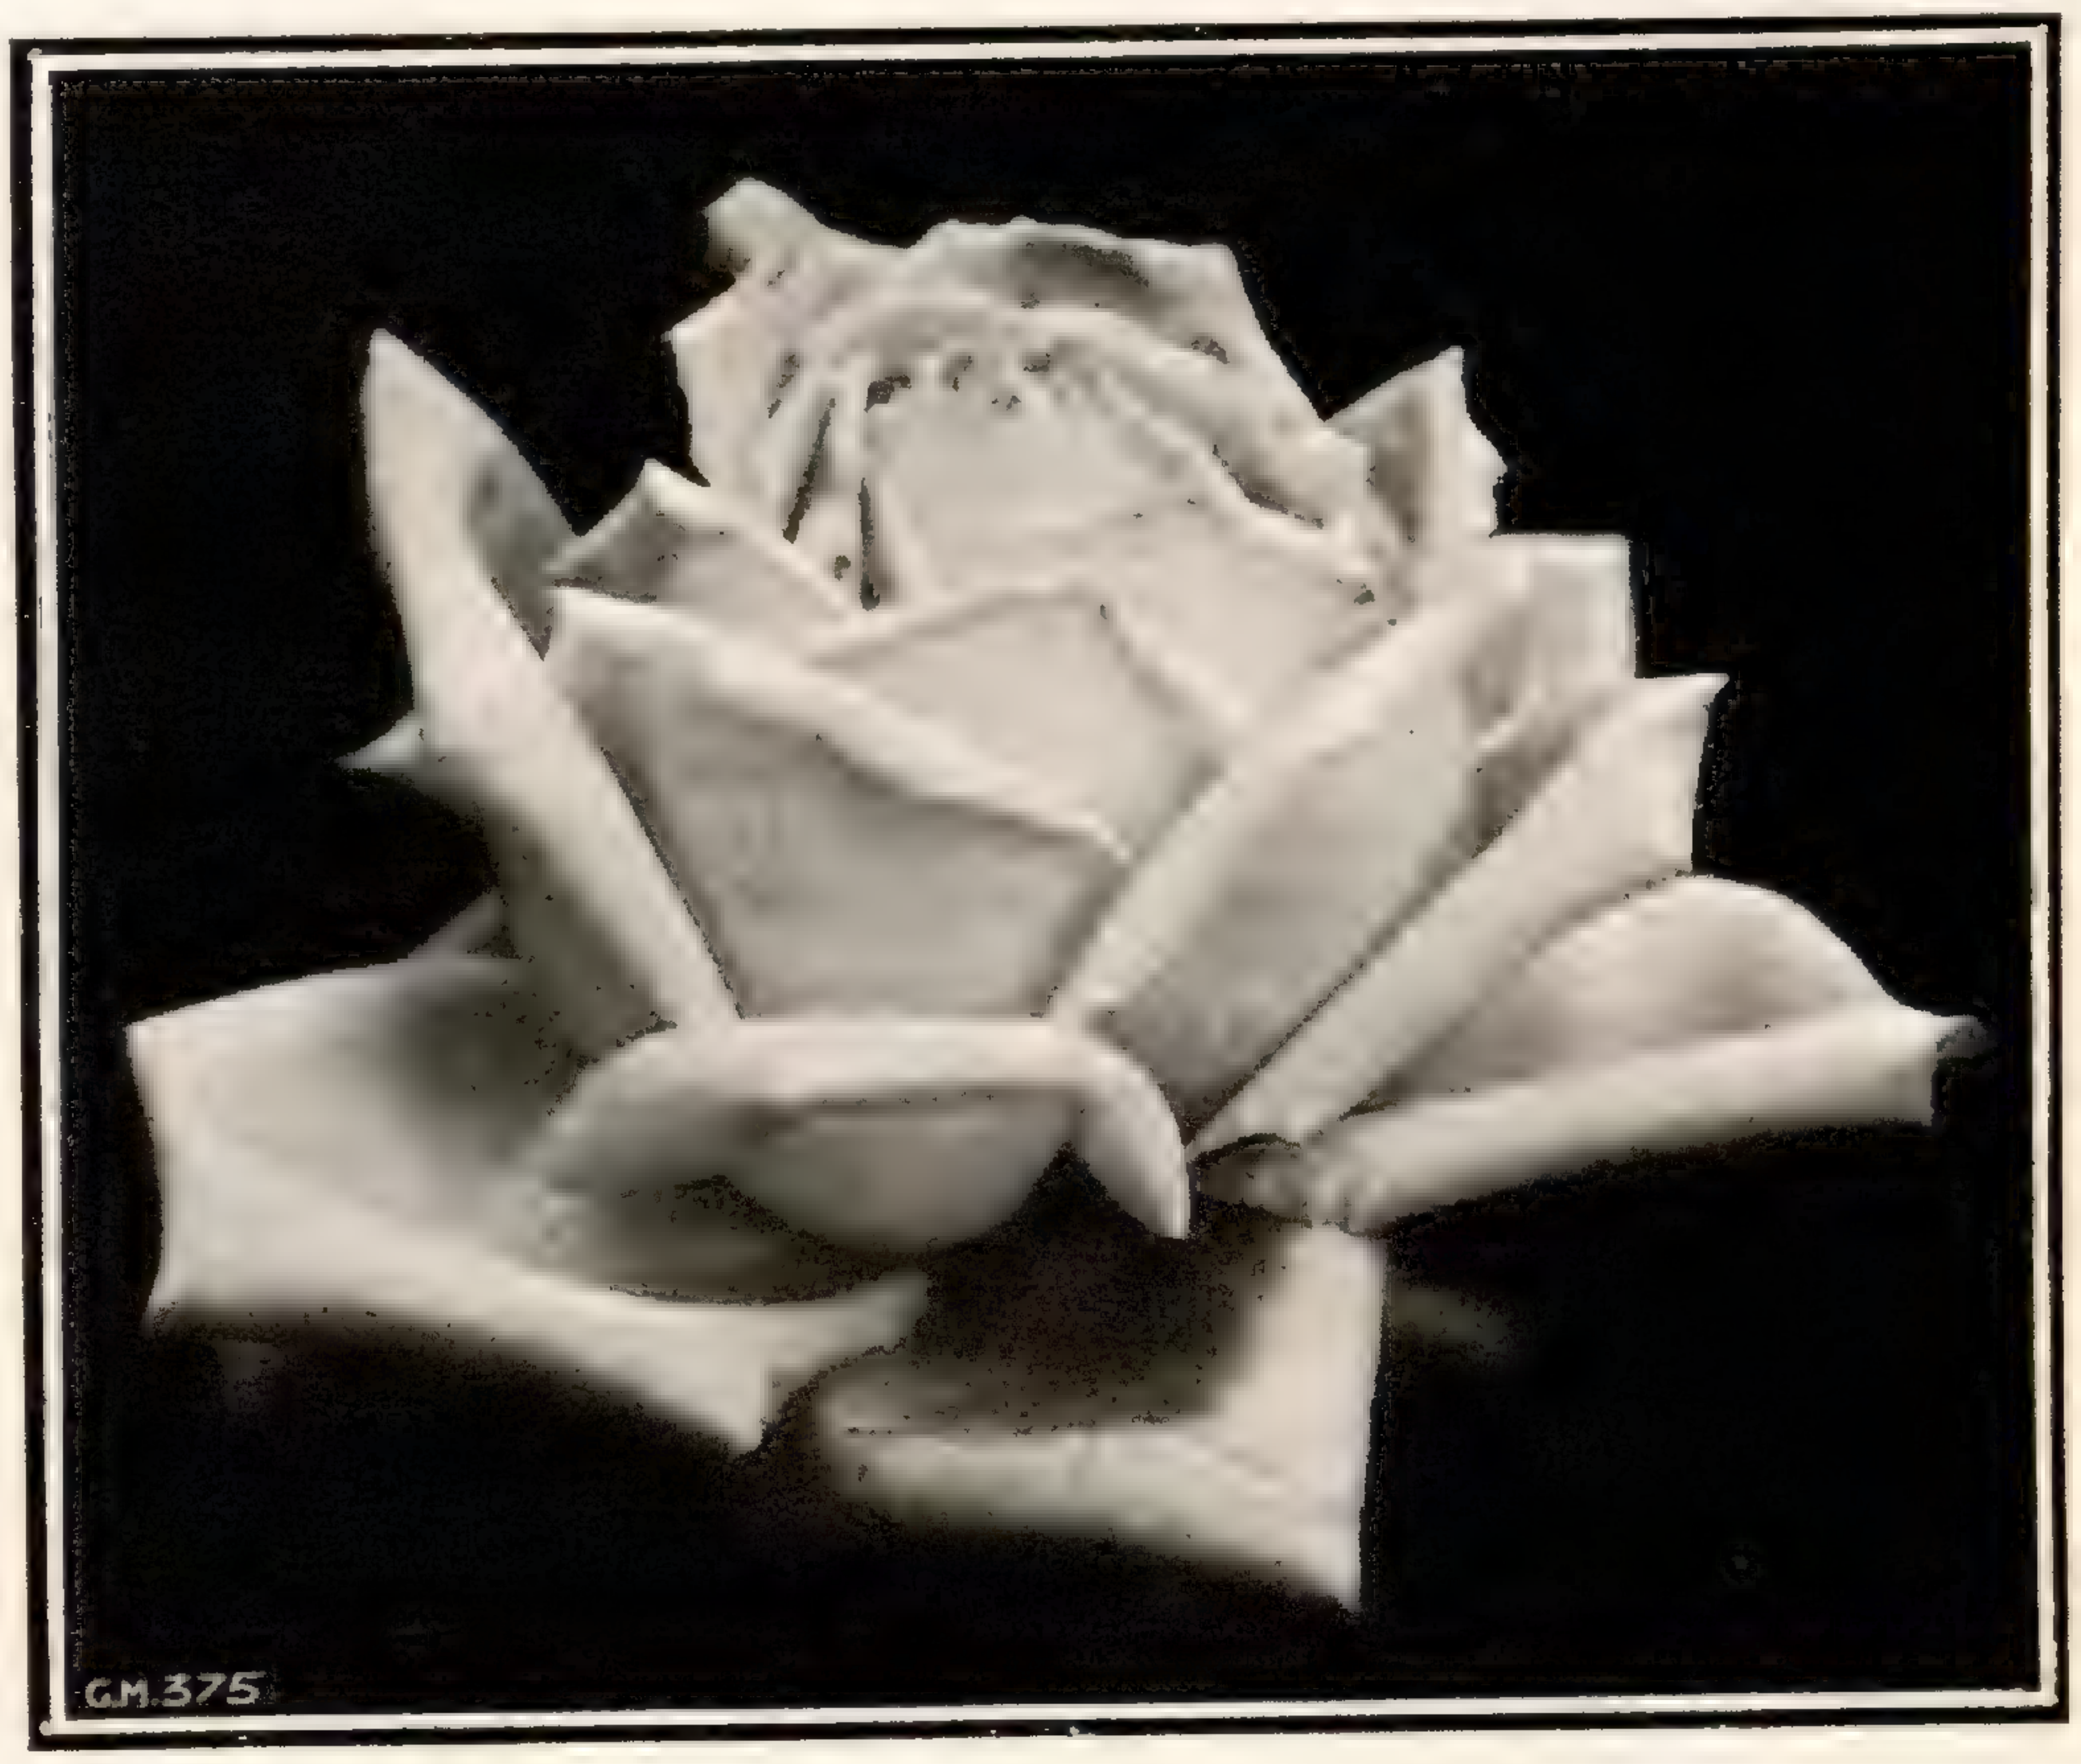
The bulbs need not be given an undue amount of root run, unless the flowering of the bulbs another year is a consideration, as they do very well when root-bound if well watered. A large bulb will succeed in a forty-eight, three medium bulbs in a thirty-two, or three, or even four, large ones in a twenty-four. The pots should be well watered once, set on boards under a north aspect, and covered with four to six inches of cinder ashes or cocoa-nut fibre refuse, being left untouched until they have made an inch of top growth, which will be in about three months. Then, as many as are wanted for the first batch should be moved indoors, and put in a subdued light until the shoots have become nicely green. An inverted flower-pot over the bulbs is a good plan to prevent excess of light and drought, both of which are very harmful to them at this stage. After this they may be set in a cold house or frame, which is protected from sharp frost, or gently forced in a warm house in which the temperature does not rise above 60 deg. As forcing is not consistent with the most finely developed flower-spikes and greatest depth of colour, a compromise has to be effected. If no other accommodation is available they may be put in a sitting-room window in full light after the spears are well greened. The important thing is to give them plenty of air and light, keeping them close to the glass of a frame or house, so that the foliage may not be developed out of proportion to the flower-spikes.

When the leaves have attained their full colour weak liquid manure may be given them once a week, and the pots should never be allowed to become dry, though, of course, they should not be kept standing in saucers of water. As soon as flowering is over they should be turned out of the pots and planted just as they are in hardy flower borders, shrubbery borders, by the side of woodland walks, and the like, where some of them will flower for several years. They may, however, be taken up out of the ground as soon as the foliage has died down, and some of the best selected for potting another season, but the practice is not recommended as they are seldom very successful as pot bulbs a second time.

By gently forcing the first two or three batches taken out of the ashes, putting the next two or three in a cold frame, and leaving the remainder to come into flower in a shady position, hyacinths may be obtained in flower in pots from the middle of January to the middle of April, and even a week or two outside these extremes. The great mistake often made in forcing is giving the bulbs insufficient time to form a good rooting system before forcing begins, the prime necessity being that the root growth should always be well in advance of the top. Algee Petts.

## WEIGELAS OR DIERVILLAS.

In making a selection of flowering shrubs, space should, if possible, be found for a collection of weigelas, as they form interesting objects either planted in groups or grown as single specimens when, during the month of June, the wealth of bloom produced is always attractive. A short time ago I saw a long row of these grown as standards, planted along a terrace. The stems were about five feet high, and so well had the plants grown that the long sprays of bloom reached near to the ground. The trees were planted about twelve feet apart, but as they had been pruned each season after flowering they had not become overgrown, so presented a neat appearance. To induce the plants to bloom freely they should be grown in an open, sunny position in order that the young shoots may become thoroughly ripened. It is useless to plant weigelas under the shade of trees or crowd the plants together in a shrubbery border, as they soon become a thicket of wood and produce but little bloom. Though weigelas will grow in almost any soil or situation, they thrive best in a rich loam, and an open, sunny position. Ample flowers will result under these conditions. The shrubs will withstand the most severe winters in this country uninjured, therefore may be planted in places where many other shrubs of a less hardy nature would suffer.



NEW H.P. ROSE CORONATION.
Colour soft clear pink. Gold Medal, National Rose Society, Belfast, July 19; Messrs. Hugh Dickson, Lim., Belfast.

The weigelas are easily propagated either by suckers, layers, or cuttings, and if by the latter mode, they should be inserted in the open ground during the autumn. If standards are desired, then run up a young shoot until it attains the desired height, when it should be pinched to induce the top buds to break, and so form a head.

There are several species of weigelas, but the most common are those varieties of the rosea type, and they form an interesting group. I have seen them growing freely in exposed situations, but have never seen them bloom so freely as they have done this year. The management of flowering shrubs is one of those branches of horticulture that receives but scant attention in most places, many of the kinds being planted and allowed to ramble at will, when they soon become a thicket of useless growths. They are either pruned at the wrong time or in an improper manner, the results being anything but satisfactory. Most deciduous flowering shrubs bloom on the young shoots, therefore these should be encouraged to develop themselves as much as possible in the early part of the season, so that the wood may become thoroughly ripened before the autumn. If due attention be paid to them we should hear of fewer failures.

Plants of all kinds are so often intermixed in the shrubbery borders that the strong-growing sorts soon overshadow the others, with the result that many which might be of interest become lost in the thicket, or are crowded out of existence, whereas had due consideration been given them the whole might have proved a source of pleasure and enjoyment. P. P.

**The Orange Lily** (Lilium croceum).—Of border lilies this species, which is a native of Switzerland and Northern Italy, occupies a foremost position, for it is one of the most dependable of all. The flowers are upright, and borne in good-sized heads, their colour being an attractive shade of reddish orange. They retain their freshness for a longer time than the different forms of the allied L. davuricum or umbellatum. Good examples of the orange lily are frequently to be seen in cottage gardens, a well-drained loamy soil being essential to its well-doing. When associated with delphiniums in a large bed a very pretty effect is produced. In some of the Continental catalogues the orange lily is to be met with under the specific name of aurantiacum.—W. T.

## THE MONTHS OF ROSES.

June and July are, according to tradition, the months of roses, but, with the aid of the more recent varieties, roses may be had in abundance for a much longer period.

> "I saw the rose grove blushing in pride.
> I gathered the blushing rose, and sigh'd—
> I come from the rose grove, Mother;
> I come from the grove of roses."
>
> —*Gil Vicenti.*

A Moslem tradition is that when Mahomet took his journey to heaven, the sweat which fell on the earth from the prophet's forehead produced white roses, and that which fell from Alborak, the animal on which he rode, produced yellow ones.

And the Greek poets tell that originally all roses were white, but were changed to red from the blood of Venus, who lacerated her feet with the thorns.

The earliest certain trace of the cultivated rose is from the pen of Herodotus, who tells that the two sons of King Temenus fled from Macedonia, and took up their abode in the gardens of Midas, where roses grew of themselves so sweet that no others could compare with them.

The rose is the badge of England, and John Gaunt used a red rose for his device in right of his wife, Maud of Lancaster, and Edmund, his brother, took for his a white rose, which their followers bore in the long wars between the houses of Lancaster and York; and long before this, at the seat of the latter at Longleat, in Wiltshire, in the garden there, grew a white rose tree, which bore upon one branch a fair white rose on one side and as fair a red rose on the other.

At one time there were no roses in England other than the wild forms, and tradition tells that they were brought here by the Crusaders from Damascus, where the hedges are choked by their boughs, and the very air loaded with their breath; and where no other roses will grow "sweet as Damask roses," wrote Shakespere.

Nearly all cultivated roses were budded or grafted on the common hedge or dog rose originally; of this rose Sir Thomas Browne writes that the beards in the leaves thereof of two are smooth, and have no beard, while the other two leaves are beset with beards on either side, but the fifth leaf is half smooth and half bearded, and in olden days there was some poetry in Latin about this, which translated reads:

> "One summer day, in sultry weather,
> Five brethren were born together;
> Two had beards and two had none,
> And th' other had but half a one."

Pliny tell how a drink made from the root of this rose saved a life; it is also called the Canker rose, and Shakespere writes:

> "The canker blooms have full as deep a dye
> As the perfumed tincture of the roses:
> But for their virtue only is their show;
> They live unwoo'd, and unrespected fade,
> Die to themselves. Sweet roses do not so."

In the poetic world the first honours have been awarded to the rose; for why, no one can tell, unless for its exquisite perfume and colour, so tender that the wild bee nestles in its scented bosom.

The yellow rose has been called the best of all the roses in the world, and came from the East.

The rose is symbolical of love, beauty, and innocence, and has furnished lovers and poets with more comparisons and imagery than all other flowers taken together; roses were more highly prized by the Romans than any other flower.

The nightingale is said to sigh for the love of the rose, and the Persians "assert that the bird flutters round the rose bushes till, overpowered by the strong scent, he drops stupified on the ground."

> "That bower and its music I never forget,
> But oft when alone in the bloom of the year
> I think: 'Is the nightingale singing there yet?
> Are the roses still bright by the calm Bendemeer?"

The Romans, by the testamentary wills, directed that their heirs should assemble once a year on the anniversary of the testator's death, at his grave-side, at which everyone present was to appear with roses; which custom, in some form or another, was continued until within comparatively recent times. Mr. Rose, who died at Barnes, in Surrey, in 1653, bequeathed to the poor of the parish the sum of £20 for ever on condition that his grave was planted with roses. This sum was laid out in land, and is called Rose Acre, and now produces annually £14 14s. 2d.

> "Roses, that briefly live,
> Joy is your dower.
> Blest be the Fates that give
> One perfect hour.
> And, though, too soon you die
> In your dust glows
> Something the passer-by
> Knows was a rose."
>
> —*Dr. Garnett.*

The rose is, according to tradition, the true emblem of the best and sweetest creature enjoyments in the world, which, being moderately used and enjoyed, may for a long time yield sweetness to the possessor, but if once the affections seize too greedily upon them, they quickly wither because of the excess of our affection to them.

George Simmonds.

---

## SWEET PEA FANCIES.

Last season countless sweet pea enthusiasts devoted their efforts to the obtaining of many-blossomed sprays of great size, to the discovery of new tints in a flower, the blends and self-shades of which seem endless; but some growers also, or in preference, sought for new methods of making use of the plant for the perfecting of the garden. Some of the discoveries that resulted are being repeated this year, others are being aimed at.

In avenues the sweet pea has perhaps the best chance to exhibit its height and fitness for colour blending; clumps when ranged like the trees of a drive, in either single, double, or treble row, have a magnificent effect, and fully enclose any path that they border, shutting out the scene beyond on each side. Sharp contrasts are visible when white and indigo-blue or cream and maroon are placed in lines behind one another; shaded effects are softly beautiful where pale salmon, salmon-orange, and orange-vermilion appear in line rotation, or three shades in pinks, mauves, or blues. If the avenue clumps are all of different hues the choice of colour to most admire proves so bewildering that the summer may probably pass leaving it still undetermined.

A wonderful result was achieved in one garden by banking up the wide border soil so abruptly that the third row of sweet peas stood a yard higher than the first row. The plants were in triple hedges in this case, instead of lines of clumps, as the tier arrangement kept any from being hidden. It was found best to level the ground, making three terraces of border. When the full growth and blossoming was accomplished the path lay in a deep glade, or gorge, the towering walls of which blushed rose and red, flamed with yellow-orange, in places, in the rest were cool with the slate-lavenders that were repeated exactly in viola carpets beneath, or were white as snowy fields of hill formation, or azure as the skies above.

The sweet pea is a wonderful plant when grown almost as a standard. The main stem acquires a breadth that is increased in appearance by a stake cunningly painted the exact shade of grey-green of the foliage. Each branch can be extended horizontally and supported to the top of a similar-coloured but much slighter stick, the space ultimately covered in the umbrella fashion by foliage and blossom proves remarkably great. Many growers for garden beauty declare that only by devoting study to the natural growth of a sweet pea plant, then to providing it with the support it actually requires to separate and extend that growth best, can the full beauty be obtained. It is to be seriously questioned if the custom of employing closely-placed faggots is not a barbarism in sweet pea records, a convenience only to be tolerated in culture for trade purposes of variety testing, seed or blossom production. Excellent is the appearance of a thin boundary hedge made by placing plants at half-yard or longer intervals, and training out each branch horizontally on a well-fashioned espalier support of stakes and stout string.

Quite contrary in character, yet offering a legitimate effect for garden beauty, is the placing of sweet pea plants singly high up in a rockery, allowing the branches to trail downwards over a sufficient depth of stone-built banks. A sweet pea dell can be exquisitely made by this means, the appearance being best when only violas of identical colours are grown in the same place. Since salmons and scarlet are unknown among violas though pinks and crimsons are most brilliant now, where sweet peas of the former hues are employed their best accompaniments are grey or silver-foliaged dwarf plants.

Sweet peas secured to fences offer a new feature. The growth of plants thus treated proves all it should be. The trusses of blossom jut out well away from the back growth, seeking sunshine and air, showing themselves off to an extent that justifies the method were it adopted for the sake of evidencing alone the beauty of the flower; whereas, of course, the object should rather be the forcing a favourite plant to adapt itself to the purposes of pleasure-ground improvement. Against a painted wooden trellis on a house wall the appearance would be exquisite, the success as certain, supposing the richness and depth of the soil were the same as in a prepared plot. Aspect has to be considered. In warm localities a south one is too hot, an east or west one proving all that can be desired.

Some cultivators are trying to encourage height in individual plants by stopping all side shoots; others are stopping main shoots when but eighteen inches tall, with a view to the production of horizontal branches of extraordinary length. Experiments are praiseworthy in gardening, yet it is difficult to see how these can extend the popularity or usefulness of Lathyrus latifolius.

Striking contrasts of colour have been pleasantly gained by mingling clumps of a pale pink, such as Gladys Unwin, with Scarlet Gem, orange-salmon Evelyn Byatt with the bright blue of Miss H. C. Philbrick, and any true azure with the magenta rose of Lord Rosebery. Combinations of other plants with special sweet peas, to show them off, is one of the most clever uses of the living pigments of the artist-gardener's palette; a hedge all of pale yellow sweet peas proved delightful last year behind a border belt of beets; vivid indeed was a large plot dotted over with clumps all of scarlet-crimsons, carpeted entirely by golden feather.

M. H.

## WINTER-FLOWERING STOCKS.

When suitable varieties are chosen, stocks are well adapted for conservatory decorations, as they produce a wealth of bloom. Some of the dwarf-growing kinds are very useful as pot plants for rooms. What could be more charming for indoor decorations than well-grown plants of All-the-Year-Round stock? This is a fairly dwarf variety of free-flowering habit, having green wallflower-like leaves. It commences to bloom almost close to the ground, and retains its foliage so as to cover the soil in the pots. Then we have Beauty of Nice producing flowers of several shades of colour. When well-grown, this variety attains to a height of about two feet, producing long spikes which are well adapted for cutting. The East Lothian is also a favourite, particularly the scarlet form. There are also several others that make suitable plants, either for cutting or for conservatory decorations, as their flowers are sure to be attractive during the dull months of winter.

The present is a good time for sowing the seed, either in pans, boxes, or a cold frame, but, whichever method is adopted, the seeds should be scattered thinly, and after giving a gentle watering, should be shaded from the sun until germination takes place. As soon as the plants appear shading should be dispensed with, so that they may grow sturdily from the beginning. When the seedlings have made their second or third rough leaf, they should be pricked out either into a cold frame or in the open ground, care being taken in doing so to make the roots firm in the soil. Give a gentle watering, and if the weather is hot and dry, shade from the sun until established.

Stocks resent having their roots disturbed when they become large, therefore they should be transferred to pots when small, those known as large 60's being of a suitable size for the first potting. Prepare a light rich compost, and place one plant in the centre of each pot; do not press the soil too firmly as stocks make strong roots. When potted the plants should be stood on a bed of ashes in a cold frame from which the lights have been removed, as they should be induced to grow as sturdy as possible during the months of August and September. When the small pots are filled with roots transfer the plants to others of larger size, the dwarf-growing kinds will do well in 48's, but the stronger ones should have 32's. When the days become shorter, and there is a greater rainfall it will be necessary to place the lights on the frames, but so long as the weather remains open air should be admitted freely at all times; when, however, the nights become cold the frames may be closed. As winter approaches the plants should be transferred in batches to heated pits, where in case of severe weather a little heat could be turned on. It will now be necessary to pay close attention to watering, as the pots will be filled with roots, and if once the soil is allowed to become dry the bottom leaves are sure to fall. At the same time care must be taken not to over-water. Should green fly make its appearance fumigate at once. When in bloom the plants will be greatly assisted by occasional waterings with weak liquid manure, but this must not be overdone.

H. C. Prinsep.

## ÆSCULUS CALIFORNICA.

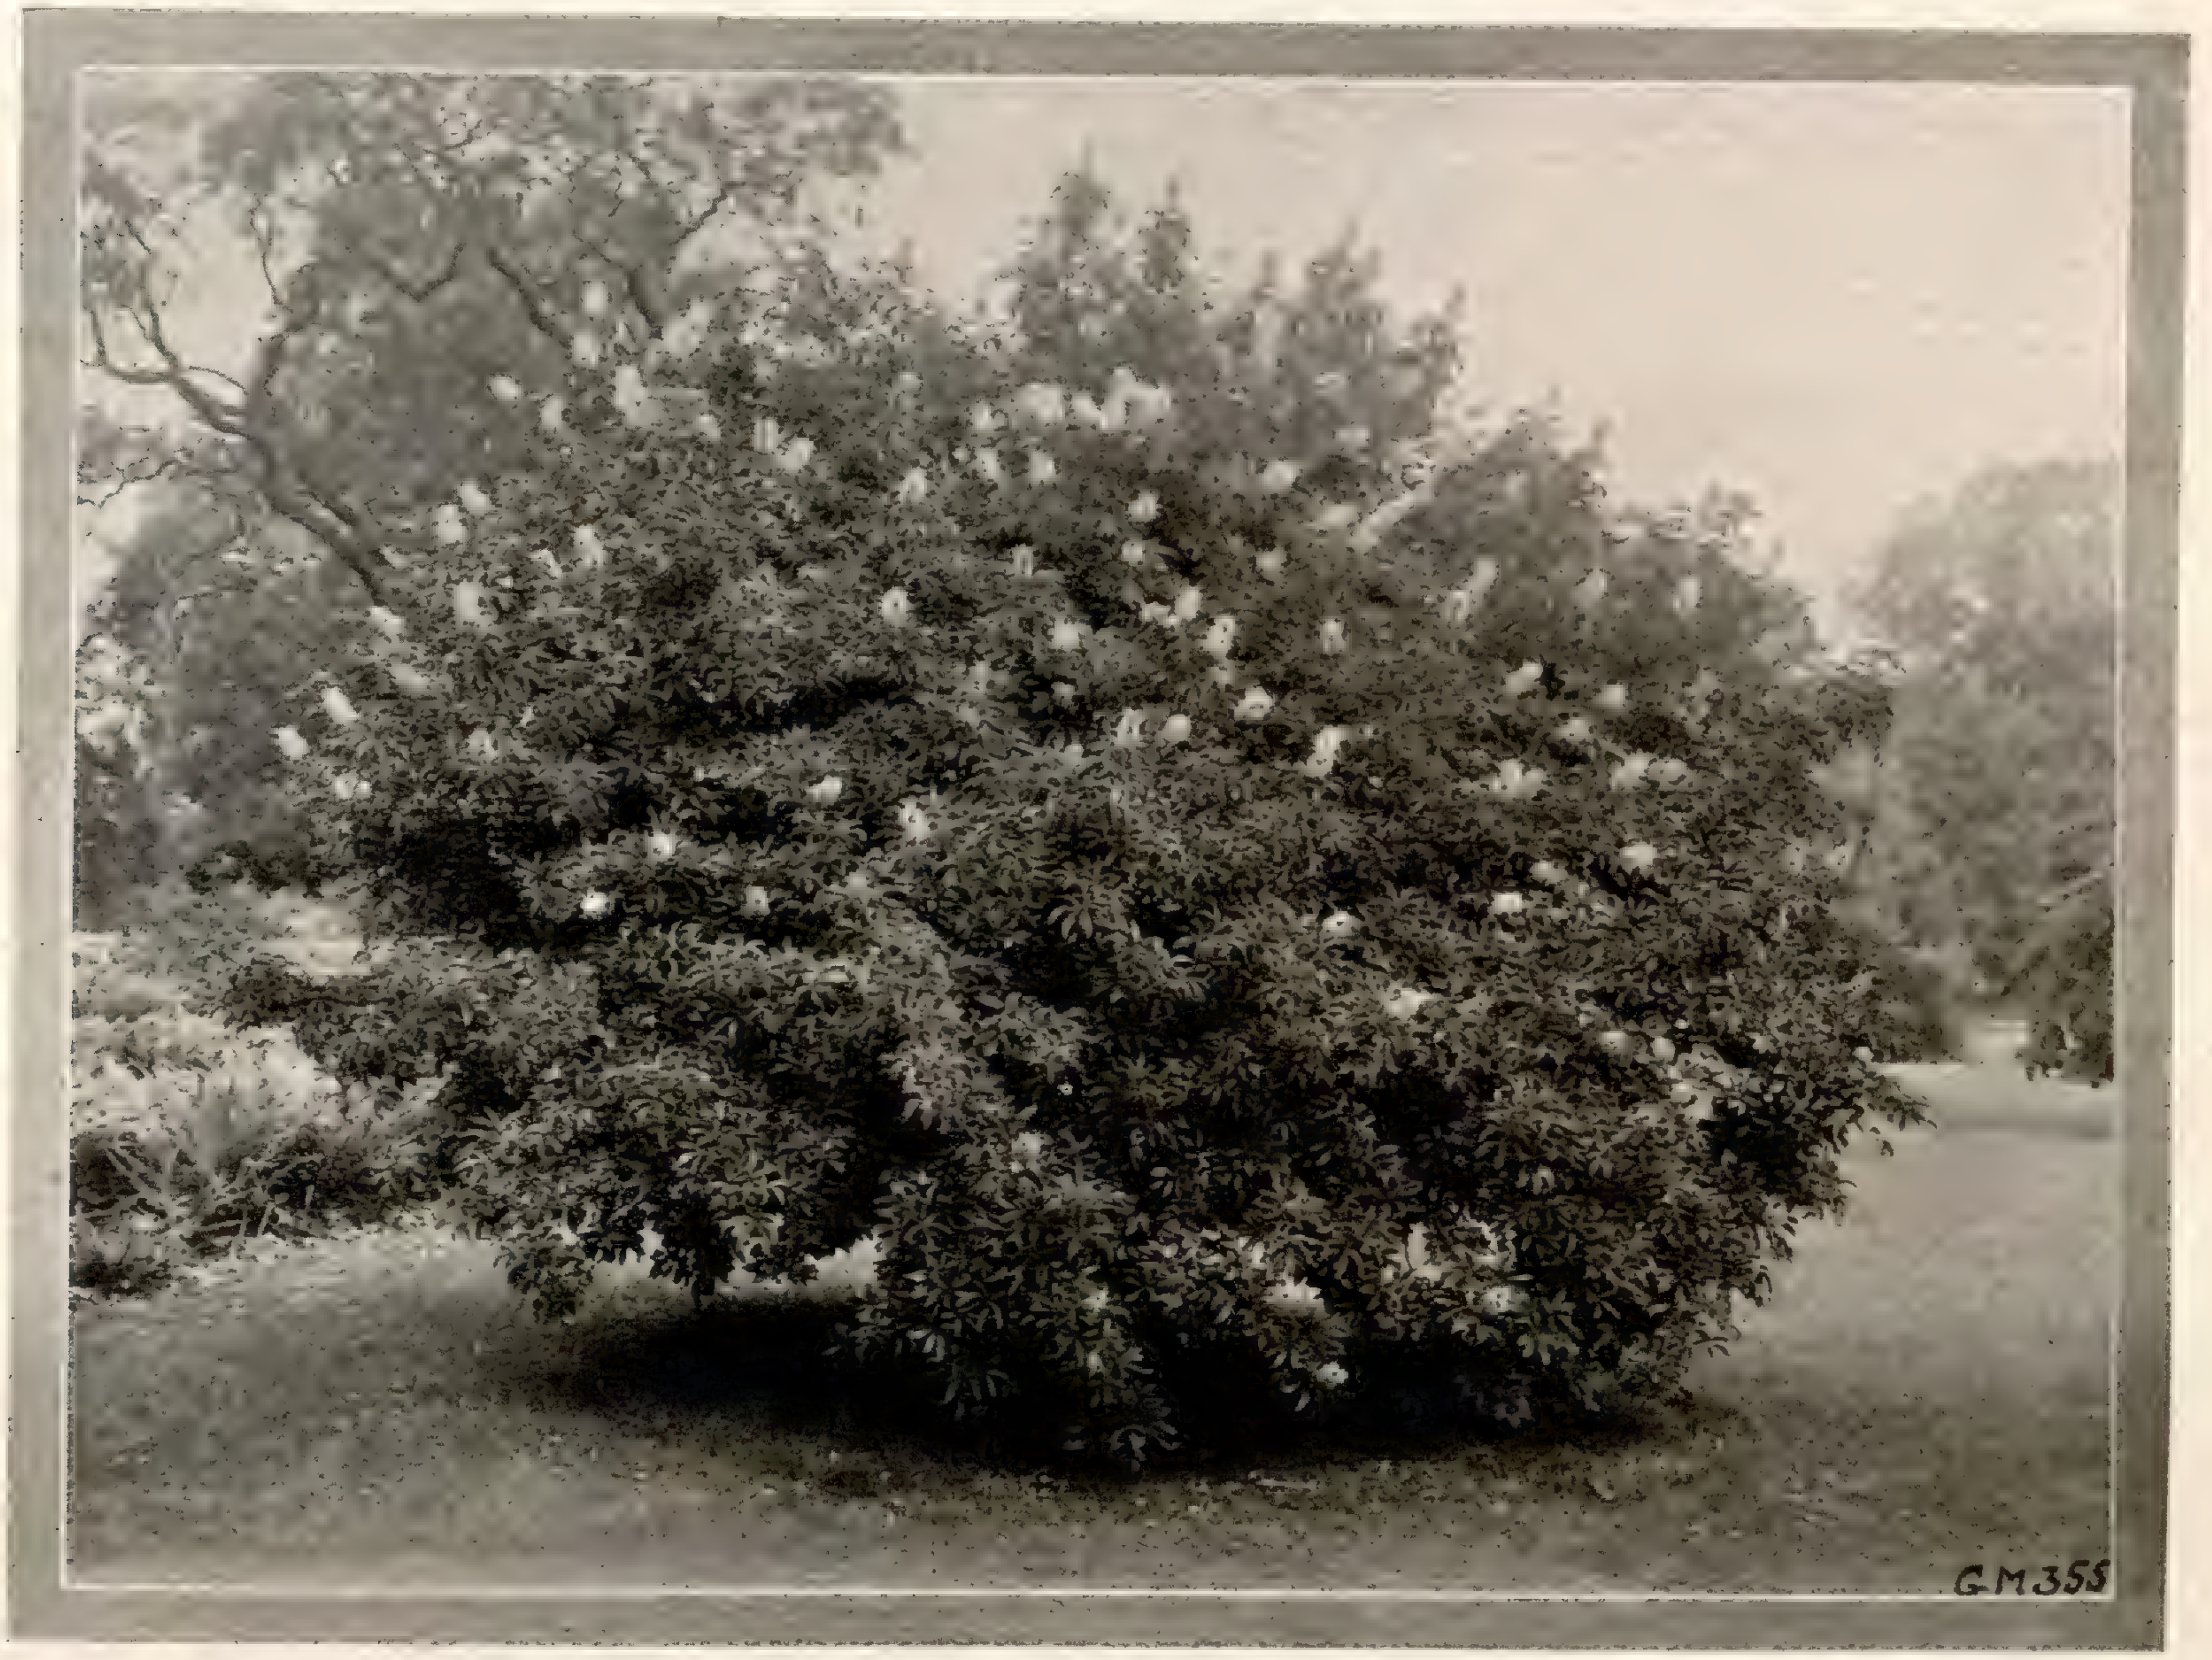
A fairly old inhabitant of our gardens, having first flowered in this country in the nursery of the Messrs. Veitch, at Exeter, in July, 1858, this chestnut, or Pavia californica, as it was then known, still remains an uncommon tree.

In its native country it forms a large shrub, 10 to 20ft. high, or a small, unusually spreading tree for its height of 30 to 40ft. Its common name is the Californian Buck-eye; it grows on the Upper Sacramento River and the western slopes of the Sierra Nevada mountains.

The leaflets are almost always in fives, 3 to 5in. long, and noteworthy as being probably the smallest leaflets of all the chestnut family. The fragrant white flowers, three-quarters of an inch across, are closely arranged on a compact raceme some 6in. in length; the orange-coloured anthers are very conspicuous. In addition to the beauty of the flowers a noteworthy and valuable character is the long season of flowering, which extends from the end of June until August, a succession of flowers continuing to open on the racemes for fully two months. The fruits, as in all the Pavia group, are smooth, brown in colour, 2in. to 3in. long, and in shape somewhat like a small pear.

The value of Æsculus californica as a lawn specimen is well shown in the illustration of a tree at Kew, about 15ft. in height and 20ft. through.

Kew. A. Osborne.



ÆSCULUS CALIFORNICA.
An uncommon but handsome tree, bearing spikes of white, fragrant flowers in July and August.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## CONSERVATORY AND GREEN-HOUSE.

CYCLAMEN. — These winter-flowering greenhouse plants need close attention. Young corms raised from seed last February have been steadily growing, and the largest are now ready for their final shift into six-inch pots. An open, sandy compost is best for them, consisting of two parts fibrous loam, one part leaf-soil, one part sand, some wood ashes, and a sprinkling of an approved fertiliser. The crown of the corm should be slightly raised above the surface of the soil when potting, to prevent damping of the flower buds when they appear. Corms kept over from last year, and which have been resting for some time, should be shaken clear of all old potting compost, and have the dead roots cut away; but great care must be taken with the living ones. The stems of dead leaves should be neatly trimmed with a pair of scissors (not pulled off) to within half an inch of the corm; re-pot at once in compost as advised above, and place in cold frames on a cool base; give shade, and water sparingly until root action and growth commence. Green-fly and black aphis are often troublesome on the young leaves, and will soon cripple them if not checked. It is best to fumigate occasionally as a preventive.

CALCEOLARIAS. — Herbaceous calceolarias should be sown at once. Choose a suitable pan, clean, and well crock it, and place over the crocks a layer of leaves. Prepare a fine sandy compost, fill the pan to within one inch of the rim, and press firm and level. The seeds should be sown thinly and evenly over the surface, and slightly covered with silver sand. The compost should be moist at the time of sowing, but should the pan require water before the seeds have germinated, the best way is to gradually lower the pan into a pail of water until the water rises through the compost to the surface. This will give the necessary moisture without disturbing the surface and washing the seeds about. The pan should then be stood in a cold frame, covered with a piece of glass, and shaded, to assist germination.

BULBS.—The time has arrived for considering the bulbs required for winter display. Freesias and Roman hyacinths should be ordered at once, and a batch of both should be potted up directly they arrive. A rich, friable compost is necessary, consisting of loam, leaf-soil, burnt earth, or wood ashes, with a good sprinkling of silver sand. The Roman hyacinths should be placed five in a five-inch pot, just burying them; the compost should be made firm, and given a good watering; when the moisture has drained away the pots should be buried in ashes. The bulbs soon commence to root and grow. The pots should be examined frequently, and when the growths are an inch long the stock should be taken out of the ashes and placed in a cold frame. After standing in the frame a fortnight gentle forcing may be commenced. The same kind of compost suits freesias, and these should be placed nine in a 48-sized pot, the bulbs being slightly covered and made firm. The pots should be stood straightway into cold frames, and covered with a layer of moss; when well rooted, growth is emitted from the top of the bulbs, and when the growths are two inches long the moss should be removed. The pots may then be placed on a shelf near the glass in a warm house. Care must be taken that they do not become drawn, or they will be quickly ruined. The secret of early forcing bulbs is to get them well rooted before placing them in heat.—Lewis Smith, Shotesham Park Gardens.

## THE ORCHID HOUSES.

CALANTHES.—The deciduous calanthes of the vestita and Veitchi section have now filled their pots with roots. It is desirable to apply a top-dressing of good fibrous yellow loam to the surface roots, mixing with it some fine dry cow manure and silver sand. They require at this season of the year an abundant supply of water, both at the root and in the atmosphere, the latter especially on bright sunny days. When the roots have permeated the fresh soil liquid manure made from sheep, deer, or cow droppings may be given from time to time. The liquid manure should not clog the compost. Care should be taken that the water used is heated to the same temperature as the house. Many plants receive a decided check from cold water, and in many cases develop black spot in the leaves and bulbs. The night temperature should never fall below 70 degrees, and in many cases it will be better if the figure reached is 5 degrees higher. If calanthes are grown among stove plants, they should be placed in a position by themselves, near the roof glass, where there is no danger of drip or water from the syringe reaching them. If grown in lean-to houses it is advisable to turn them round from time to time to keep the foliage erect. The later-flowering kinds are somewhat later in making their growth, but when they become well rooted they will need similar treatment to those mentioned.

PHAIUS, ETC.—The different sorts of phaius, as P. Wallichi, P. Sanderiana, P. Blumei, P. grandifolius, P. bicolor, P. maculata, and the hybrids, P. Cooksoni, P. Norman, P. Marthæ, phaio-calanthes, and phaio-cymbidiums, having commenced to grow, may be repotted if any are in need of fresh compost or larger pots. They all root well in a compost as used for calanthes, and they may be potted in the same manner. During their season of growth a decidedly moist atmosphere should be maintained, and on favourable occasions a light spraying overhead will do them no harm. Should the points of the leaves become discoloured, the moisture should be lessened and more air given.

PHAIUS TUBERCULOSUS may also be repotted, using a lighter compost than for the other species and hybrids. This plant requires more heat and moisture than its congeners, and should be placed in a shady position at all times.—J. T. Barker, The West Hill Gardens.

## THE KITCHEN GARDEN.

LATE PEAS.—Strict attention must be given these to ensure a constant supply over as long a period as possible. Providing robust varieties have been sown and the soil is good little will be required beyond mulching and watering. Watch for thrips in the points of the shoots, and attack quickly with a solution of soft soap and water, adding a little creamy sulphur; even dusting the rows overhead with light soot would act as a preventive. If mildew comes spray weekly with permanganate of potash; a few crystals dissolved in rain water, enough to bring the latter to a bright claret colour, at the same time dropping in a piece of sulphide of potassium, the size of a cobnut, will prove a good remedy.

COLEWORTS should be quite ready for planting out; place them fifteen inches apart in ground that has been occupied by early potatoes; plant firmly, water in, and, should cabbage butterflies be numerous, dust the plants over with dry wood ashes. If necessary sow another batch of Coleworts.

MUSHROOMS.—The late inside beds have been (and are) very prolific this year; no doubt owing to the cool nights experienced. If beds were spawned as advised outside, they will succeed these late inside ones.

SEAKALE.—This crop has made wonderful progress from thongs that were started to form crowns in boxes. Thongs that were planted straight away have come very badly, and not half a crop has shown as the result of a dry April; this shows the great value of starting thongs early in deep boxes where only a few thousand are required. Ply the hoe through the crop, and give a final dusting of soot and salt.

ENDIVE.—Transplant these as ready, and made another good sowing of the Batavian, as it can be used for cooking if required, beside being the best variety for salads.

GLOBE ARTICHOKES.—Cut the heads and place them in water as soon as ready, to encourage a regular supply. Give ample encouragement by applications of liquid manure and mulchings.

LETTUCES.—Make weekly sowings to meet the demand, and if the weather is dry water the drills previous to sowing. Make regular sowings of turnips in various parts of the garden.—Geo. Ellwood, Swanmore Park Gardens.

## HARDY FRUITS.

APRICOTS.—The summer pruning of the apricot requires a considerable amount of discrimination, to avoid, as far as possible, the inducement of late growth in the autumn; trees in vigorous health, if pruned hard and late in the summer, invariably make a late growth, particularly if wet weather sets in after a long spell of drought. Early frosts severely punish these late growths, and the trees receive a sharp check. To obviate this danger a certain number of shoots should be allowed free growth to take the flow of sap, and in this matter the operator must be guided by the vigour of individual trees; the object to be aimed at is to thoroughly ripen the young shoots and spur wood, and at the same time prevent the trees making fresh growth, to be eventually nipped by early frosts. The fruits promise to ripen early, and where the crop is a heavy one it is advisable to take off those fruits intended for preserving or bottling as early as possible, as the remaining fruits will then receive the benefit of this relief. Earwigs play havoc with the fruits unless kept under; short lengths of broad bean stalks placed in and amongst the branches will trap the marauders, and a weak solution of paraffin and water, applied to the base of the wall at intervals of two or three days, is helpful in warding off the attack of this troublesome pest.

WATERING.—The lack of rain in most parts of the country, and the great heat, has rendered the application of water to fruit trees a pressing necessity, especially so when dealing with soils of a light or shallow character. Apples on the paradise stock and pears on the quince stock are those most affected by long periods of heat and drought. Orchard trees of apples and pears worked on the crab and pear respectively are not so readily affected, although these, if carrying good crops of fruit, should, if necessary, have a good soaking. In this immediate neighbourhood the trees have had no moisture at the roots since the end of March, and, consequently, owing to lack of water, they are casting their fruits. A free and constant use of the hoe is of the utmost value in preserving moisture. Mulching should be done wherever possible as a means to the same end. Even should rain set in, the soil is now so dry that, unless it is unusually heavy and continuous for some days it would fail to reach the roots in time to assist the swelling fruits.

GATHERING EARLY APPLES AND PEARS.—Most varieties of early pears, such as Beurre Giffard, Jargonelle, William's Bon Chretien, etc., should be gathered as soon as they part readily from the stem when lifted to a horizontal position. By examining the trees at frequent intervals, and taking off such fruits as are ready, the supply will be considerably prolonged, and the flavour of the fruits be of a much higher quality. Early apples should be eaten direct from the tree, for if stored a few days they become mealy and insipid. Unless the trees are looked over daily many of the fruits fall to the ground, and are spoilt for dessert purposes.—W. Messenger, Woolverstone Park Gardens.

# EXHIBITIONS AND MEETINGS.

◆

## National Rose Society at Belfast.

JULY 19.

For the first time in its history the National Rose Society paid this year a visit to Ireland, and having regard to its success, the wish expressed by Colonel Sharman Crawford, at the opening ceremony, that it would not be the last time the society would come to Ireland, can hardly fail in its realisation.

Within recent years horticulture has received largely increased attention in the North of Ireland, more especially in the great district of which Belfast is the centre, and some two years ago the Irish Rose and Floral Society was formed, with Colonel Sharman Crawford as its president, and Mr. H. P. Pinkerton as hon. secretary and treasurer. Last year the society commenced active operations by holding an exhibition of roses and other summer flowers, and this proved so successful that this year's exhibition was extended, and the National Rose Society was invited to hold its provincial exhibition at Belfast in conjunction therewith. The invitation was readily accepted, for a desire had for several years been felt by many members of the Council that, on the first favourable opportunity an exhibition should be held on the other side of the Irish Sea. The preliminary arrangements for the show were made without the slightest difficulty, and Friday, July 19, was fixed as the most suitable date.

The exhibition was held on this date in the gardens of the Botanic Garden Park, than which no more suitable spot for a rose or other flower show could be found within the United Kingdom. The park is extensive, richly furnished with grand trees and handsome shrubs, and laid out with so much taste as to afford an excellent example of the landscapist's art. There was a glorious exhibition of roses, and this was supplemented by remarkably fine displays of sweet peas and hardy flowers. The Irish Society carried out its part of the arrangements so well as to evoke the heartiest expression of approval from both exhibitors and visitors, and it provided some half-dozen marquees that were spacious, light, and well ventilated. Thus it was that the flowers stood well, and could be enjoyed with the maximum amount of pleasure by the crowds of visitors. It was interesting to observe that not only were the tents provided with ample means for ventilation, but the ventilators were open and not kept closed as at some of the English exhibitions held of late in the hottest of weather.

There were a goodly number of the members of the executive of the National Rose Society present, and the Rev. J. H. Pemberton, president of the society, was in strong force, for he not only exhibited with much success in several of the leading classes, but he was active in fulfilling the duties of his high office. Mr. Edward Mawley, who, by the way, was described as Sir Edward Mawley (a distinction he well deserves) by one of the speakers, was, as usual, in capital form, and Mr. Pinkerton and other officers of the Irish Society did all that could possibly have been done to show that rosarians from England were heartily welcome, and to ensure the success of the exhibition.

### NURSERYMEN EXHIBITION ROSES.

The competition was very keen in the majority of cases, and the roses were, on the whole, of high quality. Very spirited was the contest in the trade class for thirty-six blooms, in which the premier award comprised, in addition to the cash prize, a valuable trophy and a gold medal. In the result Messrs. Hugh Dickson, Lim., Royal Nurseries, Belfast, occupied the place of honour with blooms equally remarkable for their large size, freshness, and colour. Of special merit were the blooms of Coronation, a superb pink flower that was awarded a gold medal in the seedling class, and also received the silver medal for the best bloom of any rose in the nurserymen's classes, other than H.T., T., or N.; Gladys Harkness, David Gilmore, Edward Mawley, Lyon, H. Pinkerton, a beautiful flower of a rich cream colour, tinted with rose; Mrs. Foley Hobbs, Gloire de Chedane Guinoisseau, Ethel Malcolm, W. C. Dickson, Mrs. Theo. Roosevelt, Charles Lefebvre, Mrs. Stewart Clark, Leslie Holland, King George V., Archie Gray, and Snowball. Messrs. Alex. Dickson and Sons, Newtownards, followed closely for second place with finely-finished blooms. Messrs. S. McGredy and Son, Portadown, were third with a fine set of blooms. Messrs. Hugh Dickson, Lim., were first also in the class for seventy-two varieties with an excellent collection, in which Mrs. Humphreys, a beautiful rose of a pleasing soft, yellow hue with deeper centre was fine. Messrs. A. Dickson and Sons were a close second with a stand in which those two brilliantly-coloured roses, C. J. Grahame and Leslie Holland, were splendidly represented. Very keen was the contest for the first place in the class for twenty-four varieties, three blooms of each, between Messrs. Hugh Dickson, Lim., and Messrs. Alex. Dickson and Sons, and in the result the first and second awards were made in the order of the names. Very fine in the first-prize stands were two blooms of Gloire de Chedane Guinoisseau, Leslie Holland, Snowball, Jonkeer J. L. Mock, David Gilmour, Mrs. S. Ross, and Mrs. D. McKee. Remarkable for their high development were the blooms of White Killarney, Lady Greenall, Caroline Testout, Mabel Drew, George Dickson, Lady Barham, and Edward Mawley, shown by Messrs. A. Dickson and Sons.

The chief class in the second of the sections set apart for nurserymen was that for thirty-six varieties, and in this the premier position was occupied by Mr. George Prince, Longworth, Berks, who staged Madame J. Gravereaux, Mrs. Dudley Ross, Earl of Warwick, Hugh Dickson, and Juliet in superb condition. Mr. J. Walsh, Portadown, was a capital second. Mr. Prince was first also for sixteen varieties, three blooms of each, with a level set of blooms, and Messrs. E. Smith, High Street, Belfast, was second.

There was a spirited competition in the trade classes for teas and noisettes, and the blooms were large in size and characterised by freshness. For eighteen varieties Mr. G. Prince was a splendid first, and especially noteworthy were the blooms of Miss A. de Rothschild, Mrs. Myles Kennedy, Madame Jules Gravereaux, W. R. Smith, Molly Sharman Crawford, White Maman Cochet, Mrs. E. Mawley, Comtesse de Nadaillac, Ernest Metz, and Souv. d'Elsie Vardon. Messrs. Hugh Dickson, Lim., were a good second. The first place for twelve teas was occupied by Mr. J. Mattock, Oxford, and Mr. J. Walsh and Messrs. F. E. Smith and Co. were second and third, the blooms being meritorious throughout.

### OPEN TO NURSERYMEN AND AMATEURS.

This section contained much to interest, inasmuch as it included the classes for twelve new roses and twelve blooms of any new rose. In the first of these two Messrs. Hugh Dickson, Lim., were first with a stand containing finely-developed blooms of Mrs. Richard Draper, Marquise de Ganay, Mrs. Maynard Sinton, Mrs. A. E. Coxhead, Ethel Malcolm, King George V., Souv. M. L. Perrier, Mrs. S. Ross, Mrs. Foley Hobbs, Leslie Holland, Evelyn Dauntesey, and Countess of Shaftesbury. Messrs. S. McGredy and Son were second, and Mr. W. Bentley, Belgrave, Leicester, third, both staging well. Messrs. Alex. Dickson and Sons had in their stand a superb bloom of their new crimson George Dickson, which was awarded the silver medal for the best bloom of a H.T. in the trade classes, which is the second time it has secured the H.T. medal at the N.R.S. exhibitions this season. The first prize for twelve blooms of a new rose was secured by Messrs. Hugh Dickson, Lim., with superb specimens of the brilliantly-coloured Leslie Holland. Mr. Prince was second with Mrs. Foley Hobbs.

There was a strong competition for the prizes for twelve blooms of any hybrid perpetual, and it was interesting to find all the exhibitors staging Frau Karl Druschki. Very fine were the blooms of this famous rose in the first-prize stand from Messrs. Alex. Dickson and Sons. Messrs. Hugh Dickson, Lim., and Mr. G. Prince were second and third with good blooms. Mr. W. Bentley scored in the class for twelve blooms of a hybrid tea with flowers of J. B. Clark in a high state of development; Messrs. Hugh Dickson, Lim., second with Countess of Shaftesbury. Mr. G. Prince was first for twelve blooms of a tea-scented variety with White Maman Cochet at its best. Messrs. Alex. Dickson and Sons were second with Mrs. Foley Hobbs.

### VASES AND BASKETS OF ROSES.

Exhibition blooms in vases were admirably shown, and the several collections formed a distinct and attractive feature. In the class for twelve varieties, five blooms of each, to be staged in twelve vases, Messrs. S. McGredy and Son were first with a fine set of blooms, those of Dean Hole, E. Mawley, Mrs. Foley Hobbs, and Mrs. D. McKee being especially meritorious. Messrs. Hugh Dickson, Lim., followed for second place with a set in which the Lyon was seen at its best. Messrs. Alex. Dickson and Son, who were third, had the brilliantly-coloured A. K. Williams in especially fine condition. Messrs. Hugh Dickson, Lim., scored for a vase of nine blooms of Harry Kirk.

Roses shown in plain baskets formed a very attractive feature, and the several contributions to the classes possessed much value educationally. On the whole they were far superior to the majority of those shown at the Society's Metropolitan exhibition, for the exhibitors, while using sufficient blooms to make the baskets thoroughly attractive, avoided the mistake of crowding the blooms. In the class for nine baskets, Messrs. Hugh Dickson, Lim., obtained premier honours with a set in which Lady Pirrie was finely shown, and in the smaller class for five baskets Messrs. S. McGredy and Son were first with tastefully-arranged baskets, in which that of the brilliant red G. C. Waud was of special merit. Mr. E. J. Hicks, Twyford, was second in the latter class, and Mr. J. Mattock third.

### DECORATIVE ROSES, OPEN.

The contributions to the classes for decorative or garden roses were numerous, and they contributed appreciably to the interest of the exhibition. The flowers staged in these classes were highly attractive, but the backs of the stages erected by some of the exhibitors were a serious disfigurement to the tent, and should not have been allowed. The post of honour in the class for eighteen varieties, to be shown in vases or other receptacles, was occupied by Mr. J. Mattock, who had Arthur R. Goodwin, Irish Glory, Mrs. Segond Weber, Bardon Job, Orleans, American Pillar, Mrs. H. Stevens, and Simplicity in capital condition. Messrs. Hugh Dickson, Lim., were second. The competition was keen in the class for twelve bunches, and Mr. E. J. Hicks was first with Rayon d'Or, Madame Abel Chatenay, Excelsa, and Countesse de Cayla as his best. The competition for the second place between Mr. G. Prince and the Rev. J. H. Pemberton was so close that there was not half a point difference in the merit of the collections; in the result the awards were made in the order of the names.

### AMATEURS.

Amateur rosarians were in strong force, and on the whole they staged blooms of fine quality. There were six or seven entries in the trophy class for twenty-four blooms, all more or less good, and in the result the handsome trophy, the gold medal and cash prize, constituting the first prize, were awarded to Mr. F. Dennison, of Leamington, who is one of the most popular of amateur rosarians, and was heartily congratulated on all sides when the decision of the judges became known. The blooms were throughout of large size, fresh, and of superb colour; and among the varieties that attracted special attention were Ulrich Brunner, Frau Karl Druschki, Dean Hole, Caroline Testout, Horace Vernet, Madame Jules Gravereaux, Mrs. Myles Kennedy (which was awarded the silver medal for the best bloom of a hybrid tea in the exhibition), C. J. Grahame, J. B. Clark, Maman Cochet, Alice Lindsell, Avoca, and Mabel Drew; Mr. W. Boyes, Middleton-on-the-Wolds, Driffield, was a capital second with large, finely-finished blooms, and Mr. J. H. Welsh, Dunardale, Londonderry, had an excellent collection of blooms for third place.

Very keen was the competition in the amateurs' class for thirty-six varieties, and the Rev. J. H. Pemberton, Havering, was a splendid first with blooms of superb quality, the most noteworthy being those of Lohengrin, King George V., A. K. Williams, Mrs. H. Walsh, Dr. O'Donel Brown, and Earl of Warwick. The other successful exhibitors in the class were Mr. H. V. Machin, Gateford Hill, Worksop, and Mr. W. Boyes. The latter had a superb bloom of Gloire de Chedane Guinoisseau, which was awarded the silver medal for the best hybrid perpetual in the amateurs' classes. The class for eight varieties, three trusses of each, was a good one, and Mr. F. Dennison was first with a splendid box, in which the blooms of Mrs. J. Laing and Miss Molly Sharman Crawford were of a high order of merit. Mr. H. V. Machin was a close second with a fine set. For six blooms of any one variety Dr. Campbell Hall, Monaghan, was first with good blooms of the Duchess of Portland, and Mr. H. V. Machin was second. There was a very spirited competition for the prizes for a collection of decorative roses, open to amateurs, and the premier award was made in favour of the Rev. J. H. Pemberton, whose collection was equally remarkable for the high development of the flowers and the taste evinced in the arrangement.

FIRST PRIZE BOWL OF ROSES AT BIRMINGHAM SHOW.
Exhibited by Messrs. Perkins and Sons, Coventry.

In other classes open to amateurs, the principal prize-takers included Mrs. Dunlop, Holywood; Mr. R. Thompson, Ballynahinch Spa; Mrs. G. Herbert Brown, Helen's Bay; Colonel Sharman-Crawford, Crawfordburn; Mr. W. Upton, Leicester; Mr. J. H. Welsh; Mr. T. F. Crozier, Dublin; Mr. F. J. Harrison, Ulverstone; and Mr. Mahlon Whittle.

### NEW ROSES.

H. Vessey Machin H.T., a large, globular flower of a rich crimson colour. From Messrs. Alex. Dickson and Sons. (Gold Medal.)

Mrs. R. D. McClure H.T., a beautiful rose, the colour clear pink; H. E. Richardson H.T., a distinct variety with medium-sized flowers of a deep crimson hue; and Coronation H.P., a lovely rose with large, globular flowers, a soft, clear, pink colour. From Messrs. Hugh Dickson, Lim. (Gold Medal.)

Lady Mary Ward H.T., a medium-sized flower of a rich orange hue, shaded yellow at margins of petals. From Messrs. S. McGredy and Son. (Gold Medal.)

Colleen H.T., an effective variety with large, bright pink flowers; British Queen H.T., flowers pure white and of superb form. From Messrs. McGredy and Son. (Silver-gilt Medal.)

Mrs. James Lynas H.T., a charming variety, the flowers large and the colour blush pink. From Messrs. Hugh Dickson, Lim. (Silver-gilt Medal.)

Miss Muriel Wilson T., a beautiful variety with pale primrose-yellow flowers. From Dr. Campbell Hall. (Card of Commendation.)

### SWEET PEAS.

The sweet peas in competition for the prizes in the twenty-seven classes provided for them by the Irish Society proved a delightful and immensely attractive feature. The number of entries was very great, the majority of the flowers were of large size, and under the favourable atmospheric conditions the colour was especially well developed. Especially noticeable was the superb development of colour remarkable in such varieties as Mrs. W. J. Unwin, May Campbell, Edna Unwin, and Elsie Herbert.

The most important of the several classes was that for twelve bunches, and here Mr. Edward Cowdy, Laughall, was first with splendidly-developed sprays of Mrs. C. W. Breadmore, Queen of Norway, Faulkner's Primrose, Edna Unwin, Audrey Crier, Afterglow, White Queen, and Mrs. Hardcastle Sykes. Mr. Robert Wellwood, of Strandtown, scored in one of the two classes for six bunches with Etta Dyke, Marjorie Willis, Douglas Unwin, Mrs. R. Hallam, Maud Holmes, and Nettie Jenkins in superb condition. In a second class for six bunches Mr. J. Achen, Portadown, was first, staging superb bunches of Tennant Spencer, Mrs. C. W. Breadmore, Helen Lewis, Nettie Jenkins, Mrs. R. Hallam, and Gladys Burt. The premier award for twelve bunches of varieties selected from a given list was awarded to Mr. J. Hall, of Moy. The premier position in the class for nine varieties was occupied by Mr. J. Smellie with Rosabelle, Mrs. Cuthbertson, Sunproof Crimson, Mrs. Hugh Dickson, Elsie Herbert, Thomas Stevenson, Doris Usher, Lady Helen Grosvenor, and Elsie Herbert in a high state of development. The competition was very strong in the whole of the classes for single bunches of specified colours, the number of entries being very large in the majority of them. Space will not permit of their being referred to in detail.

### HARDY FLOWERS.

These were so largely and well shown as to form a display that was at once attractive and of much interest. Mr. H. D. M. Barton, of Antrim, scored in the class for twenty-four bunches, which was open to amateurs only, with a magnificent collection. Highly meritorious also was the collection of twelve bunches from Colonel Sharman-Crawford, and the first-prize collection of six bunches from Mr. Robert Boyd, of Holywood, evinced cultural skill of a high order of merit.

Hardy annuals were splendidly shown, and the first prize for twelve bunches was awarded to Mr. Edwin Hughes, Craigavad, and the premier award for six bunches was made in favour of Mr. Clarence Craig, Clough. These and other exhibitors in the classes for hardy flowers may be heartily congratulated on the high quality of their contributions.

Carnations were well shown, and in the six classes provided for these flowers Mr. T. F. Crozier, Lord Dunleath, Mr. H. E. Richardson, and Mr. R. Boyd were the most successful of the competitors

---

## Birmingham Horticultural Society.

JULY 19 AND 20.

For a number of years flower shows have annually been held in Handsworth Park, Birmingham, under the auspices of the Handsworth Horticultural Society. These shows have been of considerable extent, and in many respects above the average in point of merit and interest. Every now and then the suggestion was made that the Handsworth Show should form the basis of a greater horticultural exhibition under the more general and widespread patronage of Birmingham. This year the idea took shape, and, with the Lord Mayor of Birmingham as president, and the Aldermen and Councillors on the committee, the first show of the Birmingham Horticultural Society opened on Friday last, and continued to Saturday. Nurserymen, gardeners, amateurs, and cottagers came forward right royally to support the show, and the result was a vast array of well-grown plants, flowers, and vegetables; but, alas! what should have been one of the best exhibitions ever seen in the Midlands was very badly arranged. It appears that the entries exceeded all expectations, and staging was not provided to accommodate all the exhibits, and in many classes one had to run from tent to tent in search of the entries. Such a state of affairs made both proper judging and reporting almost impossible, and as a matter of fact, the opening day left us with a good many classes still to find. It is far from our wish to throw cold water on the efforts of our Birmingham friends, and so we make the suggestion that another year a few practical horticulturists who are themselves exhibitors should be put upon the staging and schedule committees. There is no lack of highly qualified men around Birmingham, and it seems to us their absence from the committees was most unfortunate. We hope next year there will be a great improvement, and that we may then and for many years to come be able to report Birmingham Show as occupying a foremost position among the leading exhibitions in the kingdom.

### OPEN SECTION.

The four groups in the class for an arrangement of stove and greenhouse plants, occupying 300 sq. ft., were very creditable efforts. Messrs. J. Cypher and Sons, Cheltenham, were declared winners of the first prize, and it may be said their group was arranged with the good taste one always expects and finds in the work of this well-known firm. There were capital corner and dot plants of crotons, Humea elegans, and palms, with good cattleyas, odontoglossums, clerodendrons, and other fine flowering subjects in undulating mounds, surmounted by a rustic arch supporting a fine kentia as the centrepiece. Second place was worthily taken by Mr. J. MacDonald, gardener to Sir George Kenrick, Edgbaston, whose principal plants were similar in character and quality to those mentioned in the winning group, a few Malmaison carnations and crassulas also being used, together with long trailing plants of beautifully tinted selaginellas. Third prize went to Mr. W. Vause, Leamington, who used rather too many tall plants; Mr. W. R. Manning, Dudley, was given fourth prize.

Messrs. Cypher and Sons' twelve specimen stove plants secured premier honours, their Allamanda Hendersoni and A. nobilis being beautifully flowered specimens, a grand plant of Croton Warrensi being also conspicuous. Mr. W. Vause was second in this class. Of two entries staged in the class for six coleus Mr. Alfred Cryer, gardener to A. Kenrick, Esq., Edgbaston, had the best, and really good plants they were; Mr. Perks, gardener to J. Boston, Esq., J.P., Handsworth being second. Mr. Perks was also a winner for six fuchsias.

The growing popularity of rock and water gardening prompted the inclusion of a class for a display occupying 20ft. by 20ft.; there were two entries. The judges awarded first to Messrs. Gunn and Sons, Olton, who had a bright and attractive exhibit, but the dominance of border phloxes and big liliums of the longiflorum and auratum types was scarcely in keeping with the requirements of the class, whereas, as a rock and water garden, that designed by Messrs. Child and Co., Acocks Green, seemed nearer the specification, although placed second. Possibly the objection was that, although a deep gully had been formed, spanned by a bridge, and planted with Japanese iris, reeds, spiræas, etc., the water had not been turned on, whereas the centre of Messrs. Gunn's exhibit was a pool with nymphæas floating on its surface. Both exhibits were worthy of special note.

### ROSES.

The principal rose class was for forty-eight blooms distinct, for which a £6 first prize was offered, and of the four entries Messrs. Perkins and Sons, Coventry, took the lead. The flowers staged were of high quality, there being a few blooms of outstanding merit, particularly Mrs. Joseph H. Welsh, Claudius, and Dean Hole. Mr. J. Mattock, New Headington, Oxford, was second with much smaller but fresh and even flowers, Gloire de Chedane Guinoisseau, Suzanne Marie Rodocanachi, and Mildred Grant being among his best flowers. Mr. W. T. Mattock, Barton End, Oxford, was third. Messrs. Perkins and Sons scored again in the twenty-four class, showing excellent blooms of Frau Karl Druschki, Edward Mawley, The Lyon, and Lady Barham; Mr. Henry Drew, Longworth, Faringdon, followed, and Mr. J. Mattock came third.

Messrs. Perkins and Sons maintained their lead in the class for eighteen blooms, beating Mr. H. Drew and Mr. J. Mattock, who took second and third places respectively. For twelve teas Messrs. W. and J. Brown, Stamford, had the advantage, showing neat flowers of W. R. Smith, Mdme. J. Gravereaux, Maman Cochet, and Mdme. Fermorel. Mr. Drew was second, and third prize went to Messrs. Townsend and Sons, Worcester.

The prizes for a collection of roses occupying 10ft. by 4ft., were keenly contested, the first prize being well won by Messrs. Gunn and Sons, Olton. A big mass of fresh, clear Lyon roses, supported by pillars of Hiawatha, Crimson Rambler, and Leontine Gervaise, made a grand background for bowls of General McArthur, Juliet, White Killarney, Marquise de Sinety, and other of the newest and best hybrid teas. Messrs. W. and J. Brown, Stamford, were placed second, their stand just failing in light and delicate shades; Mr. J. Mattock, Oxford, came third, and a fourth prize went to Messrs. R. M. Fraser and Son, Malvern, while Mr. W. T. Mattock was highly commended. This class was a feature that would have done credit to any show.

Mr. W. T. Mattock scored with twelve bunches of garden roses, and was followed by Mr. J. Mattock and Messrs. Perkins and Sons in the order named. For a single bowl of roses there were half a dozen entries, and it must be remarked that the exhibits were very tasteful. Messrs. S. Perkins and Sons were given pride of place for the Lyon rose, displayed with long sprays of dark foliage. Miss F. Jenks, Codsall, followed with a very lightly arranged bowl, third prize going to Mr. W. T. Mattock.

### HARDY FLOWERS.

The class for two dozen bunches of hardy herbaceous flowers was responsible for six entries, among which Messrs. T. B. Grove's effort was adjudged the best. These Sutton Coldfield nurserymen had among their most successful vases some good phloxes, Veronica spicata rosea, and Galega Hartlandi. Messrs. Harkness and Sons' second-prize exhibit contained Papaver Mrs. Perry, Lilium candidum, Lupinus Rose Queen, and good gaillardias; and Messrs. G. Gibson and Co., Bedale, also had some good things on their third-prize stand. Messrs. Harkness and Sons led for a collection of delphiniums, and second prize was taken by Mr. A. Cryer, gardener to A. Kenrick, Esq., while Messrs. Gibson and Co. came third.

The collection of perpetual carnations put up by Mr. A. F. Dutton, Iver, Bucks, was the only entry in its class, first prize being awarded. A smooth-edged clear yellow, named Yellow Gem, was conspicuous on this stand, and it should be a valuable acquisition. Twelve vases of border carnations, three blooms of each, found four entries, Messrs. A. R. Brown, Lim., King's Norton, being victors with fine flowers of Lord Steyne, Alba, Margaret Thurston, Black Douglas, My Fancy, and Kaffir Chief. Mr. H. H. Parton, Moseley, was second, his Sam Weller, Lord Steyne, and Linkman being three good yellow-ground fancies; third place was awarded Mr. C. J. White, gardener to Frank Bayliss, Esq., Walsall. For a collection of carnations and picotees staged on a space 6ft. by 4ft., Messrs. W. J. Godfrey and Son, Exmouth, had the advantage over Messrs. A. R. Brown, Lim., both stands containing good flowers, nicely arranged.

The class for twelve border carnations and picotees, distinct, found Mr. W. H. Parton at the head, with large, well-grown blooms of excellent varieties; he was followed by Messrs. A. R. Brown, Lim., and Mr. C. J. White.

Violas are always nicely staged at Birmingham, and for a dozen bunches, distinct, there were six strong entries. Mr. Howard Allen, Handsworth, took first place with beautifully-grown flowers. Mr. J. Bastock, Moseley, came second (he was guilty of omitting to label his flowers), and Mr. F. Reily, King's Heath, was third. A class of more than ordinary interest was that for a collection of pansies and violas tastefully arranged on a table space 6ft. by 3ft. Here Mr. J. Bastock scored a decisive victory with small vases of good varieties set up in front of a mirror that made a very good background. Messrs. Seagrave and Co., Sheffield, were second with well-grown flowers arranged in a more formal manner; Messrs. Pemberton and Sons, Walsall, third.

### SWEET PEAS.

A good deal of interest was centred in a class for a display of sweet peas occupying 20ft. by 4ft. A silver challenge cup, value twenty guineas, a gold medal and £5 were offered for the best group, and the successful exhibitors were Messrs. Herd Bros., Penrith. Their display was arranged on a low stage in a manner that made it possible to see every flower with ease. The varieties included such good things as Red Star, Melba, Hercules, Thomas Stevenson, Romani Rauni and R. F. Felton, the whole consisting of well-grown flowers put up in a really attractive manner. Mr. J. Stevenson, Wimborne, came a good second, his flowers showing excellent cultivation, and Messrs. Holder and Co., Erdington, were third in a keenly-fought competition.

Another big class was for twenty-four bunches in twelve varieties, and there being seven entries, all of good quality, Mr. George Hallett, gardener to Sir R. Graham, Bart., Carlisle, scored a first, his flowers, which were of good quality, being set up to great advantage in clear glass vases. Mr. F. R. Minshall, Market Drayton, was a good second, and Mr. John Vicarage, Harvington Nursery, Kidderminster was third.

### GARDENERS AND AMATEURS.

This was a large section of the show, and it must be recorded that the exhibits, both in point of variety and quality, were demonstrative of high culture, showing that around Birmingham gardening is well and largely practised.

The groups in this section were admirable. Occupying 15ft. by 8ft. with single frontage, they were eight in number, and Mr. Alfred Cryer is to be congratulated on his well-merited win among so many strong competitors. All his plants were well-grown stuff, the crotons beautifully coloured, the palms shapely, and the orchids, begonias, liliums, etc., were bright and clean. With a highly-built background, central and corner mounds, the body of the group was lightly arranged. Quite different in style was the second-prize group put up by Mr. G. Corbett, gardener to Hume C. Pinsent, Esq., Harborne, whose strong point was colour, provided mainly by Verbena Miss Willmott, schizanthuses, liliums, and highly-coloured but small crotons. Of necessity these subjects gave a somewhat flat arrangement, and the introduction of a few tall foliage plants would have been an improvement. Mr. T. Perks, gardener to J. Boston, Esq., Handsworth, received third prize, his group being very tasteful in arrangement. There were two other classes for smaller groups, in one of which Mr. W. S. Smith, Handsworth, took first, and Mr. J. Cope, Balsall Heath, second; while in the other the only exhibit was that of Mr. E. Collet, gardener to T. Ollard, Esq., Handsworth, who was awarded a second prize.

Six exotic ferns were best shown by Mr. H. Faulkner, gardener to J. R. Shaw, Esq., Handsworth. In Mr. Ellison's class for twelve ferns Mr. H. Faulkner was again winner, and for three specimens Mr. Perks took first and Mr. R. Usher second. Mr. Perks also won for six fuchsias. For six stove plants Mr. A. Cryer put up some fine plants, winning a first, his Phœnix rupicola and Kentia Belmoreana being grand specimens. There were numerous other classes for greenhouse plants, such as gloxinias, begonias, etc., the competitors already named accounting for most of the awards.

There were two entries for a dozen bunches of stove and greenhouse flowers, the winner being Mr. A. H. Lord, gardener to C. A. Palmer, Esq., Handsworth; he was followed by Mr. J. Freeman, gardener to Colonel Walker, Acock's Green. A very nice little collection of hardy flowers was put up by Mr. E. J. Keeling, Small Heath, with which he won first. Sidalcea Listeri, Gypsophila rosea, Lysimachia clethroides, and Alstrœmeria chilensis were among his best subjects;

second prize in the class went to Mr. H. C. Potter, Handsworth, Mr. Carter, Erdington, being third.

There were a large number of vegetable classes, the chief one being for a collection of nine kinds. First honours were secured by Mr. E. Winchester, Rubery, who staged capital peas, cauliflowers, potatoes, tomatoes, French beans, etc. Mr. Edward Deakin, Birmingham, was second with smaller, but very even, produce; Mr. H. S. Foster, gardener to F. E. Muntz, Esq., Hockley Heath, coming third among some half-dozen entries. In Messrs. Webb's special class, Mr. H. Davis, gardener to H. Watson Smith, Esq., Stourbridge, was chief winner, Mr. Deakin taking the leading award offered by Messrs. Sutton and Sons, and again in Messrs. Yates' class.

### TABLE DECORATIONS.

There were twenty-four exhibits in the four classes for table decorations, and in the open class, orchids excluded, Mr. Stephen Sims, Derby, led with a very tasteful arrangement of Lady Hillingdon roses with trails of small-leaved ampelopsis. The second prize went to Mr. A. G. Newbold, Cuttleover, Derby, who used Carnation Mrs. Reynolds Hole in conjunction with roses, just slightly overdoing the use of the flowers; Miss Ada Townsend, Worcester, came third with a delightful arrangement of single roses. Miss M. L. Deakin won in the ladies' class, using pale pink sweet peas, with trails of bronzed selaginella; Mrs. F. Anderson, Moseley, also used sweet peas in her second-prize table.

Robert Sydenham Limited offered special prizes for decorations in their "Rural" receptacles, and Mr. Edward Deakin, Birmingham, scored with a pretty arrangement of Mrs. Routzahn sweet pea, Miss F. Jenks, Codsall, coming second with a much heavier arrangement, and third prize going to Mr. W. Caldicott, gardener to Jesse Varley, Esq., Wolverhampton.

Only one entry for a table of fruit was forthcoming, the exhibitor being Mr. Stephen Sims, Borrowash, Derby. He had Irish Peach apples, Black Hamburgh grapes, Early Rivers nectarines, and White Heart cherries, his floral decorations being of sweet pea Mrs. Routzahn.

### NON-COMPETITIVE EXHIBITS.

These were presented in large numbers, and were of considerable interest and worth. Not only did local nurserymen come forward, but well-known exhibitors from far and wide brought produce of varied character, making in all a splendid display that added much to the attractiveness of the show.

Hardy flowers were largely shown, and were the centre of attraction to most visitors. We were pleased to notice a general departure from the crowded style of arrangement in favour of a lighter and more tasteful display. Among a great variety of subjects staged by Messrs. G. Gibson and Co., Leeming Bar, Bedale, were some good bunches of Verbascum Ivanhoe, Delphinium Cashmerianum, and the striking Aconitum uncinatum. Phloxes were prominent on Messrs. Hewitt and Co.'s stand, but the Solihull firm had also many comparatively uncommon and choice herbaceous subjects. Messrs. Rich and Co., Bath, showed herbaceous flowers, as also did Messrs. W. J. Godfrey and Son, Exmouth, Oriental poppies, Romneya Coulteri, and some fine pentstemons being shown by the latter.

Messrs. Bakers, Wolverhampton, put up an elaborate and very fine exhibit in the form of a herbaceous border with a lily pool in the foreground, a stone wall and pathway, well furnished with suitable plants, running between the border and the pool. On either side of the latter were beds of roses, the Lyon and General McArthur being the varieties used. It was altogether a well-devised and capitally-executed piece of work. Both sweet peas and roses played a part in Messrs. Jarman and Co.'s exhibit, and this firm showed their sweet sultans in good style. Messrs. Clibrans, Altrincham, filled a big space with sweet peas.

A big stand of sweet peas, embracing a large number of up-to-date varieties, came from Messrs. Simpson and Sons, Birmingham. and another smaller but very choice exhibit was that from Messrs. R. J. Barnes and Son, Malvern, who also staged rambler and Wichuraiana roses and a few distinct bedding violas. The brightness, as well as the size of the sweet peas from Messrs. G. Stark and Son, Great Ryburgh, made their stand specially admirable. A new clear salmon named Stark's Salmon was undoubtedly the finest thing among the many fine things shown. Among the perpetual carnations from Messrs. Young and Co., Cheltenham, a vase of the Hon. John Boscawen was the newest, and is a very pretty variety that may be described as an improved Fair Maid.

Messrs. Sutton and Sons, Reading, staged in their usual effective manner a large and varied collection of well-grown vegetables. The skilful use of annuals of bright colours added much to the interest of the exhibit. Excellent antirrhinums, hollyhocks, and liliums supplemented sweet peas, larkspurs, clarkias, and other pretty subjects, and all were set up in a delightful manner.

Mr. H. N. Ellison, West Bromwich, had a well-grown specimen of the new Pteris Parkeri among the choice ferns he showed, and the cacti staged included a number of well-developed specimens of excellent kinds. Messrs. John Peed and Son, West Norwood, put up a group of caladiums worthy of the firm that has specialised in caladiums for so many years. From Twerton Hall, Bath, Messrs. Blackmore and Langdon brought cut blooms of double and single begonias which, needless to say, were of rich quality and most charming colours.

Messrs. Webb and Sons' familiar temple-like arrangement was furnished with sweet peas, with a few carnations and liliums at the base. The vegetables on the stand were of excellent quality, and the varieties of the very best. Mr. J. MacDonald, Harpenden, had an exhibit of lawn and pasture grasses of remarkable interest and educational value.

---

## **Southampton Jubilee Show.**

JULY 16 and 17.

On the County Cricket Ground the fiftieth exhibition of the Southampton Horticultural Society was held on the above dates, and was a great horticultural success, but we fear it was not a financial success, for at the time we left the ground there were very few visitors. The schedule was comprehensive, containing classes specially arranged for carnations, in connection with the Southern Counties section of the National Carnation Society.

### CARNATIONS.

Thirty-six classes were provided, making quite a fine display in themselves. For twelve vases of selfs, fancies, and yellow-ground picotees, arranged on a space 4ft. by 3ft., there were three entries, and Mr. J. Douglas, Bookham, Surrey, was first with desirable blooms of Purity, Pasquin, and John Ruskin. Messrs. A. R. Brown, Lim., King's Norton, Birmingham, second. Mr. Douglas was first for four vases of selfs, and Mr. Hayward Mathias, Medstead, second. In a class for four vases of fancy carnations, other than white grounds, Messrs. Douglas and Brown were first and second respectively. In the white ground fancy carnation section the Messrs. Brown were first and Mr. J. Douglas second. Yellow-ground picotees in vases were best shown by Mr. J. Douglas, the premier bloom being a good one, in this exhabit, of Onward.

Dressed flowers were neither numerous nor of exceptional quality. For six flakes and bizarres Mr. J. Douglas won, as also he did for fancies, Pasquin and Alice Byron Stewart being noteworthy flowers. For six selfs Mr. Douglas was first, and Zulu and Miss Willmott were his best kinds. Mr. Hayward Mathias had the premier yellow-ground and white picotees, winning in both sections.

In the amateurs' section there was more competition, Mr. G. Cousens, gardener to J. A. Fort, Esq., The College, Winchester, winning for six vases of selfs, fancies, and yellow-ground picotees. Mr. R. G. Rudd, gardener to W. H. Parton, Esq., Studholme, Moseley, Birmingham, had the best four vases of selfs, the best four vases of picotees, and the best single vase of any white-ground variety. Mr. R. Ransom, gardener to C. A. Linzee, Esq., Bramdean Lodge, was first for dressed carnations in two classes with good blooms of well-known varieties.

For five vases of tree or American carnations Mr. Usher, gardener to Sir Randolph Baker, Bart., Ranston, Blandford, was awarded second prize, the first being withheld. Mr. Ellwood, gardener to W. H. Myers, Esq., Swanmore House, Bishop's Waltham, won for three varieties of American carnations.

### PLANTS.

For a group of miscellaneous plants, arranged for effect on a space of 120 square feet, there were three entries. Mr. E. Wills, Winchester Road Nurseries, Southampton, was first with a rather flat arrangement of suitable plants. Mr. Turner, gardener to the Hon. Mrs. Elliott Yorke, Hamble Cliff, Southampton, second. Mr. Bealing had the best five ferns.

### SWEET PEAS, ETC.

In the class for nine distinct varieties, Messrs. Toogood and Sons providing the prizes, there were seven entrants, and Mr. Usher secured the leading place with good examples of popular sorts; Mr. Bealing, Bassett, Southampton, second. The last-named won Mr. R. Sydenham's and Mr. Longster's special first prizes with extra fine flowers. Mr. Usher secured Messrs. Sutton's first prize for six varieties, and also the lead-place in Messrs. Webb's and Messrs. J. Carter and Co.'s special classes.

Roses were well shown. For a representative group Mr. John Mattock, Headington, Oxford, secured the Hon. Mrs. Yorke's valuable challenge cup with a fine display of popular varieties, effectively arranged; Messrs. Rogers and Sons, Bassett Nurseries, Southampton, second. Messrs. Perkins and Sons, Coventry, won for two dozen distinct varieties with fresh, well-coloured examples of leading sorts; Messrs. D. Prior and Sons, Colchester, second. Messrs. Perkins also secured the premier place for twelve teas or noisettes, Messrs. D. Prior and Sons following.

Floral decorations were an extensive display. For a dinner table decoration no fewer than twelve competed. Miss Minnie Snellgrove, 10, Oxford Road, Southampton, won with a pretty table of Iceland poppies; Miss L. A. Nicholas, 60, Whitworth Crescent, Bitterne Park, second. For a table of carnations Mrs. A. R. Bide, Guildford Road, Farnham, was first among seven entrants with an effective arrangement of a dark-edged variety with suitable greenery; Mrs. Bealing second. Miss Snellgrove arranged the best sweet pea table—quite an effective effort.

### FRUITS AND VEGETABLES.

Fruit made a handsome display, and for a collection of six dishes, distinct, Mr. W. Baxter, gardener to Captain Dalgety, Lockerley Hall, Romsey, was first with extra fine grapes, peaches, and melons. Mr. T. Hall, gardener to Ellen Lady Swaythling, South Stoneham House, Southampton, won for four bunches of black and white grapes, showing excellent Madresfield Court and Muscat of Alexandria. Mr. W. Hall, gardener to Major Chichester, Embley Hall, Romsey, won for two bunches of any white grape with Muscat of Alexandria in capital condition. Peaches and nectarines were well shown, the Locksheath Nursery Company, Southampton, winning in both classes. Mr. Ellwood had the best melon—Emerald Gem.

Vegetables were a strong feature of the show, and Mr. Ellwood was invincible in all classes in which he took part, securing first place in the society's classes, and in those provided by Messrs. Toogood and Sons, Messrs. Sutton and Sons, Messrs. E. Webb and Sons, and Messrs. Carter and Co.

### NON-COMPETITIVE.

Trade exhibits were numerous and attractive. Messrs. B. Ladhams and Son, Shirley, Southampton, arranged in a separate tent an exceedingly fine old English garden, with flagged paths, rockeries, walls, etc., all effectively planted; it was quite one of the finest displays seen for a long time at Southampton. (Gold Medal.) Messrs. Rogers and Sons, Southampton, had roses, shrubs, and rockery plants. (Gold Medal.) Messrs. W. Wells and Co., Earlswood, had carnations Gloriosa, Lady Algy, Bonfire, and Scarlet Glow in good form. (Silver Medal.) Messrs. E. Webb and Sons, Wordsley, had sweet peas, gloxinias, tomatoes, melons, peas, etc., all of high quality. (Gold Medal.) Mr. Alsen, Denmead, arranged sweet peas effectively. (Silver Medal). Mr. J. Stevenson, Wimborne, sent sweet peas in variety. (Silver-gilt Medal.) Messrs. S. Bide and Son, Farnham, contributed sweet peas effectively arranged in baskets, vases, etc. (Silver-gilt Medal.)

Mr. H. Burnett, Guernsey, had carnations of high quality and great variety. (Gold Medal.) Messrs. H. B. May and Sons, Edmonton, had choice ferns. (Gold Medal.) Mr. C. W. Breadmore, Winchester, was represented by sweet peas in quantity and of high quality. (Silver-gilt Medal.) Messrs. Toogood and Son, Southampton, presented fine vegetables. (Gold Medal.) The Locksheath Nursery Company, Southampton, arranged a large group of fruit trees in pots, heavily laden with excellent fruit. (Gold Medal.)

## Cardiff.

JULY 17, 18.

The twenty-fourth annual show was held as usual in the Sophia Gardens by the kind permission of the Marquis of Bute, and was a great success. The schedule is a comprehensive one, containing close upon 200 classes, and providing sections for forestry, cottagers, and honey. The entries were numerous, and the competition keen, while the trade exhibited largely, adding much to the interest of the show.

### PLANTS.

The leading class is that for a group of miscellaneous plants arranged in the centre of the tent, and to occupy a space of 150 sq. ft. Messrs. J. Cypher and Sons, Cheltenham, were the leading prize-winners with a collection of crotons, palms, orchids, ferns, and Humea elegans, all well displayed without crowding, and producing a bold and harmonious display. Mr. McIntyre, gardener to Lady Hill, Llandaff, was a good second.

For a smaller group J. L. Morgan, Esq., Llandaff, was the premier prize-winner with a bright display, although a trifle flat. The executors of the late James Howell, Esq., Cardiff, came second. The last-named was first for three specimen ferns with large, healthy plants. Fuchsias, geraniums, begonias, and gloxinias were of an ordinary character.

### CUT FLOWERS.

Roses were numerously shown and of good quality. For twelve distinct triplets, Mr. J. Basham, Bassaleg, Newport, was first with large, fresh, shapely blooms of Ethel Malcolm, Mrs. E. Mawley, Mrs. Joseph Welsh, Mdme. M. Soupert, and Frau Karl Druschki as the best; Mr. S. Treseder, Cardiff, second, with smaller specimens; Messrs. J. Jefferies and Son, Cirencester, third. Five competed. In a similar class for teas or noisettes, the King's Acre Nursery Company, Hereford, were first with neat, if somewhat small blooms of Medea, Muriel Grahame, and Mdme. Constant Soupert; Mr. S. Treseder second. The last-named won for twenty-four distinct with neat, finely-coloured examples of popular sorts; Mr. J. Basham second, among five entrants. The King's Acre Nursery Company had the best eighteen blooms of tea or noisette varieties, as well as the best twelve of any one variety of any other than a tea or noisette, showing Dean Hole. Messrs. Jefferies and Son won with Mrs. E. Mawley for a dozen blooms any one variety, tea or noisette.

The class for a collection of roses arranged in a space 9ft. by 4ft. 6in., with rose foliage only, brought out four competitors, these making a handsome display. Mr. W. Treseder, Cardiff, was first with bold groups of His Majesty, Molly Sharman Crawford, White Killarney, Liberty, and Ethel Malcolm effectively arranged. Mr. J. Crossling, Penarth, second, with bold displays of Victor Hugo and Joseph Hill; Messrs. Jefferies and Son, third.

Carnations were numerously and well shown. For a collection of tree, American, or Malmaison varieties, arranged in a space 6ft. by 4ft., Mr. C. Wall, Melrose Nursery, Bath, had an extremely fine display of handsome blooms of rose-pink Enchantress, Carola, Winsor, May Day, and Mrs. C. Waud. Mr. Waters, Balcombe, Sussex, was second.

Much encouragement is here given to border varieties and picotees shown with their own foliage, not dressed or tied; the class is to show their value for decoration, in an arrangement on a space 6ft. by 3ft. Mr. C. Wall was here also successful with an excellent set of such sorts as Criterion, Black Knight, and Ann Hathaway.

Hardy flowers here receive much encouragement, arranged in a space 15ft. by 4ft. Mr. W. Treseder was distinctly ahead with a fine exhibit, arranged in a natural manner on the ground; Mr. R. F. West, Llandaff, second with a group more formally arranged. For twelve bunches of herbaceous flowers, in which tasteful arrangement is considered, Mr. West led with phloxes, coreopsis, gladiolus, and gaillardias, all well represented; Mr. D. Burgess, Cardiff, second, with smaller sheaves. Mr. West also secured the first place for a collection of annuals in not less than twelve distinct kinds.

Sweet peas are usually here well represented, and many classes are provided. For eighteen vases, distinct, eight staged, the best coming from Mr. A. E. Usher, gardener to Sir Randolph Baker, Bart., Ranston, Blandford, who had blooms of fine size and colour, but on such long stems as to give them a "stalky" appearance; Mr. T. Edwards, Brecon, second. No fewer than fourteen staged six bunches, distinct. Mrs. Jenner, Wenvoe Castle, was first with a desirable set of leading sorts; Mr. Alan Gibbs, St. Andrew's, a close second. Mrs. Jenner secured the leading prize offered by Mr. R. Sydenham for twelve bunches distinct. Mr. E. Thomas, Merthyr Tydvil, won the premier place in Mr. Eckford's class for twelve varieties; Mr. C. Harvey, Dinas Powis, being a close second. For one vase of any variety Mr. Usher won with Edith Taylor. In the class open only to competitors in Glamorgan and Monmouth, for six vases, distinct, no fewer than seventeen entered, and the best set was a grand one from Mr. Alan Gibbs; Mrs. S. Bryan, Bridgend, second.

### DECORATIVE CLASSES.

A great feature is here made of this department; the classes are numerous and the prizes good. For a table laid for dessert, 8ft. by 4ft., any flowers excepting orchids to be used, six competed. Mr. W. Treseder easily won the premier award with a charming display of excellent fruit, combined with a light arrangement of pink carnations and pale blue sweet peas with suitable greenery; Messrs. Case, Cardiff, second.

In the amateurs' section, nine took part in the dinner-table decorations. Mrs. Shackson, Porthkerry Park, was first with an evenly-balanced arrangement. In the class for a sweet pea dinner-table decoration nine entered, and Mrs. Gerhold, Penarth, with pink flowers and suitable greenery, easily secured the leading award.

Bouquets were a distinct feature; for roses Mr. P. Thomas, Abbey Road, Cardiff, with Abel Chatenay, was easily first. Messrs. Case secured the premier position for pink carnations, and Mr. Thomas led for a bride's bouquet, with a superb arrangement of odontoglossums. Mr. W. Treseder, with orchids, admirably disposed, won for a basket of flowers, and Mr. C. J. Ellis, Weston-super-Mare, won for two baskets of flowers, orchids excluded, with red and white carnations.

### FRUIT.

Mr. R. German, gardener to E. H. Elsworth, Esq., Llandragh Castle, was first for two bunches of white Muscat grapes, with really fine examples of Muscat of Alexandria. Black Hamburgh grapes were best shown by Mr. G. Clark, Talygarn. Mr. Elsworth had good Madresfield Court in the class for any other black variety. Mr. F. Bibby, with handsome fruit of Dryden, was first for nectarines, and also for peaches, with Crimson Galande.

Vegetables were a strong feature. Mr. Searle, gardener to the Marquis of Northampton, Castle Ashby, secured the leading awards in the principal classes.

### NON-COMPETITIVE.

Trade exhibits added considerably to the merit of the show. Messrs. Sutton and Sons, Reading, staged fully one hundred bunches of sweet peas of excellent quality, these deserving the gold medal awarded. The King's Acre Nursery Company had a representative group of fruit trees in pots. (Gold Medal.) Mr. Farmer, gardener to the Marquis of Bute, Cardiff Castle, arranged a group of miscellaneous plants that was much admired. (Gold Medal.) Messrs. John Forbes, Hawick, had pentstemons, phloxes, and delphiniums in great variety. (Silver-gilt Medal.) Messrs. House and Son, Westbury-on-Trym, Bristol, staged a bold and effective group of herbaceous plants, sweet peas, and alpines. (Silver-gilt Medal.) Mr. W. Treseder had a pleasing group of shrubs, palms, etc., at the entrance to the large tent. (Silver-gilt Medal.) Mr. Ellison, West Bromwich, was awarded a Gold Medal for a collection of cacti.

## Liverpool Horticultural Association.

JULY 17.

The annual sweet pea and rose show was held in the Corn Exchange. The entries were well up to the average, but, owing to the extreme heat, there was some falling off in the rose section.

### SWEET PEAS.

For twenty vases an excellent display was made, and Mr. W. Davies, gardener to Dr. G. J. Phillips, led the way with a grand lot of strong spikes carrying fine blooms, notable for their size and colour; Elsie Herbert, Nubian, John Ingman, Hercules, Maud Holmes, Helen Lewis, W. R. Beaver, and Thomas Stevenson were excellent. Second, Mr. R. R. Anderson, Birkenhead; third, Mr. W. Bond, gardener to J. Pearson Heron, Esq. For twelve vases Mr. W. Davies again led, having fine spikes of Nubian, Thomas Stephenson, Mrs. Hardcastle Sykes, etc.; Mr. H. Foulkes, gardener to Major F. M. Roome, Formby, and Mr. E. T. Barrett, gardener to E. Cozen Hardy, Esq., Wootton, were second and third respectively.

In the class for twelve vases, waved standards, Mr. H. Foulkes led with excellent specimens of George Herbert, Florence Nightingale, etc.; the remaining awards went to Mr. H. Forder, gardener to Colonel Cornwallis West, Ruthin Castle, and Mr. John George, gardener to Thomas Henshaw, Esq., Roby, as named. In another class for twelve vases, distinct, the prizemen were Messrs. J. George, A. Ratson, Fazackerly; and R. S. Shepherd. For one bunch of Sutton's Queen the winners were Messrs. W. Bond and G. Faulkner.

For twelve vases, distinct, amateurs only, Mr. Jos. Roberts, of Gresford, staged well for first place, and was followed by Mr. S. H. Curtis. For six vases Mr. R. Aindow, of

GLASGOW
CENTENARY FLOWER SHOW,
in Marquees on Bunhouse Grounds,
Kelvingrove, Glasgow,
On WEDNESDAY, THURSDAY, and FRIDAY,
September 4th, 5th, and 6th.

£500 in Trophies and Prize Money.

Schedules may be had on application to the Subscriber.
Entries close on August 21st.
HUGH M. MACKIE, Secretary and Treasurer,
124, St. Vincent Street, Glasgow.

SANDY SHOW, BEDFORDSHIRE.
44th YEAR.
THURSDAY, AUGUST 29th, 1912.
Largest One-day Show in the Midlands.
PRIZES VALUE £1,000, including
£90 for Plants and £55 for Cut Flowers.

Entries close August 22nd, 1912.

Schedules, Entry Forms, etc., of
WM. GREEN, Secretary, Sandy.

Formby, led, and for a like number of waved varieties, with waved standards, Mr. G. Faulkner took the lead. In the classes set apart for members of the corn trade, Messrs. E. J. Procter and J. Tapscott took the lead.

ROSES.

Considering the high temperature roses were of good colour, but below the average size.

For eighteen hybrid teas Mr. J. W. Parker, gardener to J. R. Dixon Nuttall, Esq., Prescot, was the only exhibitor, and his best blooms were Lyon, Lady Ashtown, R. C. Wardle, and Mrs. W. J. Grant, etc. For eighteen blooms, distinct, Mr. Parker still held his own with a fair stand, followed by Mr. J. H. Kefford, gardener to Mrs. J. Smith, Thelwell; and Mr. John Aindow, gardener to W. A. Rockliff, Esq., Formby. For twelve blooms Mr. Aindow came to the front with some excellent examples of G. C. Waud, Mons. Paul Ledi, etc. For six blooms Mr. W. Foulkes led the way.

For twelve blooms in not less than six varieties, Mr. Loo Thomson held the leading position; and for six, Mr. P. Fitzpatrick; and for two vases Mr. Charles Green, Neston, were first; and in the local class Mr. Chris. Hackney was successful.

OTHER CLASSES.

For a table of sweet peas, Miss Newsham led in a strong competition, and for the general table Mrs. H. E. Marsh won with lovely bronzy roses. Herbaceous cut flowers were staged finely, Mr. John George winning in the class for twelve bunches with an effective exhibit; Mr. J. W. Parker second. For six bunches Mr. Parker came out top; and for six bunches of flowers grown in the open Mr. Loo Thomson took the lead, followed by Mr. E. Sergerson.

For six carnations and picotees, three blooms of each, Mr. James Calder took the lead, having fine blooms of Ann Hathaway; Messrs. R. R. Anderson and Charles Russell took the second and third prizes respectively. For twelve blooms arranged in vases Mr. Mills, gardener to H. S. Barrett, Esq., took the lead with pleasing blooms of Miss Peggy, Miss Willmott, etc. Messrs. James Calder and Joseph Oxton took the remaining awards.

For six blooms the prizemen were Messrs. James Calder, Mills, and G. A. Turner. For six blooms, amateurs, Mr. R. Duke led, and for one vase of three blooms Mr. E. Sergerson won with Cecilia.

Mr. E. Turnbull had the best six pansies and viola blooms.

NON-COMPETITIVE.

Non-competitive displays were in strong force, and did much to enhance the interest of the exhibition. Gold Medals were awarded to Mr. R. Manson, of Gateacre, for a fine display of roses with a background of ramblers, and vases and boxes of exhibition varieties of good form and colour; to Messrs. Dicksons, Chester, who had an exhibit of roses and herbaceous flowers; to the Liverpool Orchid Company for orchids and roses; to Messrs. R. P. Ker and Sons, Aigburth, for a table of miscellaneous plants, including well-coloured crotons, with an addition of fruit and vegetables; to Messrs. Bees, Lim., for herbaceous cut flowers, roses, and alpine plants; to Mr. H. Middlehurst, Liverpool, for a pleasing collection of sweet peas of well-known varieties; to Mr. R. Wright, of Formby, for sweet peas, his Mrs. Hettie Roome being a telling new variety; to Messrs. Aldersley and Marsden Jones, for a fine display of well-grown sweet peas.

Silver Medals to Mr. C. A. Young, of West Derby, for a charming display of carnations and picotees, arranged on show boards; to Mr C. Russell, Blundellsands, for a good set of carnations in vases; to The Covent Garden Seed Company, for herbaceous flowers; to Mr. W. Rowlands, Chilwall, for cut roses; to Messrs. Jones Bros., Liverpool, for cut flowers; to Messrs. Aitken and Faulkner, Tarvin, for sweet peas and herbaceous flowers; to Messrs. Fishlock Bros., for floral decorations; and to Mr. Hodgkinson, for gloxinias of a good strain.

## Royal Horticultural Society.

### SCIENTIFIC COMMITTEE.

JULY 16.—Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Sir J. D. Llewelyn, Dr. A. B. Rendle, Messrs. W. Hales, W. Fawcett, Hooper Pearson, and F. J. Chittenden (hon. secretary).

DELPHINIUM CONSOLIDA SPORTING.—Mr. W. Hales showed inflorescences of D. consolida with all flowers on one side white and flowers partly blue and partly white on the other. They had appeared in a bed of the ordinary D. consolida at Chelsea where no white forms had been seen before.

DELPHINIUM, GARDEN FORM, VIRESCENT.—Mr. Chittenden showed inflorescences from a blue garden form of delphinium, with all the flowers virescent, the foliose character of the parts (the stamens were not affected) varying somewhat in degree. In some the carpellary leaves were still folded and closed at their edges, the ovules being represented by the serrate margins of the folded edges; in others they were quite open.

PLANTS INJURED BY FUMES FROM SMELTING WORKS.—Sir John Llewelyn showed leaves of a number of different plants from cottage gardens in the Swansea district showing very serious injury, in the form of dead margins and patches. This injury had appeared simultaneously with the introduction of a new method of extracting zinc from its ores in the neighbourhood, and it was thought that probably the greater volume of fumes emitted from the stacks, and possibly a difference in the composition of the fumes was accountable for the greater damage wrought. The specimens were referred to Dr. Voelcker.

ERIA RHYNCOSTYLOIDES.—A botanical certificate of appreciation was recommended to this beautiful, though small-flowered orchid, native of Java, exhibited by Sir Trevor Lawrence, Bart., V.M.H.

CERTIFICATE OF APPRECIATION.—A certificate of appreciation was recommended to Messrs. Charlesworth, of Hayward's Heath, on the suggestion of the Orchid Committee, for work done in raising Odontonia x Edna, exhibited at Holland House Show.

## Reading Gardeners' Association.

The strongest muster of members for the society's annual excursion since the memorable trip to Welbeck Abbey in 1907, assembled on Thursday, July 18, when, by kind permission of Waldorf Astor, Esq., the beautiful gardens and grounds at Cliveden, near Maidenhead, were visited. The steam launch "Majestic" conveyed the party from Caversham Lock at 9.30 a.m., outlying members joining at several locks and at Henley until the number reached 150.

Cliveden was reached at 1.40. At the landing-stage the party was met by the head gardener, Mr. W. Camm, and under his guidance at once proceeded by the steep winding path to the summit of the hill, thence to the huge covered tennis court, where through the kindness of the vice-president an excellent luncheon was in readiness. After the repast and the loyal toast, the Chairman expressed the thanks of the members to Mr. Astor and Mr. Camm for their kindness, and a vote of thanks was accorded to the vice-president, Mr. L. Sutton, for so kindly entertaining the party.

Leaving the tennis court the party walked across the private golf course to the pretty water garden. The fine range of glass houses and the walled garden were then inspected. The mansion, situated immediately above the world-famous Cliveden Woods, which renders the Thames at this point so singularly beautiful, claims as its founder George Villiers, Duke of Buckingham, favourite of Charles II., and was for a time occupied by Frederick, Prince of Wales, father of George III. Two former mansions having been destroyed by fire, the present handsome structure in the Palladian style was designed and erected by the late Sir Charles Barry, and stands in a beautifully timbered park of 300 acres. Passing through the forecourt lawns and gardens, gay with colour, the terrace on the south front was gained. From this point of vantage a view of surpassing beauty is obtained. In the foreground is the charming and extensive Italian garden, exquisite in design; beyond, the woodlands rise abruptly from the Cliveden reach of the Thames, and in the distance the beautifully wooded counties of Berks and Surrey are seen. Passing round the mansion the glass houses immediately adjacent were inspected, and then a visit was paid to the charming herbaceous garden just in the zenith of its beauty. Many were inclined to linger here, but time would not permit.

Having regard to the delays experienced in the morning a punctual start on the return journey was made, and Reading was reached shortly before ten p.m., after an outing pronounced by all to be one of the most enjoyable and successful promoted by the association.

## Horticultural Club.

The usual annual outing of the members of this club took place on Thursday, the 18th instant, and, despite the unseasonable lapse into chilly and gloomy weather, was an extremely enjoyable one. Some fifty ladies and gentlemen, occupying two saloon carriages, reached Slough from Paddington about midday, proceeding thence in motor brakes to Stoke Poges, where they visited the old church, sacred to reminiscences of the poet Gray, whose tomb is in the churchyard, and notable as containing the pew of William Penn, whose name is equally immortalised as the founder of the new great State of Pennsylvania. Leaving the old church, parts of which date back to the twelfth century, the party was then driven through Burnham Beeches and the charming woodlands of which they form a quota, stopping to partake of a very excellent lunch at Wingrove's Restaurant there.

Among the guests were two from Canada, Professor Hutt and Mr. Whyte, and the usual toast of "The King" having been honoured, Mr. Druery proposed that of the visitors generally, coupling their names therewith, in response to which toast they replied in highly appreciative terms as regards the hospitality they were enjoying, the wondrous beauty of the places they were privileged to visit, and last, but not least, the heartfelt reciprocity with which they and their fellows from Canada had recently met in their endeavours to increase the solidarity of the great British Empire by fraternal cooperation.

The lunch over, the party proceeded to Cliveden, where, by permission of W. W. Astor, Esq., they were conducted by Mr.

Camm, the head gardener, through its magnificent grounds and gardens, enjoying en route innumerable glimpses of the picturesque, meandering reaches of the Thames which limits the estate in that direction. Though the day was gloomy and threatening only a few drops of rain fell, and the air was sufficiently clear to detract no whit from the beauty of the many vistas afforded through judicious gaps in the woodland. From Cliveden the party were then driven, by special invitation of Sir Harry J. Veitch, to East Burnham Park, where tea was provided, and another opportunity afforded of inspecting more beautiful gardens, laid out on most charming lines, and, of course, under such auspices as those of the host, replete with the latest and most beautiful horticultural acquisitions. The party was then driven back to Slough Station, where the saloons were awaiting them, and expressed themselves as deeply grateful to both Sir Harry Veitch and Lady Veitch for their kindly hospitality and to Mr. R. Hooper Pearson, the hon. secretary of the club, for the completeness of the arrangements which had been made by him, with Sir Harry Veitch's aid, for their comfort and enjoyment during the day.

### East Anglia Horticultural Club.

Over a hundred members and friends joined in the summer excursion of this club to the noted gardens at Westwick House, Norwich. Colonel Petre, through his genial gardener, Mr. Geo. Davison, had thrown the whole of the gardens, woods, and fruit farm open for the party to ramble in at their own will. The day was cooler than the past few had been, which everyone was thankful for. Almost as soon as they entered the gardens the party was passing under a huge pergola over 300ft. long, and covered with all the choice subjects associated with such locations. The varieties of vitis were most numerous, and gave a charming effect. A little further along, and the visitors passed along a herbaceous border over 350ft. in length, and at no part less than 30ft. wide. The subjects here are planted in large bold masses, and to see them in their glory is a sight to be remembered. Most hardy plant growers know what Mr. Davison has done to improve the montbretias, and it was not to be wondered at that huge tracts of the garden are planted with these flowers. Everything in the greenhouses and vineries seemed at their best, pointing all along to the skill of the man in charge.

Fruit growers, and especially those who have visited the autumn fruit show of the R.H.S., know of Mr. Davison's skill in the culture of pears, but to see his trees is an education. This year they are better than ever, and it will not be surprising to hear that important prizes are won with them. Apples, too, were looking in first-class condition. After the mansion garden had been thoroughly inspected, the party, under the escort of Mr. Davison, wended away to the fruit farm which Colonel Petre has taken a great interest in. Tons of black currants had just been gathered and sent away, and the "pickers" were just busy upon the raspberries. All these pickers are local people, and the sums they are able to earn in this work are a great benefit to the community.

The woodlands, noted for their many kinds of timber, especially firs, were not forgotten, and the large lakes added a charm to the whole of the sylvan scene. Much more could be written, but it must suffice to say that everyone was interested and well pleased with the visit.

### Bournemouth Gardeners' Annual Outing.

On Tuesday, July 16, the members of this society had their annual outing at Southampton. Soon after arriving there a number of them paid a visit to the docks, where they inspected some large liners. After lunch at the Grosvenor restaurant they visited the Jubilee Show of the Horticultural Society of Southampton, which was held at the County Cricket Ground, Bannisters Court. Although the weather was very hot the party greatly enjoyed their inspection of the many and various exhibits, which were of a high order of merit.

### Woking Sweet Pea Show.

The first exhibition of the newly-formed society in the above town was held on the 13th inst., and it was a distinct success. The Public Hall was filled with really excellent produce; it was, in fact, the London show on a small scale, with exhibitors like Mr. T. Stevenson, gardener to E. G. Mocatta, Esq., and Mr. W. Hopkins, gardener to the President, F. A. Wellesley, Esq., J.P. There were many visitors, who, perhaps, had not an idea as to the perfection obtained in sweet peas, and were thus given an opportunity of inspecting specimens that have not been surpassed anywhere this year. Mr. Hopkins did not compete, but put up a score of big bunches in tall glasses, which were much admired. Mr. Stevenson won the first prize in the open class for twelve bunches with, among others, Elsie Herbert, Mrs. Breadmore, Thomas Stevenson, Queen of Norway, Barbara, Edith Taylor, Edrom Beauty, R. F. Felton, and a beautiful vase of a newer form named Queen Mary. The local classes brought capital competition, Messrs. Gabriel, Seabrook, Churcher, and others being responsible for blossoms of much merit. It is also pleasing to note that the society is likely to go on. Promises of support were numerous, and two interested members have already offered silver cups for next year.

## NOTES OF OBSERVATION.

**Climbing Tropæolums.**—Common as they are, so that a pennyworth of seed will go a long way, these are among the finest of climbing plants of annual duration. For the clothing of any unsightly object during the summer their rapid growth is greatly in their favour. Within recent years there has been a great improvement in the colour of the flowers.—S.W.

**Ampelopsis Lowi.** — This pretty form of Ampelopsis Veitchi, or Vitis inconstans, as it is often called, differs considerably from the type. This last is decidedly variable in character; among other items some individuals are more slender in growth than others. The variety Lowi belongs to this section, and in other respects it differs in the leaves being more or less cut and slashed, a feature totally wanting in the typical A. Veitchi. Though brought out a few years ago Ampelopsis Lowi is not yet sufficiently known, for its merits as a pretty self-clinging climber are considerable.—K.

**The Creeping Jenny** (Lysimachia nummularia).—There are very few plants of a more accommodating nature than this, for it can be put to many uses. In damp positions on the rockwork it is very beautiful, while for growing in suspended pots or baskets its markedly pendulous nature stands it in good stead. For the front of window boxes it is also just the thing, provided it is not allowed to suffer from want of water.—T.

**Verbena Mahoneti.**—This pretty verbena, which is by some authorities regarded as a variety of the Brazilian Verbena tenera, is a very pretty kind, and one quite distinct from most of the garden forms in general cultivation. It is of a rather weak procumbent habit of growth, while the flowers, which are of a clear, purplish violet colour, have each segment clearly margined with pure white so as to present the appearance of a white cross on a violet ground. It is not much known, but is amenable to the same mode of culture as the garden varieties of verbena.—S. W.

**Achimenes Rose Queen.**—Of the different garden varieties of achimenes now in cultivation many of the coloured kinds have flowers more or less of a purple hue, except the smaller forms, that show the influence of Achimenes coccinea, a pretty scarlet-flowered species from the West Indies and the oldest member of the genus. The variety Rose Queen is quite distinct from any of these, the colour being a very pleasing shade of deep pink, with a light throat. It affords a very pleasing variety to the forms more generally cultivated.—W.

**Episcia fulgida.**—One of the many beautiful - flowering gesnerads native of South America, for it was introduced from New Grenada in 1873. Both from a foliage and a flowering point of view it is very pretty. The leaves, which are roundish, oblong, and from six to eight inches in length, have their upper surface wrinkled, and of a deep green colour, with the midrib and principal veins of a silvery whiteness. The flowers are tubular and of a rosy-scarlet colour. This plant produces runners freely, and grown in a suspended basket the long stolons terminated by the young plants have a very pretty effect. If these runners are allowed full play the plants do not flower as freely as if they are pinched off. This episcia is also known by the generic name of Cyrtodeira.—T.

## OBITUARY.

### MR. WM. COMFORT.

Mr. Wm. Comfort died at Berwick-on-Tweed on July 15, at the age of 65. He was one of five brothers, all of whom, like their father and grandfather, followed gardening as a profession. He served his apprenticeship in his native county of Aberdeen, and afterwards he became foreman at Altyre, near Forres. He served as head gardener at Maryhill, Elgin; Aberlour, Banffshire; Farnley Hall, Otley, Yorkshire; Knowle Hall, near Birmingham; and Kylemore Castle, co. Galway, first under the late Mr. Henry, M.P., and latterly under the Duke of Manchester. Since he retired from service, about seven years ago, he has resided in Berwick-on-Tweed, where he carried on a fruiterer and seedsman's business. He leaves a widow but no family. One of his brothers is Mr. Charles Comfort, Broomfield Gardens, Davidsons Main's, Midlothian.

### FORTHCOMING ENGAGEMENTS.

SATURDAY, July 27.—Derby Gardeners' Association Summer Show.
Fife and Kinross Horticultural Society.
Gourock Horticultural Society.
TUESDAY, July 30.—Royal Horticultural Society: Floral, Fruit, and Orchid Committees meet at noon. General meeting with lecture by Mr. Cecil Hooper on "Pollination of Fruit Blossoms," 3 p.m. Scientific Committee, 4 p.m.
WEDNESDAY, July 31.—Burwash Horticultural Society.
Totton Horticultural Society.
Midland Carnation and Picotee Society's Exhibition at Birmingham.
Dinas Powis Horticultural Society.
Llanelly Horticultural Society.
Chesterfield Horticultural Society.
Pevensey Flower Show.
Nettlebed Flower Show.

→ Spraying ←
The question to-day is not "**Shall we Spray,**" as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers, Use **only** the **reliable** tested "FOUR OAKS" which have won **30** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-**. No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—**THE FOUR OAKS SPRAYING MACHINE CO., No. 3 G, SUTTON COLDFIELD.**

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

PROPAGATION OF ŒNOTHERA MISSOURIENSIS.—F. E. J., Hexham.—I have a good specimen of Œnothera missouriensis, but, as it does not seem to ripen seeds, I should like to know how best to propagate it.—This pretty, prostrate species does not seed readily, therefore propagation should be effected by dividing the tufted growths in spring, as soon as mild weather begins. Cuttings of the young shoots, inserted in sandy soil and placed in moderate heat, will root, but care must be taken to commence a gradual process of hardening off directly they have become well rooted.

SPARTIUM JUNCEUM.—W. N. S., Taplow.—We have a number of specimens of this splendid summer-flowering shrub, but some of them are by no means shapely, owing, probably, to lack of care in their youthful condition. Please tell me whether they will stand somewhat severe pruning, to bring them into shape; and, if so, when they should be pruned.—Except for the purpose of keeping it within bounds, or improving its shape, Spartium junceum requires little pruning, but when it seems desirable to use the knife pruning should be done in spring before new growth commences, and then the plants may be cut back quite hard if necessary, and strong growths from the base will result.

PLANTING COLCHICUMS.—N. J. C., Bristol: I shall be obliged if you will tell me the best time to plant colchicums, and from whom to obtain bulbs.—Colchicums should be planted as early in July or August as the bulbs can be obtained. If planting is deferred until after August there is considerable danger of loss resulting from the reduced vitality of the bulbs. You can procure bulbs from any of the hardy plant and bulb specialists who advertise in our columns.

GARDENERS AND HEALTH INSURANCE.—M. M., Oswestry: Kindly let me know through your columns the name and address of the secretary of the United Horticultural Benefit and Provident Society. I have been much interested in the references recently made to this society and its work in the pages of the GARDENERS' MAGAZINE.—The secretary is Mr. Wm. Collins, and his address, 9, Martindale Road, Balham, London, S.W.

SPOTS AND HOLES IN PEACH LEAVES.—A. W. E., Hertford: I am sending some peach leaves, and ask you to kindly tell me the cause of the spots on the leaves, and why the leaves fall off while green. The house is sprayed regularly every day, and the ventilators are opened first thing in the morning and not closed until the last thing in the evening. An early answer will oblige.—The leaves show evidence of a slight attack of the Shot Hole Fungus (Cercospora circumscissa). Burn all the leaves as they fall, relieve the tree of fruits as quickly as possible, and take pains to so water and ventilate that no checks are imposed. After removing the fruits spray with an ammoniacal solution of copper, made by mixing 1oz. of carbonate of copper and 5oz. of carbonate of ammonia in a quart of hot water, and then adding 16 gallons of cold water. Try a small portion of the tree first, as it may be necessary under certain circumstances to add a little more water to the solution. Do not use Bordeaux Mixture. Next year spray with the ammonia and copper solution just as the leaves begin to expand, and repeat the spraying at intervals of about ten days or a fortnight.

## NAMES OF PLANTS.

H. B., Yeovil.—1, Santolin incana; 2, a white form of Polemonium cæruleum; 3, Epilobium angustifolium; 4, Tradescantia virginica.

J. P., Sidmouth.—The specimens sent are such wee scraps that we cannot properly identify them, especially as there are no flowers; 1 is probably Marjoram, judging from its fragrance, and 2 may be the tip of a growth of Buddleia globosa.

D. H., Guildford.—With a few exceptions it is well-nigh impossible to determine a plant from a single leaf; with the best will in the world to help you we cannot do more than suggest that the wedge-shaped leaf and the trilobate one appear to belong to the aralia family. We may point out that the leaves received were smothered in red spider, suggesting that they are growing under conditions too hot and dry.

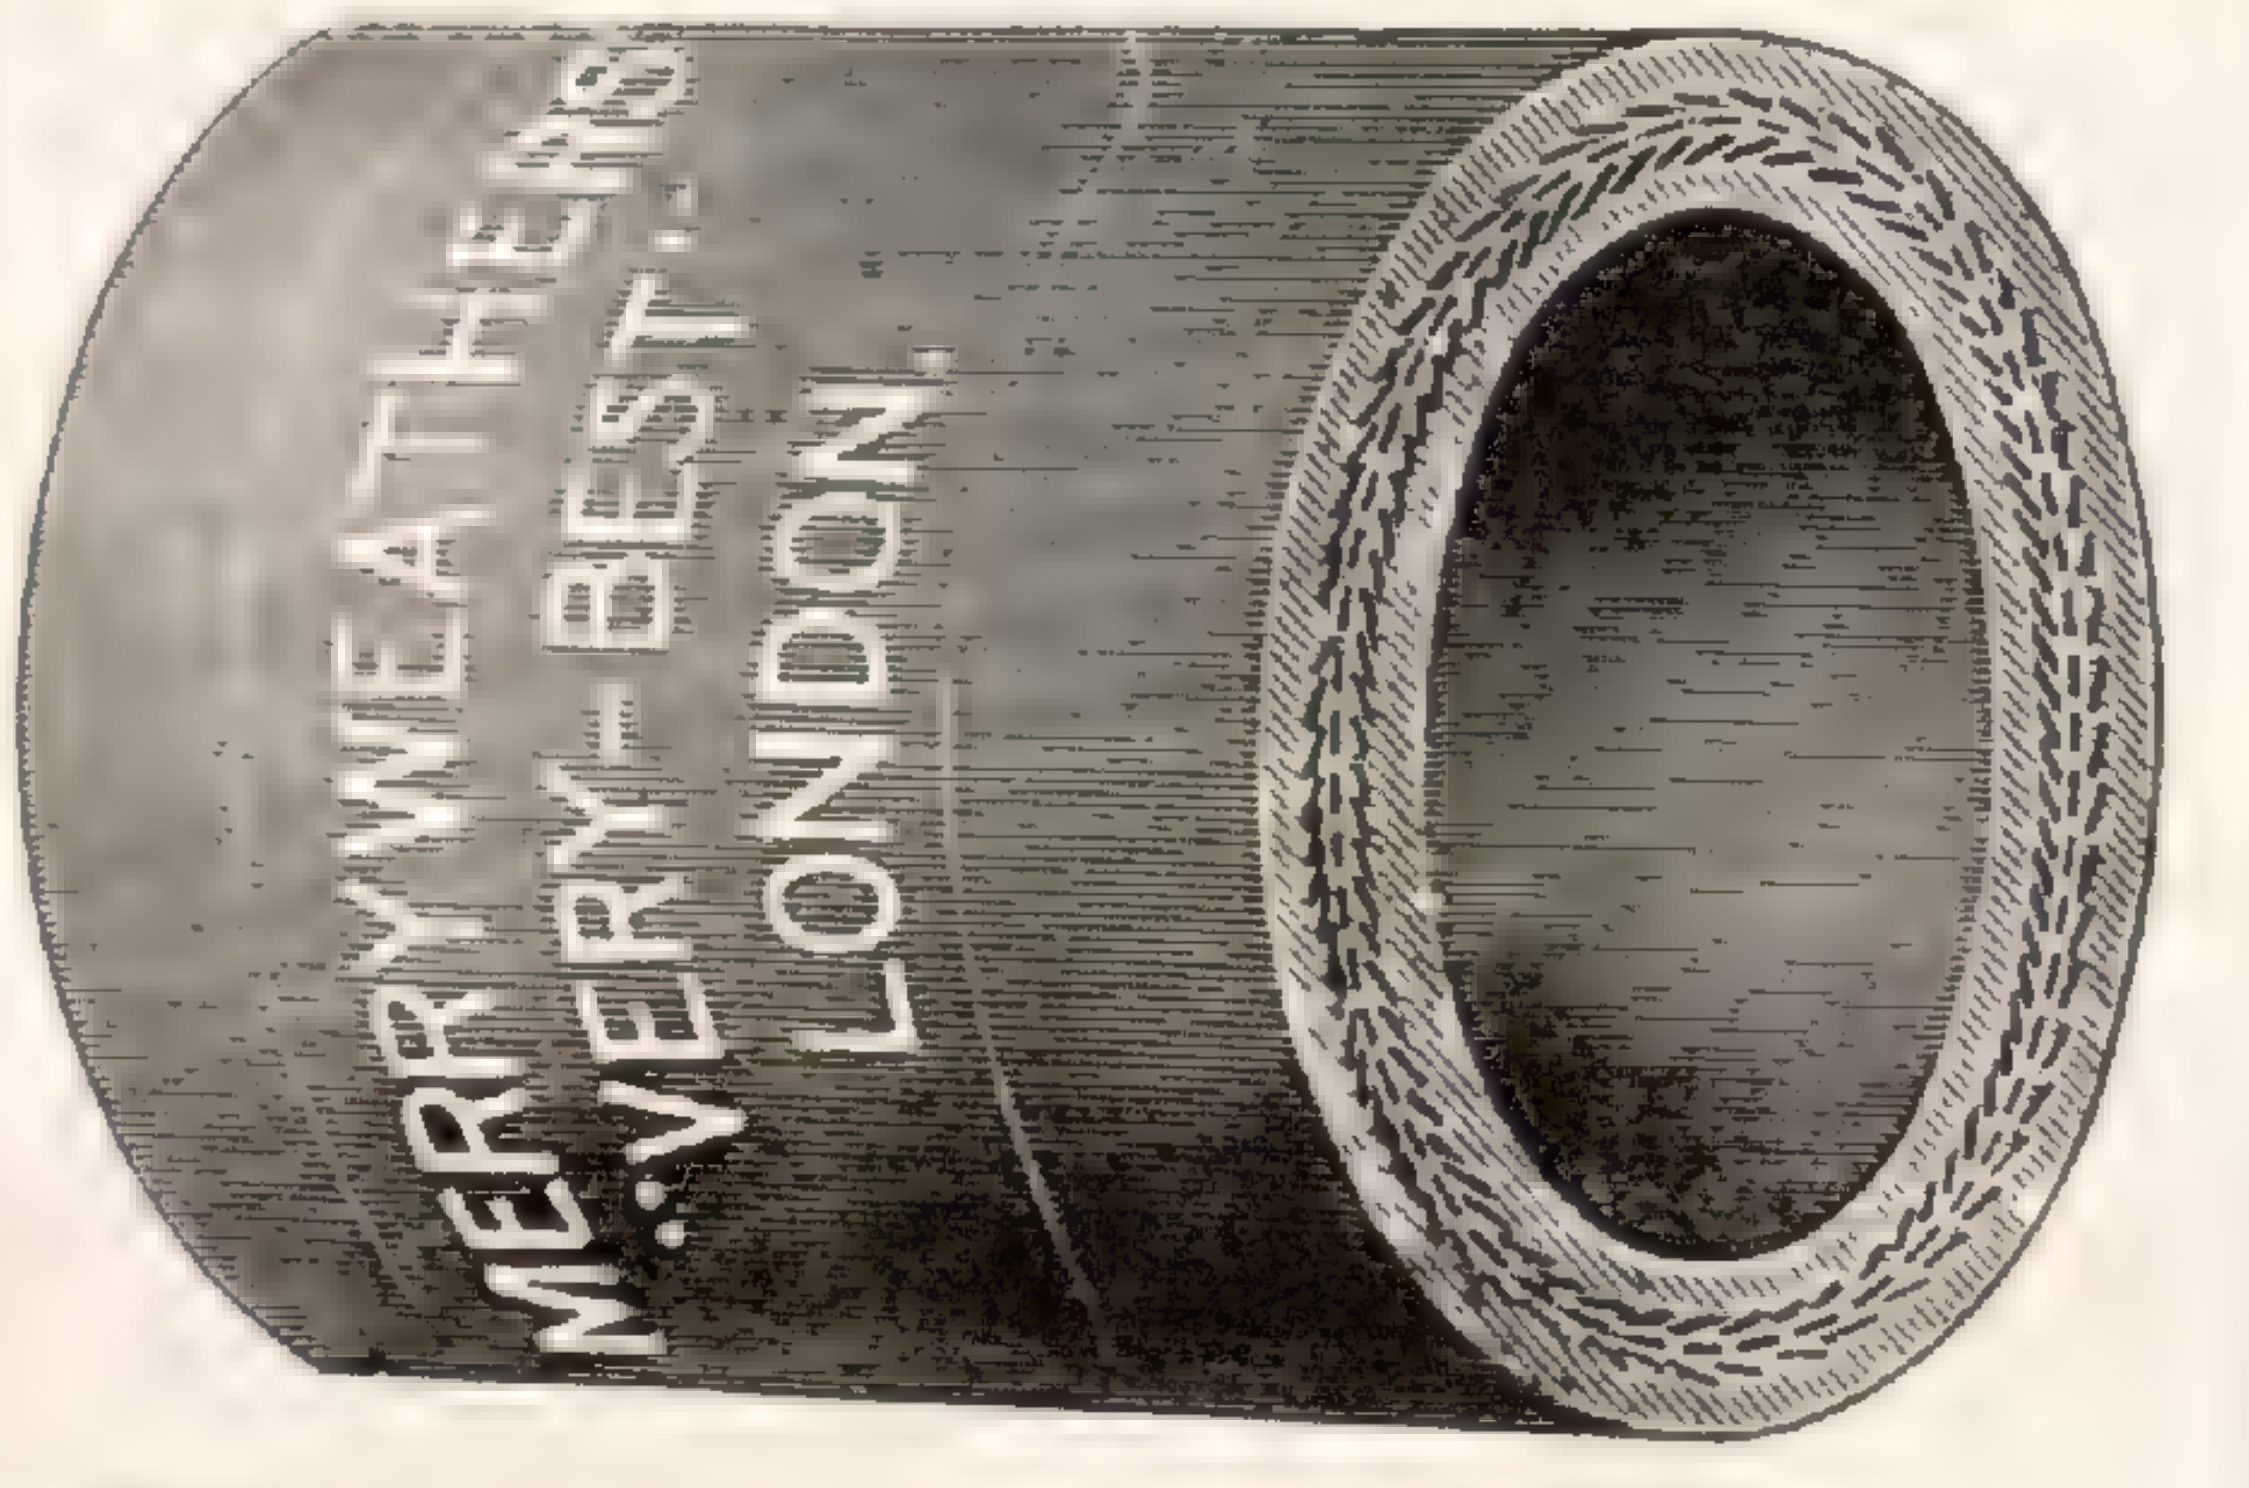
# MERRYWEATHERS'

***"VERY BEST"***

## Watering Hose

**FOR GARDENS, LAWNS, &c.**



Made on the lines of Fire Engine hose, therefore good for hard wear and long life. Customers find it good after 10 years' use.

*Beware of cheap and flimsy imitations.*

**Write Merryweathers', 63, Long Acre, London, W.C.**

## Orchids! Orchids!! Orchids!!!

The undersigned begs to announce to the Public that he is in a position to supply, wholesale or retail, **Burma Orchids**, of 50 varieties at a moderate price. Further particulars on application.—**J. C. PRAZER, Orchid Collector, KALEWA, BURMA.**

N.B.—Please register orders early for Dendrobium Nobile, thick-bulbed variety; Dendrobium Jamesianum, Dendrobium Bensoni, Renanthera imschootiana, Vanda Cœrulea Lushai Hill variety, dark blue type; Cypripedium spicerianums of five and six growths, as these are scarce and expensive collecting.

## Situations Vacant.

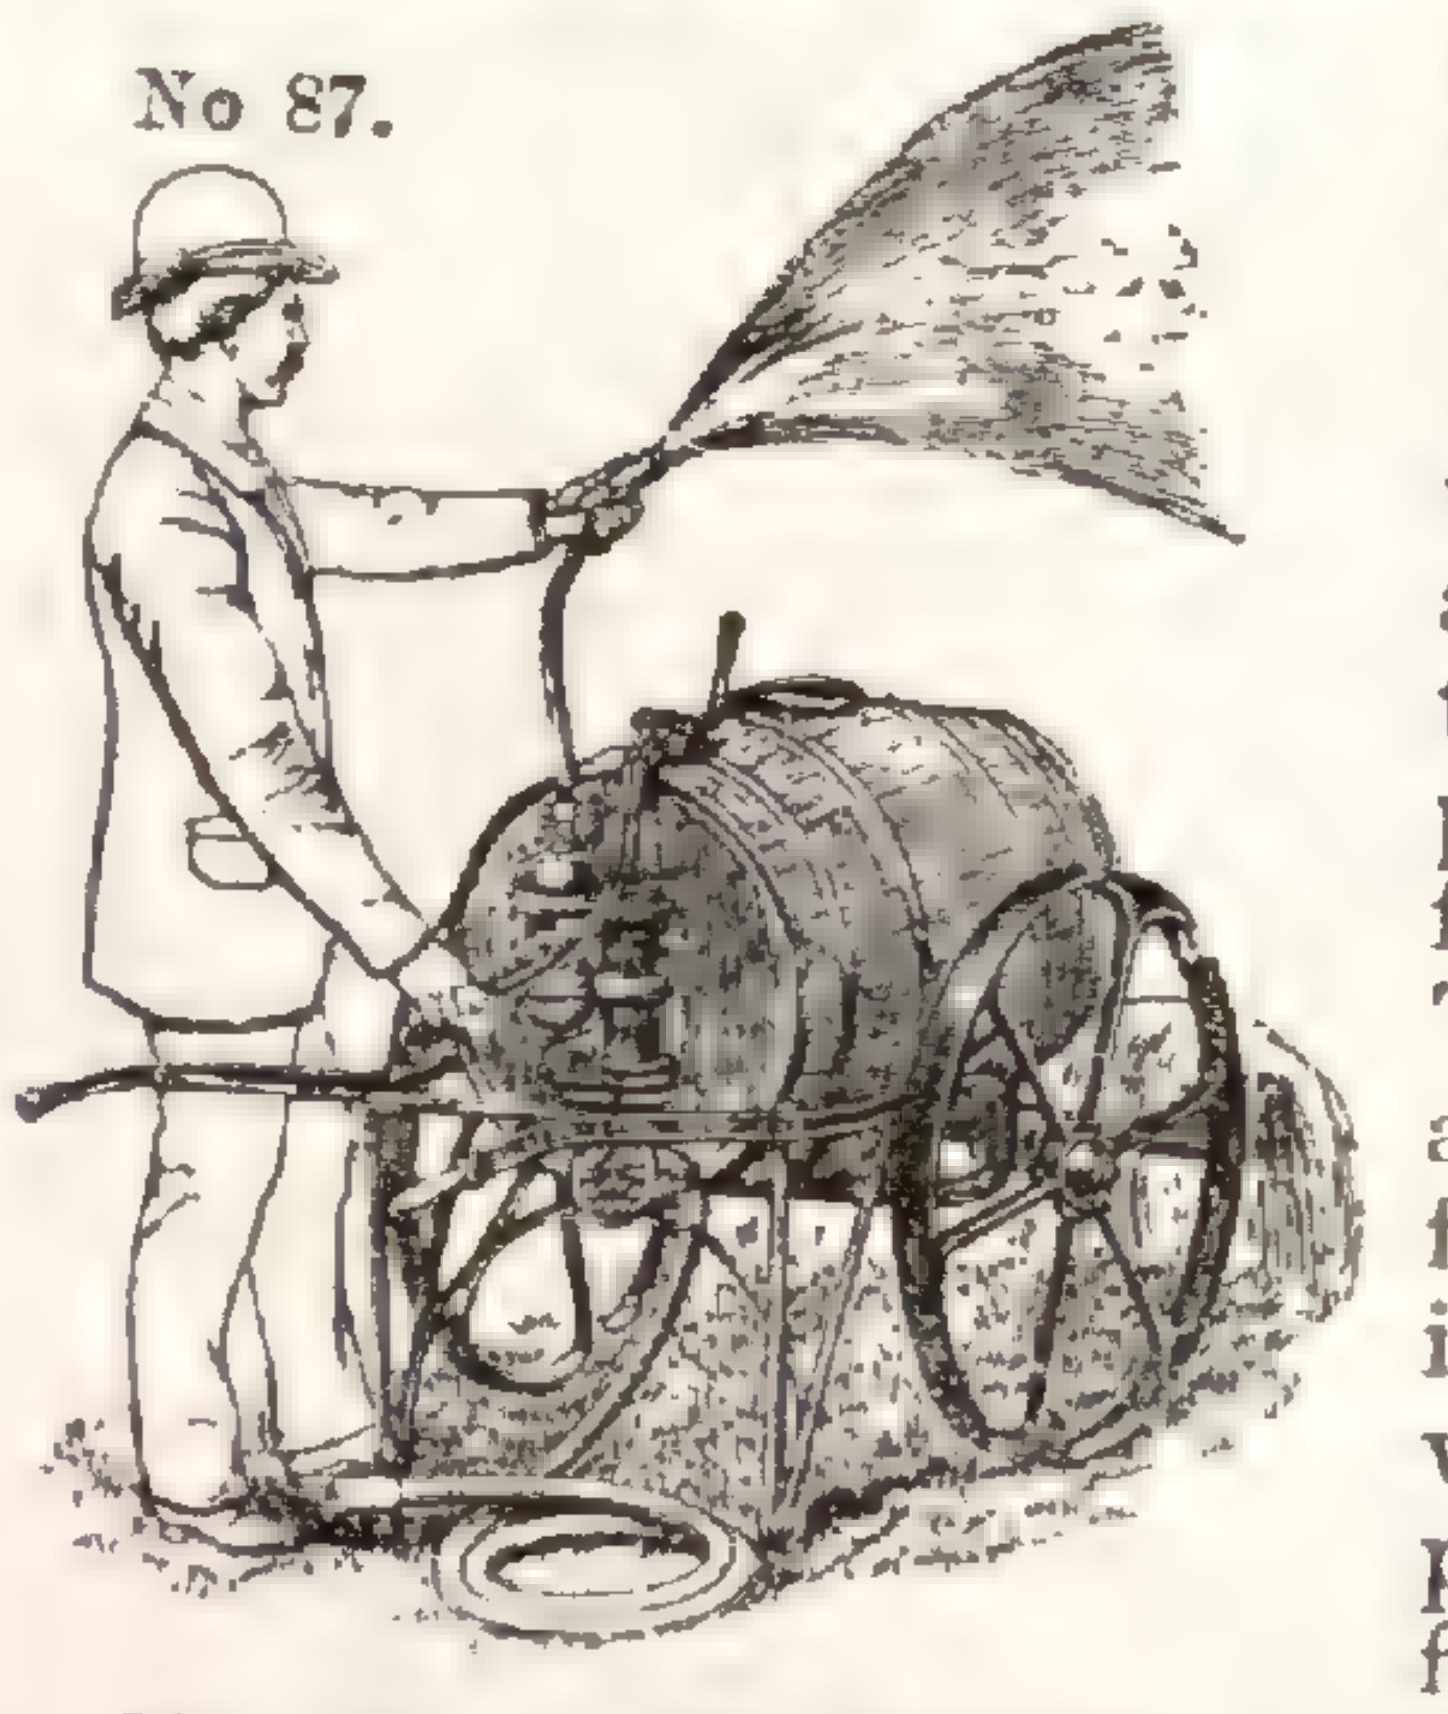
STRONG YOUTH WANTED, chiefly outside; age 18; able to take duty; wage 12s., milk, and vegetables. GARDENER, Burntwood Hall, near Barnsley, Yorkshire.

WANTED, LADY HEAD GARDENER for garden of about 8 acres, including kitchen garden of 4 acres, with vines, peach houses, melons, etc., herbaceous border and rose garden; four men kept; must have had previous experience and full training. Apply, giving full particulars, to P. VAUGHAN MORGAN, Esq., Puttenham Priory, Guildford.

## An Indispensable WATERING MACHINE

**FOR LAWNS & LARGE GARDENS**

No 87.



A most valuable implement, and very complete. Can be used for watering lawns and paths, or destroying garden pests on rose or fruit trees. Throws water a distance of 60 feet. Oak barrel, iron frame, steel wheels, well painted and finished.

No. 87.—CASH PRICES.—CARRIAGE PAID.
To hold 36 gallons, with Galvanized Spreader, Pump, and 10ft. of Suction Pipe, complete **£6 0 0**
Without Pump ... ... ... ... ... **4 5 0**

### FOR NURSERYMEN.

No. 87A SPRAYING MACHINE, as above, but fitted with extra powerful pump, and automatic arrangement for keeping insecticide preparations well mixed during use:—

No. 87A.—CASH PRICE—CARRIAGE PAID.
To hold 36 gallons, with Galvanized Spreader, Pump, and two ⅝in. delivery hoses, each 6ft. long, with Spreaders ... ... Complete **£8 16 0**

Write for Catalogue No. 153A, showing other Machines, Hose and Hose Reels, Water and Liquid Manure Carts, Garden and Sanitary Barrows, etc.

# BOULTON & PAUL, Ltd., NORWICH.

## Conservatories, Greenhouses, etc.

**Conservatories designed to suit any situation.**

**Illustrated List of Greenhouses, Garden Frames, Garden Seats, &c., FREE on application.**

**Special designs and estimates submitted.**

Send for particulars of our PATENT ROOF GLAZING.

*Illustrated book entitled "For the Garden" free on request.*

**W. T. REVITT, Newton Works, OLNEY.**

*First-class Materials and Workmanship.*

VOL. LV.—No. 3,066. SATURDAY, AUGUST 3, 1912.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Knowledge.

It is at once curious and of absorbing interest to consider how what we term knowledge, which has lifted man to so high a pinnacle above the animal world, and given him such a marvellous grip upon the natural forces of his environment, has been accumulated and built up as the ages progressed. How the capacity for thought originated we need not discuss, it is not a thing on which fossilised remains can throw any light, though in the domain of the remains of human handiwork, including the old flint tools, we get a faint glimpse of progress in contrivance of means to an end, which demonstrates the dawn, or more, of the reasoning power. It is true that in the rest of the animal world, and even to some slight degree in the plant world, we see contrivances which seem to imply even more than a glimmering of reason, but there is never an iota of that accumulating and combining faculty which man enjoys and employs, that hybridisation and cross-breeding of thought which has led up, step by step, to his present exalted position. One of the most important steps—we may indeed say the most important of all—was the translation and transformation of the intangible thought into visible and transmissible characters. Rude hieroglyphics or crude cuneiform inscriptions on stone and imperishable clay still survive to show us how this presumably commenced. Vocal language doubtless long preceded even these, but vocal language in itself is as transient as the breath that forms it, and, though memory may permit of its being handed on from generation to generation, memory itself is treacherous, and little to be relied upon. The graven word, however, lasts indefinitely, and it is one of the most interesting features of our theme that those, so to speak, original marks have been found translatable, and the thoughts therein incorporated have found transmissible shape to every civilised brain in all the countless idioms of the world, and even ultimately in the unsubstantial dot and dash, or intermittent flash of the wireless telegraph. In the interim between these two extremes there lie, of course, the many grades which printing proper passed through, the development of which has, in these days, linked together on easily intelligible lines all the intellects of the world. By virtue of this intercommunication, thought breeds thought with greater and greater rapidity. In one brain, perhaps, a mere glimmering of a great idea is conceived, and finds expression, and this in its turn becomes the fertilising germ or enlightening inspiration in another. A thousand apparently unconnected and inchoate facts are noted by various individuals, and suddenly, in some brain, a ray of light is engendered by their association, and lo! a new law is found, and a myriad other facts are simultaneously illuminated, brought into rank, and another great forward step is chronicled; and so it goes on. The more we know the more we are able to penetrate the so-called secrets of Nature, secrets no longer, but rewards held out, as it were, by her for the patient student, the "poking and prying" scientists, who devote themselves to her study in the thorough-going spirit of research. All this progress, however, depends, and this is really what has inspired us in writing the above, upon the definite and careful record of results. The entire edifice of our knowledge is built up, as it were, of a myriad of bricks. The raw material is often accumulated with little or no plan, as merely recorded and attested facts, but then, as we have indicated above, a plan reveals itself, the bricks work themselves into the structure, whose permanence, of course, depends upon their soundness, as with buildings of more substantial character. Every student of Nature, every horticulturist or gardener, to bring the point home, is a potential brick-maker, but to be a practical one he must not only experiment and observe, but he must give his fellow men the benefit of his knowledge by keeping careful record of what he sees. Too many there are who go through life, and even obtain good positions and great respect as experienced, practical men, but when they die nearly all, if not all, of their acquired knowledge dies with them. In these days we have a Press whose special function it is to collect and disseminate knowledge of practical value, record fresh observations, and, in short, do their best to add, in their own special line, as many bricks as possible to the great Temple of Knowledge, to the existence of which we all, in one way and another, are infinitely indebted throughout our lives, as the source of both our comforts and necessaries, to say nothing of our intellectual enjoyments and general progress.

MR. JOHN GARDNER.

**Mr. John Gardner,** who was appointed head gardener to the late Sir John Astley, Bart., at Elsham Hall, near Grimsby, in 1868, occupied that position until he retired in October, 1911. In recent years he served under Sir Francis E. Astley-Corbett, and during the period of forty-three years that he had charge of the Elsham Hall gardens, nothing but the most cordial relations existed between employers and employed. It is not to be wondered at, owing to the changes in horticulture and in the fashion of gardening, that Mr. Gardner practically remodelled the gardens during his tenure of office, and lived to see much of his earlier planting come to full fruition. When Sir J. Astley instituted the Elsham and Worlaby Horticultural Society forty-one years ago, Mr. Gardner became the manager of the show annually held on August Bank Holiday, and the success of the exhibition has been largely due to his work and influence. Mr. Gardner has now resigned his position in the society, but his many friends propose to present him with a testimonial as a record and appreciation of his long and able services. In his younger days Mr. Gardner was a successful exhibitor, while his success as a gardener is well known. Mr. J. Gardner, of Batsford Park Gardens, one of our contributors, is a son of the Mr. J. Gardner whose portrait appears in this issue.

**Grant of £500 a Year for Experimental Work in Fruit Culture.**—The Board of Agriculture has intimated its willingness to make a grant of £500 a year towards the provision of a plantation wherein trials may be conducted and experiments carried out in fruit culture. The Board suggests the co-operation of the County Councils of Kent, Surrey, and Sussex, and the grant will be made only on condition that the authorities at Wye Agricultural College make themselves financially responsible for the conduct of the work. We understand that the Education Committee of the Kent County Council has recommended a substantial grant for the purpose, and it is estimated that the cost of necessary land and buildings will amount to about £2,500.

**Patrinia palmata.**—As a consequence of an unfortunate printer's error, the inscription prepared for an illustration of a new fern was attached to our illustration of Patrinia palmata, on p. 571, in our issue of July 27. Those of our readers who file the Gardeners' Magazine will kindly note that the proper inscription should read: "Patrinia palmata. A dwarf hardy perennial, with palmate or trilobate leaves and flattish corymbs of clear, bright yellow flowers. A.M., R.H.S., July 16. Miss Willmott, V.M.H., (gardener, Mr. C. Fielder, V.M.H.), Warley Place, Great Warley."

**A Novel Window Display.**—During its Cricket Week, Tunbridge Wells adds to its natural beauty and gaiety by means of various decorations. The Tradesmen's Association offers several prizes for the best shop window display, and the premier award, a handsome cup, was won this year by Mr. John Charlton, whose display represented an Old English Garden. The foreground was a paved walk, with low-growing plants among the stones. Towards the terraced end a sun-dial figured, and on the terrace stood the figure of a boy carrying a flower-laden basket on his head. At the back of the window a bold herbaceous border was arranged, finely filled with hollyhocks, liliums, campanulas, delphiniums, violas, etc., with pillar specimens of rambling roses, honeysuckle, and clematises, at intervals, the whole being backed by a hedge of Cupressus Lawsoniana. This display was very greatly admired, and Mr. Charlton is to be congratulated.

**Horticulture and Land Taxes.**—The following resolution was passed unanimously by the Horticultural Advisory Committee of the Land Union, on Tuesday, July 23: The Horticultural Advisory Committee of the Land Union, consisting of practical men engaged in the horticultural trade, emphatically protests against the proposal to impose further taxes on land (as distinct from other forms of property), and states without hesitation that the practical result of such taxation would inevitably be to compel many British growers, who necessarily cultivate considerable quantities of land, to close down (they being already hard-pressed by the competition of growers in other parts of Europe). The committee further desires to point out that this result would not only ruin many nurserymen and market growers, but would throw out of employment many thousands of workpeople employed by them, and would also render it impossible for persons of moderate means to enjoy the benefits of a garden. Finally, the committee urgently claims that land should be relieved from the crushing and increasing burden of rates and taxes at present imposed to cover the cost of various public services which should properly be borne by the Imperial Exchequer.

**Proposed Rose Show for the City of London.**—Respecting this proposal, Mr. David Aitchison, St. Mary Axe, E.C., writes: I think Mr. Protheroe's suggestion (p. 568) an excellent one, and am sure there would be no difficulty in getting a sufficient number of members to start such a society, provided the annual subscription were not too high, as many people would willingly pay 5s. per annum, while only enthusiasts would give more. I believe the only society of the kind in the City at present is the "Baltic Rose and Sweet Pea Society," St. Mary Axe, which was formed in 1907, and has been a great success, the last show, held on July 2, being the best of all, but this society is confined to members of the Baltic, Mark Lane, and Lloyds.

**Open Space for Shoreditch.**—On Saturday last the gardens surrounding the old almshouses in Kingsland Road, Shoreditch, were opened for the use of the public. A lily pool and fountain have been provided, and a portion of the gardens has been reserved for games for the children. The almshouses belonged to the Ironmongers' Company, and were erected in 1715 with the money bequeathed by Sir Robert Geoffreys, who was Lord Mayor of London in 1686, when Shoreditch was but a little village. Now, Shoreditch has an area of 543 acres, and a population of 111,463, so this little open space will be a pleasant oasis in a wilderness of bricks and mortar.

**Hertford's New Garden.**—Hertford Castle and its surrounding five acres of grounds have been leased to the Corporation of Hertford, for the public use, for seventy-five years, at an annual rental of half-a-crown. This unique arrangement is due to the generosity of Lord Salisbury, who, on Saturday last, amid much enthusiasm and rejoicing, opened the fine new entrance gates presented by Mr. Osmond McMullen. These gates are practically in the centre of the town, and so are a great convenience as well as a handsome ornament. The Corporation presented Lord Salisbury with a gold key and with a silver model of the castle.

**Addition to Brandelhow Park.**—Manesty Park, about ten acres in extent, has been acquired by the National Trust. This adjoins, and will be added to, the beautifully wooded area of about two hundred acres, known as Brandelhow Park, situated on the western shore of Derwentwater.

**Carnation Feast at Reading in 1787.**—The following quaint record of particulars concerning a Carnation Feast held at Reading in 1787, appeared recently in the "Daily Telegraph": A Carnation Feast will be held at Mr. Smith's, the Horse and Jockey Inn, Castle Street, Reading, on Friday, the 27th instant, when the person that exhibits the eight best whole-blown French carnations, of eight different sorts, will be entitled to a piece of plate of one guinea and a-half value; to him that shews the eight second-best ditto of eight different sorts, a piece of plate of one guinea value; and to any person that exhibits three seedlings of his own blowing, of this year's raising, to be intitled to a piece of plate of half a guinea value. The prizes to be determined by three umpires chosen by the majority of the company. Each persons that shews to subscribe two shillings and six-pence towards the prizes, and to prove on oath that the flowers are his own blowing from the layers or plants from the spring potting

**The Hampton Court Vine,** now 144 years old, is this year carrying a crop of about 300 bunches of grapes, many of these weighing over two pounds each. The crop will soon be fit to cut.

**Progress at Brighton.**—It is with very great pleasure we learn that the Brighton and Sussex Horticultural Society has secured two hundred new members since January last. The exhibition recently held in the Dome and Corn Exchange was a good one, and the Corporation Challenge Bowl and Gold Medal for the most meritorious exhibit was won by Mr. G. Chandler, gardener to S. C. Witting, Esq., Hollingbury Copse, Patcham. For the third successive year Mr. Chandler also won the cup presented by the late Alderman J. W. Howlett for the best group. This trophy he has now won outright, but the society will not be the loser as Mr. Witting has presented another cup for competition.

**Proposed Boating Lake for Hull.**—The Rt. Hon. T. R. Ferens, M.P., the new High Steward of Hull, has offered to construct a large boating lake for Hull, between East Park and the King George V. Playing Fields. We need hardly add that the Corporation of Hull have gratefully accepted this generous offer.

**Great Rose Show at Boskoop in 1913.**—A large exhibition of roses will be held at Boskoop, Holland, in July, 1913. Mr. T. H. Van Nes is president of those who are promoting the exhibition.

**A Wild-flower Garden at Norwood.**—Attached to the South London Botanical Institute, at Norwood, is a garden about seventeen yards square, wherein Mr. Griffin, the Curator, grows a quite remarkable collection of British wild flowers, together with examples of those exotics that have settled down in this country and become naturalised. Those living in the south-east of London and wishing to improve their knowledge of British botany might well make a call at 323, Norwood Road. In the institute is a collection of some 40,000 dried specimens.

**Front Flower Gardens at Nottingham.**—We have pointed out time after time how very greatly the beauty and attractiveness of a town could be increased if the residents took some pains to make their own front gardens presentable. In this connection a correspondent points out that considerable art is displayed by many of the citizens of Nottingham in the laying out of their small front gardens. He writes: Take my street as an instance, what could be more pretty and enchanting than Dryden Street, with its beautiful old brown stuccoed frontage, now a perfect mass of greenery and creepers, the ivy and Veitchi and Virginian creeper completely festooning its windows and doorways, while many of the gardens are a perfect blaze of colour with beautiful flowers. I often go out of my way to walk down such streets, and I think it would be a good thing if our Public Parks Committee, or those in power in the Horticultural Society, would do as many of the railway companies and other authorities are doing, that is, give prizes for the best-kept front gardens. It would encourage the art of gardening and tend to make many parts of our old city pleasant and attractive.

## WILD FLOWERS WORTH GROWING.

Many of our native wild flowers are very lovely, and in a number of instances they are well worthy of cultivation, although in some quarters their beauty is overlooked in favour of more costly things. If some of these plants had been collected in far-off countries, at much risk and expense, they would be more highly valued than is the case at present. A number of our indigenous plants succeed admirably on rock gardens and in herbaceous borders, while a large percentage of them look their best when naturalised in the wild garden.

Among the anemones, A. nemorosa (the Wood Anemone) is a charming subject for naturalising; while A. Pulsatilla (the Pasque Flower) is frequently grown in rock gardens. Arabis alpina (Rock Cress) is deservedly popular; it grows freely in certain hilly districts. Dianthus cæsius (the Cheddar Pink) grows freely on limestone rocks in Somerset, and is a very attractive plant. Lychnis viscaria and L. alpina grow on the hills in North Wales and Scotland, and the improved garden forms are very effective plants. Cerastium arcticum (the Mouse-Ear Chickweed) and C. alpinum are found on the rocks in the North, and are sufficiently attractive for the rock garden. Dryas octopetala (the Mountain Avens flourishes on some hillsides in Scotland, and is a charming little plant.

Several of the potentillas (Cinquefoils) are worthy of a place; while that lovely little plant Saxifraga oppositifolia is especially attractive. Forms like S. o. splendens and S. o. pyrenaica are great improvements on the type, with larger flowers. Sedum album and S. rupestre are attractive members of the stonecrop family; and Sempervivum Tectorum (the Houseleek) is a well-known native plant that flourishes on old walls and roofs. Several of the wild orchids, like Orchis mascula, O. maculata, and Cypripedium calceolus, are lovely little plants; the latter has bright yellow flowers; and Habenaria biflora (the Lesser Butterfly Orchid) is one of the most attractive.

Aconitum Napellus, Trollius europæus (the Globe Flower), Astrantia major (the Master Wort), Centranthus ruber (Red Valerian), and Solidago virgaurea (Golden Rod) are suitable subjects for the herbaceous border, and are all indigenous. Caltha palustris (the Marsh Marigold), Epilobium angustifolium (Rose Bay, or French Willow), and Lythrum salicaria (Purple Loosestrife) flourish in shady positions near the water's edge. Scabiosa arvensis (the Field Scabious) is worth naturalising in the wild garden; as also is the common field Marguerite. Several members of the Cranesbill family, like Geraneum sanguineum and G. pratense, with purple-blue flowers, are attractive for the shrubbery border.

Spiræa Ulmaria (Meadow Sweet), Fritillaria Meleagris (Snake's Head), Digitalis purpurea (the common Foxglove), Campanula latifolia (the Bellflower), and C. rotundifolia (the Harebell) are charming subjects for naturalising. Scilla festalis (the Bluebell), narcissi, and the snowdrops must, on no account be omitted; while Myosotis alpestris (the Mountain Forget-me-not) and M. palustris are attractive in their proper sphere. Verbascum nigrum (a native Mullein), with yellow flowers, grows about 3ft. in height. Malva sylvestris (the common Mallow) and other members of the family are suitable for naturalising.

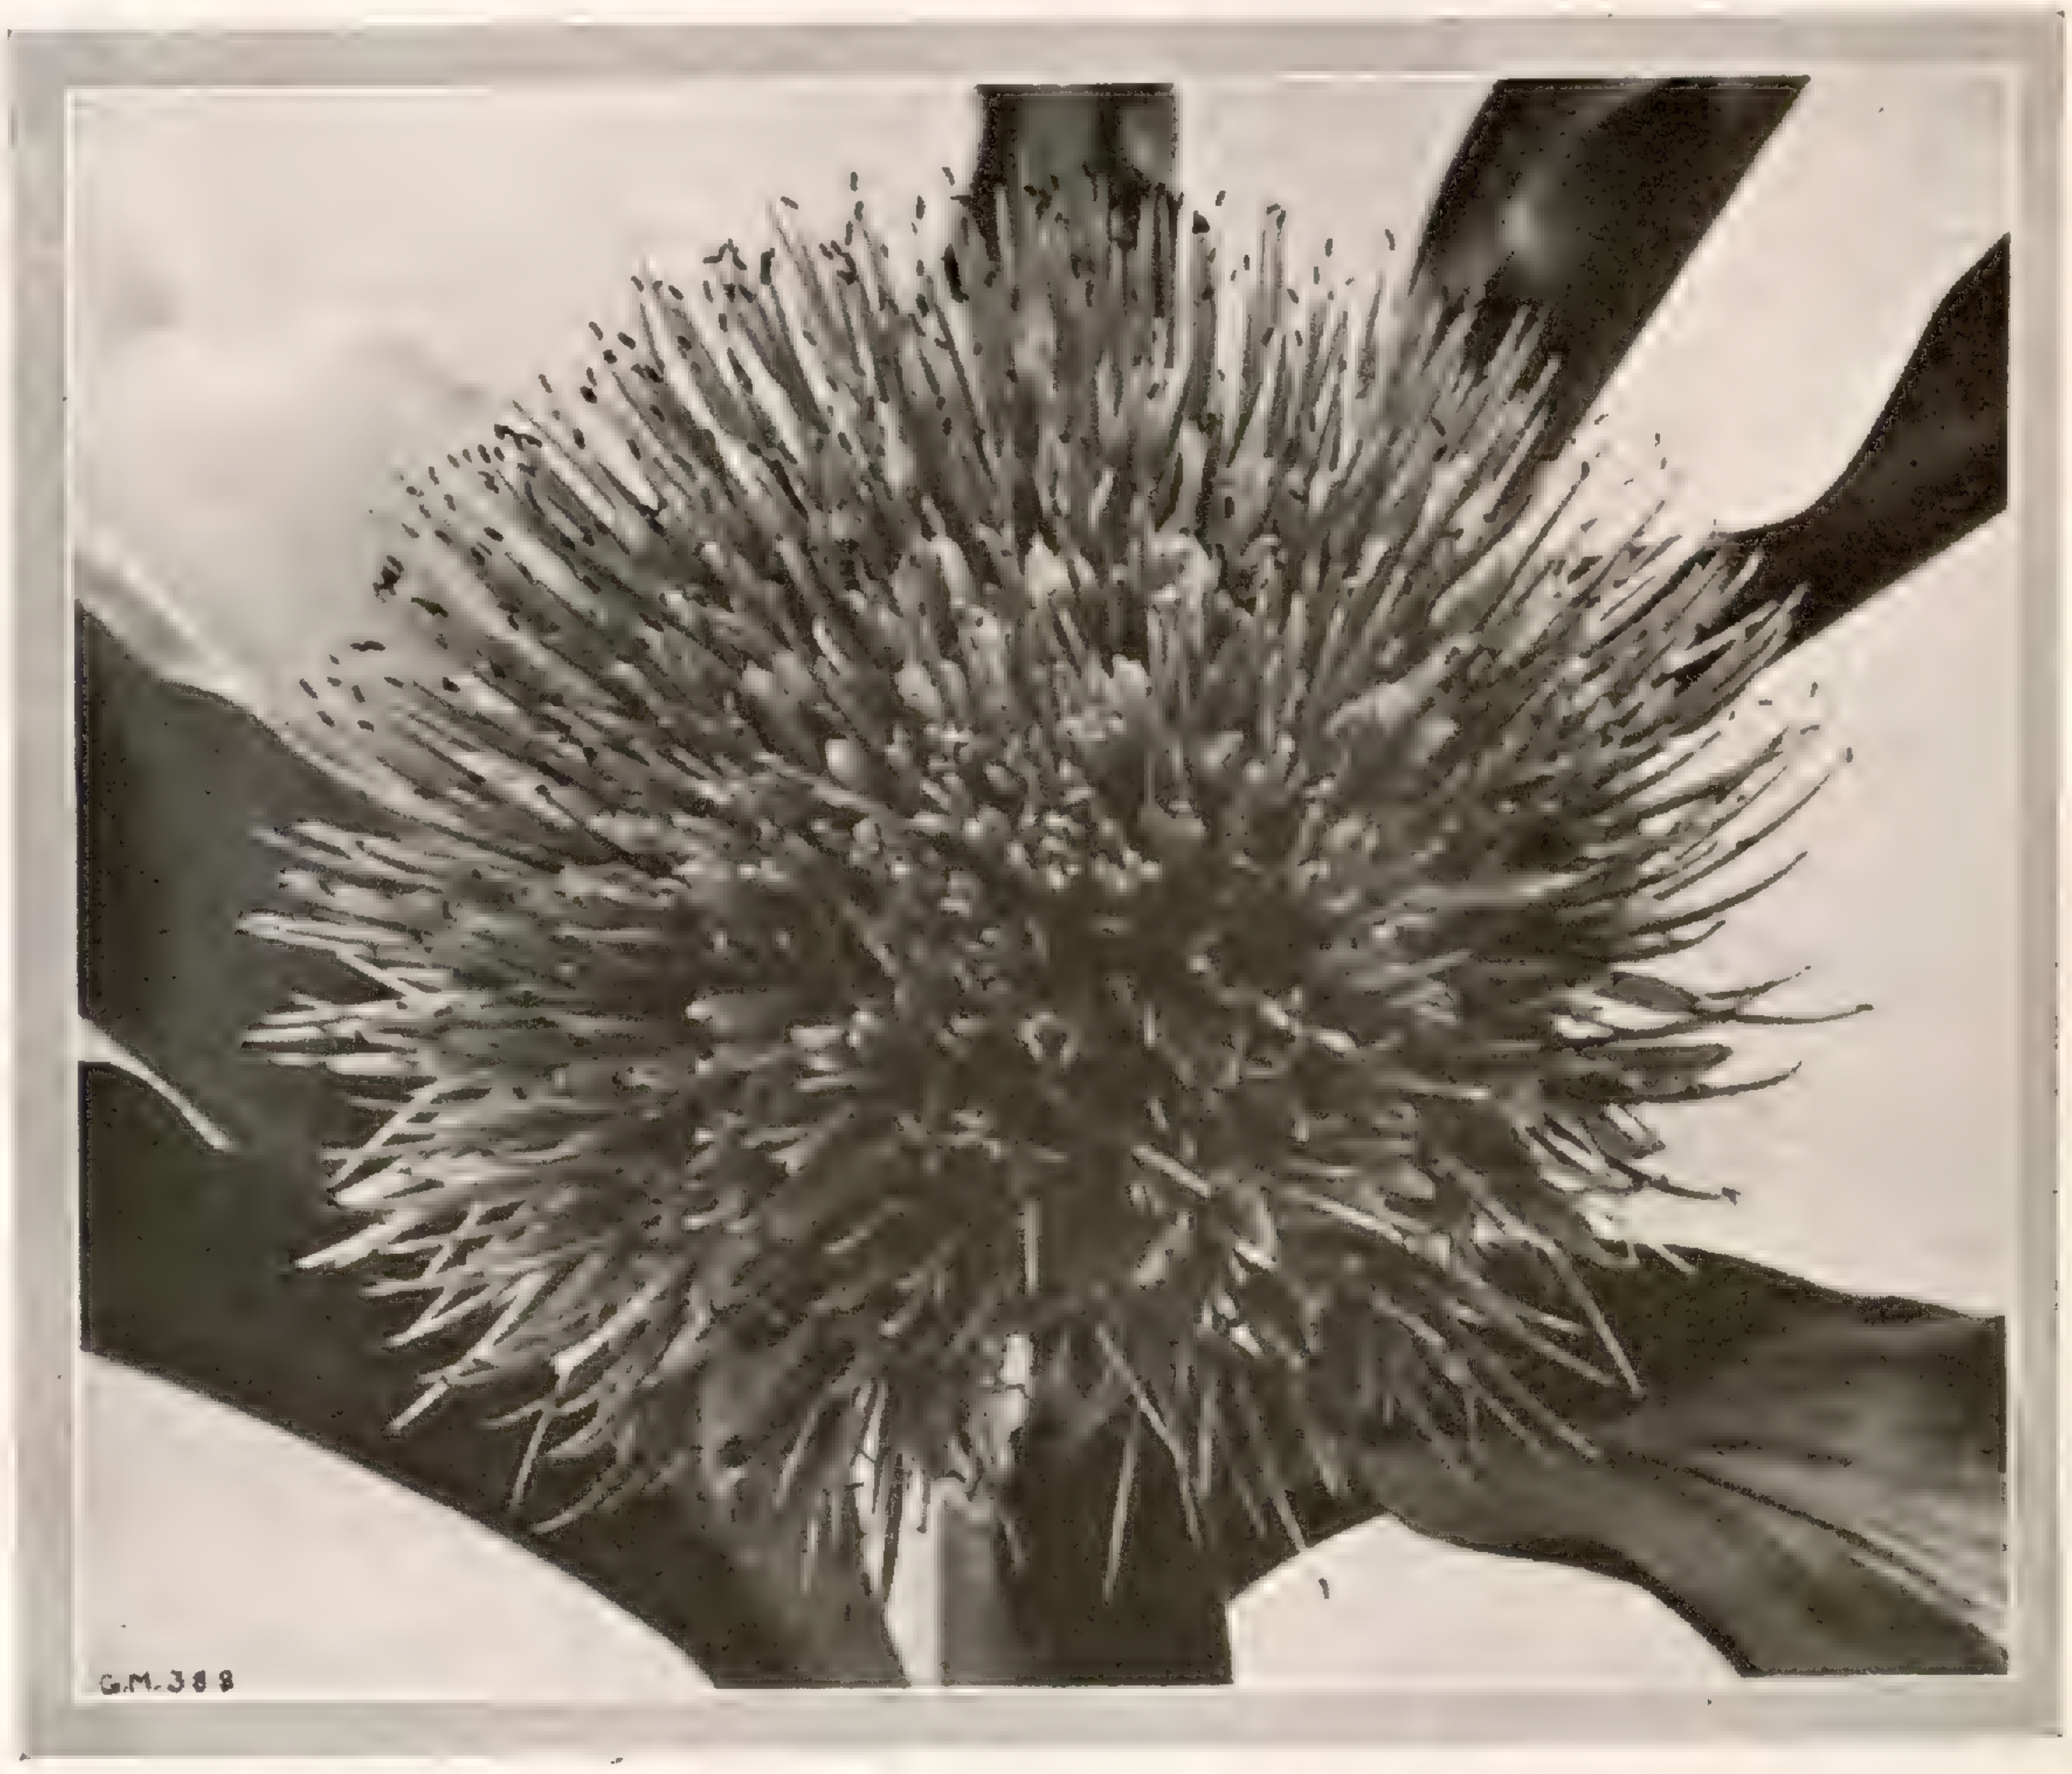
Butumus umbellatus (the Flowering Rush) and Iris pseudo-acornus (the Water Flag) are suitable for the water garden, as also is Nymphæa alba (the white Water Lily), a very charming flower. Polemonium cœruleum (Jacob's Ladder), Anchusa sempervirens (the Evergreen Alkanet), and Pulmonaria officinalis (Common Lungwort) are suitable for shrubbery borders. The periwinkles, both Vinca major and V. minor, are charming plants, and so is Hypericum calycinum (St. John's Wort), its rich yellow flowers being especially showy. Corydalis lutea (Yellow Fumitory) is largely naturalised in some districts, and it grows on dry banks and walls.

Calluna vulgaris (Common Ling), Erica ciliaris, and E. vagans (Cornish Heath) are very effective planted in large masses. Convalaria majalis (Lily of the Valley) and Primula acaulis (the Primrose) are both well known, and are seen at their best when naturalised in large masses.

Amongst climbers, Clematis vitalba (Traveller's Joy) and Lonicera Periclymenum (Honeysuckle or Woodbine) are very delightful when growing over forest trees in the wild garden. Cytisus scoparius (Common Broom) and Ulex europæus (Furze or Gorse) are very effective when in flower, and succeed admirably on rough banks. Viburnum Opulus (the Guelder Rose) and V. Lantara (the Wayfaring Tree) are both handsome shrubs; while Rosa rubiginosa (Sweet Briar) and R. canina (the Dog Rose) are each charming in their way. Cratægus oxyacantha (the Hawthorn) and the various native prunuses and pyruses, the Bird Cherry and the Crab Apple, for example, add more than a little beauty to our gardens.

The above list is by no means exhaustive, and merely indicates some of the more desirable members of our native flora. Those who are really interested in wild flowers could very well collect a number of the species named for themselves, and add them to their gardens.

Batsford Park Gardens. J. GARDNER.



HÆMANTHUS ANDROMEDA.

Flowers bright salmon-scarlet, borne in dense, rounded heads. A.M., R.H.S., July 30. R. R. Cory, Esq. (gardener, Mr. Cobb), Duffryn, St. Nicholas, Cardiff. (See p. 599.)

## PINUS BANKSIANA.

In numerous places in the North of England and Scotland there is a disposition to plant this North American tree under forest conditions, for the reason that it is considered to be of a peculiarly hardy constitution, and will probably grow where other kinds of trees will not. Before embarking on any considerable expense, however, it would be wise for intending planters to look further into the history of the tree, with a view to ascertaining whether it is ever likely to produce timber, even if it grows in high and exposed places. The Americans do not look upon it as a commercial timber tree, except in a few places in the extreme north, where there is practically nothing else.

At its best it is little more than a scrub pine, although trees with a diameter of two and a-half feet, and a height of seventy feet, are recorded by Hough in "American Timbers."

Comparatively few mature trees are to be found in this country, for its unsatisfactory growth after the first few years has been against it as an ornamental tree, and the few old trees to be found are rarely more than twenty to thirty feet high, of small girth, and a stunted character. With this in view, it appears to be waste of time and money to introduce the species where anything else can be grown, whilst for the present there is plenty of land in most parts of the country at a comparatively low elevation which might be planted before attempting high and exposed land.

The probable reason why this tree finds friends is that whilst growing in nursery quarters its growth for a few years is as vigorous as that of the Scots Pine, annual shoots of twelve to fifteen inches on three-year-old plants being not uncommon. This rate of growth is not retained for long, however, especially when the trees have been placed in permanent quarters.

W. DALLIMORE.

## HORTICULTURAL EDUCATION IN FRANCE.

In the report on Horticultural Education, prepared for the International Conference held at Chelsea in May last, Professor L. Henry, of the National School of Horticulture, Versailles, contributes the following account of horticultural education as conducted in France:—

Horticulturists may be divided under three heads, viz.: Horticulturists proper, seedgrowers, and market gardeners.

1. Horticulturists.—One or other of the following methods is usually pursued in training horticulturists proper:

A. By professional apprenticeship—

(1) Either in some horticultural establishment,

(2) At the residence of someone who possesses gardens so large as to necessitate the employment of professional gardeners for the purpose of maintaining them,

(3) In public gardens, such as botanical or ornamental gardens belonging to the State or Municipality, of which a considerable number exist.

(4) In the garden schools of the various horticultural societies (twenty-four in France).

B. By a stay in one of the special schools numbering sixteen in all.

2. Seed Growers.—The same method is followed as in the case of horticulturists proper, but in this case the number of special firms or persons cultivating seeds is much more limited, only certain large houses raising their own seeds, such as—Vilmorin-Andrieux and Cie., Cayeux and Le Clerc, Chausse, Fortin, and Laumonnier, Simon (Louis-Léon), in the neighbourhood of Paris—Rivoire at Lyon—and Denaiffe at Carignan (Ardennes).

All other seed merchants, and even some large houses themselves for different specialities, draw their seed supplies from specialists who are generally located in districts particularly suitable for such productions.

3a. Market Gardeners, or Maraichers, as they are called in France.*—In the environs of very populous centres, such as Paris, Lyons, Lille, Nancy, etc., the cultivation of market gardens to be really remunerative requires special knowledge, practice, and a particular training, which is difficult, if not almost impossible, to acquire otherwise than by a proper apprenticeship with some specialist of experience.

Thus it is in this way that the professional market gardeners in France are generally very independent, being specialists who can demand for the vegetables which they produce a remuneration quite out of proportion to the work entailed—in fact, a regular salary for one of the roughest professions, which, however, strange to say, is handed down from father to son in families of simple manners, usually patriarchal, honest, and very hard-working.

3b. Vegetable Growers.—Although market gardening is quite a special branch of the horticultural art, and necessitates a particular apprenticeship, it is not quite the same thing as producing vegetables in season, which only requires simple and non-expensive material.

Strictly speaking, this should not be called a speciality, since it is a relatively easy and simple part of horticulture in general, in fact, a cultivation open to all, yet it may become, if it is properly carried out, a source of very considerable profit.

This cultivation must be learnt with those gardeners who are established with the special aim of supplying modest households, and for this purpose they work a piece of land, more or less extensive, without attempting to obtain articles of luxury so much as those in season and of fine quality.

It can also be learnt in large private houses under the direction of a clever and trained gardener. Very often, and it is one of the best methods, the apprenticeship is a family one—the son then works as soon as he can with his father and receives from him all the technical instruction and all the necessary manual qualifications. Naturally the schools of agriculture worthy of the name make their pupils familiar with the cultivation of vegetables under conditions more or less perfect, according to the resources which they have at their disposal. Schools of agriculture themselves, when they are properly managed, and possess a chief who is practical and somewhat clever, also form gardens adaptable for the ordinary culture of vegetables.

It is in these same establishments that agricultural students are taught those methods which are indispensable to the smallholder. This part of the training is very often neglected, in spite of all the interests which it presents from the point of view of food production, and the resources which one can derive from it. The teaching of gardening, in principle, forms part of the programme of the movable domestic agricultural schools; but what can they do, and what influence can they have for a period of instruction restricted to three months at the outside, crammed with so many subjects, and purely theoretical from the horticultural point of view? They are held during the winter months, and all classes of this nature must, of necessity, do without practical application.

This is a state of manifest inferiority by comparison with what takes place in neighbouring countries (Belgium, Germany, Switzerland, Italy, England, etc.), where fixed schools are the rule and where the young woman—the future housewife—is instructed in the art of gardening, which, later on, she will have to undertake in rural cultivation.

Whilst a neighbouring country, Switzerland, possesses two horticultural schools for young women, it is as much as France can do to show a single experimental, permanent, domestic, horticultural-agricultural school, brought into being by private initiation.

### Theoretical Instruction.

Leaving aside the purely practical part and considering the theoretical instruction only, this we find is distributed—

(1) In horticultural schools of all kinds.

(2) Agricultural schools of all degrees and the farming schools where the instruction for vegetable culture is more particularly adapted to the needs of the farm.

(3) Various special schools under the authority of the Minister of Agriculture.

(4) Domestic agricultural schools, either stationary* or movable.

(5) Lectures and courses held by special professors.

(6) Lectures and courses organised by various societies of popular instruction, associations philotechniques, associations polytechniques, young people's unions, gardeners' societies, and lectures organised by the horticultural societies.

(7) Municipal and county lectures or classes.

Under the impulsion of enthusiastic initiators, these classes and lectures have been organised more or less generally, but especially, as goes without saying, in important centres where audiences are not wanting. Paris, in particular, has in this respect achieved some very remarkable progress, and such and such a professor (often a trained and clever gardener), and such and such a willing delegate, animated solely by his desire to render useful service and to serve the cause of horticulture, gathers round him in the evening during the winter in some hall which is held at his disposal by some intelligent municipality or some society favourable to progress, an audience eager for instruction—attentive and sympathetic.

There the clerk, freed from his office or shop labour, the working man from his workshop, the amateur who cultivates his little garden plot in the suburbs, come to derive the information which is necessary for the intelligent cultivation of vegetables and fruit.

### Technical Training of Arboricultural Gardeners.

4. Arboricultural Gardeners. — The knowledge of the cultivation of fruit trees is acquired in the same manner as vegetable culture—

(1) By study in special schools;

(2) Professional apprenticeship to practical work under the direction of arboricultural gardeners, whether in private houses, or in establishments devoted to fruit production, or in important nurseries;

(3) By attendance at classes and lectures given by county or municipal professors, or of horticultural societies, or even of popular educational societies.

### Technical Training of Gardeners in Private Houses.

Gardening in private houses embraces all the various branches of horticulture.

The preparation of gardeners for this work is accomplished in France principally by apprenticeship under the orders and directions of experienced, clever, and master gardeners. The apprentices, being anxious to perfect their professional instruction, afterwards stay a certain time with specialists, vegetable growers, florists, arboriculturists, etc.

The schools we have previously mentioned as teaching horticulture also train a certain number of gardeners for private houses. There are many complaints in France of the apprenticeship difficulty in horticulture, as well as in every other branch of the agricultural and industrial concerns. In order to meet this difficulty the horticultural authorities recommend and propose some special schools for horticultural apprenticeship.

### Technical Instruction of Gardeners of Public Parks and Scientific Gardens.

To stay and work in some establishment of a similar kind (public gardens and botanical gardens of the State, societies, or some large school, etc.) constitutes the most usual preparation for this work in France.

The National School of Horticulture of Versailles is, in this respect, a nursery often made use of, especially as in recent years positions of this nature are competed for.

In its School of Arboriculture of St. Mandé, the Administration of the Public Gardens and Walks of the City of Paris, who retain at St. Mandé trained and specially competent specialists, prepare agents fully qualified in these matters.

(To be continued.)

**Heuchera sanguinea.**—I noticed a reference in your paper recently to Heuchera sanguinea, and thought a note respecting it might interest you. Heuchera sanguinea, one of my introductions, was brought by a friend of mine from Mexico; there were six plants packed in a small basket, five of which were alive, and were planted in my private garden at Tottenham, where they flowered well, the spikes being four feet high, and much finer than anything I have seen since. They produced a quantity of first-class seeds, the whole of which was then handed over to Mr. T. S. Ware, of Tottenham. As the plant propagated so freely from seeds, division was neglected, and so the true plant was soon lost. However, the plant now passing under the name of "Walker's Variety" was from the original seed which I gave Mr. Walter C. Walker; when I saw it in bloom I obtained it from him, and this was the origin of the variety sent out under his name, which, I contend, is the nearest I have seen to the originally imported plants.—Amos Perry, Enfield.

---

*In horticultural language, when speaking of the cultivation of vegetables, one distinguishes between market gardeners and kitchen gardeners. Market gardeners have in view the supply of the markets, and this is carried on under special conditions; kitchen gardeners rather have in view the providing of household requirements by means within the reach of anyone.

* Permanent or stationary domestic agricultural schools are still very rare in France, as so far everybody is especially attached to the creation of movable schools.

## TALL CAMPANULAS.

The value of tall campanulas for garden decoration during the summer months is apparent to all lovers of the garden. The grace of these useful perennial plants gives a touch of daintiness which few other hardy flowers can surpass. There is scarcely a garden, whether it be country or town, which would not be greatly enriched by the inclusion of a selected collection of the taller campanulas, and this being so, it behoves the garden lover to keep in touch with the most useful members of the group.

It has ever been my aim to include at least a few of the best campanulas in every planting of hardy plants, which has come under my personal direction, and the results have always justified their inclusion. It may have been noted that in many gardens the perennial campanulas have been represented solely by the persicifolia forms, to the total exclusion of all others. Although I wish to keep the persicifolia section well to the forefront, I also desire to bring the more noteworthy of the other species well in view, in order that they may do their full share in beautifying the summer garden, as well as more robust growth.

Digressing just for a moment on the question of soils and situation, I can confidently recommend a fairly heavy soil for the majority of the tall campanulas, as in such a soil they usually produce first-rate results. A moderately heavy soil, well worked, is capable of a high state of fertility, but, on the other hand, it should be thoroughly drained if the best results are expected. Retaining the moisture during dry summer weather, it naturally ensures better blossoms and a longer period of flowering.

A notable exception to this rule is C. persicifolia Moerheimi, the popular double white, which, lacking somewhat in constitution, seems to require a lighter, warmer soil to keep it in good health. I usually endeavour to give this variety a slightly raised position in order to get the best possible display from it. As to situation, it does not matter materially whether it be sun or partial shade, save that the blossoms usually last longer if not exposed to the full power of the sun. With us this does not make much difference, as the flowers are soon pollinated by the bees, resulting in faded blossoms that have to be speedily removed.

Blues, whites, and purples are the hues that predominate among the campanulas, and these colours are very telling for garden effects. There is a lightness, a delicacy, about these shades which is wonderfully pleasing, and it is these pleasing colour tones that blend so well with delphiniums, Chrysanthemum maximum, and other associating perennials. Glorious as the campanulas are in the sunlight, they are, to my mind, far more beautiful in the evening twilight. Then in the softer, dimmer light they are superb. Silhouetted in the decreasing light those soft hues take on additional distinctness and beauty. They are then a revelation to those who do not know them under an evening sky—a glory indeed.

Taking the persicifolia group first, we note several sterling varieties. Of these the best blues include Daisy Hill, a lavender-blue semi-double; maxima duplex, a semi-double in deep blue; Pallida grandiflora, a pale blue; and La Fee, a lovely lavender-blue of great merit. Mountain Cloud is a fine large-flowered blue-purple raised here, and gives decided promise as the colour is so telling. Of the whites, the best are alba grandiflora and its subvariety, a. g. plena, two splendid gems; Coronata, with its cup and saucer blossoms; Newry Giant, a large semi-double; Moerheimi, beautiful, but none too robust; and a seedling double, named Avalanche.

C. lactiflora is very worthy of note, its height and graceful spreading heads of small milky blossoms making it and its blue-flowered variety cærulea a splendid subject where tall plants are required. C. latifolia and its varieties call for distinct notice, being of material service for the borders and the wild garden. Growing erect, with drooping flowers produced after the manner of the foxglove, these are quite decorative, especially the whites. The type is a deep blue, alba is a good white, macrantha a rich purple, and pallida a pale blue. C. Burghalti, a satiny purple-blue, and Van Houttei, a paler pendulous blue, are hybrids of latifolia, but their exact parentage seems lost. C. latiloba or grandis, is another good plant for effect. It is a soft metallic blue in colour, and with the white form alba is grand for massing. It differs from persicifolia chiefly in its very short footstalks and its pale green foliage. C. amabilis from the Crimea is a very graceful subject. Other useful forms are the single and double, white and blue, forms of C. trachelium, C. elegans, a good violet form, and the pale blue nodding flowered C. sarmatica.

P. S. Hayward.

## CELSIA CRETICA CLIVEDEN VARIETY.

The Cliveden variety of Celsia cretica was found by the late Duchess of Cleveland among the rocks in Algiers in 1898; she brought it home, and I grew it at Battle Abbey for her each year. I knew it was a fine variety, but it was by accident rather than design that I put it up before the Royal Horticultural Society. The echium then shown was brought from the Canary Islands by the same lady in 1898, and was raised from seeds also.

I may say the best results are gained with Celsia cretica by sowing the seeds now, and growing the plants in small pots; the spikes I exhibited in June were from plants in 54-sized pots. I find by more liberal treatment larger plants can be produced, but these have not the same graceful effect as those grown with their roots somewhat cramped in small pots. The latter are unique for vases, jardinières, etc., on the tables.

Wm. Camm.

Cliveden Gardens, Taplow.

CELSIA CRETICA CLIVEDEN VARIETY.
A large and handsome variety with light yellow flowers. A.M., R.H.S., April 30.
W. W. Astor, Esq. (Gardener, Mr. W. Camm), Cliveden, Taplow.

---

**Lilac Miss Ellen Willmott.**—This is one of the most striking of the double-flowered lilacs with white blossoms, its main distinctive feature being the large size of the individual blooms, in which respect, as far as my experience extends, there is no other to equal it. This variety is one of the many raised by MM. Lemoine et Fils.—T.

## A SEVEN-FLOWERED SWEET PEA SPIKE.

I am sending a photograph of a sweet pea, Mrs. Hardcastle Sykes, which I thought might be of interest to your readers. The seven flowers were produced on one stalk, which divided some 15in. from its base, each of the branches having three flowers, while the seventh bloom was placed exactly at the division. I grew a spike of Florence Nightingale with seven blooms on it, but the arrangement of the flowers was not nearly so effective as in this case.

A. E. Protheroe.

Bourne House, Purley.

A SEVEN-FLOWERED SPIKE OF SWEET PEA MRS. HARDCASTLE SYKES.

**Tuberous-rooted Begonias.**—The tuberous begonia of the present day has now reached such a state of perfection that it is difficult to say how a further improvement can possibly take place. We used to have several forms of double flowers, but the tendency now is towards the development of blossoms in shape like a perfect rose, and which, at the same time, hold their heads up well. To one who has watched the progress of these begonias from their early stages, the development of the present-day race is most surprising.—S. W.

## DAHLIA CULTIVATION FOR EXHIBITION.

During early August the dahlia grows with great rapidity, especially after rain or during damp, warm weather. Those who have grown dahlias for any length of time can look back on great extremes of climatic conditions (not that this is a matter confined to dahlia growers only), and whereas in one season it has been a case of ceaseless watering, another stands out in one's memory chiefly on account of wind and rain, and consequent wettings to the skin when attempting to do anything to the plants. These differences make it impossible to say what shall or shall not be done in the way of watering and feeding.

In wet seasons feeding is not so necessary as in dry, and the only way to apply manure is to put it on top of the ground and let it wash in. Taking an average, there are few years that are either very wet or very dry, and feeding by means of liquid manure is usually possible during some portion of the growing season. It is of no great consequence whether artificial or natural manures are given, but the latter are less likely to spoil the plants. No better plan can be adopted than to use a big tank or tub as a "distillery," and place in it, when full of soft water, a bag of animal manure and a bag of soot. The manure may be renewed frequently, and no fear need be entertained that it will be given too strong, providing the plants require the water, and are on well-drained soil. During a really dry spell give two gallons per plant twice a week, or even three times in exceptional circumstances, but it is folly to give water a little and often, as this merely damps the surface, which dries away at sunrise, and the lower roots get no benefit whatever. I might add that diluted sewage is a good stimulant, but perhaps rather inclined to cause coarse growth and flowers. I have not used it personally, but have noted the results in two or three country places, where no other manure was used.

We now come to thinning and disbudding, and as previously pointed out, pompons and singles require very little actual disbudding. In the case of pompons, the side buds are seldom very full in the centre, and a few may be removed, as well as the old flowers, while singles must have the seed pods removed. Doubles may be disbudded freely, and the side shoots for some distance down the stem must be removed also. This will also prevent the plants getting too bushy, as by removing the little side growths when disbudding very few remain to flower.

In the case of cactus varieties, a more elaborate system is often necessary, as the individual shoots are more numerous and not so robust. Red Admiral, for instance, produces quantities of growths often from below ground and near the base, but, on the other hand, Irresistible and Ivernia need hardly any thinning, and only require disbudding. The finest flowers are obtained on the six or eight main stems, and upon these being disbudded the strongest of the lower side shoots are allowed to remain, tied in, and left to develop. Thus the six main stems now become the supporters of other young shoots, which, in their turn, carry on the system, and ensure a continual display of flowers. It is a quite easy matter to overthin the plants, and a beginner in his zeal to produce big flowers, may overlook the fact that he is leaving no young growth to follow on later. I have seen plants so badly thinned that, although displaying six or seven very fine flowers, yet after these had developed and been cut, there was not a shoot left which would flower inside three weeks, and as the flowers were too early for the show they had been grown for, the exhibitor was left a wiser if a sadder man.

All weakly growth, either from the base or higher, may be cut out, and when old flowers are no further use, cut them off with as many joints as have previously been disbudded.

Having grown a good flower is only part of the battle when exhibiting is the object in view, and the part that often proves the undoing of the would-be champion is taking the flowers to a show in first-rate condition. Flowers which were perfect examples the day previous to the show are, at the time of judging, either badly flagging or open in the centre, and, although perhaps twice the size, yet count less than younger flowers on a competitor's stand.

Those who adopt some means of shading the blooms are liable to use older flowers than would be the case if all had been left out in the sun and rain; old blooms flag quickly or drop the whole of their back florets. A friend once said to me, "Why did you show that bad flower; it spoils the bunch?" I remarked: "Simply because I couldn't make another."

A few hints, however, may prove useful. First, cut early, long before sunrise, and for preference cut in the morning, even if not staged until the evening. After cutting place at once in water, allowing most of the stem to be in the water, and stand in a cool dark place, if possible on a brick or damp cement floor. When arranging the flowers in wires or on boards do not finger them, as it is surprising how soon the freshness fails if a bloom is turned and twisted a few times. When arranged, only very lightly dew them over. It may be necessary to syringe if a dry easterly wind is blowing, but the blooms had better flag a little than develop a lot of flat florets round the eye. I ought to have said that when selecting the flowers allow for what the flower will develop during the next twenty-four hours, as they often grow considerably after being placed in water. Nothing is more worrying than to feel that every minute the flowers are getting less valuable. When putting cactus dahlias in wire frames, it is best to bend the wire to fit the flower, rather than wriggle the flower about in a vain endeavour to get it to face properly.

After each show, thoroughly examine the plants, and cut out the old growths at once, tying and disbudding the younger growth. The plants often look a little shattered after a lot of flowers have been cut, but it is surprising how quickly they recover, especially if the weather permits a good watering with liquid manure.

At the end of September, or earlier if time can be spared, remove all the young wood not showing buds, and tie the plants up trim and taut. In this way fine flowers will continue to come until well into the autumn. It is always a mistake to abandon dahlias too soon, as in October they flower freely, and often to perfection, if kept free from rubbishy growth which soon exhaust the energies of the plant.

H. Stredwick.

---

## BIGELOVIA GRAVEOLENS.

This interesting Composite, though not hardy enough to stand throughout the year in the open ground, except in the most favoured parts of the country, is well adapted for wall culture in places where there is a fair amount of sun. Being naturally a sunloving shrub, a south or south-west aspect should be chosen whenever possible, and the soil should be well drained and warm, a light loam being most suitable. B. graveolens enjoys a wide range of distribution in Western North America, for it occurs from British Columbia to New Mexico. The aromatic leaves are one to three inches long, narrow, and greyish. The yellow, tubular flowers are borne during early autumn, September and October, in dense, crowded heads, and are showy at a time when flowers are becoming scarce.

In Vol. III. of Britton and Brown's "Illustrated Flora of the Northern States and Canada," p. 326, it is described as Chrysothamnus nauseosus. The name of Bigelovia was given in honour of Dr. Jacob Bigelow, the author of "Medical Botany of the United States." Although there are not a very large number of hardy shrubby plants in the order Compositæ, many of those which do exist are of an interesting character, as is instanced by the plant under notice, and by the fine collection of New Zealand olearias which was exhibited at the recent International Horticultural Exhibition.

W. D.

## SOME GOOD BUTTONHOLE ROSES.

Few flowers are more pleasing for personal decoration than rose buds, but they must be of a variety that does not fly open too quickly. Betty, G. Nabonnand, Irish Elegance, and Gardenia are very pretty in their earliest stages of growth; but they fly open too soon for any lasting decoration as a coat or buttonhole flower.

Much more lasting varieties are found in Lady Roberts, Anna Olivier, Francisca Kruger, Lady Hillingdon, Madame Antoine Mari, Madame Jean Dupuy, Souvenir de Pierre Notting, and Rubens from among the tea-scented sections, while Souvenir de Stella Gray is one of the most striking coat-flower roses we have. The noisettes give us a few suitable varieties in William Allen Richardson, Celine Forestier, and Caroline Kuster, but these blooms must be quite young.

There are several suitable varieties among the growing class of hybrid teas, some of the most noticeable being The Dandy, Avoca, Richmond, Mrs. Walter Easlea, and Chateau de Clos Vougeot, all very dark crimsons. Various shades of orange, yellow, and copper are found in Mrs. Aaron Ward, Edu Meyer, Gustave Regis, James Coey, Jacques Vincent, Madame Ravary, Marquise de Sinety, Mrs. Arthur R. Waddell, Mrs. Peter Blair, Theresa, and Madame Pol Varin Bernier. For deep cherry reds few can surpass Lady Battersea, Papa Gontier, and Madame J. W. Budde. Sarah Bernhardt and Prince Camille de Rohan are two very free-flowering, deep velvety-maroon coloured roses that last well in a suitable form, and are very sweetly scented.

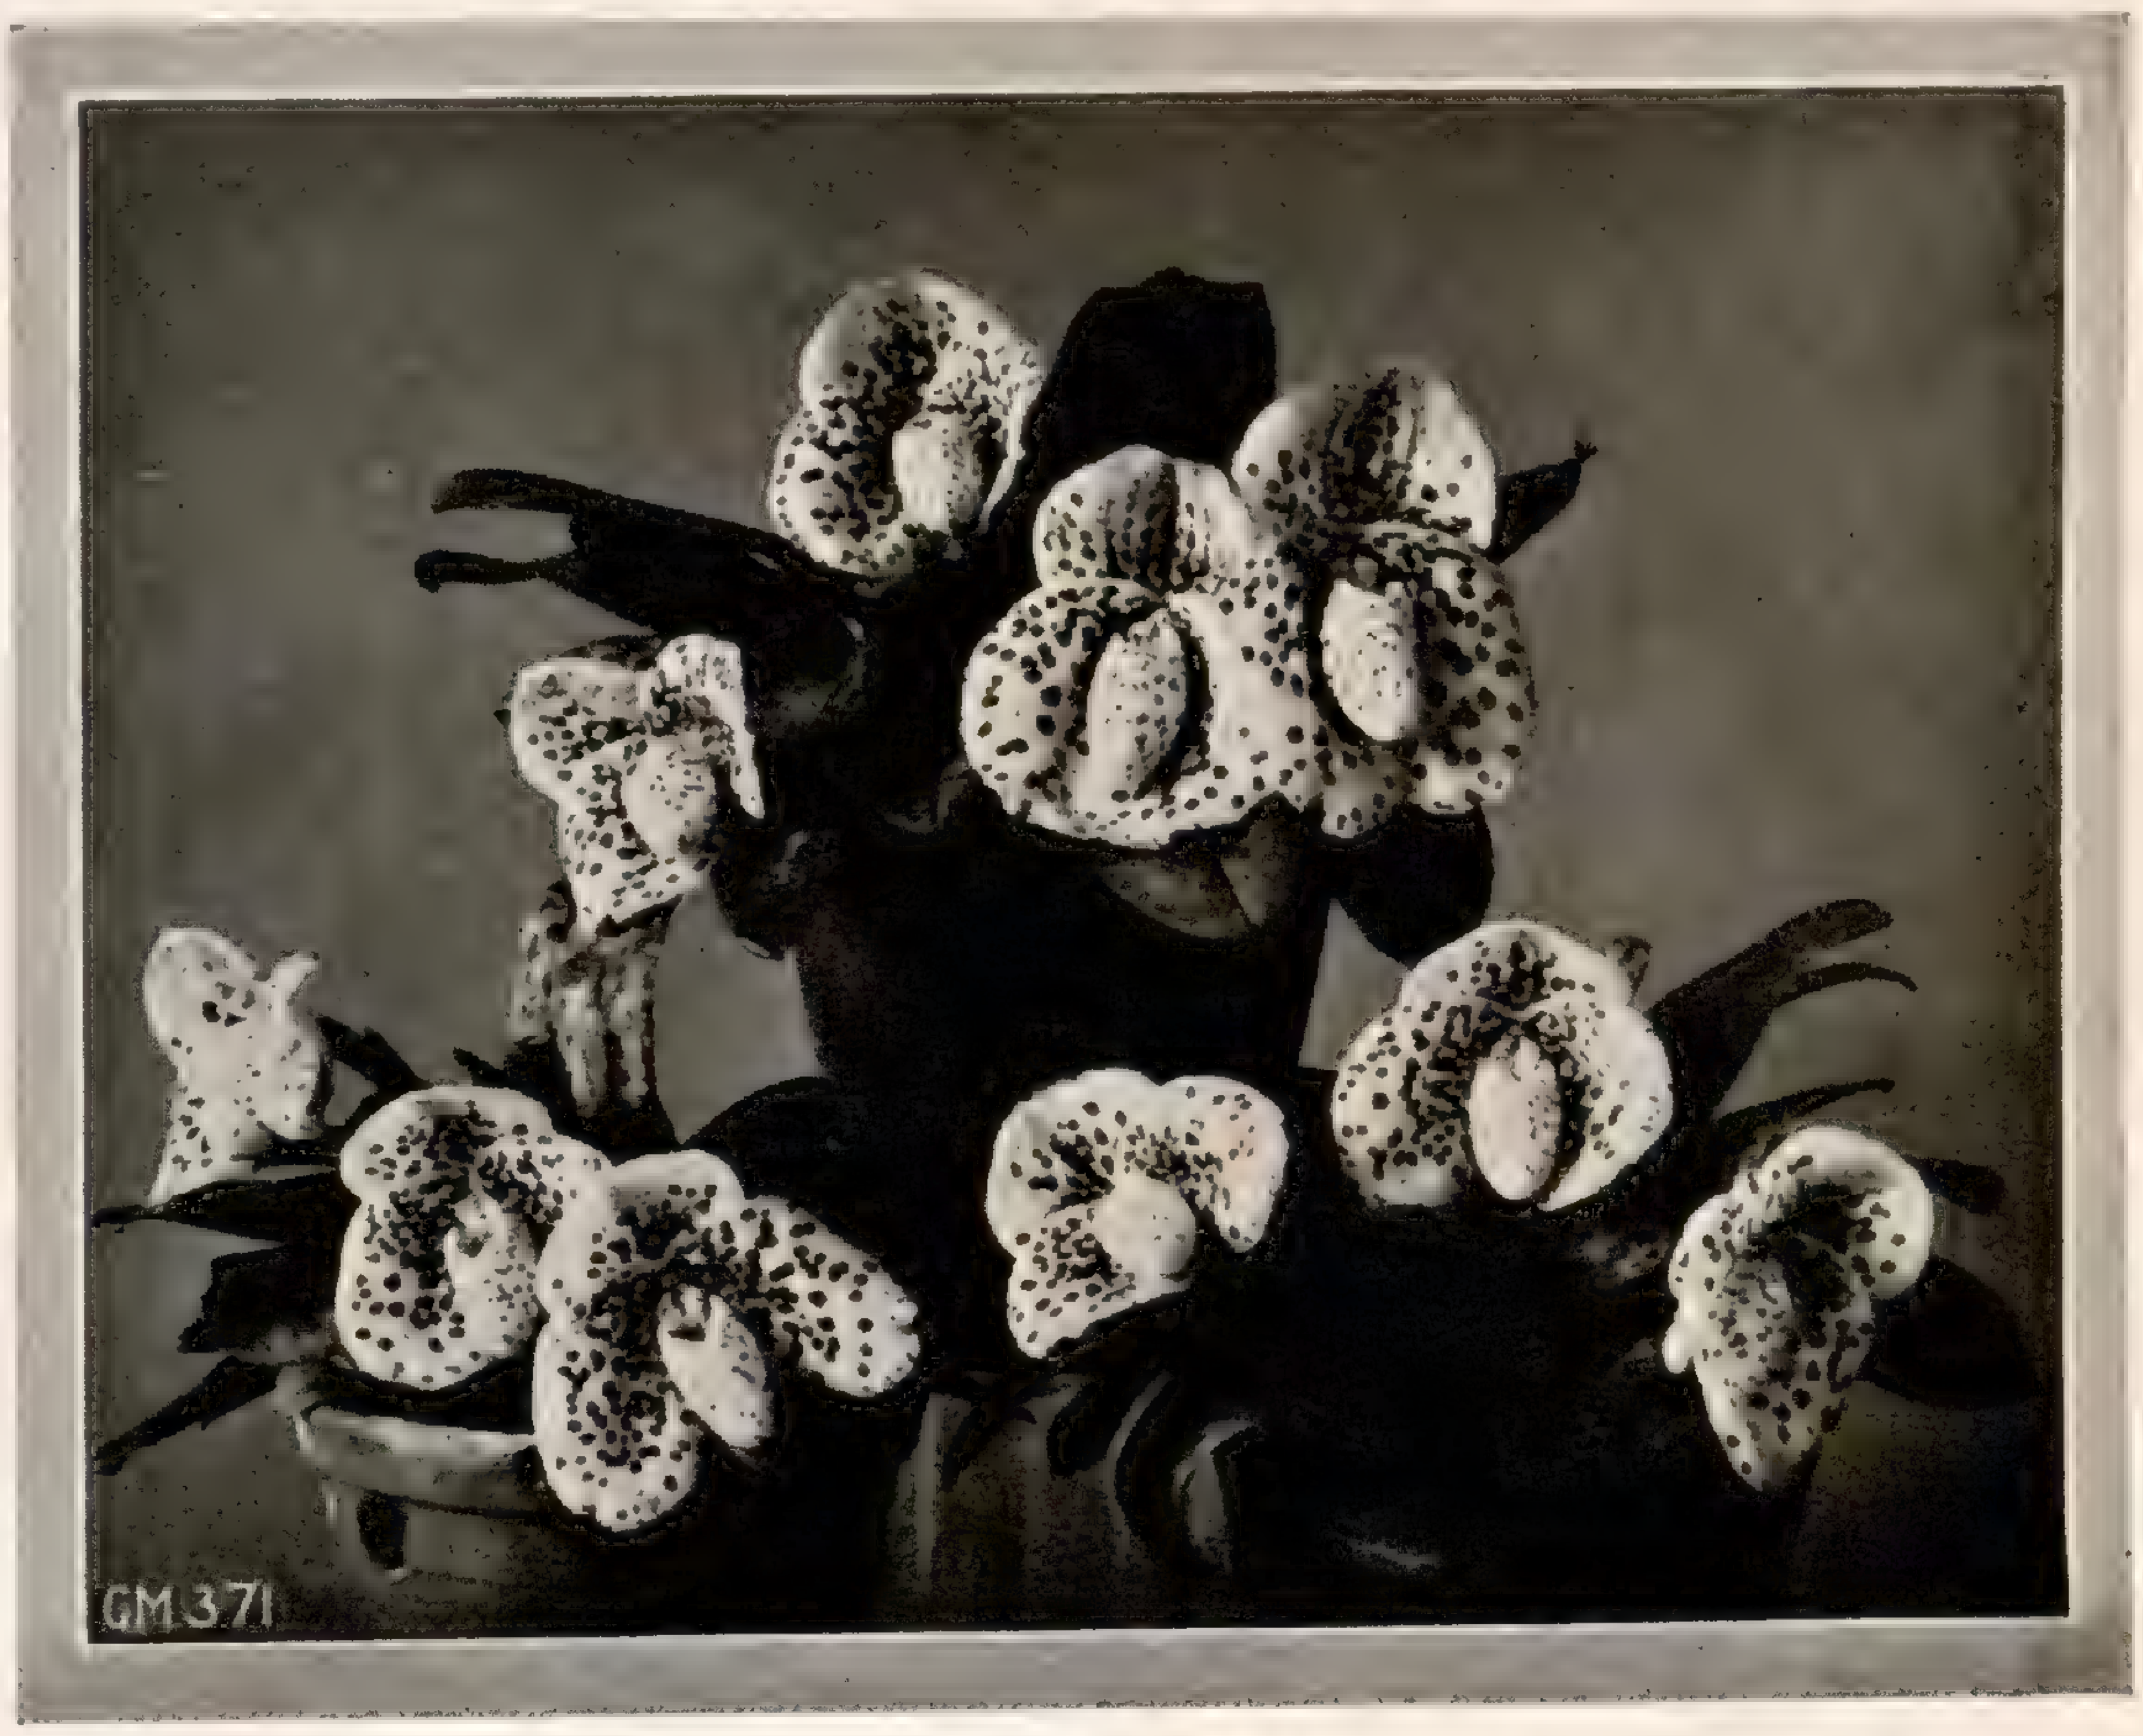
When dealing with coat flowers one cannot omit the better crested forms of moss varieties. Here, Blanche Moreau and White Bath are good pure whites; Celina is, perhaps, the best dark variety; Common Moss, Old Crested, and Salet being good pinks.

A. P.

## CYPRIPEDIUM BELLATULUM.

Cypripedium bellatulum is, perhaps, one of the most striking species of the genus, and yet is little cultivated in gardens. In few flowers is there found such a contrast of colour as in this orchid. As will be seen in the accompanying illustration, which is from a photograph of some plants grown in the Cambridge Botanic Garden, the petals, dorsal sepal, and pouch, have a ground of pure waxy white, thickly sprinkled with large, very deep blood-red blotches. The leaves, which measure about 10in. by 2½in., are also handsome, being dark velvety green, mottled with whitish patches on the upper surface, and on the under-side dark reddish-brown. The flowers are about 3in. in diameter, and are borne upon short stems. The plant remains in flower about a month.

This orchid is not of easy cultivation. It prefers a moist, tropical temperature, and should be grown in a compost consisting of loam, peat, sphagnum, and small lumps of charcoal. The addition of a few pieces of lime is sometimes recommended, but here it does perfectly well without any.



CYPRIPEDIUM BELLATULUM.

Flowers of waxy texture, white, with dark red-purple spots.

The plant is a slow grower, and, therefore, rather than endeavour to increase one's stock by means of division, it is better to import new roots. C. bellatulum was introduced into this country in 1888 from islands to the S.E. of Cochin China. A pure white variety (album) was introduced in 1895.

R. Stewart Lynch.

---

**Croton Souvenir de Thomas Rochford.**—This is a particularly good narrow-leaved croton, and one remarkable for the very bright colour that the leaves assume. Varying as they do in the colour of the leaves even on the same plant, crotons are exceedingly difficult to describe, but when at its best this variety has the major portion of the leaf of a brilliant salmon-scarlet colour, an extremely effective tint either by day or under artificial light. This last feature is greatly in its favour as a table plant.—K.

## CRINUMS FOR GARDEN DECORATION.

A number of the crinums, including one or two which are second to none in the genus, have a sufficiently hardy constitution to admit of their successful cultivation in the garden. In commit with many another exotic, they have settled down as naturalised British subjects with a good grace, and, provided the slightest protection is afforded during very severe weather, and more especially when we are favoured with torrential rains in mid-winter, they will not fail to resolve themselves into large and wide-spreading specimens.

It will occur to the cultivator to allocate a sheltered site, and perhaps no better place can be found for them than a raised border abutting upon a glass-house facing south. It is of paramount importance that the site be well-drained, and where the natural soil is heavy and tenacious loam, which often rests upon pure clay, the best plan is to remove the whole to a depth of three feet, and replace by efficient drainage and a suitable medium. To form a nine-inch layer of drainage, brick-bats, clinkers, etc., may be pressed into service, followed by turves grass sides downwards, which will effectually prevent the finer particles of soil being washed into the drainage material. A mixture of turfy loam, with a liberal quantity of leaf-soil, coarse sand, and broken crocks incorporated will meet their requirements as far as soil is concerned.

CRINUM MOOREI IN A SHELTERED BORDER AT KEW.

The best season for planting is late spring, as this allows for a long period in order to form growth, and to become thoroughly established in their new home before they are called upon to withstand our English winters for the first time. Specimens of large size, in pots or tubs, that are found to occupy too much space under glass, may be arranged in permanent quarters out of doors at any time during the early summer months, but it is inadvisable to put them out after August has become a memory.

Other details are to so arrange the border that there is a gentle slope from the back, with a view to the plants being fairly dry in winter; also to place a thick layer of cow manure about a foot distant from the plants, all round, in spring, to form a basin for the reception of the copious supplies of water they require from May onwards. A ready means of protecting the plants in winter is found in a thick layer of leaves, while reed mats will, if properly fixed, take off heavy rains, etc.

One of the most popular and most extensively planted of hardy crinums is C. Powelli, which I believe is an hybrid that claims as parents C. Moorei and C. longifolium. It boasts a robust constitution, and established plants produce several scapes from each bulb in the course of the season, the flowers being rosy-red in colour. Then we have varieties in album and rubrum, which are well worth attention, the last-named having flowers of a very pleasing shade in soft rose. I noted a small colony of C. Schimperi in a western garden last season, and was struck with the beauty of the pure white funnel-shaped flowers, which measured 9in. in length and 5in. in diameter. The more vigorous of the umbels had ten flowers, whilst those of medium stature were content with half a dozen. This species hails from Abyssinia, and the leaves are carried in perfectly erect fashion.

Another white-flowered kind is seen in C. latifolium var. Yemeuse, and when it is said that a score or more of flowers are borne upon very large umbels it will be readily understood that it is a plant of very considerable decorative value. Its flowering season extends from July to the end of August, when its efforts in this way are exhausted for the season. A first-rate colony of C. Moorei exists in a narrow border abutting upon the palm-house at Kew, and last season created a brave display. It is of strong growth, the rosy-pink flowers being borne on 6ft. high scapes. It is very necessary that this species be given a warm, sheltered spot, and this applies even in the South of England, while in the North it is liable to come to grief if left in the open. Very fine must be written against its variety alba, whose pure white flowers assume a blush tinge with age, which seems to enhance its beauty.

Walter H. Aggett.

## NIDULARIUM PICTUM.

The Bromeliads are a much-neglected race of indoor plants, some of which are remarkably showy, and, what is more, they retain their beauty a considerable time. The strap-shaped leaves, which are arranged in a regular vasiform manner, and thus form a dense rosette, are of a rich green, mottled with a deeper tint, and spiny at the edges. The flowers are borne in the centre of the tuft of leaves. They are violet in colour, and, being borne on short stalks, are not particularly showy, the most striking feature of the inflorescence being the shortened leaves which surround the blossoms. These leaves are of a brilliant shining scarlet colour, a feature which is retained for a long time.

This nidularium, which was introduced from Brazil over sixty years ago, is available for various decorative purposes, a valuable feature being the fact that from the firm, leathery texture of the leaves it is very little affected by draughts. It must be regarded essentially as a stove plant. Though generally met with under the name at the head of this note, it is by our botanical authorities regarded as Karatus fulgens, while it is also occasionally known as Guzmannia picta. Like many of its class, it grows freely in a compost made up chiefly of fibrous peat and sand, with free drainage. S. W.

# THE ROSE GARDEN AT KEW.

It seems somewhat out of place to designate any particular part of Kew where roses are gathered together as the Rose Garden, because roses are to be found in many parts of this great national garden, in scattered beds, in groups, and in large collections. There is the great rose pergola between the Rock Garden and the Herbaceous Garden, the collection of rose species and allied subjects towards the Pagoda, and the naturally planted rose garden or dell between the North Gallery and the Pagoda, but what is generally regarded as the Rose Garden proper is at the south end of the Palm House, and this is the part shown in the accompanying illustration. At the north end of the Palm House, between it and the Lily House, there are also numerous rose beds, and here the varieties Earl of Warwick, Duchess of Wellington, Mons. Paul Lede, and Mdme. Ravary give a good account of themselves. On the Palm House terrace four large circular beds occupy the corner positions, and these are filled with pegged-down plants of the inevitable Frau Karl Druschki, Gustave Regis, Lady Waterlow, and the brilliant and fragrant Gruss an Teplitz, each variety filling one bed.

The rose garden was replanted last autumn, and it has been a great success this year, while the growths on many of the varieties promise well for an autumn display. The three large beds depicted on the left of the illustration are occupied respectively by Mildred Grant, Caroline Testout, and Killarney. In the foreground is seen a small circular bed of Mrs. Aaron Ward, a charming variety, and beyond is a large bed of the newer Joseph Low, a capital pink bedding variety; further along are beds of Mdme. Abel Chatenay, always good; Lady Pirrie, a lovely copper and salmon H. T.; Lady Ashtown, a capital bedding variety; Rayon d'Or, of fine colour, but not a good grower as seen here; Mrs. A. R. Waddell, a fine, free salmon-red garden rose; a bed of standards of Florence Pemberton; a large oblong bed of the brilliant and very free General MacArthur; a small bed of The Lyon, grown as standards; and a bed of Orleans, now a dense mass of bloom, finishes the list in this direction. Marie Van Houtte, Duke of Edinburgh, and Antoine Rivoire fill beds in front of those depicted.

The old plan of filling a bed with as many varieties of roses as possible has well-nigh disappeared from gardens of any pretensions, but there are many rose lovers who have not the room to plant roses by the dozen, score, or hundreds of plants of a variety, and so they want to know which varieties are likely to be the most satisfactory. At Kew the habit of a variety, as well as the effect it produces, can be studied readily. Where beds of considerable size are devoted to one variety, it is a comparatively easy matter to determine whether such variety is suitable for the home garden. It must always be remembered that the soil at Kew is not ideal for roses, and that a variety found to succeed here is not likely to fail elsewhere.

VIEW IN THE ROSE GARDEN AT KEW.

**Dwarf Tropæolums.**—As showy annuals for dry and sunny spots the dwarf varieties of tropæolum are very desirable, as they are not at all particular in their requirements, and their flowering season extends over a lengthened period. In the suburbs of London they meet with a ready sale, small seedlings being hawked about by the costermongers in large numbers during the bedding season.—W.

# PRIMULA MALACOIDES.

The value of this primula for greenhouse decoration cannot be too highly estimated, and the species also lends itself wonderfully well to rock garden adornment. It is one of the most useful of all the recently-introduced Chinese species. The flowers are produced in great abundance on slender stems, being borne in tiers, each stem bearing a large number. In colour the flowers are of a delicate shade of lilac, occasionally varying to pale pink. For winter flowering the seeds are best sown in March, and the plants grown in a cold frame until the autumn, when they must be housed. To obtain a continuation of blossoms during the winter months seeds should be sown at intervals. Unlike the seeds of many primulas, those of this species quickly germinate, and there is little trouble in raising a batch of plants.

From an inside decorative point of view, P. malacoides is an important plant for winter use, as the flowers lend themselves exceedingly well to table dressing, and the graceful spikes of blossom are very effective. For outside planting the seeds are sown in January, and plants raised from this sowing usually flower in July, making a pretty display of colour when grown in cool, shady spots in the rock garden. For spring flowering outside the seeds are sown early in the autumn, and the plants wintered in cold frames. In April these are put out in sheltered spots, when the flower spikes soon appear. Possibly in some favoured localities this primula can be naturalised, but it is very doubtful whether it is hardy enough to withstand the dampness which is experienced in many of our gardens. E.

## QUANTITY v. QUALITY.

An interesting little article on "Baskets of Roses" appeared in the GARDENERS' MAGAZINE of July 20, in which the writer calls attention to the new classes for garden baskets to be found in many of the rose schedules of to-day. After commenting on the attractiveness of these baskets of roses, he proceeds to protest against the practice adopted by many recent exhibitors of overcrowding them with flowers; and he justifies his criticism by giving an excellent illustration, from a photograph taken at the National Rose Society's exhibition, of a basket of the Lyon rose. In this basket I can count at least forty-eight roses, which is certainly twice as many flowers as should be arranged in a basket of the specified size—namely, 14in. across.

I believe Messrs. William Paul and Son, of Waltham Cross, were the first to make considerable use of these baskets. For many years I have noticed them in the non-competitive exhibits this firm stages at the Hatfield Show, and I have always been struck with the beauty and freshness of the result. At the Holland House Flower Show this summer the same firm's exhibit owed much of its attraction to these baskets, and, as I was thinking of showing in the amateurs' class for three baskets at the National Rose Show, I noted specially how they were arranged, and how many flowers were wanted to make a good effect. In most cases from fifteen to twenty roses were used. The flowers were all young and fresh, and this gave a light and graceful effect, and allowed the form of each rose to be seen. When I came home I arranged a basket of Lady Ashtown with about twenty-four flowers. It looked well when the flowers were half-open, but the next morning they had expanded, and the basket was just a mass of pink colour, each flower having merged its shape and individuality in that of its neighbour, and any charm of arrangement there might have been was entirely lost. I think that if the flowers used are of good form, and the exhibitor is skilful in arranging them, fifteen to eighteen blooms will generally be found sufficient to make a good effect in a basket of the dimensions quoted above.

It is not, however, in baskets only that exhibitors are inclined to use far too many flowers. Many of the bunches of garden roses to be seen both at the National and at provincial shows are spoilt from a decorative, and still more from an artistic, point of view by being overcrowded. Exhibitors would seem to think they have only to produce a fine mass of colour to be awarded first prize, and in not a few cases the judges would appear to be of the same opinion. When, however, the judges have a more cultivated taste, and refuse to award the prizes to the weightiest exhibits, looking rather for beauty in the individual flower or truss, and elegance and taste in the arrangement, then it is often the public who object.

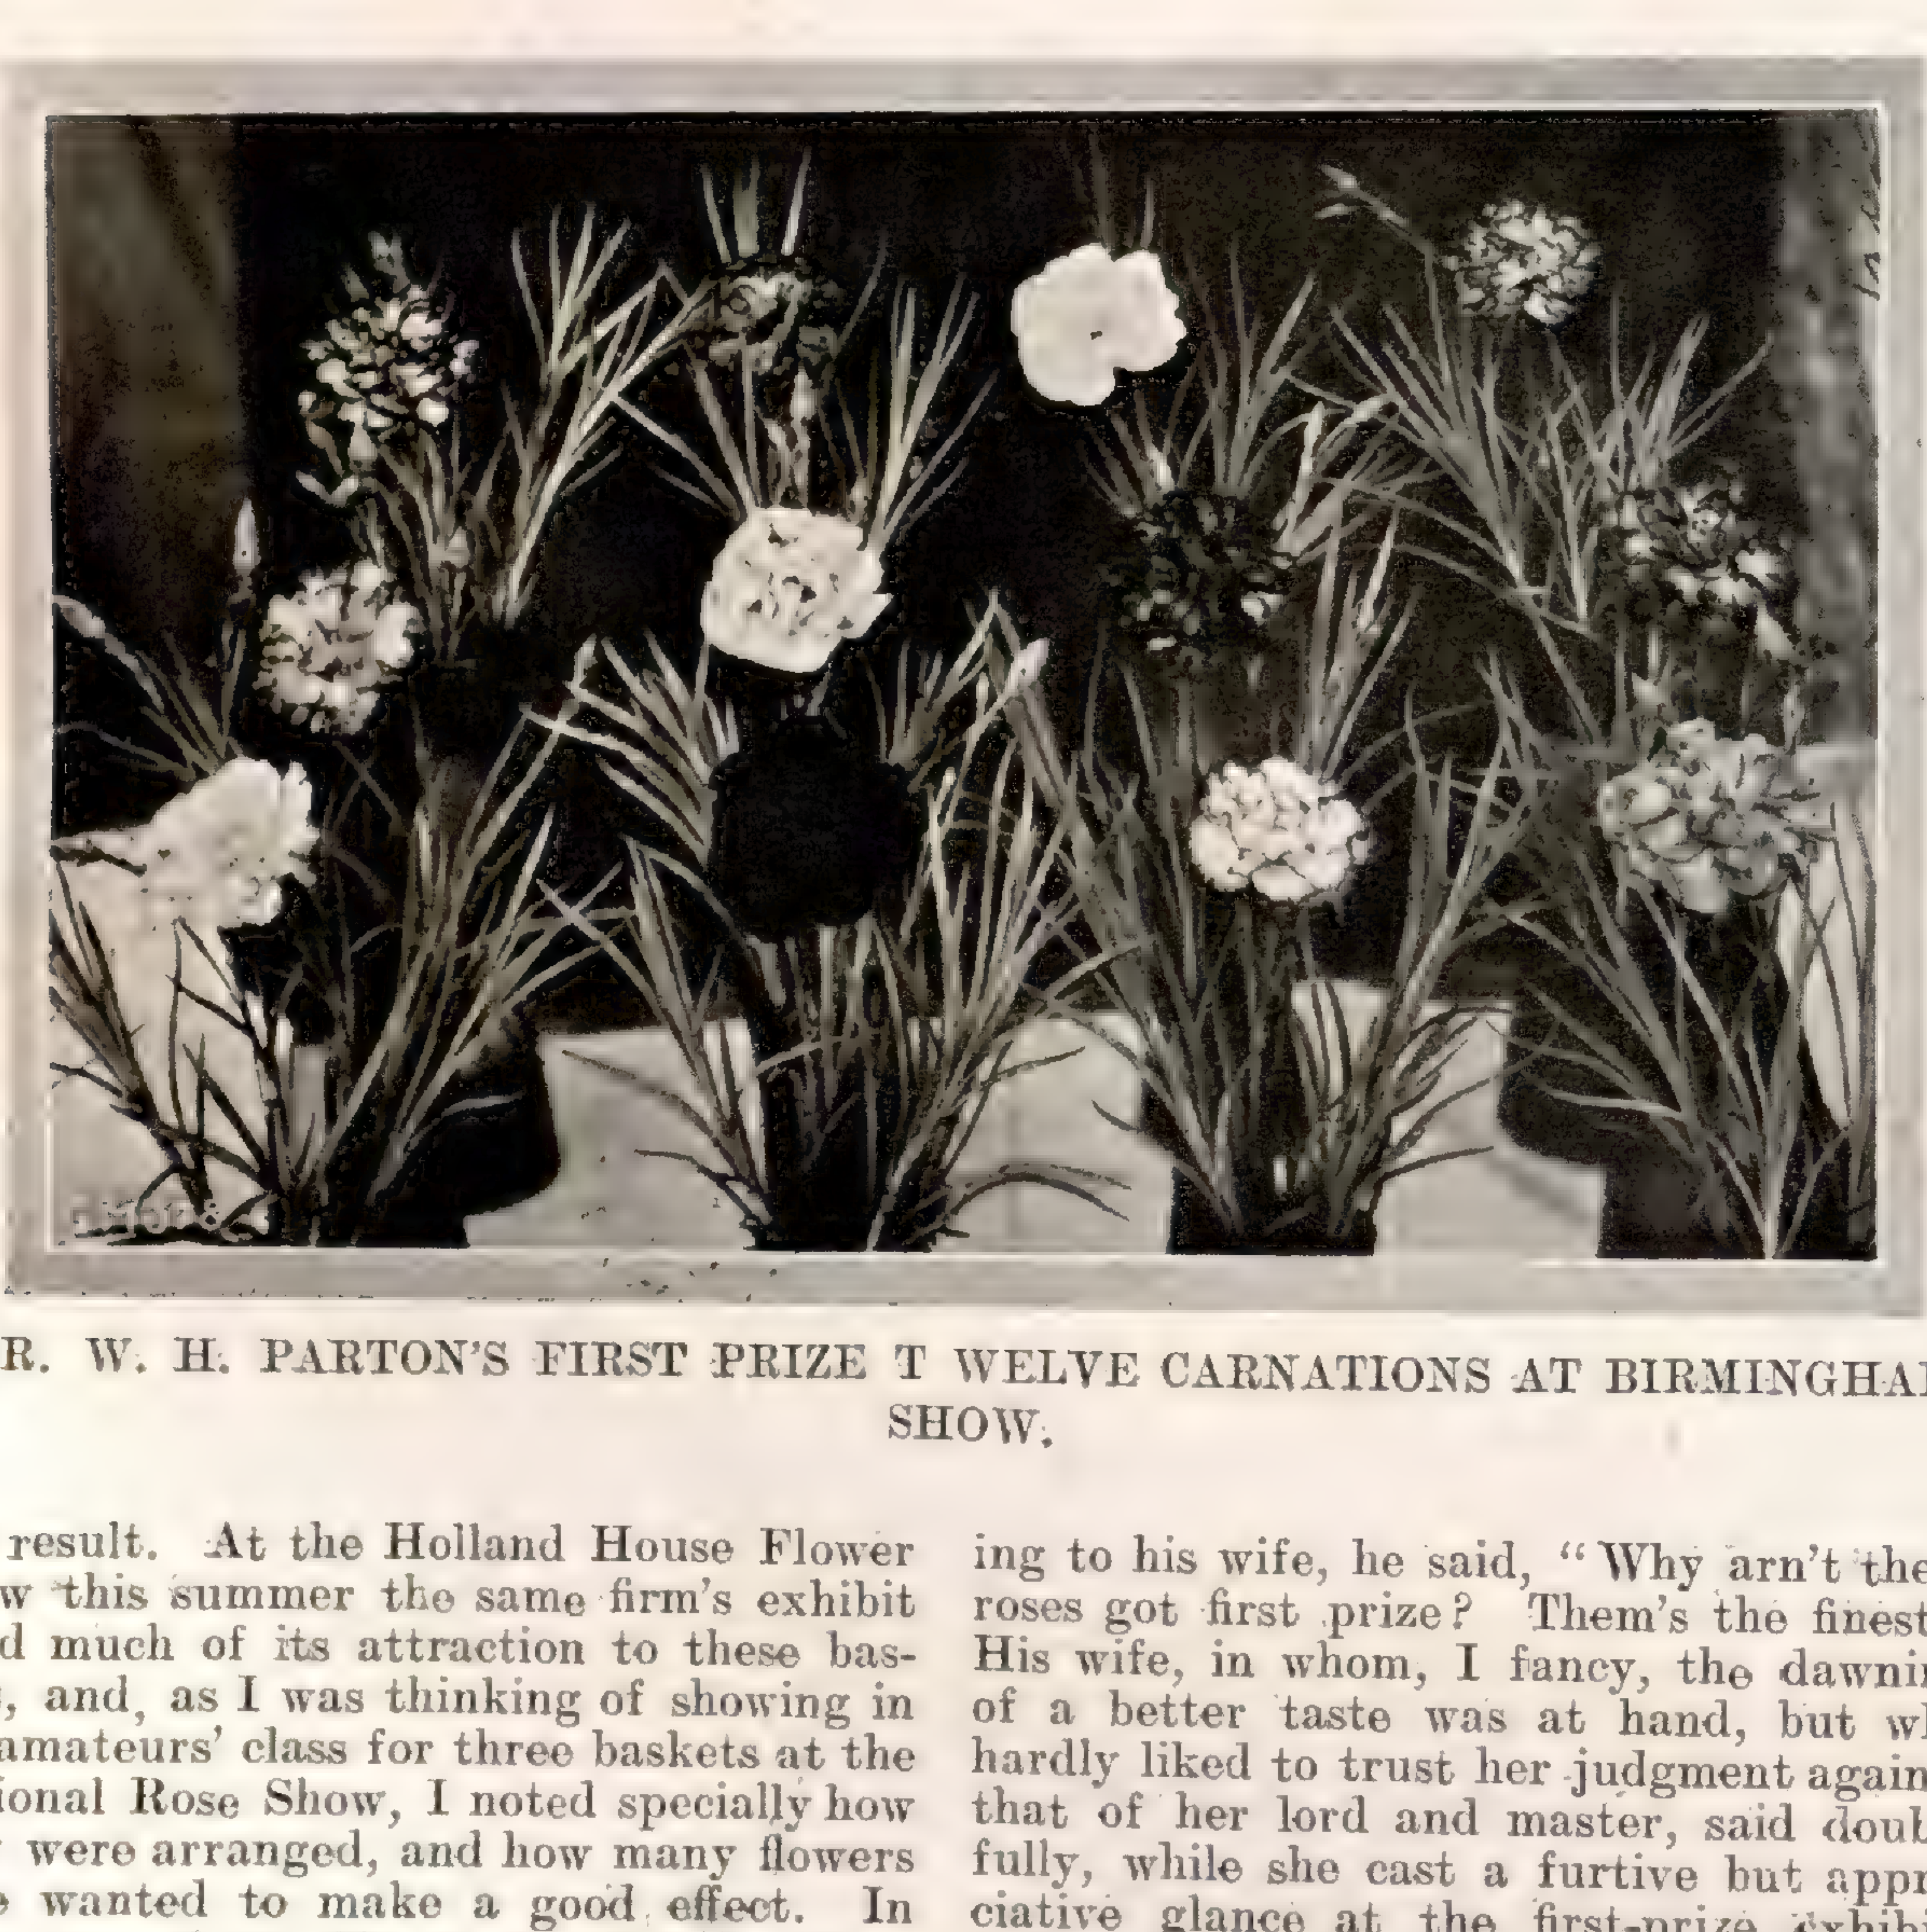
At a recent show in the Eastern Counties, where the judges had shown their good taste by passing over some enormous vases crowded with blossoms in favour of some well-arranged vases which contained about half the quantity of flowers, I was amused to hear the comments of a local visitor. He stood in front of the great, clumsily-arranged vases, then looked disparagingly at the light and pretty arrangement to which the first prize had been awarded. He was evidently much puzzled, and, turning to his wife, he said, "Why arn't them roses got first prize? Them's the finest." His wife, in whom, I fancy, the dawning of a better taste was at hand, but who hardly liked to trust her judgment against that of her lord and master, said doubtfully, while she cast a furtive but appreciative glance at the first-prize exhibit. "Yes; they are certainly the biggest." But this, from her husband's point of view, was a mere splitting of straws. "Well!" he said triumphantly, "arn't the biggest the finest?" The lady was silenced, if not convinced; but I felt very grateful to the man for having summed up in such a delightfully concise sentence what, apparently, is the motto of many exhibitors and some judges—"Arn't the biggest the finest?"

If we look to the real meaning of the word "fine," we shall see it is more nearly opposed to than synonymous with bigness. Crabb defines it thus: "Fine, in the natural sense, means smallness in general. . . thread is said to be fine as opposed to the coarse and thick. . . that the texture of a spider's web is remarkable for its fineness," etc., etc. Or, as Pope has it, "The spider's touch, how exquisitely fine!" So a specimen rose, to be fine, may be either large or small; it must be well-proportioned, pure in colour, perfect in form. A vase or basket of roses should be filled with roses that are as good in form and colour as their type admits, and so arranged that each flower or truss of flowers stands clear of the rest, allowing the beautifying effect which results from light coming between the sprays.

If the framers of schedules would more often copy the N.R.S., and specify the number of sprays allowed in a vase, we should not see so many of the distressingly crowded vases as we now do. I was sorry to see that in this year's schedule of the N.R.S. a retrograde movement had been made, in the fact that in the decorative classes for garden roses, where the space occupied by the exhibit is limited, the maximum number of stems allowed has been increased from seven to twelve. The latter number, in most cases, is too many for the space at the exhibitor's disposal; but too often the temptation to cram in as many sprays as were permitted proved too strong to be resisted, and the decorative effect of the exhibits suffered in consequence.

In sweet pea classes, and again in daffodil classes, the number of blooms to be shown in each vase is nearly always specified, with the result that no one can win simply by bringing up big battalions of blooms; and the taste of the exhibitors and of the general public is improved. There results, no doubt, a certain monotony which is the last thing to be wished for in a rose show; so it is well that in some classes the taste of the exhibitor should be trusted, and where this fails the judges should consistently refuse to award the prize. WHITE LADY.

## PRIZE CARNATIONS AT BIRMINGHAM.



MR. W. H. PARTON'S FIRST PRIZE TWELVE CARNATIONS AT BIRMINGHAM SHOW.

Mr. W. H. Parton, Moseley, Birmingham, an enthusiastic amateur carnation grower, staged at Birmingham Show on July 19 a fine dozen blooms of border carnations and picotees, distinct varieties, with which he won first prize in open competition. Our illustration of this exhibit shows that the flowers were staged singly, in vases, with sprays of carnation foliage, a method that has of late largely superseded the old-fashioned florist's custom of staging on boards. The varieties included excellent flowers of Linkman, Lord Steyne, and Sam Weller, three good yellow-ground fancies, as well as selfs of rich colours and with broad, smooth petals.

## DIPLADENIA BOLIVIENSIS.

Several examples of this easily-grown species of dipladenia were noted in a collection of indoor plants shown by Mr. L. R. Russell at Holland Park. This species, which, as its name implies, is a native of Bolivia, was first introduced by the late Richard Pearce, of tuberous begonia fame. It may be grown in a cooler structure than the large-flowered, brightly-coloured kinds, which were at one time popular for growing into large specimens. In Dipladenia boliviensis both the leaves and flowers are comparatively small, these last being from $2\frac{1}{2}$ to 3 inches in diameter, and in colour pure white, with the interior of the throat rich orange. It forms a very pretty climber for the roof of an intermediate house, especially where the flowers are brought near the eye. Besides this, pretty decorative plants may be formed by training the flexible branches around a few sticks, under which conditions they will flower freely.—T.

# ORIGIN OF COUNTESS SPENCER SWEET PEA.

Some further light is thrown upon the origin of the waved or Countess Spencer type of sweet pea by the communication made by Mr. Wm. Cuthbertson to the pages of the "Journal" of the Royal Horticultural Society. It is as follows:—

"In my lecture on 'New Sweet Peas' before the Royal Horticultural Society on February 20, 1912, I said, regarding the origin of Countess Spencer (the first of the waved sweet peas), that some colour was given to the opinion that it was a mutation from the fact that it was supposed to have occurred in other places than at Althorpe about the same time. I have had confirmation of that since.

Early in March I received a letter from an unknown correspondent—Mr. E. Viner, 14, Somerset Road, Frome—in which he stated that my name had been given him by a friend as one deeply interested in the development of the sweet pea. Mr. Viner said he thought he could tell me something that would interest me about the origin of the waved sweet pea. My reply was that I should only be too glad to hear from him. Subjoined I give the essential portions of Mr. Viner's important letter, which practically convinces me that Countess Spencer appeared as a mutation in Prima Donna in several places in Great Britain in the same season.

It will be remembered that Mr. Cole claims that his Countess Spencer was the result of crossing Triumph and Lovely, and crossing again in $F_1$ with Prima Donna. Mr. Unwin has put on record that Gladys Unwin (a modified waved form) also came out of Prima Donna, and I have been told by others that they saw the waved form the same season, but could not perpetuate it."

### Mr. Viner's Letter.

14, Somerset Road, Frome.

W. Cuthbertson, Esq., Edinburgh.

Re Sweet Pea Countess Spencer.

Dear Sir,—I received your esteemed letter this morning, and I now proceed to give you the details of the origin and pedigree of this pea.

As an artisan living close on the town, my garden has always been very limited, and therefore I have to make a selection of what serves, or what I like, best.

It must have been in the spring of 1900 I procured a few seeds each of Prima Donna and Lovely with the object of choosing the one I liked best, and my choice fell on Prima Donna. I quite discarded Lovely. The following year I grew Prima Donna from seed I saved myself, and quite late in the season I noticed a spray of two blooms (on Prima Donna) at the extremity of a shoot, with a peculiar crimpled character. I marked them and allowed them to seed (no other flowers appeared), and I obtained seven good seeds. The following year I planted them in due course, and all germinated, and, to my delight, five retained the wavy character; the other two were Prima Donna—pure. But the waved ones were glorious in the fine weather of early July. Now the Bath Show (Rose, etc.) was, and is now, held about the second week in July, and I took a bunch of the blooms and got them placed before the judges and committee, who gave me a certificate for it, and on the spur of the moment, at the suggestion of others, it was named Nellie Viner. Mr. I. House was at this show and saw the flowers, and wrote me later with the object of buying it. Later in the season I sent blooms to Mr. Eckford, to whom I eventually sold.

Through this part of the country it is well known that I secured this variety in the way described, but the fact has apparently never reached these in high places.

Mr. Wright, in his book, "Beautiful Flowers and How to Grow Them," says in the chapter on sweet peas that the variety was raised by some amateur, but by whom or where he was unable to say.

Of course I know Mr. Cole's variety was put on the market first, Mr. Eckford being obliged to grow another season, as the stock was small. Mr. Eckford was also informed that the variety on the market was something like his; he therefore dropped the idea of another name, and sent it out as his superior stock of Countess Spencer. I think had it not been for me, the finer form of this charming flower would never have been known.—I am, most respectfully yours,

E. Viner.

# EXAMINATION OF SCHOOL TEACHERS

## In Cottage and Allotment Gardening.

The Royal Horticultural Society's examination in Cottage and Allotment Gardening, open only to school teachers, was held in various centres on April 27, 1912.

One thousand and eighty-nine candidates entered for the examination, being an increase of 592 over the entries for 1911; 106 obtained sufficient marks for a first-class, 702 for a second, and 209 for a third, leaving only 30 failures, 41 absentees, and one candidate who was disqualified for consulting notes.

The examiners, Mr. F. J. Chittenden, F.L.S., Mr. John Fraser, F.L.S., Mr. Alexander Dean, V.M.H., and Mr. C. R. Fielder, V.M.H., report that, generally speaking, the answers returned showed an intelligent grasp of the subjects of the questions. The questions on vegetable cultivation, especially, produced very practical answers, and were awarded correspondingly high marks. It is, however, surprising that so many candidates would make up a hot-bed with well-rotted manure.

The examiners notice that the word "born" is much used in reference to the germination of seeds. The term is by no means a good one, for, as a rule, it applies to animal life, and not to plant life. Want of practical knowledge was very apparent where cyclamen, lobelia, and snapdragon were given as subjects suitable for training on a cottage wall! There was a similar want of knowledge, or thought, in recommending arsenical washes for currant and gooseberry bushes attacked by caterpillar.

Question 10 was well answered and diagrammatically illustrated, but in a large number of cases it was suggested that all the soil should be excavated within a given distance from the tree, instead of taking out a trench only at a certain distance. A still greater fault was the recommendation to use manure freely in refilling the trench, as this might be expected to reproduce the very condition of unfruitfulness and gross growth which it is the object of root-pruning to counteract.

In Section B a greater proportion of the candidates showed an appreciation of the principles concerning which questions were asked than in previous years; but, even so, there was still on the part of many a lamentable lack of the power to apply principles to practical gardening. Questions in Section B are designed to test how far the simple facts of plant physiology and structure, and of the nature of the soil, are really grasped by the student—grasped, that is, in such a way that they can be actually utilised in garden work. These questions cannot be adequately answered by those who have only read books. They require observant acquaintance with the things themselves, and intimate knowledge of the way a plant "works."

Perhaps the commonest mistakes were in saying that a plant is variegated because it does not receive sufficient carbon-dioxide; that hoeing "fills up the capillary tubes"; that the cabbage white butterfly pupates in the soil; and in confusing transpiration with respiration. Such errors result in mistakes in cultivation if an attempt is made to apply them.

W. Wilks.

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price, 7s. 6d. net by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

# LYCHNIS CŒLI-ROSA.

Cultivated in gardens as Viscaria oculata, this beautiful and showy annual possesses merit of a very high order for garden decoration, being admirably adapted for producing a lasting and effective display in beds or borders. A native of Southern Europe, and a member of the Dianthus family, it revels in abundance of sunlight; in other respects it is an extremely easy subject to cultivate, succeeding in any ordinary garden soil.

Like many of our best annuals, this subject amply repays careful cultivation, and is indeed never seen at its best unless thinly planted, allowing some 15 to 18in. between the plants. Sown in the open ground toward the end of September, and transplanted to frames for the winter, strong, bushy plants are obtained that are ready for permanent planting about the end of March or early in April. Growth is exceedingly rapid, and by the middle of May each plant will be at least 2ft. through and almost as high, the entire clump or bed presenting an impenetrable mass of leaves, stems, and blossoms, the latter being so much in evidence at that season that few annuals can equal it in this respect. The flowering season of autumn-sown plants extends from early May until the end of July, as the effort at seed production does not appear to impair their vigour to the same degree as in some other instances, while it is worthy of note that viscarias transplant with great freedom.

Autumn sowing has much to recommend it where an early display is required, but seeds sowns in the ordinary way in the open, during March, will yield, at least, equally good results, and the plants will form a succession to those sown in autumn. The advantage of sowing in situ in spring is readily apparent with many annuals; increased vigour and lasting qualities, combined with extra size, are generally in evidence, while it calls for the minimum of labour and attention. Staking is neither required nor desirable.

The best forms of Lychnis cœli-rosa or Viscaria oculata, for garden decoration, include the type, having rosy-purple flowers, the base of the petals being marked by a heavy dark blotch, and cœrulea, a most delightful shade of lavender-blue, and somewhat suggestive of a blue linum in flower; essentially a summer colour, it appeals to a very wide circle of admirers. In fulgens the colour is a good shade of blood-red, while picta has flowers almost pure white, with a dark blotch at the base of the petals.

Viscaria oculata is now regarded as a species of lychnis, the name given in the "Kew Hand List" being Lychnis cœli-rosa.

Thomas Smith.

Coombe Court Gardens.

# THE JACOBEA LILY.

Sprekelia formosissima is often met with in bulb catalogues as Amaryllis formosissima, is a native of Mexico, and, according to the "Dictionary of Gardening," was introduced therefrom as long ago as 1658. Bulbs can, when dormant, be purchased at a comparatively cheap rate, and with ordinary care they can be depended upon to flower in early summer. The blossoms, which are produced before the leaves, are of an intense crimson colour—a very striking tint. This sprekelia is not at all a difficult subject to grow. The bulbs should, on receipt in the autumn, be potted in a mixture of loam and sand, with a little leaf-mould if the loam is of an adhesive nature. They must then be kept in a greenhouse temperature, and given a little water occasionally during the winter months. As the days lengthen more water will be required.—W. T.

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

SOPHRONITIS GRANDIFLORA.—This is now commencing to grow, and may require repotting. It should be grown in shallow pans filled to quite three parts of their depth with drainage materials. Only a thin layer of compost is needed, and the kind used for cattleyas will answer requirements. The plants should be potted quite firmly, and be suspended in a light and moist position in the Odontoglossum house. Water must be afforded sparingly until the flower buds appear and the roots enter the new compost freely, when an increased supply may be given. The other sophronitis may be treated likewise, with the exception of S. violacea, which thrives better in a shady part of the intermediate house, and requires, when in active growth, an abundant supply of water at the root.

SOPHRO-CATTLEYA, SOPHRO-LÆLIA, AND SOPHRO-CATLÆLIA HYBRIDS.—These comprise some of the most gorgeous and highly coloured flowers imaginable. Undoubtedly, as time goes on, a true scarlet cattleya (or what will answer its purpose) will be obtained in this group of orchids. So far, some considerable difficulty has been experienced in the cultivation of these kinds, but many hybrids of complicated parentage take some little time to understand, and this most brilliant race is no exception. There are some three dozen or more of these interesting plants at the present time in existence, all worthy of a place even in the most select collection. Many will now commence to grow, therefore if any are in need of new rooting material, attention should be given them without delay. They are best treated as cattleyas, and will succeed in a similar compost, and delight in a cool position, elevated well up to the light in the cattleya house. They require very careful treatment at all times, and should be carefully watered, as an excessive supply may cause the decay of both leaves and pseudo-bulbs. Plants that are now at rest must not be unduly hurried, and a cool position in the intermediate house is the best for them. Cleanliness of the plants and their surroundings is an absolute necessity, remembering that attacks of small scale will do these delicate plants irreparable damange.

BURLINGTONIAS.—Many do not succeed with these orchids as well as they would like. They are free flowering, of compact habit of growth, and the flowers last for a considerable time in full beauty if kept free from damp. They thrive in small baskets, or pans, and should be suspended from the roof of the cattleya or intermediate house, where, owing to the amount of light and air available, they make satisfactory progress. They will succeed in the same kind of compost as the preceding. The drainage should be ample, and during the season of growth a free supply of water should be given, but when the plants are resting this must be greatly diminished, yet not altogether withheld, for if allowed to get dust-dry they will suffer, and the growth made will be unsatisfactory the following season. Small white scale is very persistent in attacking these plants, and must be kept in check by frequent sponging.—J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

RIVINA HUMILIS.—This shrubby plant is well worth growing for house and table decoration because of its bright red berries, borne in racemes. Well-grown plants form a pleasing contrast to the general collection of stove plants, especially in the dull season. Propagation is readily effected either from seeds or by cuttings. If two or three batches of plants are raised at intervals of a month or thereabouts, they will become effective successionally. Like many other stove plants the Rivinas will withstand a lengthy sojourn in the cool greenhouse during the summer, but a temperature of not less than 60 deg. is necessary during winter and spring. The standard form of training will give the best effect.

REMARKS IN GENERAL.—There will not be a press of work in this department for a time, therefore devote special attention to securing sufficient numbers of the various plants required for use indoors during next winter and spring. Where time allows thoroughly wash all pots with hot water, inside and out, before use, and wash the crocks used for drainage. It sometimes happens that the outsides of pots containing plants become coated with moss; these also should be cleaned. Above all things avoid overcrowding and an excess of shade at this season, and turn the plants occasionally to ensure symmetry. The careful cultivator who is interested in his work will attend to these small details regularly, and without such attention the best results cannot be expected. While the daily watering is being done many of these details may well be carried out, such as giving each plant a turn, picking off decayed foliage and superfluous growths. Admit air freely on fine days to ensure short-jointed, mature wood, and properly developed leafage. Staking should be attended to betimes where required, and care taken not to insert the stake too close to the main stem of the plant or the main roots may be severed. I am inclined to think this is a matter too often neglected. Probationers will do well to bear in mind that to be thoroughly successful cultivators it is very important they should think of these small matters for themselves.—H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

MELONS.—Plants that have recently been put out into their fruiting quarters are making rapid progress. Pay particular attention to stopping, tying, and thinning out the young growths, and pollinate the female flowers daily until a sufficient quantity of fruits are set. Maintain a free circulation of air in the house night and day during the flowering period, and guard against the use of strong stimulants until after a good crop has set and the fruits are swelling freely. The house should then be closed early in the afternoon, well syringing the plants with tepid water. Red spider is more or less troublesome to the plants at this season of the year, so a sharp look-out must be kept, and if discovered immediate steps should be taken to eradicate it. Also in many places mildew is troublesome on late-planted melons. We find the best remedy for mildew is to lightly vaporise the plants on three successive evenings with the sulphur vaporiser, but air must be admitted to the house early next morning, or otherwise the foliage is liable to burn during sunshine.

STRAWBERRIES.—Stock layered into three-inch pots, as advised in a previous calendar, will be well rooted, and no time should be lost in placing them in their fruiting pots; use six-inch pots for the final shift. The pots must be thoroughly clean, and moderately drained with clean, broken crocks and rough lime rubble; mix up a sufficient quantity of soil to pot the whole batch of plants, and place it under cover; use good fibrous loam, mixed with leaf-mould, or well-decayed cow manure, with a little lime rubbish or road scrapings added. Place one plant in each pot, and pay particular attention, when giving them the final shift, that the base of the crown is not lower than the finished surface, or otherwise this will induce them to form two or three crowns. Make the soil moderately firm in the pots, using a light rammer for this purpose; after the work of potting has been accomplished place the plants in a shaded aspect for a few days until they have recovered from their shift, and afterwards they can be placed in the open quarters on a gravel or ash base. Give water carefully until the roots have permeated the new soil, and spray the plants two or three times a day with clear water. Remove all runners as they appear. The pots can be placed close together for a time, but as the foliage develops more space must be allowed to afford the plants plenty of light and air. It should be borne in mind that unless the crowns of the plants are fully developed and well ripened poor results will follow when forcing takes place.—Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

TROPÆOLUM SPECIOSUM.—This attractive climber is not so frequently grown in English gardens as it deserves to be, owing, no doubt, to the fact that it is difficult to establish in many localities. It should always be given a cool position, and where it has failed to succeed elsewhere it might well be given a trial on a north aspect, as it frequently grows and flowers freely in such a situation. It can sometimes be grown with success when planted under the shade of evergreens, and the background provided by them displays its brilliant vermilion flowers to advantage. A deep, fairly light and moist soil suits this climber the best, and when heavy land has to be prepared for it, a quantity of leaf-soil must be thoroughly incorporated. It requires watering in dry weather, and a mulch of short manure helps to keep it cool at the base. It is best propagated by division of the roots, and young plants should be planted out in the spring.

ROMNEYA COULTERI.—There is no more delightful subject than the Californian Tree Poppy for planting in a warm and sheltered part of the rock garden, or at the base of a wall facing south. The flowers are usually produced on the points of the new shoots, and are sometimes six inches across, of the purest satiny whiteness, with yellow centres. The plant is quite hardy, but it prefers a fairly light, warm soil, in which it produces vigorous growths that flower during August and September. The flowering stems should be cut down in winter, and a liberal mulching of leaf-soil be then applied over the roots. It greatly resents disturbance when once established, but when removal is necessary it is best carried out in the spring, just as growth is about to commence.

MECONOPSIS WALLICHI.—Under favourable conditions this handsome plant forms a specimen fully four feet in height, and when its pretty pale blue flowers are expanded it is a conspicuous object in the rock garden. During the summer it prefers a fairly moist and partly shaded position, but in the winter months means must be taken to prevent it becoming too wet at the roots. Meconopsis integrifolia is another interesting plant, with pale yellow flowers. It is a biennial, and succeeds under the same treatment as the foregoing. Sow seeds as soon as they are ripe, and let them germinate in a cold frame. Plants growing in the wild garden here have developed into sturdy specimens from self-sown seeds.

SHRUBS NOW IN FLOWER.—Among flowering shrubs, those that contribute to the floral display at the present time are especially welcome. Several of the spiræas are gay with bloom, and of these S. Lindleyana, with its fine arching plumes, is a lovely plant, fully ten feet in height. S. ariæfolia is another desirable kind, with creamy-white flowers; while S. Anthony Waterer, S. bullata, and S. Douglasi, all with bright red flowers, are attractive. S. Aitchsoni, somewhat like S. Lindleyana, has pretty fern-like foliage. In the broom family, Cytisus nigricans has tall, erect spikes of yellow flowers; while C. leucanthus is a pretty, dwarf shrub with cream-coloured flowers, and it is suitable for the rock garden Ceanothus Gloire de Versailles is flowering freely, and makes a capital plant for the pergola. Hydrangea paniculata is producing its plume-like heads in profusion, and Clethra arborea is studded with its lovely white bell-shaped flowers. The latter subject prefers rich loamy soil, with peat or leaf-soil added, and it thrives best in partial shade.—J. Gardner, Batsford Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

On July 30, there was another small exhibition at the Royal Horticultural Hall, Westminster. Phloxes and gladioli were very much in evidence. Orchids were not largely represented, and no Certificate or Award of Merit was granted by the Orchid Committee. The Floral Committee had a fairly busy sitting, and granted nine Awards of Merit; while the Fruit and Vegetable Committee granted three Awards of Merit and one First Class Certificate to potatoes that had been grown at Wisley and tested for cooking quality.

### FLORAL COMMITTEE.

A rare display of very fine gladioli from Messrs. Jas. Kelway and Son, Langport, provided one of the leading features of the meeting. The spikes were set up lightly with asparagus sprays. Several of the new Langprim hybrids were shown, but large-flowered forms were most in evidence, and of these we were specially interested in Crown Jewel (A.M.), pink and yellow; and Lady Muriel Digby, Lady Regnart, Cowslip, Hall Caine, La Parisienne, Prince of Orange, Golden Measure (very fine), and Miss Zena Dare. All these latter were of yellow or yellowish colouring, and formed a distinct and attractive set.

Several small collections of gladioli were staged by Dutch growers, notably Messrs. Jean Barth Bros., G. Zeestraten and Sons, and P. Vos. There was no style in the disposition of the spikes; in one case there was a printed label to designate ownership; in another a pencilled note; and in another case a name and address was written in ink on a piece of soft paper. Conspicuous varieties were Badenia, with bluish-mauve flowers marked with violet; Glory of Noordwyk, soft yellow, that has gained a F.C.C. at Amsterdam, Haarlem, and London; Willy Wigman, white, with red-brown blotches; Emperor of India, darkest maroon-crimson; and the small yellow Sulphur King.

Messrs. Jas. Veitch and Sons, Chelsea, exhibited four graceful rafter plants of fuchsias, set over a collection of cannas, in splendid variety, Browallia speciosa major, B. viscosa, Kalanchoe flammea, and a set of beautiful greenhouse rhododendrons, among which was the new rosy-carmine Clorinda (A.M.), a fine variety, obtained by crossing R. jasminiflorum carminatum with R. Minerva, these two parents being also shown. Thalictrum dipterocarpum, with its graceful spikes of bluish-mauve flowers, also figured in this group. Hæmanthus Andromeda (A.M.), with large, dense heads of bright salmon-scarlet flowers, and large, broad green leaves, was represnted by seven flowering specimens, exhibited by Mr. Cobb, gardener to R. R. Cory, Esq., Duffryn, St. Nicholas, Cardiff. This hæmanthus reminds us of H. Katherinæ.

In the exhibit from Messrs. H. B. May and Sons, Edmonton, conspicuously beautiful ferns were Adiantum Farleyense gloriosum, A. Veitchi, A. cardiochlaena, Nephrolepis Neuberti, and N. Mayi. Mr. F. Cooper, gardener to N. C. Davidson, Esq., Borlases, Twyford, Berks, sent a batch of seedling coleuses, but the colouring was not particularly brilliant. A bank of carnations from Messrs. Wm. Cutbush and Son, Highgate, was composed chiefly of perpetual varieties, such as Mikado, Rose Doré, the new light yellow-ground Miss Winnie Hey, Mrs. McKinnon, a new red, Carola, Goldfinch, and R. F. Felton.

Messrs. Bees, Lim., Liverpool, exhibited Lobelia Blue Bees, a strong-growing, trailing variety, with bright blue, white-eyed flowers; Roscœa capitata purpurata, with purple flowers, and Dracocephalum Forresti, with soft lavender-blue flowers, and Lilium lophophorum, were also staged by the Liverpool firm.

Messrs. T. S. Ware, Lim., Feltham, were large exhibitors of phloxes and pentstemons, and they showed the latter particularly well, staging a dozen spikes or so of such showy and beautiful varieties as Fire Dragon, Salamander, Damocles, Arethusa, Eros, the vivid and white-throated Diamond—a splendid sort, Lady Hallé, Sylviane, Taurus—deep red, a dense spike, Mrs. R. Paget, and Capella. Messrs. Stuart Low and Co., Enfield, set up a few perpetual carnations, but their most prominent subject was Clethra arborea (A.M.), with horizontal spikes of pendant, pearly-white flowers; some of the plants, in five-inch pots, were flowering quite freely and beautifully. Where it thrives out of doors this is a fine flowering shrub. Hardy flowers in variety were contributed by the Guildford Hardy Plant Nursery Company, Guildford.

An effective bank of hardy flowers from Mr. Maurice Prichard, Christchurch, included a selection of the best phloxes, the pretty Heeria elegans, with rosy-purple flowers; Lysimachia Henryi (A.M.), of dwarf habit, and bearing clusters of yellow flowers; delphiniums, gladioli, Montbretia George Davison, and the handsome Crimson Powelli. Phloxes were largely staged by Messrs. W. Wells and Co., Merstham, the leading varieties being Champs Elysées, Selma, Elizabeth Campbell, Henri Regnault, Le Prophete, the large-flowered Rose Queen, Geoffry St. Hilaire, and the dark purple Le Mahdi. Messrs. Rich and Co., Bath, presented a collection of pentstemons, but, unfortunately, the flowers had not travelled well; the same firm contributed a collection of phloxes that included the leading varieties.

Mr. Jas. Box, Lindfield, displayed phloxes in fine style, his group being quite artistic, as well as effective. There were great mounds of such lovely sorts as Sheriff Ivory, Le Mahdi, Lindfield Beauty, G. A. Strohlein, Fiancée, General von Hentz, Frau A. Buchner, and Selma. The new, large-flowered Francois de Neufchatel—greyish blue; and Widar, soft blue, another new sort, were two very promising varieties of considerable distinction. Messrs. Webb and Brand, Saffron Walden, exhibited fine spikes of splendid hollyhocks, the big double blooms being very attractive. A few outstanding varieties were Walden Primrose, Fire King, Peri, Ovid, Rosy Morn, and Lady Bailey.

The phloxes exhibited by Mr. H. J. Jones, Lewisham, were well staged, and notably good were the spikes of Mdme. Paul Dubrie, soft blush; Brilliant, Antoine Mercier, Le Mahdi, G. A. Strohlein, and Elizabeth Campbell. Two stands, composed of sprays of Bocconia microcarpa and Solidago altissima, attracted a great deal of attention, the ladies being loud in their praises of this pretty combination of greeny-grey and gold. Messrs. H. Cannell and Sons, Swanley, filled a large space with a brilliant exhibit of cannas and begonias, the latter chiefly represented by double varieties. Their pendulous double scarlet variety, named Decorator (A.M.), was especially graceful and suitable alike for pots and baskets, for while the stem is fairly sturdy, the flowers hang gracefully on longish stems. The parents of this variety were Washington and Fleur de Chrysanthéme.

The Rev. J. H. Pemberton, Havering, exhibited Rose Danæ (A.M.), a small-flowered, pale yellow variety, suggestive of Allister Stella Gray, but bearing its blooms more sturdily in lax clusters. One of the most brilliant flowers in the show was Eschscholtzia Mikado canaliculata (A.M.), a vivid scarlet variety, with orange-yellow centre, and with the petals beautifully crimped or goffered (the ladies would probably say pleated), in regular lines from base to margin. This was shown by Mr. W. H. Gardiner, St. Osyth.

### ORCHID COMMITTEE.

Messrs. J. and A. McBean, Cooksbridge, put up a small collection of orchids, and here were Odontoglossum Harryanum, O. Rolfeæ, O. Elaine, Cattleya gigas, Odontioda Charlesworthi, Dendrobium Dearei, etc. Messrs. Stuart Low and Co., Enfield, submitted a group of considerable size, and made a quite good show with Cattleya Warscewiczi, C. Harrisonæ, C. granulosa, Brasso-cattleya Maronæ, Renanthera Imschootiana Miltonia Lambeauianum, and Disa grandiflora. From Mr. E. H. Davidson, Borlases, came a six-flowered spike of Vanda Sanderiana, Cattleya Rex, with two spikes, Odontioda Cooksoniæ with two fine spikes, etc.

Messrs. Charlesworth and Co., Haywards Heath, had a small exhibit, and here the leading plant was Odontioda Madeline, a lovely crimson-flowered hybrid between O. Charlesworthi and Odontoglossum crispum; Cattleya Warscewiczi majestica, Stanhopea oculata, Habanaria Suzannæ with white, fringed flowers, Grammangis Ellisi and Brassavola Digbyana were also well shown. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, showed a fine specimen of Cypripedium W. R. Lee, with five spikes, and a total of thirteen flowers; a cultural commendation was awarded. Odontoglossum Jasper was well shown by Mr. De Barri Crawshay, Rosefield, Sevenoaks.

Mr. Thurgood, gardener to H. T. Pitt, Esq., Rosslyn, Stamford Hill, exhibited Cattleya Dowiana, C. Warscewiczi, Frau Melanie Beyrodt with five lovely flowers, Odontioda Charlesworthi, Brasso-cattleya Helen, and the quaint little Bulbophyllum barbigerum. Mr. H. A. Tracey, Twickenham, also sent a few orchids.

### FRUIT AND VEGETABLE COMMITTEE.

The Church Army sent a large collection of vegetables grown at gardens in Stillington Street and Elverton Street, Westminster; dwarf beans, carrots, marrows, endive, onions, parsnips, and turnips were specially well represented.

Several potatoes, cooked and uncooked, were brought up from the society's gardens at Wisley, and awards were made as under.

### CERTIFICATES AND AWARDS.

First-class Certificate.—To Potato Witchill Seedling, from Messrs. Smith and Son, 18, Market Street, Aberdeen.

Award of Merit.—To Lysimachia Henryi, from Mr. Maurice Prichard, Christchurch; to Gladiolus Crown Jewel, from Messrs. J. Kelway and Son, Langport; to Begonia Decorator, from Messrs. H. Cannell and Sons, Swanley; to Rhododendron Clorinda, from Messrs. J. Veitch and Sons, Chelsea; to Hæmanthus Andromeda, from R. R. Cory, Esq., Duffryn, St. Nicholas, Cardiff; to Clethra arborea, from Messrs. Stuart Low and Co., Enfield; to Eschscholtzia Mikado canaliculata, from Mr. W. H. Gardiner, St. Osyth; to Rose Danæ, from Rev. J. H. Pemberton, Havering, Romford; to Astilbe simplicifolia, from Mr. G. Reuthe, Keston, Kent; to potato Imperial Beauty, from Messrs. Barr and Sons, Covent Garden, W.C.; and to potatoes Irish Gem and King George V., from Mr. W. E. Sands, Hillsborough, co. Down, Ireland.

### MEDALS.

Silver-Gilt Flora.—To Messrs. J. Kelway and Son, Langport, for gladioli.

Silver-Gilt Banksian.—To Mr. Jas. Box, Lindfield, Sussex, for phloxes; to Messrs. T. S. Ware, Lim., Feltham, for pentstemons and phloxes.

Silver Knightian Medal.—To Westminster City Church Army Gardens, for vegetables.

Silver Flora.—To Messrs. H. B. May and Sons, Edmonton, for ferns and campanulas; to Messrs. Jas. Veitch and Sons, Chelsea, for greenhouse plants; to Messrs. Stuart Low and Co., Enfield, for orchids; to H. T. Pitt, Esq. (gardener, Mr. Thurgood), Stamford Hill, for orchids.

Silver Banksian.—To Messrs. H. Cannell and Sons, Swanley, for begonias, etc.; to

Mr. M. Prichard, Christchurch, for hardy flowers; to Mr. E. H. Davidson, Borlases, Twyford, Berks, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. J. and A. McBean, Cooksbridge, for orchids.

Bronze Flora.—To Messrs. W. Wells and Co., Merstham, for phloxes and carnations.

Bronze Banksian.—To Messrs. Aldersey and Marsden Jones, Tilston, Malpas, for sweet peas; to Mr. H. J. Jones, Ryecroft, Lewisham, for phloxes.

## Leamington.

The third annual show of the Leamington and County Horticultural Society was held under favourable conditions in the park on Wednesday and Thursday, July 24 and 25. Thanks to liberal support from the gentry of the county of Warwick, this society offers very attractive prizes, and at no provincial show is there so fine an array of handsome challenge cups as at Leamington. Competition is consequently very keen, and, although the society is quite in its infancy it manages to provide an exhibition of flowers, fruits, and vegetables that is equal to that seen at what may claim to be the leading shows in the country.

It is somewhat strange that in face of all this there is very much room for improvement in attendance; in fact, on both first and second days the attendance was most disappointing. We wish it were otherwise, for the management of the show is in every respect a credit to those in office, and if the good people who are generous in the matter of subscriptions would but come forward and grace the show with their attendance, Leamington would speedily stand high among horticultural events. The weakness in this respect is a real danger, as evidenced by the fact that the trade exhibits this year were fewer than on the two former occasions. It is the attendance that attracts those exhibitors who exhibit for commercial purposes, and the trade can be relied upon if they find the public are ready with their support.

In a show of all-round excellence the outstanding features were the carnations, the big collections of roses, and the wonderful group of stove plants from Messrs. J. Veitch and Sons, which received unstinted praise from all. Table decorations were numerous, but it is surely time someone came forward with some originality and variety to break the monotony of sweet peas used in small tubes that do not hold sufficient water to keep the flowers fresh.

### GROUPS AND PLANTS.

The group class was not large, there being only three entries. The space occupied by each was 20ft. by 12ft., and certainly in point of merit the exhibits would compare favourably with those generally seen at the leading events. Messrs. J. Cypher and Sons, Cheltenham, who secured the chief award, had a group in their best style. A grand specimen Kentia occupied the position of honour in the centre of the group, raised on a cleverly-constructed arch, which was tastefully furnished with small crotons, caladiums, the pretty little Origanum hybridum, etc. The corner crotons were beautifully furnished plants, and the groundwork of cattleyas, odontoglossums, maidenhair and other ferns was disposed with exquisite taste. Mr. J. Macdonald, gardener to Sir George Kenrick, Bart., Edgbaston, was an excellent second, and in his arrangement he used orchids and liliums freely among the foliage plants. Mr. Wm. Vause, the local nurseryman, had a very effective, but slightly heavier group, for which he received third prize.

Messrs. J. Cypher and Sons led the way for twelve stove and greenhouse plants, with beautifully-trained specimens of stephanotis, clerodendrons, statices, and ixoras, with a splendid specimen of Phœnix Roebelini in the centre of the group. Mr. Vause's second prize lot consisted of much smaller plants. Mr. R. Denton, gardener to A. Cay, Esq., Woodside, Kenilworth, received first prize for three lovely ferns, second prize going to Mr. Bartlett, gardener to C. C. Shaw, Esq., Thornbank, Leamington; and third to Mr. H. J. Finch, gardener to J. H. Burley, Esq., Leamington. Mr. Vause had a finely-developed bougainvillea, with which he won first for a single specimen plant in bloom. Mr. Bartlett scored for a single specimen foliage plant, Mr. A. J. Friend, gardener to the Misses Robinson, Leamington, being second, and Mr. Vause third.

In the class for six begonias, first prize among six entries went to Mr. Jones, gardener to Mrs. Rayson, Leamington, the plants being well furnished with bloom. Mr. Denton took second place. Mr. J. Steadman, gardener to Mrs. Stanbridge, Elm Bank, Lillington, was third. Mr. W. G. Jones had a good half-dozen gloxinias that stood right away from three other very moderate entries. Mr. Denton received a twenty-guinea challenge cup for a group of ferns arranged on 20ft. by 4ft. table space. No other competitor came forward, which is a matter for regret, as this should be a fine class with so attractive an award. Mr. Denton's collection included a good many varieties of adiantums, plumose nephrolepis, lomarias, etc., all small, neat plants. Mr. Denton's name again appeared as winner for three coleus, his plants being dwarf, symsymmetrical bushes of brightly-coloured varieties. Three zonal pelargoniums were shown by Mr. W. G. Jones, who staged shapely plants of double varieties; Mr. M. Golby, gardener to Mrs. Jenkins, Westwood, Holly Walk, Leamington, coming second.

### ROSES.

The class of greatest interest among the roses was for a group of either pot plants or cut flowers, arranged for effect on a table space of 12ft. by 4ft, a challenge cup, value 25 guineas, being offered. Only three exhibits were put up, but they were so excellent that the class was the object of general admiration. The fortunate winners were Messrs. Gunn and Sons, Olton, who deserve high praise for the glorious display of the leading varieties they arranged with masterly skill. Great pillars of Excelsa, Dorothy Perkins, and Dorothy Dennison were supported by mounds of White Maman Cochet, The Lyon, Lady Roberts, and the delightful Edu Meyer, with a host of others in smaller bunches. Mr. Wm. Lowe, Beeston, Notts, was a fine second; Le Progres, rich orange-buff, was well shown, with Richmond, Geo. C. Waud, and Pharisaer, while all the more popular hybrid teas were put up in either small groups or big masses. The King's Acre Nurseries, Lim., Hereford, had a good group, for which third prize was awarded, their stand of the charming, single Irish Elegance being conspicuous.

Roses in boxes made a very good diplay, the flowers being well up to exhibition standard. Messrs. Perkins and Sons, Coventry, took the lead for twenty-four blooms, and on a very even stand were particularly good flowers of William Shean, Claudius, Mdme. M. Soupert, and Captain Hayward; second place was taken by Mr. Henry Drew, Longworth, Faringdon, and it may be said that the two exhibits were very nearly equal in quality. King's Acre Nurseries, Lim., Hereford, were third, their flowers looking just a bit weather-beaten. Twelves made a big display with some half-dozen or more entries, Messrs. Perkins and Sons winning again, the second and third prizes going to King's Acre Nurseries and Mr. Henry Drew in the order named.

Messrs. Perkins and Sons once more led in the class for six blooms of one variety, showing beautiful flowers of Horace Vernet, an old favourite. Messrs. Chapman and Collins, Royal Road, Leicester, were second with Captain Hayward, and King's Acre Nurseries third with Alfred Colomb. Mr. Henry Drew led for twelve teas with a very striking stand, his best flowers being Mrs. Foley Hobbs, White Maman Cochet, and E. V. Hermanos; second place was filled by Mr. W. T. Mattock, Barton End, Oxford, the King's Acre Nurseries figuring as third prize winners. The best six teas of one variety were Messrs. Chapman and Collins' set of Nita Weldon, Messrs. Perkins and Sons' Mdme. Jules Gravereaux coming second, and Mr. Drew third with White Maman Cochet.

### HARDY FLOWERS.

A twenty-five guinea challenge cup for twenty bunches of herbaceous flowers, excluding bulbs, secured four entries, and these, being well staged, made an excellent show. Messrs. Gunn and Sons were most successful, and their flowers were fine, clean, and good throughout. Phlox Josephine Gerbaud was prominent, and other good things were Lysimachia clethroides, Potentilla Gibson's Scarlet, and a particularly brilliant gaillardia named Vulcan. Mr. Frank Bouskell, Market Bosworth, put up a good set for second prize, his Papaver Jeannie Mawson, Helenium cupreum, Aconitum bicolor, and Sidalcea Listeri being beautifully grown. Mr. C. H. Herbert, Acock's Green, came third, his flowers being staged with pleasing lightness. Mr. Herbert scored for twelve bunches with a big bunch of Eryngium amethystinum, and good alstrœmerias, lythrums, galegas, etc.; Mr. Wm. Lowe, Beeston, was second; and Mr. F. Bouskell third.

Some very nice cactus dahlias were staged by Messrs. Pemberton and Sons, Bloxwich, Walsall, who won first for twenty-four blooms; Johannesberg, a big amber flower, was very attractive; and Peerless (crimson) was also good. The Messrs. Pemberton also scored for six varieties of violas. There were some fine vases staged in the class for six bunches of stove or greenhouse flowers, the winner being Mr. F. Daniels, gardener to J. B. Akroyd, Esq., Birdingbury Hall, Rugby. Lapageria rosea, L. alba, gardenias, Gloriosa superba, and liliums were the flowers used, asparagus sprays serving to set them off. Second prize was won by Mr. T. Parry, gardener to W. J. Gresson, Esq., Birlingham House, Pershore; Mr. A. J. Friend, Leamington, coming third.

It is dangerous to resort to superlatives, but the opinion was freely expressed that the display of carnations here was the finest seen at any British show. At all events, we have no hesitation in recording that eight entries in the class for a group of cut carnations, each filling ten feet by four feet space, were as fine a lot as any society might wish to see, and the judges' had no light task in selecting the exhibit that should receive the challenge cup. Messrs. Young and Co., Hatherley, Cheltenham, were the fortunate winners, and were warmly congratulated on their success. Quality of bloom on this stand was well assisted by tasteful arrangement, and, as we have often remarked, Messrs. Young and Co. both grow and stage remarkably well. A big mass of Duchess of Devonshire, with Hon. Lady Audley Neeld on either side, made the centrepiece, with Lady Henderson, May Day, White Perfection, and plenty of other varieties to flank them, and finish off the front. It was a splendid effort. Mr. Chas. Wall, Melrose Nursery, Bath, came a very good second, a good many border varieties being used in this exhibit, in addition to well-grown perpetuals. This was an exhibit that would have done credit to any exhibition, and it was the exceptionally keen competition and the excellent arrangement in the winning group that placed it second—a position of no small credit in such company. Mr. C. F. Waters, Balcombe, who came third, had also a grand lot of flowers.

Mr. A. F. Dutton, Iver, Bucks, had a beautiful set of twelve vases, with which he secured first prize, the new variety Mrs. A. F. Dutton being shown in splendid form. Mr. W. H. Parton, Studholme, Moseley, was placed second, his flowers being border varieties of choice quality; Messrs. A. R. Brown, Lim., King's Norton, followed, also with border kinds. Mr. Parton's set of twelve blooms, selfs, won well, Solfaterre, Mrs. Griffiths Jones, Sir Galahad, and Cardinal being lovely flowers; second prize in this class went to Mr. C. H. Herbert, who was first in the class for twelve fancies.

### SWEET PEAS.

These were put up in large numbers, and the leading class was for a display occupying a space of twenty feet by four feet, a twenty guinea challenge cup being offered as first prize. The victor was Mr. T. Jones, Bryn Penylan, Ruabon, and it goes without saying that his flowers were remarkable for their size, length of stem, and good texture; while the arrangement was very neat. Afterglow, Rosabelle, and Charles Foster were brought prominently before and above a mass of popular varieties, and at the back were big stands of Melba, Edrom Beauty, and Thos. Stevenson. The second prize was annexed by Mr. E. T. Bromley, Roseleigh, Wilmcote, Stratford, who introduced baskets among his vases.

Robert Sydenham Limited's class for nine varieties made a great display, the entries being numerous and good. The chief award went to Mr. W. H. Holloway, Port Hill Gardens, Shrewsbury, his flowers being large, without coarseness; second prize fell to Mr. W. V. Wall, gardener to J. Booth, Esq., Ardencote, Claverdon, who used maidenhair fern (we did not like it) to set off the flowers; the third prize was secured by Mr. T. Batchelor, gardener to H. Mitchell, Esq., Mercote Hall, Hampton-in-Arden; fourth going to Mr. J. Randall, 103, Tackbrook Street, Leamington. Messrs. Webb and Sons also had a good sweet pea class for eight bunches, the lead being taken here by Mr. P. Vincent, gardener to J. W. Lamplough, Esq., Manor House Hotel, Leamington; with Mr. A. Taylor, Leconfield, Kineton Road, Olton, second; and Mr. G. L. Blackburn, gardener to Captain Starkey, Bericote House, Leamington, third.

### FRUIT.

A collection of fruit of high quality was exhibited by Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, who secured the challenge cup, and also a Silver-gilt Knightian Medal from the R.H.S. The eight dishes were of Black Hamburgh and Muscat of Alexandra grapes, Welbeck Seedling melon, Williams' Bon Chretien pears, Barrington peaches, Pineapple nectarines, Brown Turkey figs, and Rival apples. The table was tastefully decorated with Malmaison carnations that were a fine exhibit in themselves.

Mr. Gibson repeated his success in the four-dish class, showing a splendid Royal Jubilee melon, with peaches, nectarines, and Muscat grapes. Second prize in this class went to Mr. E. R. Jones, gardener to Lord North, Wroxton Abbey, Banbury, his Black Hamburgh grapes being very good bunches; third prize was taken by Mr. E. Coy, gardener to the Lady Knightley of Fawsley, Daventry. Mr. Gibson won for black grapes, followed by The Manor Fruit Farm, Knowle, the same order being maintained in the white grape class. Mr. Gibson's dish of Barrington peach topped all other entries; Mr. Jones, Wroxton, led for nectarines with a fine dish of the variety Pineapple, and also scored for a white-fleshed melon. The Manor Fruit Farm won both for dessert and cooking apples, beating Mr. Gibson in the former class.

### VEGETABLES.

These were staged in considerable quantity, but the quality was not at all high. The class for ten dishes found several competitors, and first prize fell to Mr. J. R. Tooley, gardener to Hugh Andrews, Esq., Toddington Manor, Winchcombe; Mr. E. R. Jones, Wroxton Abbey, second; and Mr. Rainbow, 11, Church Hill, Birmingham, third. Several firms offered prizes for produce grown from their seeds, and the result was a big display, occupying all one side of a tent. Mr. G. L. Blackburn, gardener to Captain Starkey, Bericote House, Leamington, took the lead in Messrs. Clibran's class. The first prize in Messrs. Dickson and Robinson's class went to Mr. T. Parry, gardener to W. J. Gresson, Esq., Birlington House, Pershore; Messrs. Webb's prize being secured by Mr. E. Winchester, Brookside, Rubery, Birmingham. Still another class was provided by Messrs. Sutton and Sons, the winner here being Mr. W. Wright, gardener to M. P. Lucas, Esq., The Oaks, Leamington.

### OTHER CLASSES.

In the amateurs' section there was a group class, the area to be covered being 12ft. by 9ft. A challenge cup, which was the leading award, was secured by Mr. A. J. Friend, gardener to the Misses Robinson, Newlands, Leamington, who made free use of Oncidium flexuosum, Francoa ramosa, begonias, and carnations, together with Asparagus plumosus, crotons, and small palms. It was a bright and well-devised group. Mr. J. Fisher, gardener to Alderman Holt, Oaklands, Leamington, took second place.

Table decorations filled a large tent, there being no less than twenty-six exhibits. For a dinner table for eight persons, Mr. W. J. Mattock, Oxford, took first place with a nicely-arranged centrepiece of odontoglossums and Gloriosa superba, and corner vases of cypripediums, with a judicious use of asparagus and selaginella. In the ladies' class Miss M. L. Deakin, Hay Hall, Hay Mills, Birmingham, was first, using sweet peas lavishly. Robert Sydenham Limited's class filled well, and Miss Deakin was again the winner, and we certainly liked this table better than that in the previous class.

### NON-COMPETITIVE.

Messrs. J. Veitch and Sons, Lim., Chelsea, had an exhibit that for extent, variety, and intrinsic value was admittedly the finest feature of this fine show. The group was mainly composed of a superb collection of ornamental stove and greenhouse plants, and to enumerate the many subjects, all of which were really good, would occupy more space than we can afford, much as we should like to give our readers an idea of the beauty and interest of a group which filled nearly 700 square feet.

Messrs. Peed and Sons, Norwood, were the fortunate winners of the challenge cup offered for the best trade exhibit, the firm putting up a really good group of caladiums in excellent variety, and all well-grown, highly-finished plants. Rufus, a blood-red variety, was very conspicuous, and the huge leaves of John Peed were in striking contrast to the tiny, but pretty, C. argyrites, which is as useful and popular as ever. Maidenhair ferns were freely used to set off the bright and varied foliage of the caladiums. Conspicuous on a big stand of ferns, put up by Messrs. H. B. May and Sons, Edmonton, were some excellent specimens of Platyceriums. Mr. H. N. Ellison, West Bromwich, had ferns and cacti, many of the latter being of comparative rarity.

Hardy flowers were shown well by Messrs. Dicksons, Lim., Chester, their phloxes and gladioli being remarkably bright. Another big and attractive exhibit of hardy flowers was put up by Messrs. J. H. White and Co., Worcester, Montbretia rosea and Campanula Bonieusis being worthy of special note. Sweet peas came in quantity from Messrs. Aldersey and Marsden Jones, Tilston, Malpas, and also from Messrs. W. H. Simpson and Sons, Birmingham, who, in addition, showed a fine lot of antirrhinums. Sweet peas and carnations were tastefully used by Robert Sydenham Limited, Birmingham, to demonstrate the usefulness and artistic merits of their rural table decorations.

Messrs. J. Waterer and Sons, Lim., Bagshot, had a group of conifers and other ornamental trees and shrubs in the open; Cedrus atlantica glauca was represented by a number of young shapely trees, and there was a mass of vivid colour in the flowers of Spiræa Anthony Waterer. A big display of horticultural requisites was made by Messrs. Wm. Wood and Sons, Lim., Wood Green, there being, in addition to samples of chemicals, a number of tools and implements of varied utility. A device that deserves mention was a moth trap, exhibited by Mr. Hagon, of Leamington; by means of this trap, which is lit up at night, moths can be caught alive, thus serving either the purpose of clearing a garden of pests or of obtaining specimens for study.

### MEDALS.

The society's medal awards to non-competitive exhibits were:

Large Gold.—Messrs. J. Veitch and Sons, Lim.; and Messrs. J. Waterer and Sons, Lim.

Small Gold.—Messrs. H. B. May and Sons.

Silver.—Messrs. J. H. White and Co.; Mr. H. N. Ellison, Messrs. Aldersey and Marsden Jones, Messrs. W. H. Simpson and Co., Messrs. Dicksons, Lim., Robert Sydenham Limited, Major Stringer and Messrs. Harbutt and Co.

Bronze.—Messrs. Hinton Bros.

### ROYAL HORTICULTURAL SOCIETY'S AWARDS.

A deputation from the Royal Horticultural Society visited the Leamington Show, and made the following awards:

Gold Medal.—To Messrs. J. Veitch and Sons, Chelsea, for stove and greenhouse plants; to Messrs. J. Cypher and Sons, Cheltenham, for a group of plants; to Sir G. H. Kenrick, Bart. (gardener, Mr. Macdonald), Edgbaston, Birmingham, for a group of plants.

Silver-gilt Flora.—To Mr. W. Vause, Leamington, for group of plants; to Messrs. J. Cypher and Sons, Cheltenham, for stove plants; to Messrs. Gunn and Sons, Olton, for roses; to Mr. Chas. Wall, Bath, for carnations; to Messrs. Young and Co., Cheltenham, for carnations; to the Misses Robinson, The Newlands, Leamington (gardener, Mr. A. J. Friend), for a group of plants.

Silver-gilt Banksian.—To Alfred Holt, Esq., J.P., Oakland, Leamington (gardener, Mr. J. Fisher), for a group of plants.

Silver-gilt Knightian.—To His Grace the Duke of Portland, K.G. (gardener, Mr. J. Gibson), Welbeck Abbey, for fruit.

Silver Knightian.—To H. Andrews, Esq. (gardener, Mr. J. R. Tooley), Toddington Manor, Winchcombe, for vegetables; to Mr. J. E. Warr, 3, Glebe Place, Leamington, for vegetables; to Mr. G. H. Wilkins, 18, Northcote Street, Leamington, for vegetables; to Mrs. E. W. Everitt (gardener, Mr. E. Allaway), Sherbourne House, Leamington, for fruit.

Silver Flora.—To Mr. William Lowe, Beeston, Notts, for roses; to Messrs. Gunn and Sons, Olton, for herbaceous flowers; to Messrs. Dicksons, Chester, for cut flowers; to Messrs. W. H. Simpson and Sons, Birmingham, for sweet peas; to Messrs. Aldersey and Marsden Jones, Tilston, for sweet peas; to Mr. C. F. Waters, Balcombe, for carnations; to C. C. Shaw, Esq. (gardener, Mr. W. Bartlett), Thornbank, Leamington, for a group of plants; to Mr. T. Jones, Bryn Penylan, Ruabon, North Wales, for sweet peas.

Silver Banksian.—To F. Bouskell, Esq., Market Bosworth, for herbaceous plants; to the King's Acre Nurseries, Hereford, for roses; to A. Cay, Esq. (gardener, Mr. R. Denton), Woodside, Kenilworth, for ferns.

Bronze Knightian.—To Mr. T. Noon, jun., The Square, Stockton, for vegetables; to Mr. J. Wright, 45, Guy Street, Warwick, for vegetables; and to Mr. Ed. Deakin, Hay Hall, Hay Mills, Birmingham, for vegetables.

---

## Scottish Horticultural Association.

The annual excursion of this association took place on July 27, when, on the invitation of the hon. president, Captain Archibald Stirling, 100 of the members, including the president, Mr. Massie, and several other office-bearers, visited the beautiful grounds of Keir. On arrival at Keir the visitors were received by Captain and the Honourable Mrs. Stirling, and afterwards they were entertained to luncheon in a large marquee erected on the lawn. Captain Stirling presided at the luncheon, and, after the loyal toast had been duly honoured, extended a hearty welcome to the party, and gave the toast of "Prosperity to the Association," and in doing so, he referred to the hearty response which had been made to the appeal which he had sent out for new members. The toast was acknowledged by Mr. Massie, who said that the future success of the association was already assured by the result of the appeal, and that Captain Stirling's year of office would be remembered as a red-letter one in the annals of the association, and he conveyed to Captain and Mrs. Stirling the hearty thanks of the party for their splendid hospitality. Thereafter Captain and Mrs. Stirling conducted the party over the principal apartments of Keir House, and the weather, which, unfortunately, had broken down early in the afternoon, having improved somewhat, the fine gardens and grounds were next inspected. On leaving, three hearty cheers were, on the call of the President, given for Captain and Mrs. Stirling, and, but for its being somewhat marred by the weather conditions, the outing was a most enjoyable one in every respect.

## Melksham and District Gardeners' Society.

The members of the above society had a most enjoyable outing to Reading on Tuesday, July 23, when they paid a visit to the well-known seed establishment of Messrs. Sutton and Sons.

Mr. Leonard Sutton welcomed the party, and two representatives of the firm took them over the whole of the offices and warehouses. Before inspecting the trial grounds the party enjoyed an excellent luncheon, provided by the firm, and presided over by Mr. Castle. Mr. Legg, on behalf of the society, thanked the Messrs. Sutton for their kindness. Some two hours were profitably spent at the trial grounds, and at 3.15 a brake conveyed the party to Southcote Manor, some four miles out, where was to be seen a large breadth of sweet peas, in the finest varieties, the soil being of greater depth here than at Reading. The party also explored the fine old manor house, rich in oak panelling, etc. A drive back to Reading, and a cup of tea, completed a very pleasant day's arrangement.

## Haywards Heath Show.

The twenty-fourth annual exhibition of the Haywards Heath Horticultural Society was held on July 24, and it was a great success.

This society is one of the most flourishing in the south, and the fact that it drew a gate of £115 indicates how well it is supported. Even the rule that compels handing over half the gate money, above £50, to the local Athletic Club, does not prevent the society from keeping a reserve and balance of about £50.

The recent show was favoured by beautiful weather, and, as the local conditions had been more favourable to plant growth than in some districts we know of, the exhibits were of high quality all through.

The sweet peas were wonderfully good, although some of the competitors have much to learn in the art of staging. Mr. F. Beal, of Uckfield, again won the James Box Challenge Cup for eighteen bunches. His blooms were remarkable for size, and we have never seen Mrs. Hardcastle Sykes in such good form. No one ventured to try conclusions with Mr. Beal, and unless someone outside the district ventures to give him battle next season, the cup will be his. Although numerous exhibitors contested the smaller classes, no one had flowers to match Mr. Beal's eighteen. For twelve bunches Mr. C. Lucken had a clear win.

The rose classes were rather weak, very few really good flowers being on view. Border carnations and dahlias were well shown, and hardy flowers were splendidly staged. Mr. J. E. Shirley, gardener to the Rev. T. G. Wyatt, easily won the Kleinwort Challenge Cup for eighteen bunches of hardy flowers, and here again, unless some newcomer puts in an appearance, a fine cup will depart for good, as Mr. Shirley has two claims upon it.

The plant classes brought out some fine exhibits, and we have not seen better fruit and vegetables staged at any district show this season. Giant gooseberries are a feature at Haywards Heath, and anyone who desires to know what big berries really are should visit this show. Black currants, too, were almost as big as Morello cherries, even the cottagers being able to shine in this direction. Messrs. Sutton and Sons, Messrs. J. Cheal and Sons, and Messrs. Daniels Bros. offered prizes for vegetables, and these were hotly contested.

The combined competition, open to all horticultural societies in Mid-Sussex, brought Lindfield and Balcombe into close contest, and the former gained the challenge trophy, reversing the award of last year. The Balcombe collection was richer in flowers, but it was not so artistically staged, nor were the fruits and vegetables so fine in quality as those of Lindfield. On the latter exhibit we noted some of the most gigantic gooseberries we have seen, while the grapes, peaches, etc., were all of high class.

## OBITUARY.

### MR. JAMES MITCHELL.

One of Forfarshire's oldest and most respected gardeners, Mr. James Mitchell, who for forty-five years was head gardener to the Earl of Dalhousie at Panmure House, has passed to his rest. Coming to Panmure sixty years ago, he had the honour of remodelling the old gardens, laying out and planting new ones, and erecting commodious glass structures, to the great satisfaction of the four successive Earls with whom he served. Born in Arbroath district eighty-nine years ago, he was a noted local historian, and an antiquarian of no mean order. A natural student of botany and geology, a good all-round gardener, and a competent judge, his services were often requisitioned in various ways. He retired from active work fifteen years ago, and went to live in Carnoustie, but latterly he resided in Dundee.

One of Nature's gentlemen, he was generous, kind, sympathetic, and sincere, and quickly found out the good points in his "Billies," as he always called his young men. These he encouraged, ruling with gentleness and firmness, for harshness was not in his nature. Many of his men now hold good positions in the world of horticulture, in almost every land where the art is practised to any extent, and these will recall his good qualities and cherish his memory.

## TRADE NOTES.

Messrs. Webb and Sons, of Stourbridge, have been awarded gold medals for exhibits of their specialities at Bath, Wolverhampton, Southampton, and Birmingham shows. Other recent awards include gold medals at York and Richmond.

Messrs. Robinson Bros., Lim., West Bromwich, are organising an exhibition of horticultural produce for the benefit of their customers, and a glance through the schedule before us shows that the firm is entering into the venture in a spirit of commendable enterprise. £350 in all is divided between seventy-five classes, the largest individual prize being £20 for the best collection of vegetables. The show will be held in the Botanic Gardens, Edgbaston, Birmingham, on August 28 and 29. Schedules may be had on application to Messrs. Robinson Bros.

At the leading horticultural shows at which Messrs. Sutton and Sons, of Reading, have been recently exhibiting, they have received the highest award, a gold medal, viz., on July 9, Wolverhampton, for sweet peas; July 10, Bath, for flowers and vegetables; July 17, Cardiff, for sweet peas; July 19, Birmingham, for flowers and vegetables; and July 23, at Brighton, for flowers and vegetables.

## GARDENERS AND GARDENING.

### THE DIPLOMA AND THE GARDENER.

Mr. J. W. Bamber, Lecturer on Horticulture and Nature Study to Herts C.C., has contributed the following article to the "Monthly Magazine" of the North of England Horticultural Society:

It may be too early to criticise the promised Diploma in Horticulture, so little of a definite nature being known by the crowd —of which I am one. It is to be hoped the last gathering for conference and discussion on this urgent and overdue subject has not yet been convened. Up to date there has been too much Professor in evidence and not enough Worker, and till this error is corrected, matters are not likely to be satisfactory to all. If the way the wind blows tells anything, the diploma is not for the working gardener, but for those at the top of the profession. Viewing it so, it is commendable, desirable, and useful; but if this is to represent the sum total of horticultural education and award, then it is insufficient, and does not meet a great need—perhaps the greatest need—in the profession. What is wanted is something to meet the working gardener. It is useless saying we will leave the gardener out for the present. This cannot be. If the diploma is to represent real training, then all those who obtain it will have been gardeners somewhere in their training.

Leaving school will represent the beginning of the training, and the diploma will represent a finish. What the gardener requires is an award somewhere intermediate between beginning and finish. The education for the award cannot be undertaken by mutual improvement societies. A competent teacher is required, and the work must be undertaken by educational authorities. Courses of study at a college, or long-continued courses at a secondary school, are not essential to train the gardener. As a matter of fact, most young gardeners have neither money or the time to attend costly courses of education, and if such courses of study are insisted on, then the opportunity for obtaining the diploma will be limited to a favoured few. What the diploma should represent is knowledge and practice in combination, and where this has been obtained matters little; it may be in some obscure garden, or it may be in some college with a shining reputation. To infer that knowledge and truth can be found only within college walls is to infer a fallacy, and to think that gardeners who work small gardens are all ignoramuses is another fallacy, and both are fatal to progress. The college does not make the gardener. The true gardener is born and not made, and what the college gives is the best opportunity for educing all that is good within him.

All educational systems represent means to an end, the end being the making of good and beautiful citizens, each after his own particular line. Elaborate collegiate systems of education are no better than simpler

→ Syringes ←

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No.1 Four Oaks Undentable, 1¼ × 20in. 21/-; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1⅛ × 20 in. 12/6 or with Angle Joint, 18/-.

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:— The FOUR OAKS SPRAYING MACHINE Co., No. 3G, Sutton Coldfield.

systems if they produce no better results. The first things requisite for horticultural education are—a good teacher, a lecture room and laboratory, a sympathetic and encouraging educational authority, and a standardised syllabus that shall embody the base principles of the profession. Perhaps it may be said that any such system would be a neglect of the practical. Where the students are gardeners the practical can be left to look after itself, at least in the early stages. From experience we all know the average gardener is fairly proficient in his practice but weak in his theory.

What a gardener should learn, in profit to himself, is unlimited. Generally it cannot be too wide, and specially it should be directed to his calling, which will demand a knowledge of botany, zoology, and geology. The elementary and second stages in the first subject requires but little modification to fit it to the gardener, but a special syllabus in both the other subjects will need to be drawn up to meet the gardener's requirements. The whole training in these subjects should not occupy more than a four years' study. Once a student has made up his mind to try for something higher than the position of head gardener then he will be prepared to extend his studies. He must learn by practice the most up-to-date methods for all work, and for this purpose it would be necessary for him to attend courses—here the short course may be of value—at an experimental garden.

To meet the case of the working gardener, I would suggest classes in secondary education between 7 p.m. and 10. These classes are popular in the cotton districts of Lancahire, and there is no great reason why they should not be tried elsewhere. A young lad leaving school could without effort attend one class a week. Granting the lessons were honestly worked and continued till the ages of 22-25, a fair amount of general and special training could be got in, more than enough to make an intelligent worker in Nature's workshop, instead of one who works this way and that because his chief taught him so.

The best education in practice is obtained not by staying a long time at one big place, but by stopping short periods at good places. If a young man migrates, say every two years, he should satisfy himself beforehand that a new place will extend his previous practical experience. Mr. Hale's suggestion of an organised system of exchange of young gardeners deserves the deepest consideration. This migration has one drawback. In many country districts it will not be possible to get two classes, representing different stages in the instruction, running contemporaneously. This means a young man leaving Stage II. and migrating to Stage I. will have a waiting break in his study. With a little thought this could be remedied.

Let the gardener once realise that the diploma is only granted after an intense training that must reach a standard which is altogether unnecessarily high for his work, then he will regard it as hopeless, and the consequent apathy will keep him at about the same level of educational inefficiency. On the other hand, foster his hopes by an intermediate award, that will meet all his working requirements, and at the same time incur little expense, then the probabilities are created that many gardeners, after reaching the intermediate stage, will continue their studies, it may be from love, or it may be with the prospect of obtaining a higher position in life. It is the gardener—the worker, and not the lecturer or professor, that stands in most need of facilities for progress. Elevate the worker and workers will supply all the lecturers needed.

Any system of education that omits the initial stages and ignores the worker is faulty, and cannot be permanent. There is no need for a feverish haste. Certainly, it would be wiser to build slowly and well than to hasten the matter, and produce a system that is productive of little more than dissatisfaction.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

---

PELARGONIUM PAUL CRAMPEL.—"W. T." writes: Noting, under "Answers to Correspondents" (page 420), your reply to "J. W.," perhaps I can throw a little light on the matter. There is certainly no variety known as Paul Crampton—indeed, the close resemblance of the two names would suggest that it has arisen from a mistake in spelling. The variety Paul Crampel, a single-flowered one, was first distributed by M. Lemoine, of Nancy, in 1892, but it was some time after that before it became popular. Then, about four years ago, it produced (in, I believe, more than one place) a double-flowered sport, and this is now extensively grown under the name of Double Paul Crampel, and though I have met with it in many quarters, no other name, so far as I know, has been applied to it. It is a good showy variety, but is never likely to attain the same amount of popularity as the single form. Of this last there is a salmon-coloured kind, which has been of late very frequently met with under the name of Salmon Paul Crampel. It will no doubt be a good deal used for bedding, as last season it gave satisfaction in the few places in which it was tried.

INTERNATIONAL FLOWER SHOW IN NEW YORK IN 1913.—In answer to several correspondents who ask for information regarding the International Horticultural Exhibition to be held in New York next year, we may say that the European address to which enquiries should be sent is, Exhibition Offices, 75, Chancery Lane, Holborn, W.C. The exhibition will be held from April 5 to April 12, in the Grand Central Palace, 46th to 47th Street, Lexington Avenue, New York City. All exhibits for this exhibition will be admitted to the building duty free. The exhibition is being promoted by the Society of American Florists and Ornamental Horticulturists, and the European agent is Mr. A. S. Manders.

CODE DES COLEURS.—A. W. F., Ruby: We hope to give you the necessary reply in our next issue.

BLACK FLY ON CHRYSANTHEMUMS.—F. R., Stocksfield: I find black fly very troublesome on my chrysanthemums, especially on the upper portion of the growths, and I should be very glad if you will tell me how best to get rid of the pest.—Spray the infested plants with a quassia solution, or dip the affected portions, if such a proceeding is practicable. Place half a pound of quassia chips in boiling water, and allow them to simmer for ten or twelve hours, always keeping the chips well covered with water. Dissolve quarter of a pound of best soft soap in some boiling water, and to this add the quassia extract, duly strained; stir well together, and add sufficient soft water to make up five gallons of mixture. Spray or dip the plants on two consecutive days, and on the third day syringe with clear water.

BLACK SPOTS ON ROSE LEAVES.—J. J., Bungay: I enclose a few rose leaves, and you will find each leaflet has one or more blackish spots. One or two rose trees show more of this "spotting" than others, and those most affected are losing some of their leaves. This loss of leafage suggests a fungus attack, therefore I shall be glad if you will tell me what causes the spots, and how I had best proceed to cure the trouble.—The blackish spots are evidence of the presence of a fungus known as Actinonema rosea. So far as we are aware, only the leaves are attacked. Remove and burn all badly affected leaves, and all those that fall from the tree. Spray occasionally with potassium sulphide solution, and commence spraying early next spring as the buds burst, and repeat the spraying at intervals of a week or so.

---

### NAMES OF PLANTS.

W. D., Sussex.—1, Asparagus Sprengeri; 2, Jasminum officinale.

F. B. M., Conway.—1, Gaultheria Shallon; 2, Ligustrum lucidum.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Irish Cottage Gardening.

MR. P. S. HAYWARD.

Within the past twenty years so much has been accomplished in the development of both the practical and scientific aspects of horticulture in Ireland that those who are interested in rural industries have full justification for indulging in a strong feelling of gratification. Such an immense amount of good work has been done that those who have been actively engaged in bringing about the great and highly beneficial changes that are everywhere manifest might almost be excused were they to show an inclination to assume they might slacken in their efforts without appreciable injury to the cause they have so much at heart. During this comparatively short period we have seen a complete change in the views that were held with regard to the possibilities of Ireland as a fruit-producing country. A quarter of a century ago few indeed were those who considered the cultivation of the choicer kinds of hardy fruits on commercial lines possible. But many were those who regarded the derelict and practically worthless orchards then so numerous, not as evidence of a lack of enterprise, but as a proof of a change in the climatic conditions of the country during the period which had elapsed since their formation. Now it is generally admitted by those who have given their serious attention to the question that, not only can hardy fruits be grown in open orchards, but, given the necessary knowledge, with such success as to justify the adoption of orchard culture in fruit production for market. As the result of this reversal of opinion, large areas have been planted with the finest of the varieties of hardy fruits that thrive in the open, and strenuous endeavour has been, and is, indeed, being made to adopt the most advanced methods of procedure in their management. In like manner the possibilities of bulb culture has been recognised, and, as so well known to those interested in the bulb trade, hardy bulbous plants of various kinds are now being largely grown with a full measure of success for commercial purposes. Other subjects of interest to horticulturists are also being successfully cultivated, but for our present purpose it is not necessary to particularise them. The improvement in the horticultural aspects of the country is largely due to the activities of the efficient staff of horticultural instructors that has been organised by the Irish Agricultural Department, and to the aid rendered by the well-devised demonstration plots that have been formed in a considerable number of districts. Considerable assistance has also been rendered by the Ulster Fruit and Chrysanthemum Society, which has for several years past carried out a series of competitions in the pruning of orchard trees. Great as the progress of improvement has been, we may hope that, with fuller experience on the part of all who are engaged in educational work, the rate will be materially accelerated. We give expression to this hope because, while the achievements in the past have been such as to afford abundant satisfaction, much work of importance remains to be done. Private gardens that are under the charge of experienced men are now, as in the past, remarkable for their varied attractions and high keeping, and need not be referred to in this connection, except to say that they have exercised a highly beneficial influence on the transitional work that has been accomplished outside their boundaries during the last two decades. With so much to afford satisfaction in connection with the present position of horticulture in Ireland, it is a matter for regret that but little, if anything, has been done to encourage the cottagers and owners of the smaller holdings to beautify the surroundings of their homes with such flowers as would be well within their reach, and to improve their methods of cropping the areas devoted to vegetables for home use. Cottage gardening can hardly be of less importance in Ireland than in England, and yet it would appear from observations recently made in the more northern of the several provinces, that, while immense improvements have been made in cottage gardening in England during the past quarter of a century, the Irish cottage gardens are at the present time in much the same condition as they were at the beginning of that period. It would, perhaps, be unreasonable to expect any material extension in the area available for the cultivation of flowers, but it is difficult to understand there should have been no improvement in the utilisation of the available spaces if serious attempts have been made to instruct the occupants in the methods of procedure best adapted to their circumstances. At the present time, it is possible to travel long distances without seeing a cottage set in a garden worthy of the name. In numberless instances the space available for flowers is not sufficient for the production of an effective display; but, surely, if there is room for only half a dozen plants, it is better to fill it with attractive subjects that can be readily obtained and easily grown, than to allow it to be overrun with weeds. Again we observed in many cases that where the area was sufficient to form an attractive little flower garden, the plants were of an indifferent character, and allowed to so run together as to form an inextricable and certainly not beautiful mass. Very few, indeed, were the gardens in which there was evidence of the owners being otherwise than oblivious of the necessity of periodic thinning and replanting. The present state of things as regards the floral aspects of cottage gardening in Ireland is especially to be regretted because of the number of beautiful plants that can be successfully grown in the country which will not succeed in England, or only in a few favoured districts. In one garden we saw a hedge of Veronica Andersoni, which was producing a glorious display of flowers, but in hundreds of others this handsome shrub was wholly absent. The elegant Fuchsia Riccartoni enjoys a considerable degree of popularity, and is frequently met with, and, in some instances, has been allowed to fill the whole garden and envelop the cottage in flowers and foliage—a practice that is not desirable from a hygienic standpoint. Considerable variation in cultural methods is found in connection with vegetables, but there is a remarkable similarity in the cropping, for the majority contain but little beyond potatoes, cabbages, and curly kale. These are all good in their way, and should probably form the staple crops, but there are others which will at once occur to our readers that are equally essential to health, and give a good return for the space devoted to them. There may be some difficulty in effecting the much-needed improvements, but most work that is worth doing is beset with difficulties, and none occur to us in this connection that cannot by strenuous endeavour be surmounted. The time has come when an endeavour should be made to instruct cottagers in the best methods of furnishing and managing flower gardens, clothing the walls of their dwellings with climbers, and in cropping their kitchen gardens with a view to obtaining a greater variety of vegetables than is now grown without any material reduction in quantity. This educational work is likely to be more successful if carried out in conjunction with parochial organisations, but the help the horticultural instructors are so well able to render should be taken full advantage of.

---

**Mr. P. S. Hayward,** whose portrait we give in the present issue, is familiar to our readers through the vigorous articles on hardy flowers and Japanese gardening that have appeared from his pen in our columns. He is gardener to Mr. and Mrs. Lilley, at Holland House, Southcliffe, and has, practically, made the gardens of which he has charge. He is an idealist in gardening, with a strong leaning towards Japanese art and design as expressed in horticulture. After three years' service in landscape gardening under his father, Mr. Hayward spent a number of years in private and trade gardens, chiefly in Kent and Sussex, and then filled a position as manager to an East Anglian firm of florists. Later, he was engaged by Messrs. R. Wallace and Co., in constructing and planting rock gardens for Lord Cowdray, F. J. Hanbury, Esq., and others, finally making the rock gardens, water gardens, rose garden, and pergolas at Holland House, Southcliffe. Mr. Hayward takes a close interest in the improvement of hardy flowers, and is always endeavouring to create novelties. So far his chief successes have been among pentstemons, aubrietias, campanulas, irises, and varieties of Viola gracilis, but he has also raised many new carnations and begonias. By way of recreation, Mr. Hayward contributes articles upon those subjects he most loves, and he has "the pen of a ready writer."

**Severe August Weather.**—The first week of the present month is likely to hold the record for bad weather for many years to come. In many districts holiday-makers experienced the most unpleasant conditions of rain and wind, while in some places the temperature fell to freezing point, and in others snow fell. Snow fell in many parts of Scotland, and even in Westmorland, in the Upper Eden Valley, snow fell so heavily that the haymakers were able to engage in a snowballing match. After a heavy wind and rain storm Newcastle experienced a severe fall of temperature, seven degrees of frost being recorded on one farm, while freezing point was reached in many places, and consequently many tender crops have suffered badly. Even in the Peak district, round Huntingdon, and in many of the fen-lands, frost was registered, and this added to the trouble farmers are already suffering from potato disease. In some parts of Wales the heavy rains have caused the rivers to flood the hay and corn fields, and in Devonshire rain and wind have very largely spoiled the hay and apple crops. For holiday-makers, as well as for farmers and gardeners, the weather is anything but propitious, and it is sincerely to be hoped that brighter, warmer weather will speedily return, to the great benefit of everyone and everything.

**The Oldest Vine in Scotland** is supposed to be the fine old specimen of Black Hamburgh in the gardens at Bearehill, Brechin, the residence of Mrs. Duthie. This vine is said to have been planted 135 years ago, so that it runs the Hampton Court vine closely in point of age. Under the care of Mr. Scott, the gardener, the Bearehill vine is carrying a crop of about four hundred bunches of grapes.

**Disaster to French Culinary Pea Crop.**—A report has reached us to the effect that the culinary pea crops in some parts of France have been more or less ruined by severe attacks of a fungus named Thielavia basicola, a pest all too well known among sweet pea growers in this country. We regret this is so as it will probably mean a great shortage of seed peas, but now that the disease has worked such havoc experts will be set to work to find cause, cure, and preventive measures, and probably in our own country the fear of similar trouble will inspire action.

**Weybridge Recreation Ground,** which is such a source of pleasure to the inhabitants of Weybridge, is at present very gay with masses of various hardy perennials. Ample room is provided for bowls and tennis for the grown-ups, and for cricket, swings, and see-saws for the children, and there still remains room to walk upon the grass and view the long flower borders and their contents. Mr. Pagram, who is well known as the raiser of several fine single chrysanthemums, has charge of this little park, and finds in it ample scope for his energies. Achillea eupatorium massed in a border near one of the entrances, is producing a very fine effect just now.

**Cottage and Window Gardening in Norwich.**—We are always delighted when we have the opportunity of recording successful efforts to beautify village, town, or city by means of cottage gardening and window gardening. Norwich is especially fortunate in that a number of her public men take a keen interest in such matters as these. Sir Eustace Grey, chairman of the City Parks and Gardens Committee; Mr. Edward Wild, chairman, and Mr. Louis Miller, secretary, of the Open Spaces Society; and Rev. G. N. Herbert, chairman, and Mr. M. C. F. Solomon, secretary, of the Window Gardening Society, are, with others, doing a great work of encouraging gardening in and round the humbler homes of the city. In the parish of St. John de Sepulchre, the appearance of some of the streets has been altogether transformed from grey to gay by the admirable displays of flowers in front and back gardens, and by the particularly good results obtained in window gardening. A wonderful spirit of rivalry and "house pride" has sprung up concurrently with the advance in floriculture, and as such a spirit is wonderfully infectious, other districts are certain to follow suit if those who have the power have also the will to offer modest prizes by way of encouragement.

**Holiday Visitors to Public Parks and Gardens.**—Notwithstanding the cool wind and occasional showers, holiday-makers in the London district fared better than most people on Bank Holiday, and there was a goodly measure of sunshine throughout the day. Kew Gardens received 108,000 visitors; 200,000 went to Hampstead Heath and Parliament Hill Fields; Richmond and the Thames Valley were well patronised; about 50,000 went to Hampton Court, 33,201 to the Zoological Gardens, and 10,000 to Windsor Castle. All the London parks were filled with holiday-makers, who thoroughly enjoyed the fresh beauty of flowers and grass and trees.

**Royal Botanic Society.**—By a codicil attached to his will, Mr. C. Brinsley Marley, the late treasurer, the Royal Botanic Society has been released from obligations amounting to £1,560. At a recent meeting of the society one hundred and thirty-seven new Fellows were elected, and thirty-three nominations were made.

**Sisyrinchium angustifolium,** a rare British plant, that is generally considered to belong almost entirely to Ireland, has been found wild in Glen Clova, Forfarshire, and the specimen was identified by the Kew authorities. Hooker gives the habitat of this species as "Bogs, Galway and Kerry."

**A Big Foxglove.**—The big gooseberry seems to have given place to the big sunflower, but the latter has now a keen competitor for public favour in the big foxglove. In an Irish contemporary a lad of 8½ years records a foxglove 8ft. 3in. high, carrying 225 blossoms, as against a previous best of 8ft. ¼in. and 119 flowers. While the "big" in flowers, fruits, and vegetables is by no means always the best, we are rather pleased to notice the keenness with which these floral records are contested, because it shows the widespread interest in gardening, and such records always tempt someone else to cultivate better than they have done previously.

**The Mischievous Bullfinch.**—In a recent issue of the "Journal of Economic Biology," the editor, Mr. W. E. Collinge, gives the results of his investigation of the food of the bullfinch, and these fully justify the opinions held by gardeners and fruit growers as to the injury done to vegetation by this handsome and destructive bird. Mr. Collinge made an analysis of the contents of the stomachs of 308 of these birds, which were killed at different seasons in five counties. As the result of this analysis, it was found that from January to May the food of the bullfinch "consists largely of fruit-buds and fruitlets, and in addition to those which are eaten, an equal, or even larger, number are wantonly destroyed by this bird." Mr. Collinge further states "that the bullfinch is for quite half the year most destructive in fruit orchards, causing considerable losses to growers, which far outweigh any little good it may do in keeping down the spread of weeds. Indeed, its value in this respect is extremely doubtful, for it certainly helps in the distribution of such weeds as dandelion, dock, groundsel, ragwort, charlock, etc."

**An Extraordinary Mushroom.**—Mushrooms do many queer things, especially if they find themselves in unusual places. At Hull a mushroom forced itself through a greenhouse wall composed of bricks and a layer of cement, and even after that effort developed to the size of a saucer. As other mushrooms are developing on the inner side of the greenhouse wall, the owner is wondering what may happen to the greenhouse if more of them start housebreaking.

# THE POSSIBILITIES OF A SCHOOL GARDEN.—II.

### As a Manual Process.

When gardening was first introduced as a recognised subject in the curriculum of elementary schools, it was as a manual process pure and simple, and as such it remains, but with a number of other features added to it, which have suggested themselves as time has passed. Even as a manual process school gardening has not escaped criticism. Many have said, and some still say, "What is the good of spending money in teaching boys gardening? They can learn that at home." Perhaps they could, but do they? Experience answers, "No," and in a general way the amount of gardening that the average boy learns at home is on a par with his knowledge of geography and arithmetic that he acquires from his parents. I think if the majority of teachers were asked what their pupils know about gardening when they first enter the class, I think the answer would be that, with here and there an exception, the lads do not even know the proper way to handle the tools, and if they were left to sow seeds of their own accord at the outset the amount of after-thinning required would be enormous.

The fact of the matter is that gardening at home and gardening at school are two entirely different and opposite things. Take, as an illustration, the son of an ordinary labourer who has a large garden or allotment to look after. Of course, he makes use of his boy, but how much real gardening does the latter do? For the most part, he is a drudge, a picker of stones and puller of weeds, and his mind, instead of being fixed on his work, is centred on a bit of green somewhere not far off where more fortunate lads of his age are enjoying a game of cricket. In fact, I am not sure whether this gardening at home is not rather qualified to give a distaste for the work, and I have heard more than one man say that he had such a surfeiting of it as a lad at home that he never wanted to do any gardening afterwards. Again, what can the average parent teach about gardening, even if he had time in his few spare hours to impart a portion of his own store of knowledge to his son?

Gardening at school, however, is another matter altogether. Nine out of every ten boys like it, there is a sense of personal possession about the lad's plot; it is his own, he is a gardener, a proprietor, he does the sowing and the planting, and when the crops grow and mature he feels that he has accomplished something. Not only this, but the school plot instils into the nature of many a boy a taste for gardening that grows. Not long ago a head gardener who is fully qualified to teach his boy gardening, informed me that his lad displayed no interest in it at all until he was given a plot at school, but after that a new interest was awakened, the boy wanted a piece of ground to work himself; he made a raid on his father's seed supply, and spent his evenings cultivating the patch that was given to him. It is not too much to say that the lad would not have done so if he had never been put in the garden class at school, and thus the influence of the teacher was greater than that of the parent, and it happens so in many things besides gardening.

The school garden gives an opportunity to what is generally called the dull boy, but whom it would often be more fitting to describe as the lad who is not endowed with great mental power, but with capacity for working with his hands. Previous to the introduction of manual processes in the school curriculum, this boy never had a chance; his place was at the bottom of the class, and no matter how he tried, he could make no headway. In the school garden, however, the boy who nature intended to work with his hands rather than his brain finds his vocation. He can hold his own here, because he can work, and very often a lad of this type is receiving an infinitely better education on the garden plot than he could ever do inside the school, because he is getting training and exercise in the use of his hands.

In a certain village where no better provision could be made, an intelligent cottage gardener of the labouring class was engaged to teach the boys in the school garden. Some exception was taken to him because he was not qualified to give any theoretical instruction, but I cannot help thinking that this was wrong. It was not claimed for him that he was the type that you would select as a teacher of school gardening, but in the particular instance he was the best material available, and what he could do was to make the boys skilful workmen. He knew how to dig, how to sow, plant, and perform other operations in a workmanlike manner, and if he could teach the boys to do these things as well as he could do them himself, then they would be all the better for the instruction they received under him. What is wanted in these days is not only men who know something, but men who can do something, and a great failing about education in the past was that, while it imparted so much knowledge, it failed to make the boy useful in the sense of being handy as a workman.

Nor is it only on the school plot that gardening is useful as a manual process, for the gardener, like the sailor, is proverbially a handy man; he wants a lot of things that he cannot buy, so he makes them. Very often a school garden is associated with the workshop, and the two go very well together. Gardeners are in the habit of making a good many things out of material that is available, and, though the article, when complete, may have its faults in point of roughness and finish, it serves his purpose, which, after all, is the great thing. Previous to the introduction of school gardening, who ever saw a hand-barrow made in a school out of an empty sugar-box? Yet these are the things that are being turned out continually now, and not long ago I saw a boy at a school making, for his own use, a small frame with the aid of his pocket-knife, a hammer, and a few nails.

Just another illustration, and this was a case of a man who employed three boys in his garden, and when asked which was the best, he pointed to one, and said that he could do things without the need of being shown how. This was a boy who in the last two years of his school career had been in the gardening class. If, then, gardening at school, with the allied woodwork, etc., were nothing more than a manual process, the using of tools, the exercise of muscle, and the doing of work, it would justify its place in the school curriculum, because we do not want boys to be turned out of elementary schools with their hands untrained entirely in manual labour. By nature boys like to use their hands, and one object of school gardening is to teach them that it is not infra dig. to do so. It upholds, in fact, at an early and impressionable age, the dignity of labour, it appeals to the boy's sense of order, to his inventiveness, and his inquisitiveness, and because the garden is at school, it possesses a fascination that it could never have at home.

H.

# THE ENGLISH HEDGE-ROWS.

> "The tangled hedge-rows, where the cows push out
> Impatient horns, and tolerant, churning mouths,
> 'Twixt dripping ash boughs; hedges all alive
> With birds and gnats, and large white butterflies."

In olden times there were no hedges or fences; the country was all waste. According to tradition, our hedges owe their origin to the Black Death or plague, a pestilence which so decimated the rural districts of England that much of the arable land passed out of cultivation, and was turned into pasture. Then, we are told, hedges were planted to prevent the cattle from straying.

In the year 1514 the citizens of London felt grieved because the fields about Islington, Shoreditch, and other places near to the City were enclosed, fenced, and hedged, which stopped their practice with the bow and arrow and other pastimes. So they assembled themselves one fine morning, and went with spades and shovels into these fields, and within a short space of time all the hedges were cut down, the ditches filled, and the fields were never after hedged.

But far away from London hedges were a necessity, not only to keep cattle within bounds, but to mark the different ownerships of the several properties. Thus it came about that we got our beautiful roadside hedges. Wordsworth writes:

> "Once again I see
> Those hedgerows, hardly hedgerows—little lines
> Of sportive wood run wild."

The original senses of hedges is enclosures, and near Cambridge is a collection of farm buildings, which are called the King's Hedges. A hedge is a barrier or fence formed by bushes or small trees growing close together, such as thorn bushes or beech, generally woven together when newly planted, with twigs or wattling.

A favourite in the hedge-row is the holly. Then we have the black and white thorn, which, when properly attended to in respect of annual pruning, is the most effectual fence for domestic animals, and also an excellent shelter. In Kent, Surrey, and Sussex, we find quickset, holly, yew, and privet all mixed with hazel, ash, dog-rose, and other varieties, intermingled with the sweet honeysuckle.

Some of our roads are bordered by high hedge-rows studded with stately trees, the character being given rather by age and wide-spreading branches than by mere loftiness; the banks somewhat lofty, and their clothing various, now covered with long, lank grass, now short and smooth, now bare and worn into little furrows, with the knotted roots of ancient trees obtruding through the road; these scenes in summer are very beautiful to the eye, but these hedges are not safe hedges. They are used by vagabonds as places of shelter or resort, for they are far away from the police. In olden days these rogues were called "Hedge Birds."

Much is to be learnt from our hedges. Do you want to go out for pleasure? Poor Robin, in 1733, wrote:

> "Observe which way the hedgehog builds her nest;
> For if 'tis true that common people say
> The wind will blow the quite contrary way."

There are many curious hedge plants to be found by a careful searcher. One, the Bee Orchis, on which Nature has formed a bee feeding on the breast of the flower, so perfect that it is impossible to distinguish it from the real bee. Then there is the Fly Orchis, which is to be found on and in the hedges near the sea coast in Devonshire; then the foxglove, which is said to resemble young ladies—they always turn their flowers towards the roadside, they know they have pretty faces. You will never find these flowers facing the hedge. In the Midlands you will find "hedges of thorn, brier, rose, bramble, and maple, only to be seen and to be admired and loved." Box hedges are not durable, for box is easily rent from the stem when old, and clipped holly grows no berries, and has a dull look, but it makes the best and most impenetrable of hedges.

In the outskirts of London, we see in nearly every street the privet planted in the little front garden, and being frequently clipped, it keeps its leaves all the year round, and is pleasing to the eye.

In Shakespeare's time, on washing days, the linen was dried on the hedges, and so it is to this day in many country places; and, strange to say, in the West of England, you often see children on their way to school walking on the hedge tops.

England has many admirable lanes, but none more so than Troutbecks, where these run towards the wilds at the head of its glen. You have the mountains on either hand, the beck more or less by your side, flowery meadows stopping its way, and such a tangle of honeysuckle and hawthorn for hedges as the eye loves to behold, mixed with wild raspberries, white and pink foxgloves, and lovely ferns innumerable—a scene once seen not soon forgotten.

Hawthorn may be found in perfection on the road to Oxford, before reaching Beaconsfield. The only thing to complain of is the almost oppressive scent of the hawthorn, with the showers of white petals that fall continually and whiten one like a snowstorm. In Suffolk it was a custom that the first farm servant who brought in a branch of hawthorn in full blossom on the first of May should have a dish of cream for his breakfast.

Ashurst, in Sussex, is so called from the enclosures being small, and the hedge-rows wide; hence "the wood of ash trees." Chidham, in the same county, has a curious story, for in a hedge-row on the farm of Mr. Woods was discovered growing a single wheat stalk, which, by careful treatment, became noted throughout England for its productiveness.

A favourite in our hedge-rows is the sweet briar, perfuming the surrounding air, and even when not in blossom exhaling a delicious fragrance. The oak is also found in the hedge-row, and in May tassels of green flowers hang from the twigs; the leaves show a transparent yellow-green, and here and there may be seen the rosy cheek of a swelling white oak apple.

We never hear of transplanting hedges in these days, yet in the year 1771, at Swaith, near Barnsley, it was a practice to transplant white thorn hedges of any growth, even to thirty or forty years old. In winter, after cutting, the old hedge was grubbed up, and set pretty deep in a trench where the new hedge was to be made, and did not fail to grow.

In the Island of Portland, four miles from beautiful Weymouth, there are no hedges! Geo. J. Simmons.

---

**Begonia Major Hope.**—For bedding purposes this pleasing pink, double-flowered variety seems to have caught on everywhere, and it plays a part in many pretty combinations. In conjunction with Alyssum maritima and Leucophyta (Calocephalus) Browni, it forms a very attractive bed at Hampton Court.—K.

## GARDENERS AND GARDENING.

### Does Education Pay

I was not at the conference at the International Horticultural Exhibition when the education of a gardener was considered, and I am therefore unacquainted personally with what may have been discussed. The question of the education of a gardener is as necessary now as ever it was, and with this difference, that, under present competition, the better a man is equipped the greater chance he has of succeeding.

When one considers the remuneration offered at the present day for the average gardener, there does not, however, appear very much to tempt young men to qualify for such positions, and it requires a large amount of enthusiasm to induce the embryo gardener to take up the profession when he sees the difficulty men have in obtaining suitable positions. If a young man has started on a gardening career, the best thing he can do is to educate himself for the position he aims at. Unfortunately, the majority of gardens are somewhat isolated and the opportunities for acquiring other information than is gained in daily practice are limited; but if head gardeners were more ready to assist and encourage those who want to improve themselves, these helps to self-improvement would be easily obtained. I fear there are many gardeners who do not give their young men much encouragement in these things; and, on the other hand, there are comparatively few young men of the present day who show any great desire for study. I know this from personal knowledge of young men who have served under me.

How many young men of the present day trouble to keep a diary of the work which goes on in the garden, whether in their own department or in others? Or if there is a good collection of conifers or other outdoor plants, do they make themselves conversant with the names, habit of growth, and other peculiarities of the trees or plants? What botanical knowledge do they possess to enable them to recognise the plants they meet with under different conditions of growth? How many can draw a plan to scale, and work it out in practice? Yet these things are necessary in the equipment for a responsible position as head gardener.

It should be realised by our young men that knowledge acquired can never be taken from them, and the greater knowledge a man can bring to bear upon his work the greater his chances of obtaining his proper position. Tact, smart appearance, and good manners are all valuable factors in the struggle for positions. There is also another useful thing if a man has to work for his living, and that is, influence. Many men occupy their present positions because they are "sons of their fathers"; probably if they had competed on their merits for the positions they now hold they would have lost the prize. Again, many men seize their opportunity when offered, and are shrewd enough to make the most of it. There appears to be at the present time some scarcity of really good young gardeners.

Gardening has changed in many ways of late; a few years since a head gardener was engaged for the position he was expected to fill. The employers knew what the engagement was for, and the carrying out of their duties was left to the man engaged. Things worked smoothly, and generally to the mutual benefit of employer and employed. Nowadays it does not appear necessary for the head gardener to know very much, as, too often, the management and control of the gardener is taken out of his hands; he is told how to carry out certain duties, and so is reduced to a machine which can be set in motion as desired.

It is well that the owner of a garden should be keenly interested in it, but it would be better if the pros and cons were discussed between himself and his gardener, without much notice being taken of third persons. There should then be that mutual confidence between them so necessary in all undertakings, and which is beneficial to both. Under such conditions we should find fewer dissatisfied gardeners, and a greater incentive to the younger men to interest themselves in their work. Paul T. More.

---

### A Gardener's Education.

This topic, which has been so much discussed, proves very interesting to the majority of gardeners, but I do not think it goes much beyond that. The suggestion that there should be a National Diploma in Horticulture is a good one, but if such a diploma is established I do not think it will be very beneficial to the average private gardener. The possession of a diploma would be of more use to a man seeking a position as horticultural instructor.

In his remarks on this subject (page 574), "J. C. W." suggests that the diploma would be likely to bring a different class of men into the profession; but would many of the middle-class, which he alludes to, accept situations at the present rate of remuneration? Furthermore, he assumes that the establishment of a criterion of ability would soon improve the wages of gardeners. This I fail to understand. There are already a large number of well-trained and capable gardeners who are prepared to accept situations at the present rate of pay, and so long as that is so, employers are not likely to pay more, in spite of what the B.G.A. hopes to do, and however good its intentions may be. I venture to say that the majority of employers do not care whether their gardeners hold a diploma or not, so long as they carry out their duties in a satisfactory manner.

In most cases such a diploma would go to the college-trained man; but would the latter be capable of taking charge of a large private garden? I think most readers will agree with me that he would cut a poor figure compared with the man practically trained in garden management. The training afforded by a horticultural college teaches students something about manures, insect pests, and how to grow certain crops, but it by no means teaches the various duties a private gardener is expected to carry out—duties that can only be learned by experience. I do not know that there is a better way of training a gardener than by the apprenticeship system, which enables him to accumulate a knowledge of all branches of his profession; but in addition to practical work, young men should be encouraged and helped to study. They will never regret the time so spent in future years. Personally, I have been fortunate enough to receive a college education, but, in addition to that, I have worked my way in different gardens from the very bottom of the ladder. A good education is certainly a considerable help to a gardener, but he cannot obtain a full knowledge of his profession without steady and continuous application to practical work.

Nous Verrons.

---

**Thunbergia grandiflora.**—For a lofty structure where a stove temperature is maintained, this thunbergia can be recommended as a vigorous-growing climber, and one whose large, light blue flowers are borne in great profusion over a lengthened period. It is a native of the East Indies, where it may be often seen festooning forest trees. —S. W.

**Hydrangea paniculata.**—The large-headed Hydrangea paniculata is grown in immense numbers, both as a hardy shrub and as a pot plant. For the open ground the typical kind does not, at least to my mind, gain sufficient recognition, and it is very difficult to obtain from nurseries. From the variety grandiflora it differs in its more vigorous growth, richer green leaves, and fewer sterile blossoms.—W.

## NEW PLANTS, ETC.

### BEGONIA DECORATOR.

A handsome and useful begonia, suitable alike for basket or pot culture. The soft scarlet flowers are double and of good size without being unduly heavy, and they are carried at the end of fairly long, pendulous stems. Washington and Fleur de Chrysanthéme were the parents of this newcomer. A.M., R.H.S., July 30. Messrs. H. Cannell and Sons, Swanley.

ESCHSCHOLTZIA MIKADO CANALICULATA.
Flowers rich scarlet, with orange centre. Petals prettily crimped. A.M., R.H.S., July30. Mr. W. H. Gardiner, St. Osyth.

### CLETHRA ARBOREA.

A beautiful flowering shrub that is only a success under glass, except in very favoured places. The flower spikes stand out almost horizontally from the stems, and each carries from a dozen to a score of pendant, white flowers. It is by no means a new plant, but is deserving of attention for greenhouse culture. A.M., R.H.S., July 30. Messrs. Stuart Low and Co., Enfield.

### GLADIOLUS CROWN JEWEL.

A splendid, large-flowered variety with the flowers well posed on the stout and branching spikes. The colour is soft deep pink, the three lower segments having each a blotch of yellow. A.M., R.H.S., July 30. Messrs. Jas. Kelway and Son, Langport.

### LYSIMACHIA HENRYI.

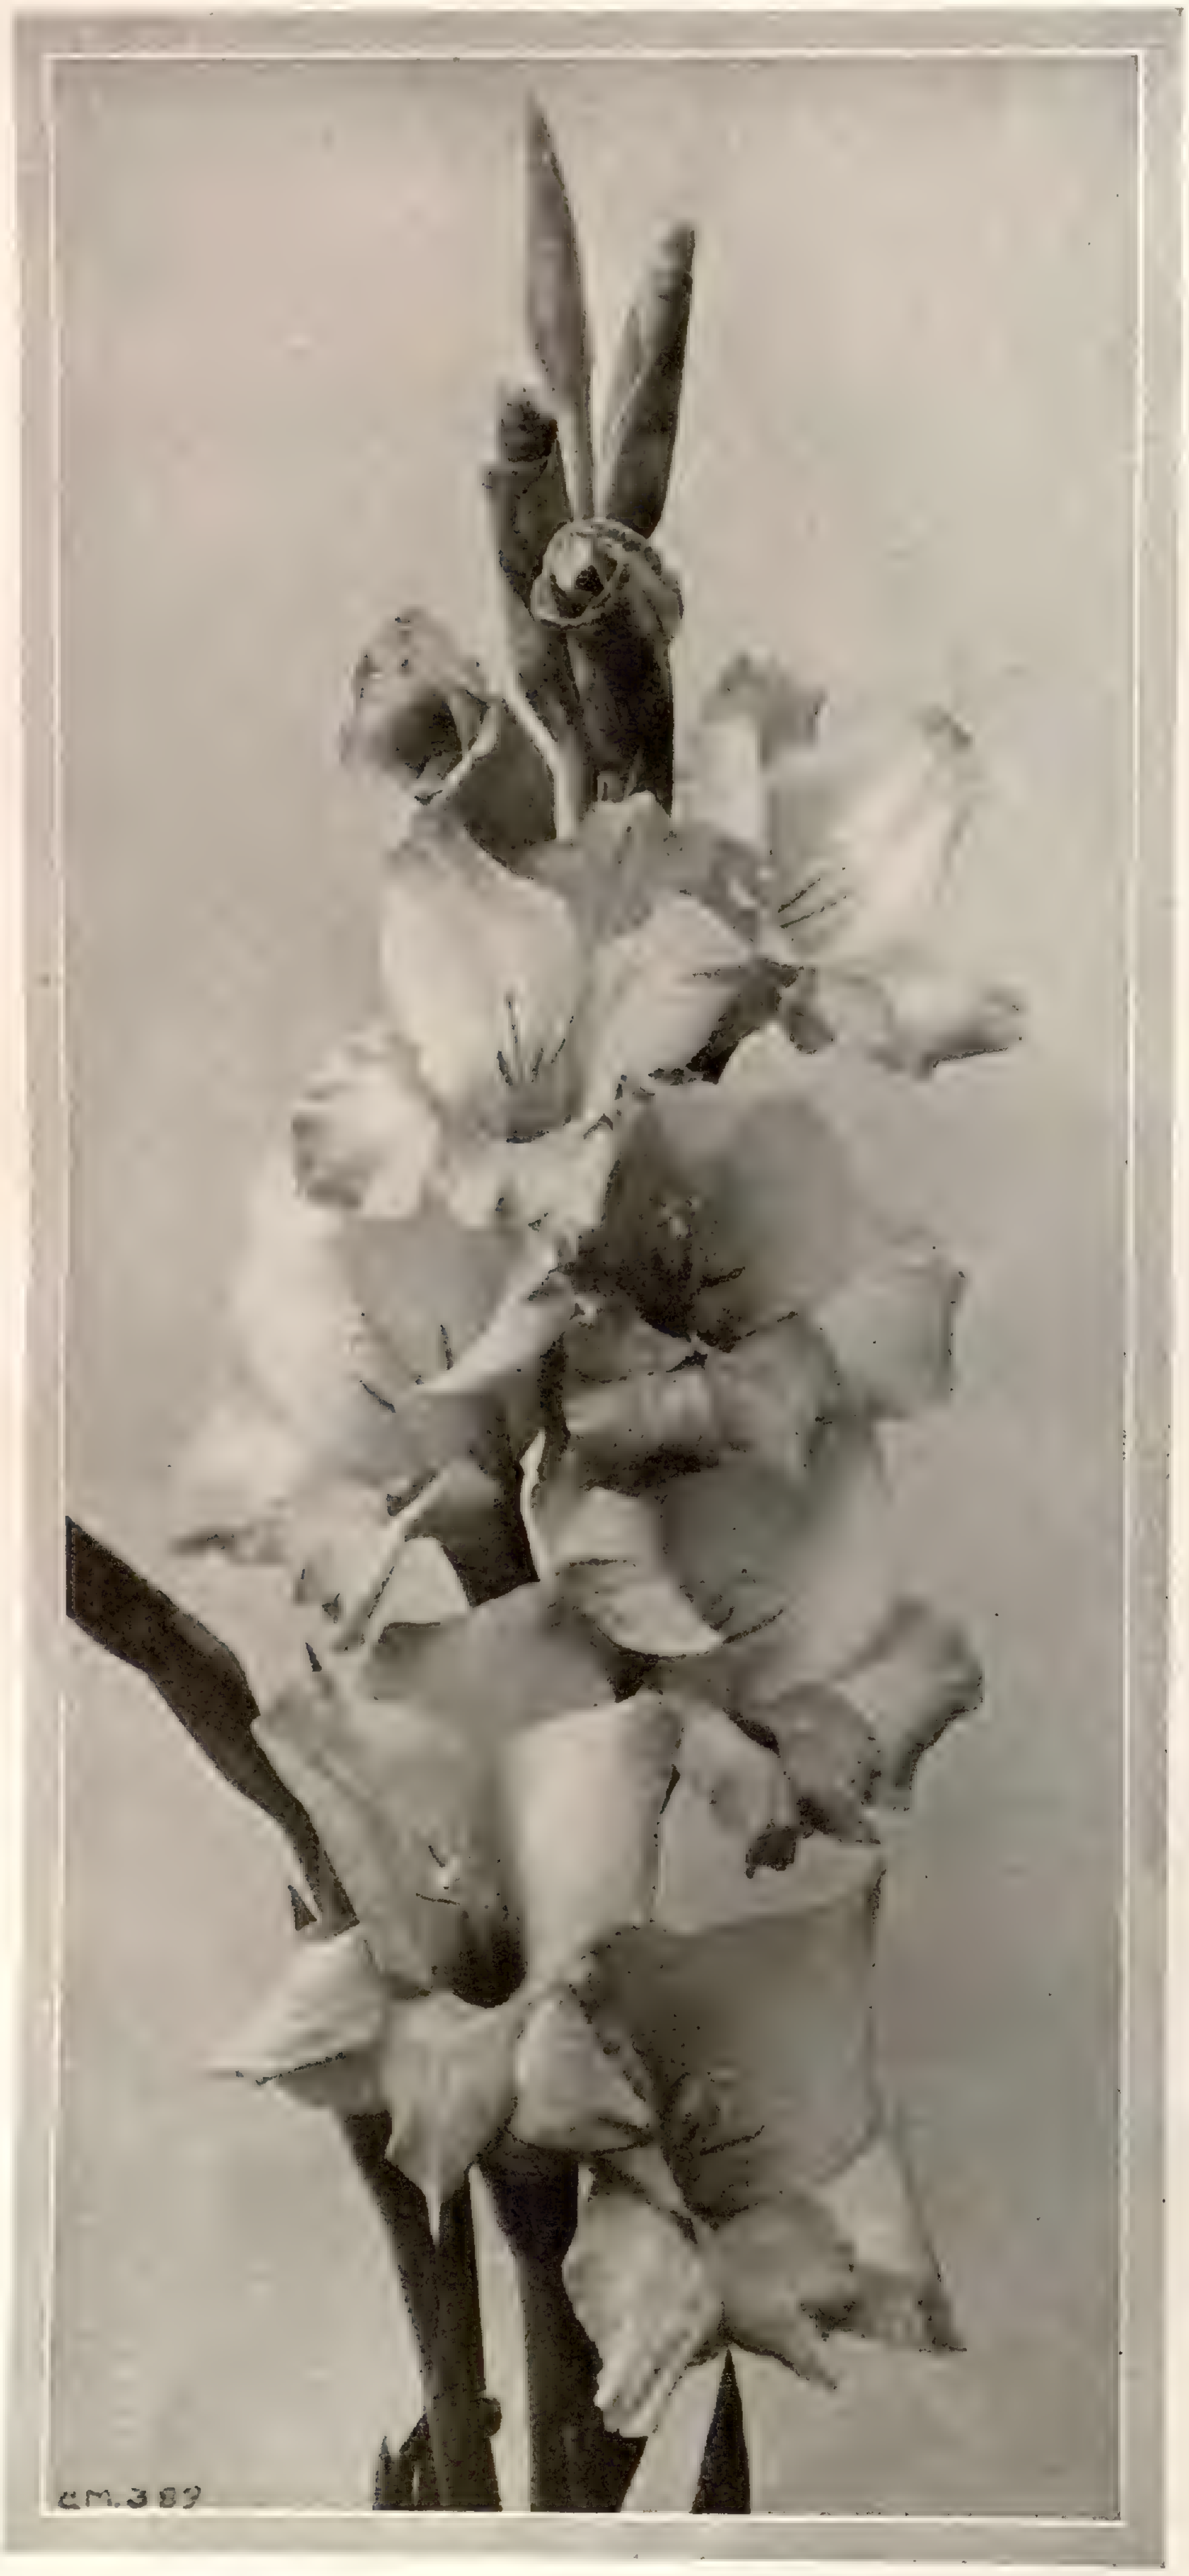
This new Chinese species is of lowly growth and dense habit. The stems are stiff and inclined to be prostrate; the lanceolate leaves are about two inches long and freely produced, while the small, yellow flowers, not so large or bright as those of the Creeping Jenny, are borne in clusters at the ends of the growths. A.M., R.H.S., July 30. Mr. Maurice Prichard, Christchurch, Hants.

### ASTILBE SIMPLICIFOLIA.

A charming little alpine species that does not exceed six inches in height when in flower. The deeply-lobed and deeply-toothed leaves cluster closely together, and from among them rise the little spikes of tiny pure white flowers. The spikes are about eight inches long, and are usually curving rather than erect. A.M., R.H.S., July 30. Mr. G. Reuthe, Keston, Kent.

### HÆMANTHUS ANDROMEDA.

This is a handsome plant, closely allied to the Amaryllis, but bearing much smaller flowers than the latter, and having them crowded together in a globose head. The colour is rich salmon-scarlet. Seven specimens were shown, and they reminded us strongly of Hæmanthus Katherinæ. A specimen was figured on p. 589 of the Gardeners' Magazine of August 3. A.M., R.H.S., July 30. R. R. Cory, Esq. (gardener, Mr. Cobb), Duffryn, St. Nicholas, Cardiff.



GLADIOLUS CROWN JEWEL.

Flowers deep soft pink, with a yellow blotch on each of the three lower segments. A.M., R.H.S., July 30. Messrs. Jas. Kelway and Sons, Langport, Somerset.

### RHODODENDRON CLORINDA.

A warm-greenhouse variety, obtained by crossing R. javanicum carminatum with R. Minerva, the former carmine, and the latter yellowish. R. Clorinda bears good trusses of beautiful, light, rosy-carmine flowers. A.M., R.H.S., July 30. Messrs. Jas. Veitch and Sons, Chelsea.

### ESCHSCHOLTZIA MIKADO CANALICULATA.

Eschscholtzia Mikado has been long recognised as one of the finest members of its family, and, grown in a mass, the vivid scarlet flowers, with their orange centres, produce a wonderful colour effect, especially during sunshine. E. Mikado canaliculata differs only from the type in having the petals lightly and prettily crimped or pleated, the lines of the "pleating" running regularly from the base to the margin of each segment. A.M., R.H.S., July 30. Mr. W. H. Gardiner, St. Osyth.

### ROSE DANÆ.

A free-flowering, sturdy rose, producing its blooms in lax, stiff clusters. The shining foliage and the buds suggest that Allister Stella Gray was probably one parent. The buds are yellow, and the flowers open soft yellow, but soon fade to cream and white. It is an attractive variety. A.M., R.H.S., July 30. Rev. J. H. Pemberton, Havering, Romford.

### POTATOES.

Witchill Seedling. — A shapely, shallow-eyed kidney potato, with a skin only slightly russeted. F.C.C., R.H.S., July 30. Messrs. Smith and Son, Aberdeen.

King Georve V.—A handsome white kidney potato, with shallow eyes and roughened skin. A.M., R.H.S., July 30. Mr. W. E. Sands, Hillesborough, co. Down, Ireland.

Irish Gem.—A fine-looking, smooth-skinned roundly pebble-shaped variety. A.M., R.H.S., July 30. Mr. W. E. Sands, Hillesborough, co. Down.

Imperial Beauty.—A very clear, smooth-skinned potato of decided and elongated kidney shape. A.M., R.H.S., July 30. Messrs. Barr and Sons, Covent Garden.

## SIMILARITY IN BUNCHES OF GRAPES.

For several years past I have noticed that the bunches of grapes on shoots growing from certain spurs had the same peculiarity of shape every year. I refer to the variety Alicante. On what I may term No. 1 the bunch had the same high front every year; the back portion of the bunch at the top receding. On No. 2 the bunch came with long, even shoulders every year, the finished bunches always being tapering and well-formed. On No. 3 the bunch was quite round, that is, the shoulders and other parts of the bunch growing out evenly all round, the finished bunch standing out well on the exhibition board. The bunches on shoots from other spurs have varied in shape from year to year, but those referred to have never varied, the bunches of one year being counterparts of those of previous years. I wonder whether other cultivators have noticed anything similar in regard to their own vines; if so, their observations will be of interest. Geo. Garner.

## VIOLA HEDERACEA.

Commonly known as the New Holland violet, this is one of those dainty little subjects that one is so apt to overlook among larger and more vigorous plants; hence it is necessary to exercise some care when selecting a position for it. It is stoloniferous in growth, having small reniform leaves like some campanulas, while in general habit of growth it is suggestive of a toad-flax. The flowers, borne singly on wiry stems, are quite reminiscent of the Dog Violet in form, the colour being a pale violet-blue with a broad margin of white. It succeeds best planted in a cool, well-drained spot, with not too full an exposure to sun, while, on account of its diminutive size, no stronger-growing subject should be allowed to encroach upon it. Introduced from Australia, and known to gardens since 1823, this plant is not commonly met with, probably because it does not prove really hardy in cold or otherwise unfavourable districts.

# "A GRAND FERTILIZER."

"The value of CLAY'S FERTILIZER needs but little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur growers are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."—NURSERYMAN AND SEEDSMAN, July 20, 1912.

## HYDRANGEA HORTENSIA.

It is worthy of note that, despite many transitions through which horticulture has passed in the last decade or so, Hydrangea Hortensia has ever maintained a foremost place in gardening. It is difficult to exaggerate its usefulness, as it lends itself to a variety of purposes in decoration, while in the cultivator's hands it is most tractable.

HYDRANGEAS ON THE TERRACE AT COOMBE COURT, KINGSTON.

For furnishing greenhouses and conservatories specimens in small-sized pots are generally in request; these are readily obtained by inserting cuttings at this season; placing them in a close pit until rooted, when they should be gradually inured to less close conditions, eventually exposing them to sun and air in autumn in order to build up strong buds to flower the following year. Plants treated in this manner may be grown in 60-sized or 48-sized pots, and will develop an inflorescence out of all proportion to the size of the pot, the chief requisite to this end being a rich, loamy soil when potting, while, during the growing period in spring, a weekly application of liquid manure is advisable. After flowering, plants of this description are most suitable for growing into large specimens. Before placing them in larger pots as much old soil should be removed as possible, as this admits the maximum quantity of new soil, and is also a safeguard against overpotting. To obtain large specimens, such as are generally in request, as tub plants, for furnishing terraces and other formal positions in the garden during summer, large plants of several years' growth are needed, and, when placing these in large tubs, it is never advisable to use plants other than those thoroughly well rooted, as hydrangeas resent anything in the nature of sour soil, and the tendency to this end is ever present at "tubbing" time, hence more than ordinary care should be exercised in watering. Once established in tubs it is comparatively easy to maintain hydrangeas in maximum vigour by frequent applications of liquid manure or an approved fertiliser dusted over the surface and watered in, while an annual top-dressing of rich soil to the tubs in spring will greatly stimulate activity in the roots.

Hydrangea Hortensia attains its highest decorative beauty when treated practically as a hardy shrub, as is readily evidenced from numerous examples grown in the open in favoured parts of the country. When cultivated in tubs or pots, protection from frost is necessary in the case of the roots, and if water is withheld from these in late autumn, so that the mass of soil is practically dry during winter, then hydrangeas may safely be wintered in any airy outhouse, shed, or even sheltered verandah. Early in March they should be examined, cleaned, and watered, and placed in a sunny yet sheltered part of the garden, and, with the unfolding of the first leaves, the annual top-dressing should be afforded. Plants so treated flower during August and September.

In order to obtain hydrangeas in flower during May and June the plants should be introduced into heat in January. A temperature of 50 deg., rising 5 or 10 deg. with sun heat, is ample at all times, and if they are placed near the glass and fully exposed to the sun, short, robust specimens will result. A long-growing season is much to be commended for hydrangeas, in preference to rapid forcing, as the latter invariably weakens the wood, and entails much staking, whereas, by the former method the wood is generally strong enough to support the flowers without assistance.

Hydrangea Hortensia is most in request at present when obtained in rich pure shades of pink or blue; the former colour is readily obtained by high cultivation, and may be described as natural to the species, but the blue colour is more or less accidental, and, with plants cultivated in pots, is rarely permanent; hence artificial treatment is most generally practised in order to obtain this colour. Oxide of iron and alum have long been held in repute by gardeners as a means to this end, but their action is always slow and often erratic. A preparation lately placed upon the market gives the quickest results I have yet obtained, and the blue shades are singularly free from the purple which frequently mars one's efforts in this direction.

It is well to remember when potting hydrangeas, with the view of obtaining blue flowers, that lime in any form is detrimental to the process, a remark that applies equally to water impregnated with the same substance. Thomas Smith.

Coombe Court Gardens.

---

**Bougainvillea glabra.**—Despite the fact that, when grown out of doors during the summer months, the bracts of this bougainvillea are very richly coloured, it is often allowed to develop in a close and shaded structure, under which conditions it cannot for one moment compare with those grown in a cooler and more exposed manner. Time was when this bougainvillea was regarded absolutely as a stove plant, but now, in common with many other subjects, it has been proved that less heat is necessary for its well-doing.—W. T.

## ROSE MADAME JULES GRAVEREAUX.

This fine rose was introduced by Messrs. Soupert et Notting eleven years ago, and has remained a great favourite from the first. It is classed as a tea-scented variety, although it is not a pure tea rose, being the result of crossing the noisette Rêve d'Or with the hybrid tea Viscountess Folkestone, which the late Mr. Henry Bennett—a pioneer among rose hybridists—gave us in Jubilee year.

In colour, size, and habit of growth, Madame Jules Gravereaux is just what one might reasonably look for from such parentage. It is a splendid climber for almost any position, and makes grand heads in standard form. In addition to its great usefulness in the garden (it being almost impossible to use it to wrong purpose), it has figured very prominently in the winning stands at rose exhibitions, gaining the silver medal as the best flower of any tea or hybrid tea variety upon many occasions.

Of exceptionally strong and robust growth, it flowers more continuously than most of our vigorous roses. Carrying handsome foliage that is freer than usual from mildew—a most disfiguring as well as crippling disease upon rose foliage, it does not possess quite such long and rambling growths as the strongest of its parents—Rêve d'Or—and is all the more suited for pillars because of this characteristic, combined with the excessively free-blooming qualities of Viscountess Folkestone.

It is also a capital rose on the back wall of a conservatory, but must not have a too moist atmosphere because of its great doubleness, any check to opening causing decay. Most of us recognise the fruity sweetness of perfume found in Viscountess Folkestone, and all of this is fortunately retained in the rose under notice. The flowers illustrated represent some recently exhibited in fine form by Messrs. Frank Cant and Co., Braiswick Nurseries, Colchester.

ROSE MADAME JULES GRAVEREAUX.
A free-flowering, sweetly-scented variety, flesh-coloured, with yellow shading.

---

**Lilium Warleyense.**—As shown at Holland Park, and illustrated in the Gardeners' Magazine of July 6, this is indeed a superb lily, but still I question if it can be regarded as other than a form of Lilium sutchuenense, a Chinese species with which we have within the last ten years or so become fairly familiar. True, I have never before met with examples of L. sutchuenense the equal of those shown as L. Warleyense, but unusually developed bulbs may account for this.—W.

## HARDY PLANT CHAT.

### Dictamnuses.

The fraxinellas are such distinct-looking hardy flowers that they should never be forgotten by those who wish to possess the best border flowers of June and July. Yet there are many gardens which are the poorer because of their absence. They are said to be good dry-weather plants, but this must be accepted with the proverbial grain of salt, as some experiments with plants in dry and moderately dry soils proved to the writer. These dictamnuses form long tap roots, it is true, but if the subsoil is a poor and sandy or gravelly one this is no great advantage, as they find their way down into a stratum where there is little to support the plants. The best are those which have access to some good rich soil beneath, and it is advisable to give them as good a chance as possible by deep digging or trenching and manuring at first. Good plants have been much crippled by neglect of this attention, whereas those which were properly attended to showed their gratitude for liberal treatment.

There is, however, a considerable diversity among the individual plants, many of which have been raised from seeds, and show a good deal of diversity in stature and vigour. The dictamnuses known as caucasicus and tauricus are, however, nobler than the other forms of the common one, which is named D. albus in the Kew "Hand List," although best known to us as D. Fraxinella. Some doubt has been thrown on the belief that the dictamnuses emit an inflammable vapour, which will ignite on a calm evening if a lit match is applied to the flowers or upper portions of the stems. This is, however, a well-proved fact, and it renders these handsome border flowers more interesting than they would otherwise be. Yet they deserve notice for their beauty. By the way, they are easily raised from seeds, but if these are not fresh germination may be slow.

### Sanguisorba canadensis.

One finds that this tall border or wild garden plant is appreciated for cutting, as it has pleasing creamy-white flowers in light-looking spikes. It is rather surprising to know that so many people are unacquainted with this Canadian burnet, especially as it increases quickly, and is very accommodating in its ways. Although a native of swamps and low meadows, where it grows from one to six feet high, it is not at all averse to a dry border, and it grows with the writer to quite five and six feet in such a border. It is not nearly so stiff when in flower as our native burnet, and the spikes look quite light and elegant. It sows its seeds freely enough, and also increases by underground runners, so that it can hold its own well, and requires to be watched, indeed, lest it injures some of its neighbours

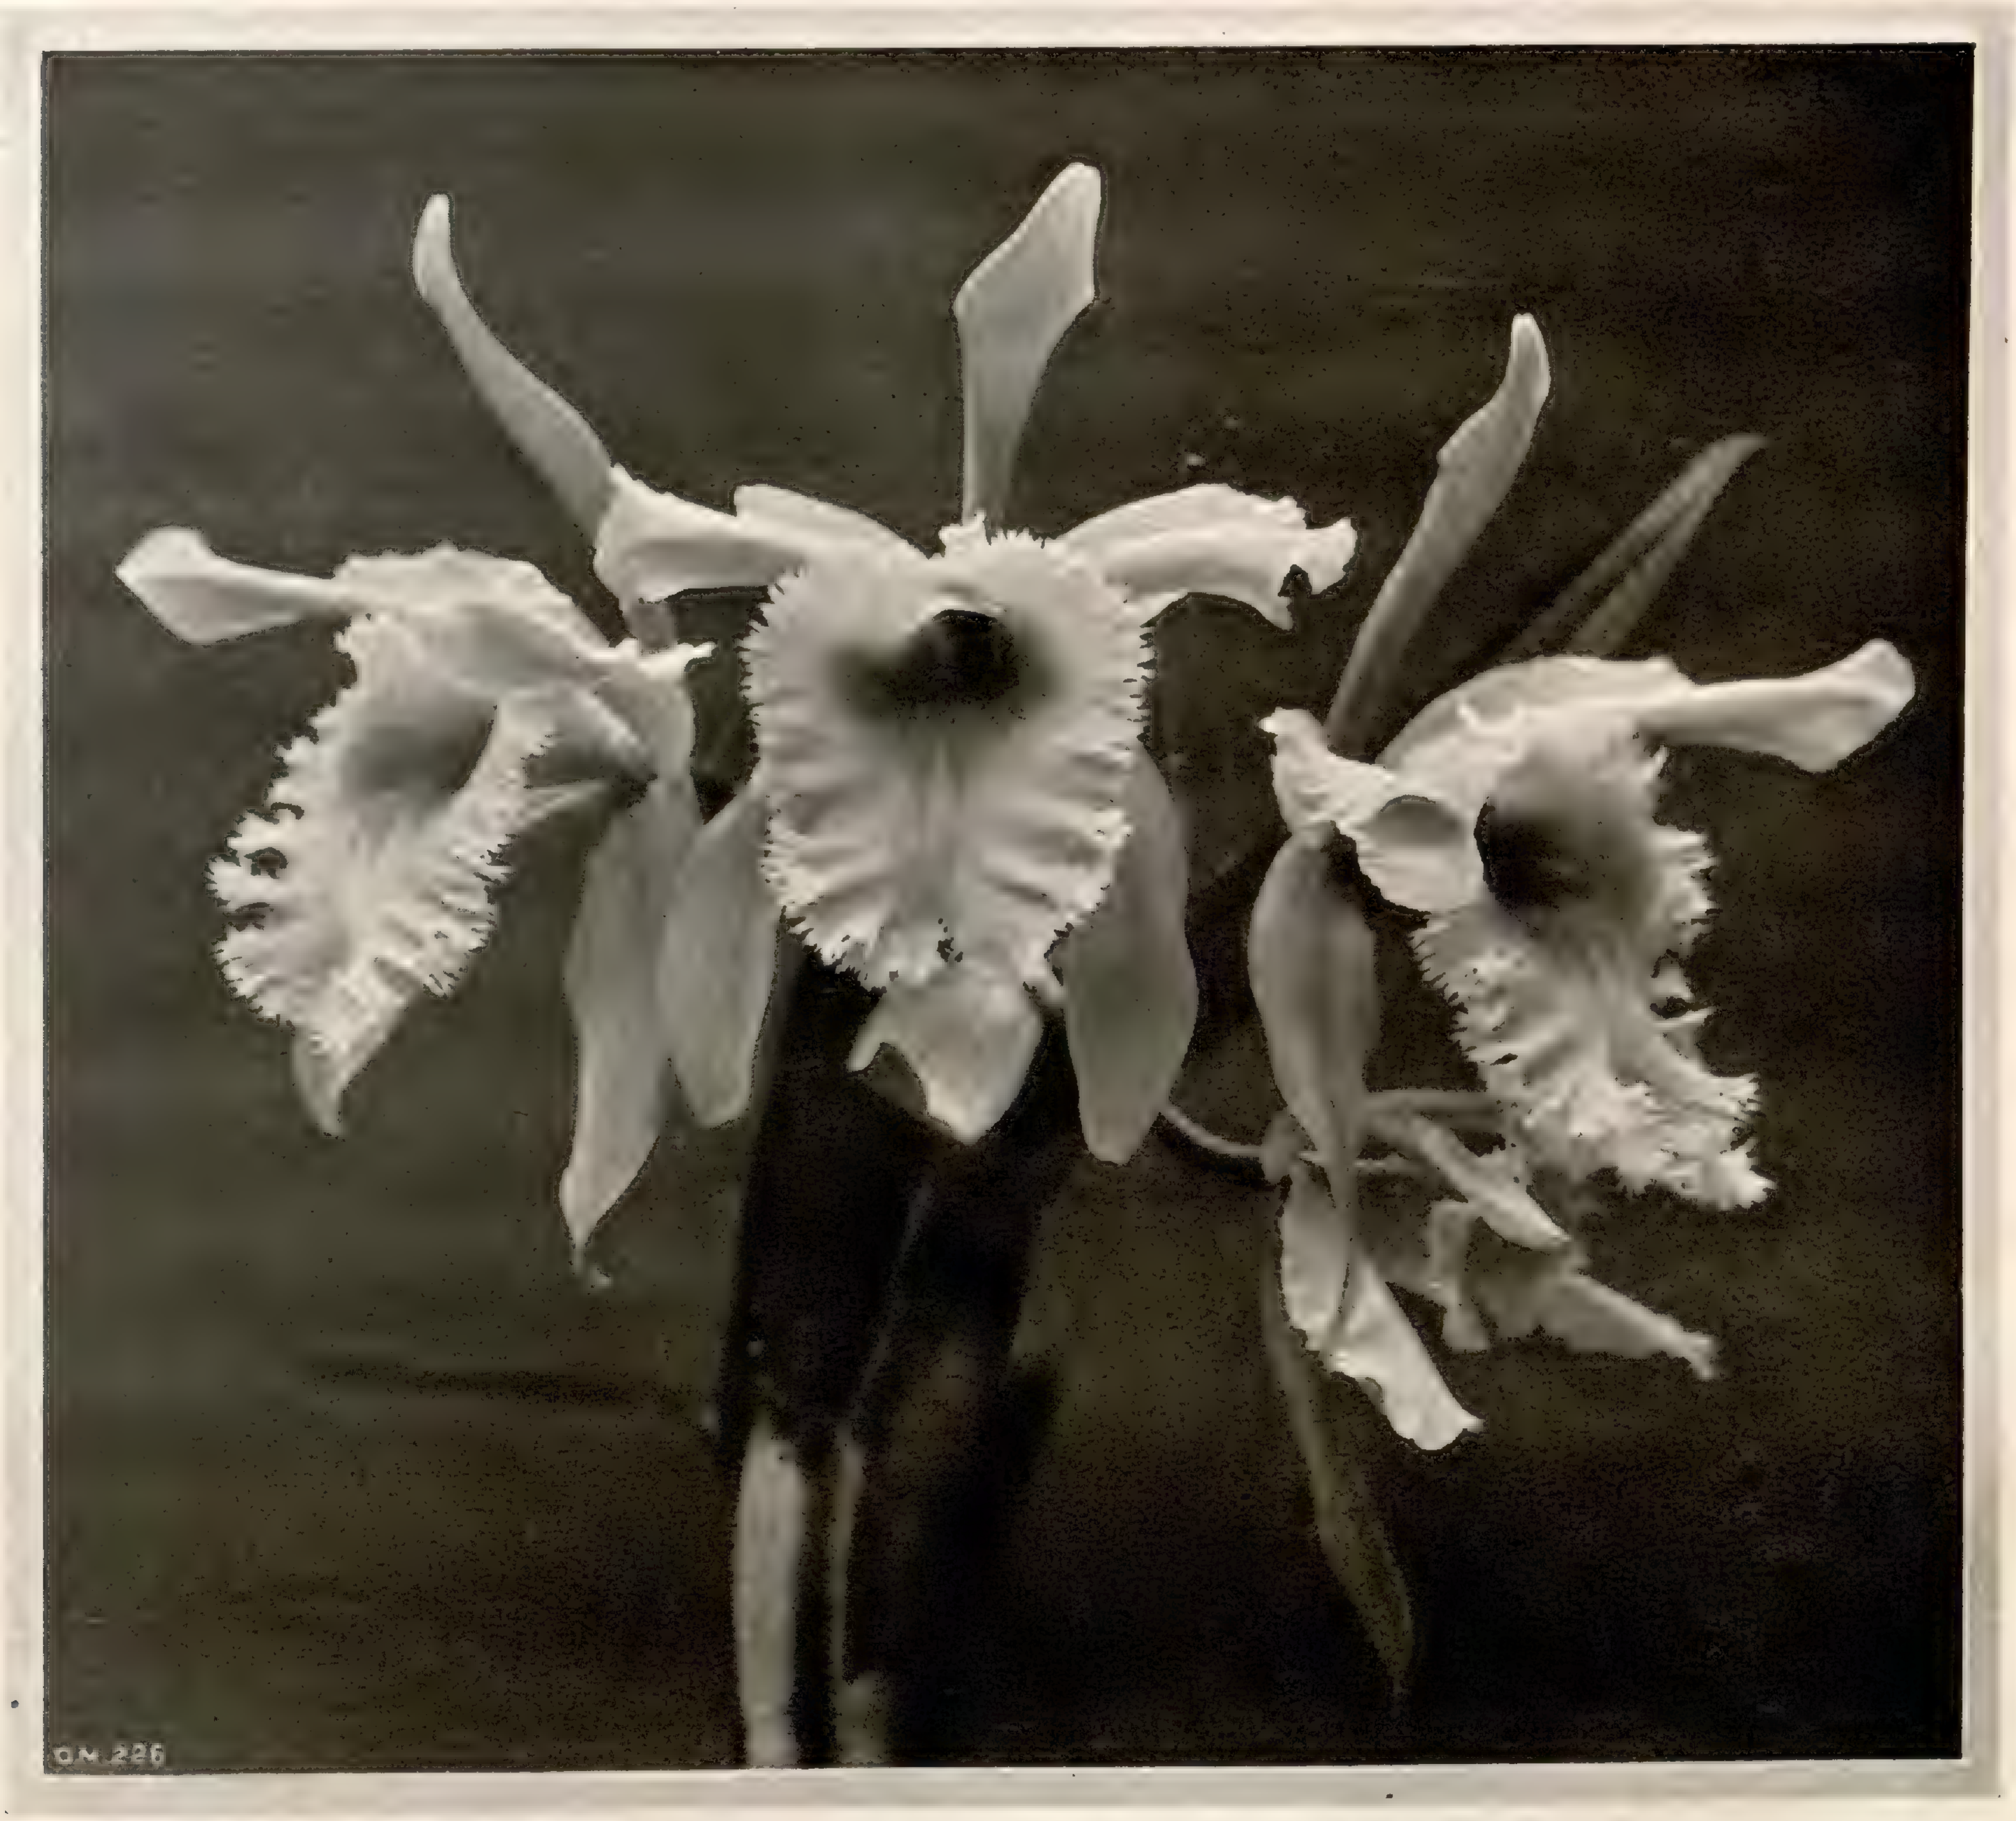
### Geranium pratense.

It may appear superfluous to write of the native cranesbill called Geranium pratense. But it would seem that there is a good chance of it giving a considerable diversity of colouring if some attention were devoted to raising seedlings. We know, of course, that some of the best forms approach G. grandiflorum in size and colour, and that there is also a white variety. Then there are the double varieties—that with double blue and the one with double white flowers—both making good border plants. The writer came across a light blue variety in a garden the other day. This was a self-sown seedling which had originated in a nursery in the midst of a clump of a hemerocallis, and both had been purchased to secure this light blue variety. In view of its appearance, and the fact that we have a white variety and that the deeper-coloured ones vary in depth of tone, there would surely be some encouragement for seedling raisers, crossers and hybridisers to persevere.

S. Arnott.

---

## BRASSO-CATTLEYA HEATONENSIS HOLFORD'S VARIETY.

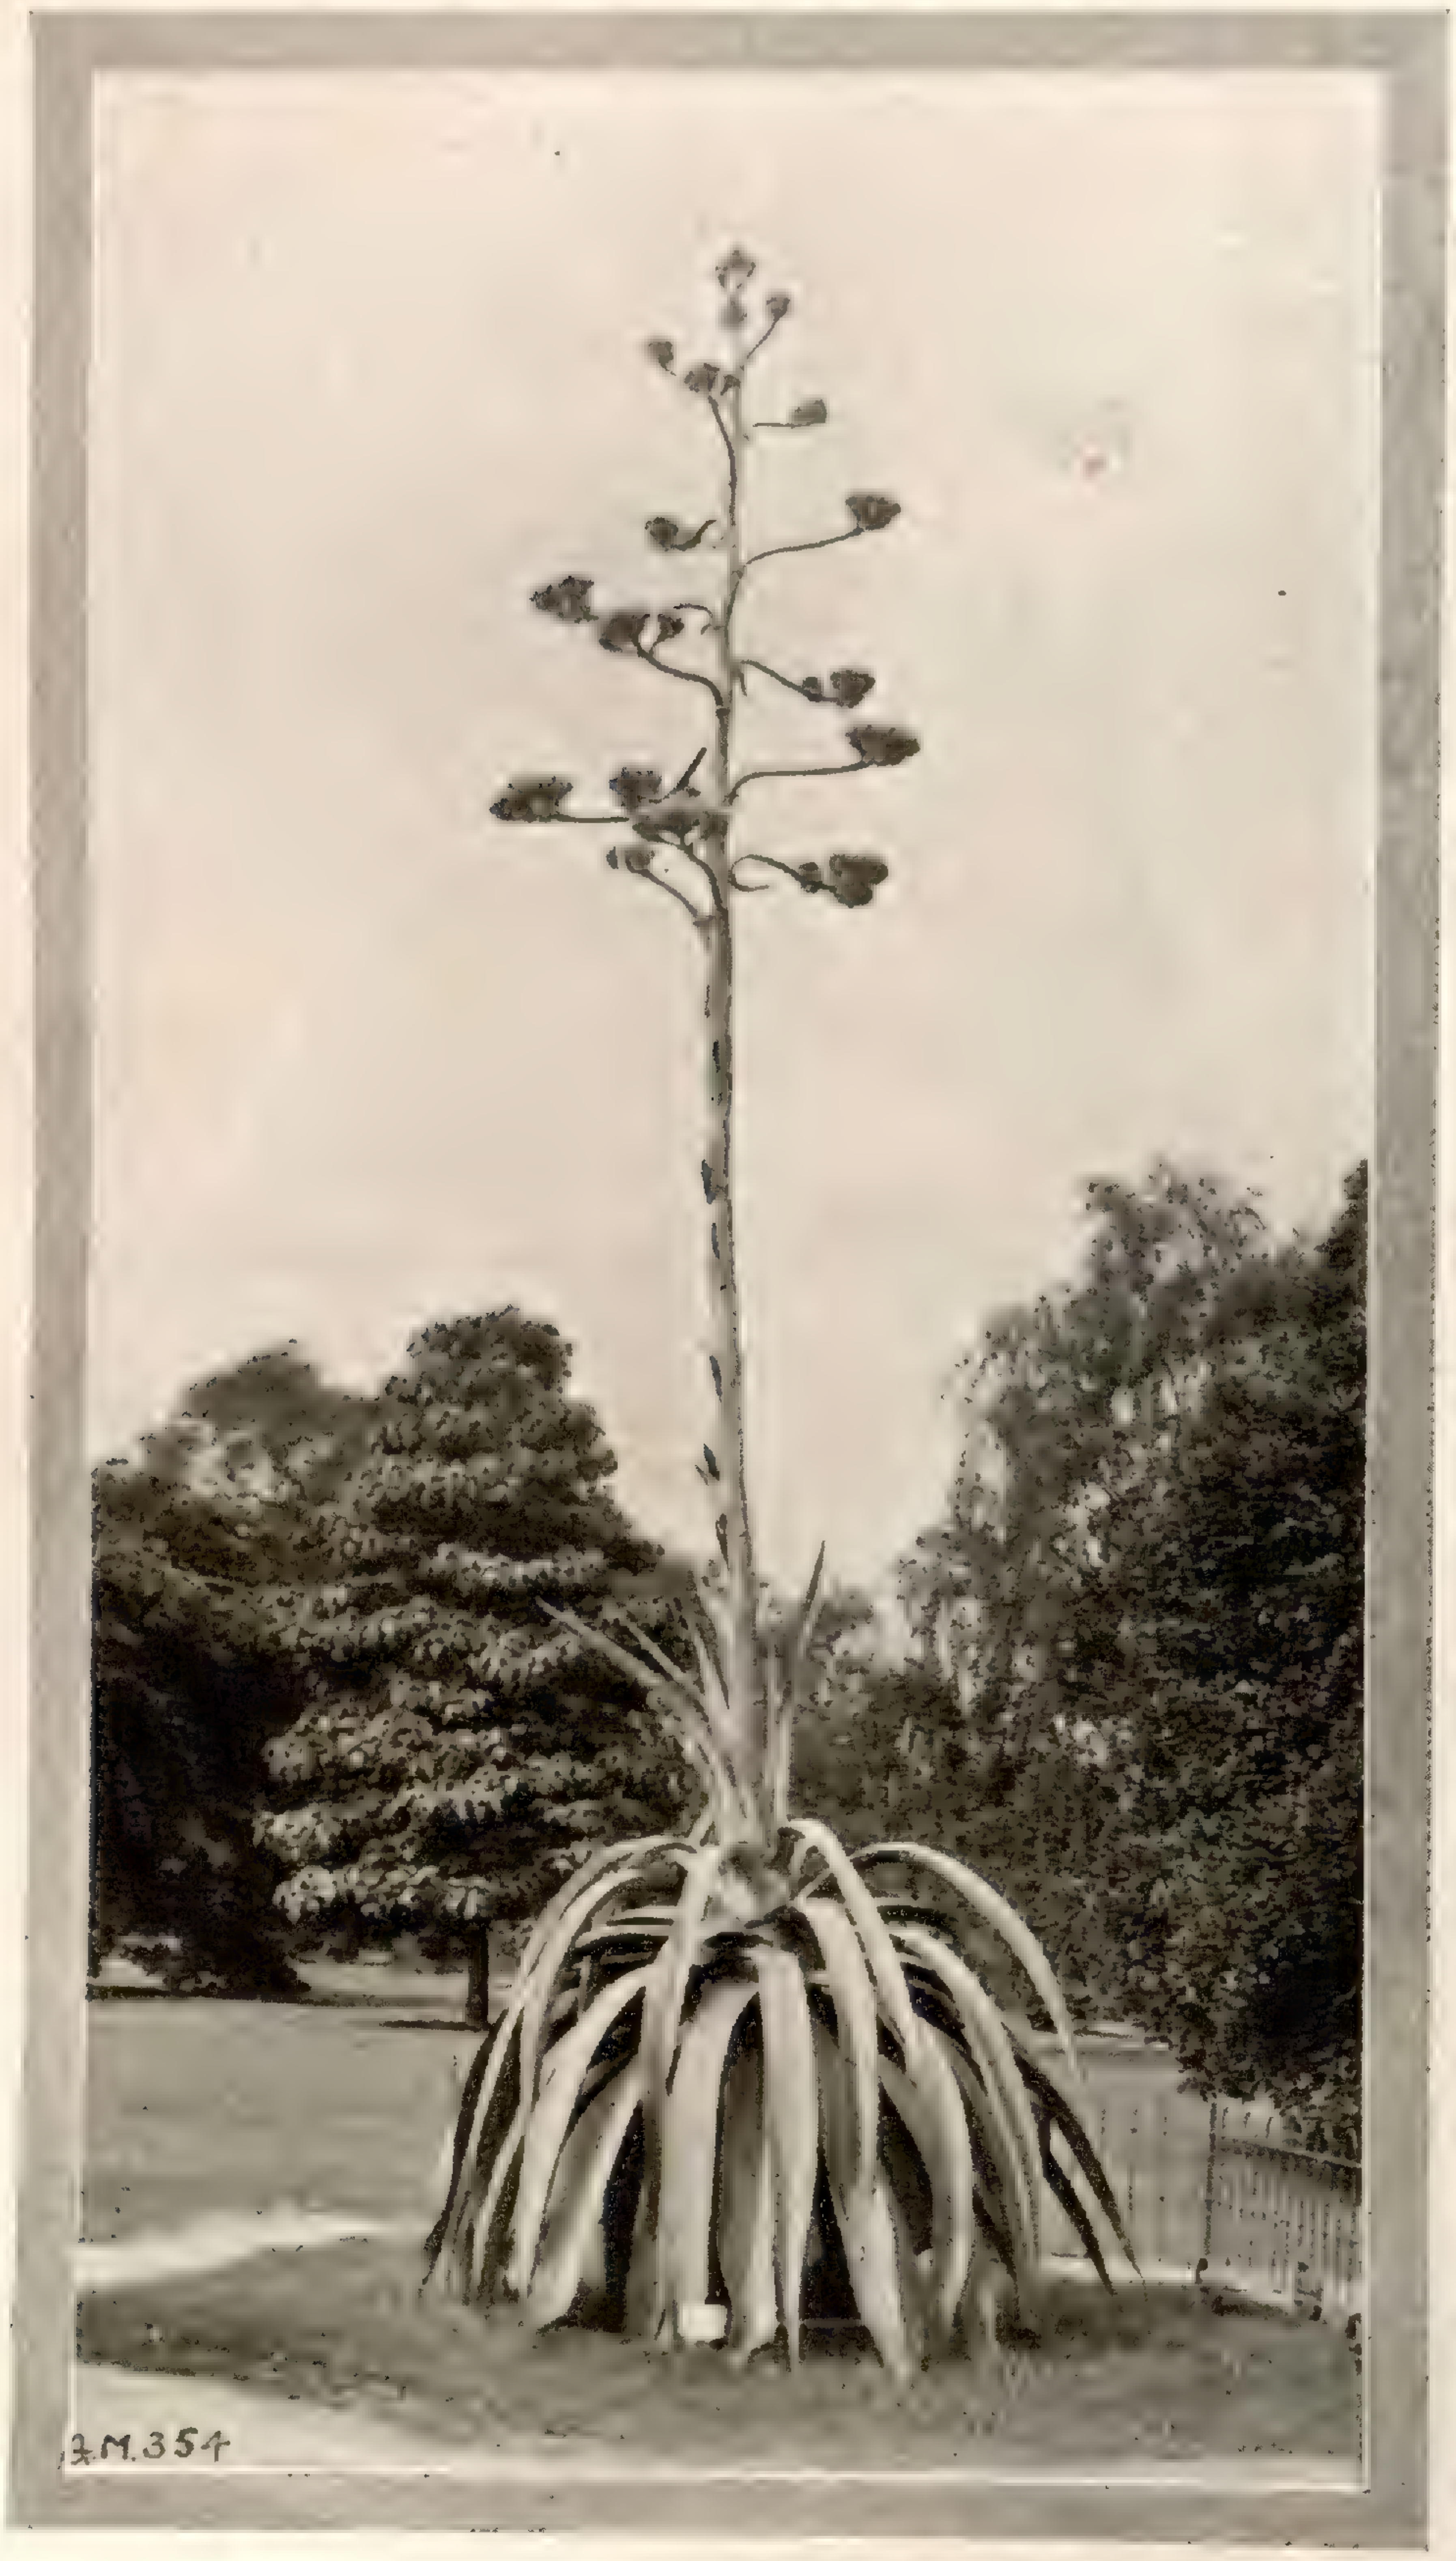


BRASSO-CATTLEYA HEATONENSIS HOLFORD'S VARIETY.
Flowers large, soft buff-yellow, shaded with silvery rose; lip finely fringed.

Among the many very handsome orchids that bear a varietal name, which is a sign of their great worth, few of the large-flowered hybrids derived from Brassavola Digbyana exceed Brasso-cattleya Heatonensis Holford's Variety, either in size or beauty. This is a wondrously beautiful form of the hybrid between Brassavola Digbyana and Cattleya Hardyana, and the colouring is an exquisite combination of soft, buff-yellow and silvery-rose, with a large yellowish area on the centre of the large and prettily fringed lip. At the great International Horticultural Exhibition of May last the specimen herewith illustrated was a conspicuous beauty in the splendid display of fine plants so admirably staged by Mr. H. Alexander, orchid grower to Sir George Holford, Westonbirt, Tetbury, Gloucester

## AGAVE ATROVIRENS.

The stately Agave atrovirens has of late created much interest owing to the splendidly developed specimen which for a long period was one of the most noteworthy objects in the succulent house at Kew, having reached the flowering stage, and once more brought into prominence the legend that certain of the agaves blooms once in one hundred years. In the GARDENERS' MAGAZINE for May 4 of the current year we gave an illustration of the plant before the development of the flower spike had commenced, for the purpose of showing the noble proportions of the species when in a robust state of health, for many years previous to its reaching the period of flower development. Concurrently with the illustration a brief account was given of the history and characteristics of the species, and in presenting an illustration of the specimen when its notable inflorescence had attained its full development, there is no occasion to do more than briefly refer to one or two points of interest of which no mention has previously been made. The plant has sixty leaves, and of these the largest was seven feet three inches in length, and had a breadth of fourteen and a-half inches at the base, and of nine and a-half inches in the middle. Several of the lower leaves had a thickness of fifteen inches at the base and eleven inches in the middle. Of the year in which the specimen that has now flowered, and thereby reached its last stage, was added to the Kew collection there is no record. It is, however, known that it was in the collection in 1873, and that it was then between four and five feet in diameter, or about one-third the diameter that was ultimately attained.



AGAVE ATROVIRENS, OR THE CENTURY PLANT, NOW FLOWERING AT KEW.

---

**Erigeron speciosus superbum.**—Given fine weather, this is a charming plant for the herbaceous border, but very few are so quickly affected by the rain. It causes the heads of bloom to droop, and the florets to stick together to such an extent that it is termed by a friend of mine the Dorothy Draggletail Plant. Two or three bright days, however, suffice to put matters right.—K.

## THE STUARTIAS.

The Stuartias form an interesting group of shrubs, and the few species in cultivation are of an ornamental character. Unfortunately they are not very easy to cultivate, hence their comparative rarity. About half a dozen species have been described, but it is doubtful whether more than three are grown in this country. They appear to require a warm, moist, and deep, loamy soil, but appreciate a little peat about the roots. Permanent positions should be found for plants whilst they are quite small, for they are very impatient of root disturbance, and suffer severely after transplanting. Seeds form the best means of increase, although it is possible to root cuttings. Young plants should be grown in pots until such time as they can be placed in permanent positions.

S. Malachodendron from the Southern United States, forms a shapely bush, from 6 to 14ft. high in its native country, though it rarely exceeds the smaller dimensions here. The leaves are up to 4in. in length and 2in. or so wide, and the flowers, which are borne singly from axillary buds, are 3½ to 4in. across, white, with sometimes crimson marks on the outsides of some of the petals, and a central mass of purplish or crimson-purple stamens. The flowering period is July and August. In America it inhabits swampy ground, and often occurs in shady places. As long ago as 1742 it was recorded as having flowered in the garden of Mark Catesby, at Fulham, but neither then nor since has it been common.

S. pentagyna is another species from the Southern United States, where it is met with in the mountains of Carolina, Georgia, and Tennessee. Its average height appears to be from 8 to 10ft., although specimens up to 20ft. high have been recorded. The young wood is usually tinged with red, and the same colour may often be noted about the margins of the leaves. The leaves are broadly ovate, up to 4½in. long and 2½in. wide, with serrated margins. As in the former species, the flowers appear singly from axillary buds. They are white or cream-coloured, often deeply stained with crimson on the outer side, 3 to 3½in. across, and usually composed of five large petals and one small petal, the yellow stamens forming a good-sized tuft in the centre of the flower. A figure of it is given in the "Botanical Magazine," t. 3,918.

S. pseudocamellia is a Japanese plant, which has been said to attain the dimension of a good-sized tree under the most favourable conditions in its natural habitat. The largest examples are stated to attain a height of 50ft., with a girth of 6ft., on the mountains of Hakona and Nikko. Here, it has only been seen in bush form, although its habit is more suggestive of tall growth than that of the other species. The lance-shaped leaves are 2 to 3in. long, with finely-serrated margins. The white flowers are about 2in. across, and they are relieved by a central mass of golden stamens.

Another Japanese species has been described in S. monodelpha, but it is doubtful whether it is in cultivation. Described as a tall shrub or small tree, herbarium specimens show it as having oval leaves up to 3½in long and 1¾in. wide, and small white flowers with violet anthers. In addition to this there are two other species, S. grandiflora and S. serrata, neither of which is known in gardens, although the name of grandiflora is sometimes given to S. pseudocamellia.

W. DALLIMORE.

# CAMPANULAS FOR THE HERBACEOUS BORDER.

The list of campanulas suitable for the herbaceous border is an extensive one. The various species and varieties make up a group of plants which cannot very well be dispensed with. The flowers are also highly appreciated for cutting, as the majority of them last well in a cut state.

Although by no means fastidious regarding soil and situation, the majority of campanulas delight in a cool root run and a half-shady position. Many of the dwarf alpine species, which are usually grown in the rock garden, may be successfully used for edging the herbaceous border, especially if a few stones are used to prevent undue moisture lying round and amongst the tender shoots. Generally speaking, a light loam, which has been enriched with decayed manure, will be found an excellent rooting medium, but it must be fairly moist. It is necessary to lift, divide, and replant some of the strong-growing kinds every two or three years, otherwise the growths become too crowded, and small flower spikes will result.

CAMPANULA CARPATICA ALBA. [Photo: C. P. Raffill.

A fine white-flowered plant for beds or borders.

Campanulas are readily raised from seeds, and, although the colours are sure to vary somewhat in shade, yet this is a highly interesting part of the work, and many beautiful plants are to be so obtained.

C. amabilis is a splendid member of the family, having large, open, saucer-shaped flowers, borne on branching stems about 2ft. high. In colour the flowers are a rich blue. Being a fast grower, this species requires dividing about every two years to obtain good spikes of blossom. C. barbata should be treated as a biennial, for it invariably dies out after flowering. It well deserves a place in the border.

The various forms of C. carpatica are wonderfully well suited to the front portions of the borders, where they form excellent edgings. The foliage is very thick, and most of the varieties of this type are profuse bloomers. C. carpatica has blue flowers, and there is the lovely white form C. c. alba, that must not be omitted. There are several beautiful selections or hybrids from this dwarf campanula which should be included in every collection of hardy plants. China Cup, with pale blue flowers; Isobel, blue; pelviformis, soft blue, flowers slightly reflexed (this latter variety has also a white form); Riverslea, a strong grower, with large, open flowers of a pale blue colour; and White Star are all good, and this last may be said to be the best of the whole section. The growth is somewhat stiff and more erect in habit than the others, and the large, open flowers, which are white, with a distinct shading have a ring of pale purple in the centre. These campanulas are of great value, for they may be grown to advantage both in the rock garden and the border.

C. Fergusoni is a hybrid of exceptional merit, being the result of a cross between C. carpatica and C. pyramidalis alba. The flowers are pale blue, borne on stems which grow from 18in. to 2ft. high. C. glomerata and C. glomerata dahurica are both fine border kinds, growing about 2ft. high, and producing terminal heads of purplish flowers. C. grandis (or latiloba) is a beautiful species, somewhat similar to C. persicifolia, but having more expanded flowers than the latter. The rich blue flowers are much appreciated for cutting, as they are light and graceful. This species, with its white form, alba, make a capital pair. C. lactiflora grows about 4ft. high, and has beautiful sprays of milk-white flowers, which which are borne on the ends of the growths. The colour will vary slightly when plants are raised from seeds, and a little more blue will be produced in many of the flowers; in any shade of colour it is a plant well worth cultivating. C. latifolia and its white form are desirable plants, growing about 4ft. high; C. latifolia macrantha is an improvement on the type, having larger flowers.

C. persicifolia (the Peach-leaved Bellflower) is a popular old favourite in all gardens, and is one of the most useful of all the campanula family. To obtain the best results it is important that the plants should be lifted and divided at least every two years, and the strongest growths must be selected for replanting. Replanting should be attended to early in the autumn. C. persicifolia and its numerous varieties should be well represented in every collection, not only on account of the great value they possess for border decoration alone, but for the usefulness of the flowers for cutting. C. persicifolia alba has large, pure white flowers, and there is also the double variety, C. p. alba fl. pl. Among the named varieties there are Daisy Hill, with round, double flowers of a pleasing shade of blue; Humosa, semi-double, blue; La Fee, one of the more recent introductions, with large lavender-blue flowers, and is an excellent addition to the family; and Moerheimi, a well-known variety, its pure white semi-double flowers produced in great abundance, and lasting for some considerable time. Unfortunately, in some gardens this variety does not grow quite so freely as many of the others, therefore a little more attention should be given it. Newry Giant is said to be an improvement on the preceding, having a much stronger constitution.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

COCHLIODAS AND ODONTIODAS.—The genus Cochlioda is not a large one, the only known species being C. Noezliana, C. rosea, C. sanguinea, and C. vulcanica. These, however, in the hands of the hybridist, have been of considerable importance. Crossed with odontoglossums, they have given us the beautiful odontiodas, and these comprise some of the most brilliant orchids that have yet been raised. As time goes on, undoubtedly still greater strides will be made in these plants, and we shall obtain flowers of vivid colouring and easily produced in a cool house. There are already some thirty or more odiontiodas in commerce, and all have some good qualities, and are worthy of cultivation. O. Bradshawiæ, O. Bohnhoffiæ, O. Charlesworthi, O. heatonense, O. Keighleyensis, O. Thwaitesi, and O. Vuylstekeæ, comprise the best-known and include some of the choicest. They all thrive in a cool, airy, and moist atmosphere, such as is suitable to the cool odontoglossums. I find they succeed grown in shallow pans, suspended or raised well up to the light, the whole year round. In a suitable atmosphere, and under judicious treatment, they are easy to cultivate, and not subject to insect pests, but every endeavour must be made to keep thrips at bay. This troublesome pest must be eradicated by mild fumigations at regular intervals.

POTTING.—The plants are rather erratic in their time of growing and flowering, but the majority are now making their growths for next year's flowering. If any are in need of fresh rooting materials they should be potted just as the young growths are about to push forth new roots. They should be treated exactly as odontoglossums, and will succeed in the same kind of compost, potted in the same manner, and in the same way. Small pans should be employed, as nothing is so fatal as overpotting. The pans should be thoroughly well drained with clean crocks, and the plant should be placed so that the base of the pseudo-bulbs is slightly above the rim of the receptacle; press the compost moderately firm, without bruising the roots. I do not advocate finishing off with a layer of fresh sphagnum moss, as so often seen, but believe in trimming the whole of the surface to give it a neat appearance. During active growth the supply of water must be ample, but at no period should the rooting material be allowed to remain dry for any considerable length of time.

MILTONIODAS AND ONCIDIODAS.—Cochliodas have also been crossed with Miltonias and Oncidiums, and no doubt, as time goes on, we shall have our collections enriched by many beautiful bigeneric orchids. As the culture of these latter hybrids differs from the former, I will defer giving their treatment until some later date. In treating bigeneric hybrids, where the parents are of a quite different character, it is always safe to treat the plant according to the predominating parent.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

STREPTOCARPUSES.—These plants are most useful at this period when some of the earlier subjects are passing out of bloom. Given an airy, light position, and shaded, they present a brilliant display when massed together. The colours have been so improved during the last few years that they now vie with the gloxinias, while for general use they far surpass those fine plants. The culture is simple when well understood. The compost best suited to their needs will be two parts fibrous loam, one part peat or leaf-soil, and one part coarse silver sand. They are best raised annually, and should be sown in two batches Seeds for one batch should be sown now, while another sowing should be made in February. The plants, when well established, like liquid manure frequently. Streptocarpuses cannot be relied on to reproduce themselves true from seed, unless each variety is kept separate. Should it be desirable to increase any special variety there are two methods of doing so. One way is by division, the stem being severed between the growths; the plant should then be pulled to pieces, and each portion potted up separately. The other, and perhaps better, way is to cut off some of the long leaves, and prepare pans of compost, two parts sand, one part loam, and one part cocoanut-fibre refuse, well mixed. The midrib of the long leaves should be cut through with a sharp knife, one inch from cut to cut, and the leaf spread out its full length, with the midrib slightly buried and made firm in the compost; the pans should be placed in a propagating frame, and kept moist and shaded. Small plantlets will soon appear at each cut in the mid-rib, and shortly afterwards they will emit roots, and when these are an inch long, the leaves should be severed and each piece with a plantlet potted up separately.

HEATING APPARATUS.—The present is the most convenient time to have this examined and overhauled. Should a boiler have given out or developed leaks it may have to be replaced by a new one, and this can be now carried out without fear of injury to the plants, and prevent a big loss should it have to be done in the winter or spring. See that air valves and stopcocks are clear and work freely; leaky joints in the pipes should also be picked out and re-plugged. Furnace bars must be removed, the bearings cleaned and replaced; if one should be burnt or warped it should be replaced by a new one, otherwise all the others will quickly warp, too. Furnace doors should be in order, and the flues and chimney stacks clean, and everything placed ready to start the fire at any moment. — Lewis Smith, Shotesham Park Gardens.

## HARDY FRUITS.

LAYERING STRAWBERRIES.—In many parts of the country the long period of dry weather has seriously affected the strawberry plants, and for those contemplating the formation of new plantations from home-grown stocks it will be a difficult matter to secure the requisite number of layers. The operation should be completed as soon as circumstances permit, for it is an essential point to have the young plants established as early as possible in their permanent quarters. The general practice is to layer into 3in. pots; it is advisable not to use too small a pot, as the root action is quickly restricted, and, if not frequently looked over during dry weather, the plantlets are apt to suffer from lack of moisture. It is possible to establish useful plants by drawing the runners from two rows into one space, and then partially cover with finely-broken mushroom bed manure or leaf-mould, or a mixture of the two; this makes a good rooting medium, and the young plants may readily be lifted with good balls of roots for immediate transference to their allotted quarters.

PREPARATIONS FOR PLANTING.—The site selected for forming new beds, if not previously well manured and trenched, should be prepared at the earliest possible moment; generous treatment in the way of manure and deep cultivation of the soil well repays the trouble involved. Our method is to prepare the station early in the year, and plant a crop of early potatoes; these are cleared off, and the land carefully forked over to remove any small tubers which may have been overlooked at lifting time. Other crops may be grown, but only those which will be over in time to prepare the ground well ahead of planting time.

PLANTING STRAWBERRIES. — The earlier the plants are put out in August the better opportunity they will have to develop good root-action, and sound, plump crowns for the ensuing season. Generally the space allowed between the rows is two feet, and eighteen inches from plant to plant in the row, and where the plants are treated as biennials this is a satisfactory method to follow. There are two varieties for which the above spacing is not strictly adhered to. Reward is so vigorous with us that more space is required, both in the row and between the rows; on the other hand, Waterloo, the very dark-coloured variety, requires much less space than most varieties, and is planted one foot apart in the rows. The soil should be in a moist condition at planting time, as should also the ball of soil of the young plants; plant firmly, and not too deeply. A good soaking of water will complete the operation.

SWEET CHERRIES ON WALLS. — As soon as the fruits are gathered remove the nets, and thoroughly cleanse the trees with the garden engine or hose. Probably aphis will be present, and this should be eradicated with a suitable insecticide. Fasten in any loose growths required for extension, removing others which are not necessary for filling up gaps, etc. Varieties which hang on the trees well into August may possibly require extra protection against wasps; if so, this should receive prompt attention. Young trees should on no account suffer from lack of moisture at this particular season.—W. Messenger, Woolverstone Park Gardens, Ipswich.

## THE KITCHEN GARDEN.

PARSLEY.—The June sowing has germinated well. Encourage a free growth by stirring the soil regularly, and giving an occasional dusting of soot. Make still another sowing if demands require it, but this time make the sowing on a sheltered border, where handlights or frames can be used through the winter months.

LEEKS.—The earthing up of these should now be completed without delay. In dry weather give copious supplies of water and liquid manure. A late batch could still be planted as ground becomes vacant, planting these with an iron bar, six inches deep, just covering the roots with soil, and adding more soil at intervals.

BROCCOLI.—Late spring varieties may still be planted out; land that has been cropped with strawberries for three years provides a very good site. Perhaps an iron bar will be needed for planting them, the ground being hard on such plots, but fine firm growth will result, which will stand the severe weather with impunity.

WINTER GREENS AND SAVOYS in plenty should still be planted; water in as planting proceeds. Providing a batch was sown late in May, good sturdy plants will be forthcoming for planting now. Continue to plant out coleworts.

AUTUMN-SOWN ONIONS.—Beds for these will soon be required if they are to mature where sown. We find it the better plan to sow on ground previously occupied by potatoes, levelling it up and making it firm before sowing the seeds. We delay the planting until March. Good varieties for this sowing are White Leviathan, Red Rocca, and Lemon Rocca.

SPRING-SOWN ONIONS that have been cultivated for special purposes will not need much attention after this date in the way of watering. All that is now needed is to encourage in every way a steady ripening process by aerating the soil, and pulling decayed leaves and decaying skins away. When bulbs are finishing off partially raise them with a fork, eventually lifting them altogether, when they can be laid on moss, wood wool, or any other soft material, and placed in the sun, but kept from rains.

LETTUCE.—Make a judicious sowing of various kinds, and in various parts of the garden, for the early spring supply; perhaps the 20th of the month is the best time in the south, allowing a week earlier in the north. Excellent varieties are Stanstead Park, Brown Bath Cos, Sutton's Winter White Cos, All the Year Round Cos, Little Gem, and Golden Ball.—G. Ellwood, Swanmore Park Gardens.

SANDY SHOW, BEDFORDSHIRE.
44th YEAR.
THURSDAY, AUGUST 29th, 1912.
Largest One-day Show in the Midlands.
PRIZES VALUE £1,000, including
£90 for Plants and £55 for Cut Flowers.

Entries close August 22nd, 1912.

Schedules, Entry Forms, etc., of
WM. GREEN, Secretary, Sandy.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Leicester Flower Show.

AUGUST 6 AND 7.

The 27th of the series of horticultural exhibitions in the Abbey Park, Leicester, was held on Tuesday and Wednesday, and, from the horticultural standpoint, was one of the most successful. Financially, it must have been considerably below the average, for at Leicester, as elsewhere in the Midlands, the weather was wet and tempestuous, and therefore not favourable to flower shows. That the attendance was below the average there can be no doubt, but it was surprising to see such a large gathering under such untoward conditions.

The same number of tents were provided for the accommodation of the competitive contributions and the miscellaneous collections as in previous years, but they were all of greater length and width, and were well filled. The groups arranged for effect formed a large and highly attractive feature. Roses were shown in such large numbers and splendid condition as to surpass all previous displays. Sweet peas were plentiful and good, and it was therefore unfortunate that the blanks in the tent devoted to them were such as to mar the effect which they are so well able to produce. Floral decorations were of high merit, and constituted an attractive feature, and of fruits and vegetables there were immense displays.

The exhibition is held under the direction of a committee formed by members of the Leicester Corporation, and of this body Mr. Collier is the chairman, Mr. J. Stayne is the secretary, and Mr. J. Burton is the superintendent, and committee and officials may be heartily congratulated on the admirable manner in which the arrangements were, in accordance with custom, carried out.

### CUT ROSES.

Roses were shown in much larger numbers than usual, and the contributions to both the amateur and trade classes were remarkable for their high quality. As the result the displays of these fragrant flowers constituted one of the most distinct and attractive of the many features of interest.

There were six entries in the open class for twenty-four varieties, and the majority of the stands contained blooms of quite exceptional excellence, but, unfortunately, several suffered much from what is technically known as over-dressing. The blooms staged in this class by Messrs. Perkins and Son, of Coventry, were almost free from this defect, and as they were otherwise good, the premier award was made in favour of the firm. Of much merit were the blooms of Mrs. John Laing, Charles J. Grahame, Mrs. T. Roosevelt, Captain Hayward, Avoca, Lyon Rose, Gloire de Chedane, Guinnoiseau, Marquise de Ganey, Yvonne Vacherot, and Florence Pemberton. Messrs. Hugh Dickson, Lim., Belfast, followed closely for second place with splendidly developed blooms, which had been somewhat over-dressed. Very fine were Charles K. Douglas, a beautiful crimson hybrid tea; Edward Mawley, Berthe Gaulis, Mrs. Sam Ross, Mrs. David McKee, Lady Alice Stanley, and H. E. Richardson. Mr. W. H. Frettingham, Beeston, who was third, also had blooms that were large in size and well finished. There was a spirited contest in the open class for twelve tea-scented varieties, and the awards were made in favour of Messrs. Perkins and Son, Mr. H. Drew, Longworth, Berks; and Messrs. R. Harkness and Co., all of whom staged well.

In competition for the prizes for twelve blooms of any one variety, Messrs. Hugh Dickson, Lim., were first with Captain Hayward, the blooms of full size, and distinguished by their brilliant colouring and high finish. Mr. H. Drew and Messrs. Perkins and Son were second and third with Mrs. John Laing in good condition. The prizes for twelve blooms of any one tea-scented variety were awarded to Mr. W. Bentley, Belgrave, Leicester; Messrs. Perkins and Son; and Mr. W. H. Fettingham, who staged Mrs. Foley Hobbs, Molly Sharman Crawford, and W. R. Smith respectively.

There were two entries in the open class for a display of roses, and both were so highly meritorious as to form a fine feature. Messrs. Hugh Dickson, Lim., were first with a display remarkable for its effectiveness and the high quality of the blooms. The general scheme comprised a series of pillars of La Tosca, Frank Workman, Lady Pirrie, Madame Ravary, Dorothy Perkins, Lady Godiva, Excelsa, and baskets of such roses as Captain Hayward, Karl Frau Druschki, and Mrs. Sam Ross. In the fringe of roses along the front Simplicity and Hiawatha were used with good effect. Mr. John Barrow, Oadby, was first with a charming arrangement, but rather too light for so dull a day.

There were three competitors in the amateurs' class for twenty-four blooms, and the post of honour was occupied by Mr. F. Dennison, Cranford, Leamington, with splendidly developed blooms of Florence Pemberton, Gustave Pigneau, Caroline Testout, John Ruskin, Horace Vernet, Madame Wagram, Comtesse de Turnne, George C. Waud, Dean Hole, Earl of Warwick, and other of the leading varieties. Mr. H. Lowe, Beeston, followed for second place with a box of excellent blooms. Mr. W. Boyes, Middleton-on-the-Wolds, was a very close third with excellent blooms, the high-coloured varieties being especially noteworthy.

In competition for the prizes for eighteen varieties, Mr. F. Dennison was again first, staging blooms of exceptional merit, the Lyon Rose being perfect in colouring. The Rev. J. H. Pemberton, Havering, was a close second with blooms of full size and superb in finish; especially noteworthy were those of Dr. O'Donel Browne, Countess of Shaftesbury, Earl of Warwick, Hugh Dickson, Claudius, and Francois Michelon. In the class for twelve blooms, distinct, the prize-takers were Mr. F. Dennison, Mr. R. Clarke, Beeston, and Mr. W. Buxton, Carlton, in the order of their names.

The successful competitors in the amateurs' class for tea-scented varieties were Mr. F. Dennison, Mr. W. Upton, and Mr. H. Lowe, all of whom staged blooms of good quality. There was a brisk competition in the class for six blooms of any one rose, and the premier award was made in favour of Mr. F. Dennison, with a box in which Alfred Colomb was represented at its best; Mr. H. Lowe staged the Lyon Rose in fine condition for second place.

For twelve blooms in three varieties, arranged in as many rows, Mr. F. Dennison was first with well-developed blooms of Alfred Colomb, Dean Hole, Ulrich Brunner, and Bessie Brown; Mr. W. R. Clarke was second with good blooms. The amateurs' class for eighteen blooms was a strong one, and Mr. G. Speight, Market Harborough, was first with large, well-finished blooms, that of Marquise de Ganey being especially meritorious. Mr. M. Whittle, Belgrave, Leicester, staged well for second place, and among his blooms was a splendid example of J. B. Clarke; Mr. W. Upton third. There was a very severe competition in the amateurs' class for twelve blooms, and Mr. G. Speight was again first, and was followed by Mr. W. Upton and Mr. M. Whittle for second and third place.

The sixes were good, and for blooms of distinct varieties without reference to class, Mr. M. Whittle scored, and Mr. G. Speight and Mr. W. Upton were second and third. Mr. G. Speight obtained premier honours for six tea-scented varieties, and Mr. W. Upton for six of any one variety.

To the miscellaneous class Mr. W. Bentley contributed a large and highly attractive collection of roses, which occupied about one-half of the length of one of the largest tents. At the back were huge pillars of wichuraiana roses that reached from the stage to the top of the tent, and in front of these were short pillars and vases of exhibition and decorative varieties, the whole producing a charming effect.

### HARDY FLOWERS.

Hardy flowers constituted, as usual, a distinct and attractive feature. For a collection, Mr. C. H. Mayer was a capital first with lightly arranged vases of coreopsis, chrysanthemums, veronicas, marguerites, phloxes, pentstemons, helianthuses, and perennial peas. Mr. H. Hill, Syston, had a good collection for second place, but it suffered much from overcrowding. Stocks were hardly up to the average, owing to the heavy rains, but Mr. A. Gilmore, who was first, staged large and otherwise well-developed spikes.

Sweet peas were shown in large numbers, and produced a highly attractive display. They were, of course, much better than at last year's exhibition, but they were not equal to some previous years owing to the cold, wet weather that prevailed for some time previous to the date of the exhibition. The effect was somewhat marred owing to the number of blanks in the tent devoted to these flowers, and for these those who failed to fill their entries were responsible. Leicester is by no means the only show that has suffered from growers of sweet peas who have entered but have not shown their flowers or taken the trouble to inform the officials of their inability to take part in the competition. With a view to prevent entries being sent in without full consideration, or to induce entrants notifying the officials when they are prevented showing, some societies stipulate that a certain sum should be sent with the entries, and that this shall be forfeited if the entries are not filled and no notice sent that the entrants are unable to stage. It would be well were this practice to be more generally adopted.

A considerable number of special prizes were provided by seedsmen, and in Messrs. E. Webb and Sons' class for six bunches Mr. E. Sandle, Knighton, and Mr. C. H. Mayer were first and second with meritorious flowers. Two classes were provided by Robert Sydenham Limited, and in that for six bunches Mr. G. E. Lewis and Mr. Henry Stanton were first and second. In competition for the prizes for nine bunches Mr. E. Sandle, Mr. C. Robinson, and Mr. A. Cameron were the prize-takers in the order of their names. Mr. W. Butler, Oadby, and Mr. A. Grover were first and second in Messrs. Harrison's class for nine bunches, and in Mr. Unwin's class for the same number of bunches Mr. Widderson was successful in obtaining premier honours.

Carnations were largely and well shown, and in competition for six varieties, six blooms of each to be shown in vases, Mr. F. G. Duffey was a good first with finely-finished blooms; Mr. R. Makepeace was a good second, and Mr. Hill third. For six blooms, distinct varieties, the winners were Mr. F. G. Duffey, Mr. J. Gumley, and Mr. J. Rudkin. The best collection of fancy carnations were those shown by Mr. J. Gumley, Mr. J. Rudkin, and Mr. F. G. Duffey. Picotees were well shown by Mr. J. Gumley, Mr. Duffey, and Mr. R. Makepeace.

### FLORAL DECORATIONS.

Floral decorations were plentiful and of much merit. Very strong was the competition in the classes for baskets of flowers, but, unfortunately, the majority of the arrangements were much crowded. Mr. H. Widdowson, Loughborough, was first with a lightly arranged and very tasteful basket; Mr. J. Barker was second with a basket that would have probably taken a higher place had the quantity of flowers been considerably reduced. Mr. J. Vine was third with an effective but somewhat formally arranged basket.

Hand bouquets occupied a long run of tabling, and proved a great source of attraction to visitors. Mr. J. Barker had the best shower bouquet, and Mr. E. Vine was second. Mr. J. Barker was also first for bridal bouquets with a remarkably tasteful arrangement of carnations, chrysanthemums, and lilies. Mrs. Underwood, Coventry Road, Letterworth, was second.

### PLANTS.

The big marquee in which the groups arranged for effect had a place was rich in attractions, and afforded many object-lessons of much value in the arrangement of plants remarkable for the beauty of their flowers or foliage. The competition in the great group class was of the keenest, and Messrs. J. Cypher and Sons, Cheltenham, added to their many honours by winning the first prize. That the arrangement was remarkable for the taste displayed goes without saying, and to describe it in such manner as to convey a clear idea of it is practically impossible without devoting more space than can be spared to the report. Suffice, therefore, to say that the group was one of the most successful of the many efforts of the firm, and afforded an object-lesson of a value that cannot well be over-estimated. The second prize was awarded to Mr. Holmes, West End Nurseries, Chesterfield, for an effective group that was probably rather too strong in crotons, although characterised by much taste; Mr. W. R. Manning, Dudley, was third with a good group.

Specimen plants were not plentiful, but they were more numerous and of higher quality than is usually the case at provincial shows. For a single specimen in bloom, Mr. C. Ward was first with a well-flowered example of Stephanotis floribunda; and Messrs. J. Wright and Sons, Leicester, were second with a large, finely-flowered fuchsia. Mr. C. Ward and Messrs. J. Wright and Sons were also first and second for coleus with large and highly coloured specimens. Ferns were represented in capital condition, and chief among the more successful exhibitors were Mr. W. Weston and Mr. H. Rogers, Leicester. The last-named exhibitor and Messrs. J. Wright and Sons were especially successful in the classes for zonal pelargoniums and fuchsias, both staging splendidly-flowered specimens, trained in natural, and therefore graceful, style.

### FRUIT.

The most important of the features in the division set apart for fruit was that formed by the contributors to the two classes for dessert tables, decorated with flowers. Two separate sets of prizes were provided in each class, one for fruit and the other for flowers. There was an especially strong contest for the prizes for six kinds of fruit, and the premier award was made to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby. The kinds were Muscat of Alexandria and Muscat Hamburgh grapes, Noblesse peaches, Pineapple nectarines, Royal Favourite melons, and Lady Sudeley apples, all of which were of the highest quality. Mr. Goodacre was first also for floral decorations, which consisted chiefly of vases of Madame Abel Chatenay roses and Francoa ramosa. Mr. T. Ireland, gardener to the Misses Webb, Newstead Abbey, Notts, was second for fruit and decorations, both being of a high order of merit. Especially noteworthy were the dishes of Goshawk peaches and Pitmaston Orange nectarines. Mr. Buxton, Carlton, was third for decorations and fruit with excellent produce, and tastefully arranged flowers. It is seldom that the prizes for decorations follow those for fruit, as in this case.

Very brisk also was the contest for the awards in the class for tables of eight kinds of fruit with floral decorations, and Mr. J. H. Goodacre repeated the splendid success achieved in the preceding class by winning both for fruit and decorations. The fruits included two grand clusters of Muscat of Alexandria, and equal numbers of bunches of Black Hamburgh and Muscat Hamburgh grapes, which were remarkable for size of berry and fine colour; and excellent dishes of Lord Napier nectarines, Barrington peaches, Souvenir du Congrès pears, James Grieve apples, and Brown Turkey figs, with a Royal Favourite melon. The floral decorations consisted chiefly of scarlet carnations, gloriosas ,and orchids. As in the class for six kinds, Mr. Ireland was second for fruit and decorations, the peaches and nectarines being especially high in quality.

For four varieties of grapes, two bunches of each, Mr. Goodacre was a splendid first with clusters of Madresfield Court, Muscat Hamburgh, Muscat of Alexandria, and Gros Maroc. Mr. Ireland was a close second with large, well-finished clusters. In the class for two bunches of black grapes, Mr. J. H. Goodacre scored with two superb clusters of Black Hamburgh, and he was first also for two bunches of white grapes, well-finished bunches of Muscat of Alexandria. Mr. Buxton was first for six dishes of hardy fruit, and Mr. G. H. Greasley, Rothbury Temple, second. Peaches were admirably shown, and the premier award was made in favour of Mr. John Hay, Hothorpe Hall Gardens, Thedingworth, who had Sea Eagle in splendid condition. The best dish of nectarines was that of Stanwick Elruge, shown by Mr. T. Sims, Pinfold, Thorpe Satchville. Melons were comparatively few in number, but of cherries, plums, gooseberries, apples, currants, there was an immense display, and the fruit generally was of very high quality.

### VEGETABLES.

There was an enormous display of vegetables of all kinds that are now available for exhibition, and on the whole the quality was remarkably high. The contributions to the classes for collections were sufficient to fill the whole of one side of a marquee about two hundred feet in length, the other side being occupied by the entries in the classes for single dishes of specified kinds. As is customary, the entries were numerous in the society's class for a collection of nine kinds, and the produce was throughout of great excellence. Mr. J. Hudson, Gimson Road, Leicester, was, as for some years past, successful in obtaining the first place, and staged produce in every way worthy of his high reputation as a cultivator. All the examples were so good that none can be mentioned as being the most noteworthy. Mr. Hartshorn and Mr. W. Ball, who were second and third, also staged collections of great excellence. There were nine entries in the class, but not one of the exhibitors affixed a single name to his exhibits.

There were six or seven competitors in the class in which Messrs. Sutton and Sons offered the prizes for six kinds, and in this, as in the preceding class, the post of honour was occupied by Mr. J. Hudson with a collection deserving of the highest praise. Mr. W. Ball was a good second, and Mr. W. Townsend, Melton Mowbray, was third. Messrs. E. Webb and Sons' prizes for six kinds of vegetables were keenly contested, and Mr. J. Hudson, Gimson Road, Leicester, was first with cauliflowers, onions, tomatoes, runner beans, and peas of exceptional quality; Mr. O. Hartshorn, Thurmaston, was a good second; and Mr. W. Buxton staged excellent produce for third place. The competition for the prizes offered by Messrs Harrison and Sons, Leicester, for collections of ten varieties was spirited, and Mr. J. Hartshorn, Syston, and Mr. J. Cank were first and second with excellent produce.

### NON-COMPETITIVE EXHIBITS.

The miscellaneous contributions from nurserymen and seedsmen were numerous, meritorious, and interesting, and contributed very materially to the attractions of the exhibition. The following awards were made:

Gold Medal.—To Messrs. E. Webb and Sons, Wordsley, Stourbridge, for a large and tastefully arranged collection, comprising sweet peas and other annual flowers, and many other of the specialities for which the firm is famous; to Messrs. Harrison and Son, Leicester, for an attractive and interesting collection of cut flowers, vegetables, etc.; to Messrs. J. Wright and Sons, Market Place, Leicester, for a large collection of miscellaneous plants; to Mr. H. J. Rogers, Leicester, for an effective collection of flowering and fine foliage plants; to Mr. Charles Warren, Abbey Nurseries, Leicester, for a large and tastefully arranged collecton of cut roses, etc.

Silver Cup.—To Mr. W. Bentley, Belgrave, for a large and beautiful collection of decorative and rambling roses.

Silver Medal.—To Messrs. Aldersey and Marden, Malpas, for a fine collection of sweet peas; to Mr. Ellison, West Bromwich, for an interesting collection of cacti, etc.; to Mr. J. Wilkins, Ayleston, for an admirable exhibit of rock and alpine plants; to Messrs. G. and F. Hallam, Aylestone, Leicester, for cut roses; to Mr. George Underwood, Ayleston Park, Leicester, for a large and interesting exhibit of violas; to Messrs. R. Pringle and Co., Belvoir Street, Leicester, for an exhibit of carnations and miscellaneous plants.

## Royal Horticultural Society.

### SCIENTIFIC COMMITTEE, JULY 30.

Present: Mr. E. A. Bowles, M.A., F.C.S. (in the chair), Messrs. E. M. Holmes, C. H. Hooper, A. Worsley, G. Wilson, J. T. Bennett Poë, J. O'Brien, A. W. Hill, and F. J. Chittenden (hon. secretary).

INJURY FROM SMELTER FUMES.—Dr. Voelcker reported that the leaves sent to him from the last meeting were damaged by smelter fumes, probably by hydrochloric and sulphur acids in the fumes. Zinc and manganese were also present.

HYBRID ORCHID.—Mr. O'Brien drew attention to a hybrid orchid, Brasso-cattleya x Thetis, shown by Messrs. J. Veitch. It was raised between Brassavola Digbyana and Cattleya Aclandiæ, but practically all the spotting of the latter had been eliminated by the cross.

CATERPILLARS ON HOPS.—Mr. E. M. Holmes remarked upon damage done to hops by the larvæ of the peacock butterfly, Vanessa Io, in Herefordshire; Vanessa C.-album frequently damages them, but he had no doubt whatever that, what was apparently a previously unrecorded occurrence, in this case V. Io was the culprit.

MIMULUS MOSCHATUS ALMOST SCENTLESS.—Mr. A. W. Hill showed specimens of Mimulus moschatus to draw attention to the almost scentless condition of the plants. It would appear that under certain cultural conditions this plant fails to produce the essential oil to which its characteristic odour is due in any great quantity.

DELPHINIUM MACROCENTION.—Mr. Bartholomew, of Reading, sent a specimen of this uncommon species of delphinium from his garden. It is a native of Uganda, and is somewhat poorly figured in "Bot. Mag.," tab. 8,151.

## Royal Lancashire Show.

At the exhibition recently held at Moor Park, Preston, special prizes, in the form of silver cups, were awarded to the most successful amateur exhibitors, resident in the County of Lancashire, as follows: For herbaceous and hardy cut flowers, to Mr. W. G. Eastham, Preston; for sweet peas, to the Rev. A. R. Tomlinson, Bolton-le-Sands; and for cut roses, to Mr. R. L. Garnett, Wyreside.

### Bishops Waltham.

JULY 31.

This society held its 38th annual exhibition in the grounds of the historical old Palace Ruins. A special feature of the show is its division for floral decorations, and the interest taken in the neighbourhood makes it an event of some importance.

It would be difficult to find a more beautiful table than that arranged by Mrs. E. C. Pern, Droxford, Hants. The competition was good, eight competing. The conditions in this class are unusual, as orchids, roses, and carnations are prohibited. The winner chose Melba sweet peas, gracefully arranged with Asparagus plumosus, croton leaves, Berberis purpurea, selaginella, and grasses, the colours being blended in an admirable manner. Miss Taylor, Bemerton Rectory, Salisbury, was a good second with pink larkspur and Francoa ramosa. In a similar class for a decorated dinner-table, where carnations or roses only were to be used, five competed, Mrs. A. R. Bide, Highlands, Farnham, winning with Rose Lady Hillingdon, and its own dark foliage; Mr. R. F. Bealing, Bassett, Southampton, was second with a good arrangement of pink carnations.

For a table arranged with sweet peas, Mrs. A. R. Bide was awarded first, and Mrs. W. Parvin, Wintershill, second; eight competed. Miss Taylor was first in the class confined to lady members only, with a neatly arranged table of clarkias; Mrs. Pern second with purple and white centaureas. Miss Taylor was also first with a beautifully arranged basket of wild flowers. Mrs. Bide used roses Mrs. A. R. Goodwin and Mrs. W. Massey for a basket of flowers—a handsome combination that won easily.

Mr. Bealing was first for a vase of carnations, using Enchantress; he was also first for a bowl of roses—Mdme. Abel Chatenay—a delightful exhibit; Mrs. A. R. Bide being second with Sunburst. Vases of sweet peas arranged for effect were very good, ten competing.

Cut flowers made a fine display, the sweet peas being numerous and of good quality. Dr. E. C. Pern was easily first for twelve vases; Mr. I. Peppler, Bishops Waltham, winning for six varieties. Messrs. J. Carter and Co.'s first prize was well won by the Misses Gladstone, Hampton Hill (gardener, Mr. W. Cooper). Robert Sydenham Limited's first prize went to Mrs. C. Macrae, Meonstoke House (gardener, Mr. H. Childs), for six varieties; and in Messrs. Toogood's class Mr. T. C. Wilson, The Thicketts (gardener, Mr. H. Barnes), was successful. Mrs. Macrae was well represented by eighteen varieties of hardy cut flowers, and won easily in this class, and also for twelve bunches. Mr. W. H. Myers, Swanmore House (gardener, Mr. G. Ellwood), made a good display with annuals, in six varieties, and there were numerous good entries. Cactus dahlias in bunches of four varieties were distinctly good, the Misses Gladstone being first among six entries. Roses were a fine feature, and Mr. Myers had a grand display of six varieties (rambling section), among them being Flower of Fairfield, Lady Gay, and Minnehaha.

Fruit was of fine quality. For four kinds, grapes excluded, Mr. Myers won with fine plums, peaches, nectarines, and a melon. Mrs. Macrae was first for four dishes of fruits grown out of doors.

Vegetables were well in advance of other years. Mr. Myers secured first award in the leading classes, winning the first prizes offered by Messrs. Sutton, Carter, Webb, Toogood, and Dickson and Robinson. Potatoes, cauliflowers, tomatoes, onions, peas, and carrots were all of fine quality. Mrs. Macrae again won easily for prizes offered by Messrs. Daniels Bros., and Messrs. E. Hillier and Son, Winchester.

Non-competitive groups made a grand display. The Locksheath Nurseries, Lim., staged fine carnations, delphiniums, and gladiolus, the latter being exceptionally good. Their fruit trees in pots caused much interest, Apple Warner's King being phenomenal. Mr. J. Lewis, Sunny Hill Nursery, Swanmore, had a collection of small decorative plants, including lilies, ferns, geraniums, etc. Messrs. Rogers and Son, Southampton, sent numerous varieties of cut roses.

### West Derby.

This society held its twenty-first annual show in the Rectory Grounds, on August 5, by the kind permission of the Rev. Percy Stewart, president of the society. The entries were fully up to the average, and in many cases the competition proved very keen.

Mr. G. Osborne, gardener to Drs. Tidsdall and Ingall, led for the group of miscellaneous plants, and the same exhibitor had the leading four stove and greenhouse plants, and won for two palms or cycads. For six begonias, three doubles and three singles, Mr. T. Young, gardener to Miss Crossthwaite, led, with Mr. C. A. D. Crossthwaite second. Mr. G. Osborne had the best pair of pelargoniums.

For six dishes of fruit, distinct, Mr. G. Osborne took the lead with good grapes and well-coloured peaches. For six dishes of hardy fruits, Mr. H. Osborne took the lead, with Mr. Leith as second. For two bunches of white grapes, Mr. H. Osborne, gardener to R. R. Heap, Esq., won with Muscat of Alexandria; Mr. T. Edgar, gardener to the Rev. Percy Stewart second. For the two bunches of black grapes, Mr. H. Osborne and Mr. T. Edgar were placed as named, and Mr. Leith led for the dish of tomatoes with fine fruits.

In the class for a collection of vegetables, nine varieties, Mr. G. Osborne proved the winner with a fine set, followed by Mr. Leith For six varieties Mr. T. Edgar and Mr. S. Mashford proved successful.

In the class for twelve bunches of hardy herbaceous cut flowers, for which a handsome silver challenge cup was offered as first prize, Mr. T. Edgar proved successful, with Mr. H. Osborne second. For twelve bunches of hardy or half-hardy flowers, Mr. H. Osborne led in a strong competition. In the single vase classes Mr. T. Edgar scored for cactus dahlias, Mr. G. Osborne for gladiolus, Mr. R. S. Shepherd for carnations, and Mr. G. Osborne for roses and sweet peas.

The arrangements were good, and the attendance large.

### Mid-Annandale Flower Show.

A capital show was held in the grounds of the Mid-Annandale Agricultural Society on August 2. Last year the Lockerbie Show was practically a sweet pea one, but this was combined with the horticultural section of the Mid-Annandale Society, the latter's show falling at Lockerbie this year. The result was a good one, there being a strong entry, although the disastrous weather for some time before the show prevented some of the exhibits from being forward. This was especially noticeable in the sweet pea section, for which a marquee was provided. The popular flower was well shown, Mr. G. L. Moffat, Lockerbie, being the leading winner. Other cut flowers were very good; roses, largely cultivated here; cactus dahlias, violas, antirrhinums, etc., being well shown.

Pot plants were limited in numbers, but were highly creditable. Grapes and small fruits were among the best of the fruit classes, and vegetables were generally of high quality, though the leeks and onions were small, the early date of the show accounting for this. Amateurs made a good competition, and their produce was most creditable.

Messrs. E. Fairbairn and Sons, Edentown, Carlisle; and Messrs. Palmer and Son, rose growers, Annan, sent good non-competitive stands. The principal winners in the gardeners' classes were: Mr. Jas. M'Donald, Dryfeholm; Mr. J. Henderson, Elmbank, Dumfries; Mr. J. Wilson, Summerville, Dumfries; Mr. J. Wilson, Eskrigg; Mr. J. Tweedie, Broombush, Lochmaben; Mr. G. French, Heltand Cottage; Mr. D. Whitelaw, Locharbriggs; Messrs. Adamson and Hunter, Lockerbie; Mr. W. Tweedie, Mouswald; and Mrs. Black, Mayfield.

### G.C.R. Employees' Flower Show.

Under the auspices of the Willesden and District Horticultural Society a successful flower show was held at Neasden on Bank Holiday, August 5. The society is mainly supported by the employees of the Great Central Railway Company, and with the enthusiasm that generally characterises the railwaymen in gardening matters the show was well supported both in regard to entries and attendance.

Among the leading classes for vegetables was one for a collection of ten kinds. This was well filled, and the quality of the produce, and the manner in which the vegetables were staged, were highly creditable. There were also a number of classes for flowers and plants, and quite a big entry for table decorations in which the wives of the members showed themselves adepts in the artistic arrangement of cut flowers. The children had a class for wild flowers, and right well it was filled, many comparatively scarce and very beautiful native plants being represented. Mr. W. A. Richardson, the courteous and able secretary, was well supported by an energetic committee of workers, and we were delighted to find the society doing really good work for the advancement of horticulture among the workers of the district.

In addition to the prizes awarded at the show, there was a keen competition for the best kept allotment and garden, and it may be said the skill, forethought, and careful management everywhere apparent showed that in and around Willesden and Neasden there are quite a colony of enthusiastic and able amateur gardeners.

## NOTES OF OBSERVATION.

**Browallia viscosa.**—This pretty Browallia, which was shown at the meeting of the Royal Horticultural Society on July 30, is not nearly so well known as Browallia speciosa major, to which it affords a very pleasing companion. The flowers of the newcomer are smaller than those of the other, and of a rich, deep blue colour with a conspicuous white eye, such as is to be seen in some of the bedding lobelias.—K.

**Arctotis grandis.**—This is one of the many attractively-flowered members of the composite family that we have received from the southern part of Africa within recent years. The fact that daisy-like flowers with long, firm stems are at the present day much appreciated has no doubt a good deal to do with this arctotis being generally distributed. It is usually treated as an annual, under which conditions it both grows and flowers freely. In common with other members of the same order, Arctotis grandis is not seen at its best during dull, wet weather; but, given a bright, sunny day, the marguerite-like blossoms, whose florets are almost white on the upper surface, but tinged with purple on the reverse, with a conspicuous blue disc, are very attractive.—W. is best protected by a frame.—K.

**The Stag's Horn Sumach** (Rhus typhina).—A striking specimen of this in the front garden of a small villa is much admired by passers-by, and well serves to show its value in such a spot, as, though quite tree-like in habit, it seldom outgrows its position, while, should this happen, it can be readily pruned back in the spring before growth commences. Apart from its handsome pinnate foliage, its attractiveness is, in late summer and early autumn, greatly enhanced by the bright crimson inflorescences which terminate every shoot. Although their colour is lost, these remain in winter after the leaves have fallen, and impart a singular appearance to the specimen. The decaying leaves in autumn are also brightly coloured.—W.

# HORTICULTURAL EDUCATION IN FRANCE.

(Continued from page 590.)

## Technical Instruction of Wine Growers.

The cultivation of the vine in France must be considered under two aspects:

1. Viticulture properly called—that is to say, cultivation for the production of wine, the drink which is most consumed in France.

This important part of French agriculture is taught in the agricultural schools, and more particularly in those belonging to the vine-growing districts. There are, besides, two special schools: The National School of Viticulture of Montpellier (Hérault), and the Practical School of Viticulture of Beaune (Côte d'Or).

2. Cultivation of grapes for the table.

This cultivation constitutes one of the principal branches of fruit tree growing; it is taught as an integral part of arboriculture.

Cultivation in greenhouses, which, during the last twenty years, has made remarkable progress in France, is taught and practised with success at the National Horticultural School of Versailles, where some special houses have been built concurrently with the greenhouses for forced peaches and other fruit trees subjected to this kind of cultivation.

In certain parts of French territory, more particularly in the districts of the North and neighbouring regions, the business of forcing-houses and grape-houses is most important and prosperous.

## Technical Instruction of the Small Country Cultivator.

Here again family education plays the principal rôle. The father transmits to his children some portions of ground fertilised by his labours, with materials patiently got together, with cattle raised and fed through his jealous care, with the modest pecuniary resources slowly and laboriously accumulated little by little, and also conveys the tradition of his work, which he takes the precaution to show to his posterity as soon as they are able to assist him in his modest but independent and noble task.

In France country families of this kind are very numerous; in fact, one can say that they constitute the majority of the population, the most healthy part, the most virile, and the vital strength of he country.

Though for a considerable time rather against professional instruction by technical classes and lectures, the small French cultivator now sends many of his children to agricultural schools, and more particularly, as is to be expected, to those which answer their requirements the best (practical schools, farming schools, elementary agricultural schools, etc.).

It is this source which provides the majority of the pupils at our great National Horticultural School at Versailles, and one can say of this school, which has acquired a place of honour in French horticulture, that it is really the work of the sons of our small cultivators—the children of our rural democracy.

## Horticultural Degrees.

The special official horticultural degree, the highest to be obtained in France, is that given by the National Horticultural School of Versailles at the end of the three years' course of study, and bears the modest title of Diplôme de l'Ecole Nationale d'Horticulture.

This degree is given by the Minister of Agriculture after severe examinations, which are more and more difficult to measure as the level of the instruction is advanced in this remarkable institution, and is worthy in all respects of the great and universal renown of French horticulture.

This diplôme, though without a high-sounding name, has a great horticultural value, because it is only given to those pupils who are truly worthy to receive it.

It is necessary to say that certain people consider this title too humble, and are of opinion it should be transformed to the more high-sounding title of "Diplôme d'Ingénieur Horticole."

Beyond the diplôme already mentioned, "Certificats d'étude" are given, the possession of which allows the holder to have a certain number of pupils who, although not passing very high in their examinations, have shown they have sufficient knowledge to enable them in some measure to do good practical work.

The certificated pupils taking the highest places in the school of Versailles can obtain from the Minister of Agriculture a course in horticulture, either in France or abroad.

The title of Stagiaire is very superior, and very much sought after by the pupils of the National School of Horticulture; it constitutes for them a powerful stimulant.

## Diplomas and Certificates, other than those given by the State.

The various French Schools of Horticulture and Arboriculture other than that of Versailles, and not depending upon the State, but of the towns and counties—as that of St. Mandé (Seine), of Villepreux and of St. Cyr (Seine and Oise), d'Hyères (Var), d'Antibes (Alpes-Maritimes), or even of congregations (Asile de Fleury-Meudon, Ecole St. Nicolas d'Igny, Asile Fénelon à Vaujours, etc.)—also give diplomas or certificates of special study, but these titles are hardly of any value outside the interested establishments.

It is the same thing with the organised lectures or classes organised by the societies, counties, municipalities, etc.

The means by which gardeners of all classes can obtain information and advice.

1. The Agricultural Bureaux to the Government.—No official service of information or advice exists in France, so far as horticulture is specially concerned. This has yet to be completely organised. It is true that the Minister of Agriculture has at his disposal two organs, viz.:—

1. The monthly report of the office of agricultural information.

2. The Minister of Agriculture's circular of information.

Moreover, besides the fact that horticulture has only what may be called an insignificant place here, these publications are only sent gratuitously to the principal officials of the Department of Agriculture.

Neither the one nor the other can then be considered as answering this service fully. It is almost exclusively by the horticultural societies, by means of their journals and reports, and by the horticultural press, that the information referred to can be obtained.

## Bulletins and Journals Published by Societies.

All the French horticultural societies, and all the horticultural unions, have special organs of their own, which are published for the use of members of those associations, and the importance and frequency of issue of each depends principally upon the resources at their command. As a rule they are published monthly; sometimes, however, it is only quarterly, and in exceptional cases every six months or else annually.

These organs are, before all other things, intended for the publication of the activities of the society, the proceedings of meetings, the accounts of shows and exhibitions, visits to growers, horticultural events of local interest in the particular district, etc.

Certain of these publications are remarkable for the interesting matter which they contain, the diversity of the subject treated, and the care and trouble with which they have been studied.

The most important of these publications, and at the same time the most interesting and reliable, is, without doubt, the "Journal of the National Horticultural Society of France," which appears very regularly on the 10th of each month, in an 8in. pamphlet, containing from 50 to 100 pages, and is sent to each of the members.

Note.—The volume for 1910 contains 1,003 pages, of which 100 pages contain advice upon different matters.

The importance of this publication has increased from year to year since the foundation of the society in 1827, and in a measure has helped to increase the latter's prosperity.

At the end of 1909 the society had: 16 members of honour, 11 patrons, 36 corresponding members, 9 perpetual members, 58 life members, 131 lady patronesses, 3,650 shareholders, 266 honorary members, 304 societies and corresponding institutions. In all 4,481 members, which shows an increase of 1,457 over the number in 1899.

The "Journal of the National Horticultural Society of France" contains copies of the official documents, the minutes of the proceedings of all meetings, the reports received upon the different exhibitions and shows, various reports from its delegates, original articles on technical subjects, studies of different questions concerning horticulture, etc.

Numerous photo prints interspersed in the text still further increase the interest in this remarkable publication.

Several provincial horticultural societies, as, for instance, those of Lyons, Nancy, Lille, etc., themselves also publish reports and journals which, without having the importance of the "Journal of the National Horticultural Society of France," have not less real interest in them above all from the point of view of local horticulture.

Finally, one ought to mention, while on this subject, the Report of the Association of Old Pupils of the National School of Horticulture of Versailles, an association founded in 1882, and which can boast, with only a few exceptions, almost all its former pupils.

This report has a permanent place amongst the members of the association and the school. It gives the news of the school and makes known the position of each of the members, the works, prizes, and the success of everybody. Open to all, it publishes studies and original articles which are the more appreciated because they are written by old comrades and friends. It also gives a register of deaths of its members. It appears at the commencement of each year, and is brought up to date by a monthly publication which, under the title of the "Monthly Bulletin and Circular," contains the changes of address, the marriages, births, deaths, the distinctions and honorary duties of the members, the news relative to the association and the school, the positions vacant, establishments to let, etc., etc.

This circular, which is of great interest to members of the association, is confided to the care of the Printing Committee, who acquit themselves very well and very conscientiously of their task, their services being rendered gratuitously. In the page of information each member has the right to an announcement of three lines, free, and for every additional line he has to pay 50c.

## French Periodicals on Horticulture.

However important, however well done or useful the "Journal of the National Horticultural Society of France" might be, it cannot contain sufficient for the intelligent and studious horticulturist who is anxious to keep himself up to date in all movements and progress in horticulture, and to increase his technical knowledge. The publication in question does not address itself to the great mass of cultivators of gardens, but only to those who form a part of this big society—that is to say, those who pay the subscription, which is quite high enough (20 francs for members who are shareholders, and 25 francs for ladies who are patronesses). It has not, then, in any true sense a popular and professional publication.

It is the same thing with regard to the reports and journals of other horticultural societies and particularly so in the case of the Report of the Association of Old Pupils of the National School of Horticulture at

Versailles, which answers a special purpose. Therefore the periodical horticultural publications play a very considerable part in the homes of French horticulturists. There is not a horticulturist worthy of the name but receives his journal on horticulture. From this publication he learns the latest horticultural news, and by this he is advised of all interesting topics of new plants, processes, and rules, also of special methods of culture, of exhibitions, shows, etc., etc.

### Tuition in Primary Schools.

Up to what point is "horticulture," as a subject, taught in the elementary and upper schools—that is to say, what is the amount of horticultural tuition given in schools in France?

Tuition in horticulture is given in primary schools of every kind. For a long time past people have been endeavouring to organise and develop the elementary teaching of agriculture generally and horticulture in particular.

The law relative to primary education of June 15, 1879, which only came into force in 1882, after the pedagogic reorganisation, prescribed and provided for the teaching of agriculture in the primary public schools of every denomination*.

At different times indications have been given to the teachers, by instructions from the Ministry of Agriculture, as to the methods to be followed, which, if they had been conscientiously and intelligently observed, would have produced all the happy results which they were capable of producing, and also would have had a most favourable influence over agricultural progress.

The lists of subjects of January 4, 1897, and the very clear and precise circular issued by the Minister which accompanied them and contained comments upon them, thus define the rôle of the teacher as regards the professional tuition, viz.: "The school ought to prepare the child intelligently for an apprenticeship to the profession which will make him a living, and also to give him a taste for it."

Horticulture, naturally, has its place in the official programmes both for schools for girls and those for boys. The instructions of the Minister and his various circulars, notably those of April 25 and May 12, 1898, specify these. These instructions say that "masters and mistresses should select some lessons which could be given in the garden."

With a view to stimulating the zeal of the masters and mistresses in the carrying out of this important part of their task, and in order to encourage them, the Government offers every year, by way of recompense, special prizes for those amongst them who receive special mention for their success in this respect. A decree of January 30, 1891, provided for the division of the departments into four sections, and the distribution takes place in one section each year.

In recommending masters and mistresses "to select some lessons which can be given in the garden," the Minister's instructions pointed out the course to follow in order to teach the first elements of agriculture.

It is, in fact, only by giving lessons in the school-garden that the master or mistress can give this tuition most efficaciously and instil into the child a taste for horticulture. Such, at least, is the opinion of most careful, thinking people regarding agricultural progress. This was the opinion expressed by M. Duruy, Minister of Public Instruction before 1870, concerning whom profound and lasting memories still remain in the Rue de Grenelle. M. Duruy founded the "Champ de l'Ecole," or school-field, and almost all of a series of measures in favour of the creation of this.

The idea was taken up and extolled after his death by many promoters of agricultural tuition—such as Pierre Joigneaux (the eminent plebian), Georges Ville (Professor at the Museum of Natural History), Maurice Gérard (Professor at the Rollin College), and more recently M. Réné Leblanc (Inspector-General of Primary Education), who, by meetings in the provinces, has done so much for agricultural education.

In a school-garden the master has a powerful element to aid him in popularising and teaching horticulture. He has here free lands and liberty of movement. The people living in the country, when they are at times in doubt as to their knowledge, say, of an agricultural matter, readily recognise in him a certain superiority in the knowledge of kitchen gardening—that is to say, in whatever relates to vegetables, trees, or flowers. Then, have not his lessons, demonstrations, and advice much more weight and efficacy than if they were given in the open field? Also, as every horticultural operation may be compared to an operation of cultivation on a large scale, one recognises what may be the result of an education intelligently imparted in a school-garden, where a child has to do various kinds of work, which does not overtax his muscles like much of the work in the fields would do.

The school-garden, and the theoretical and practical lessons which the teachers give therein, play an important rôle in the agricultural education of the child; and this has been so well done in France for some years past that an active and fruitful propaganda has been made upon this subject by the general inspectors, academy inspectors, horticultural societies, societies for education and popular instruction, giving particular advice, etc.

In approving this tuition the Ministerial decree of January 31, 1897, which modified that of January 18, 1887 (Article 256), relative to the certificates for primary study, suggested one or two of the questions chosen in the programme for an average course of instruction.

(To be continued.)

**Polygonum lanigerum.**—A hot, sunny summer shows this polygonum at its best, hence in some places, at least, it is decidedly less effective than last year. For all this, it is even now very conspicuous, especially where care has been taken to plant it in a position fully exposed to the sun, and it has not an excess of moisture at the roots. Its distinctive character consists in the extreme silvery nature of the long lanceolate leaves, which, under a brilliant sun, are almost dazzling from their whiteness. This polygonium is a native of the tropics of the old world, and has been grown here about twenty years.—W. T.

**British Influence in Canada.**—The following interesting facts and figures regarding immigration to Canada has just been issued by the Department of the Interior at Ottawa. It appears that during the last 11¾ years 2,118,712 immigrants have entered Canada. Of these the British numbered 823,188; Americans, 752,120; and from Continental countries there came 543,404 persons. The distribution of this movement among the provinces of Canada has been approximately as follows: Western Canada absorbed the majority; 954,000 having settled in the three prairie provinces and 240,000 in British Columbia. In Eastern Canada, Ontario received upwards of half-a-million newcomers; Quebec, 300,000, and the Maritime Provinces, 100,000. During the fiscal year which ended March last immigration touched its highest point with 354,237, of which 138,121 were British and 133,710 from the United States, with 82,406 coming from other countries. Immigration from the United States continues to be a most interesting and significant factor. There is no doubt, considering the class from whom these immigrants are drawn, that they, with the purely British element, will provide that assimilative force necessary to impose British traditions and institutions upon the large contingent of immigrants drawn from other and possibly more backward races coming into Canada.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

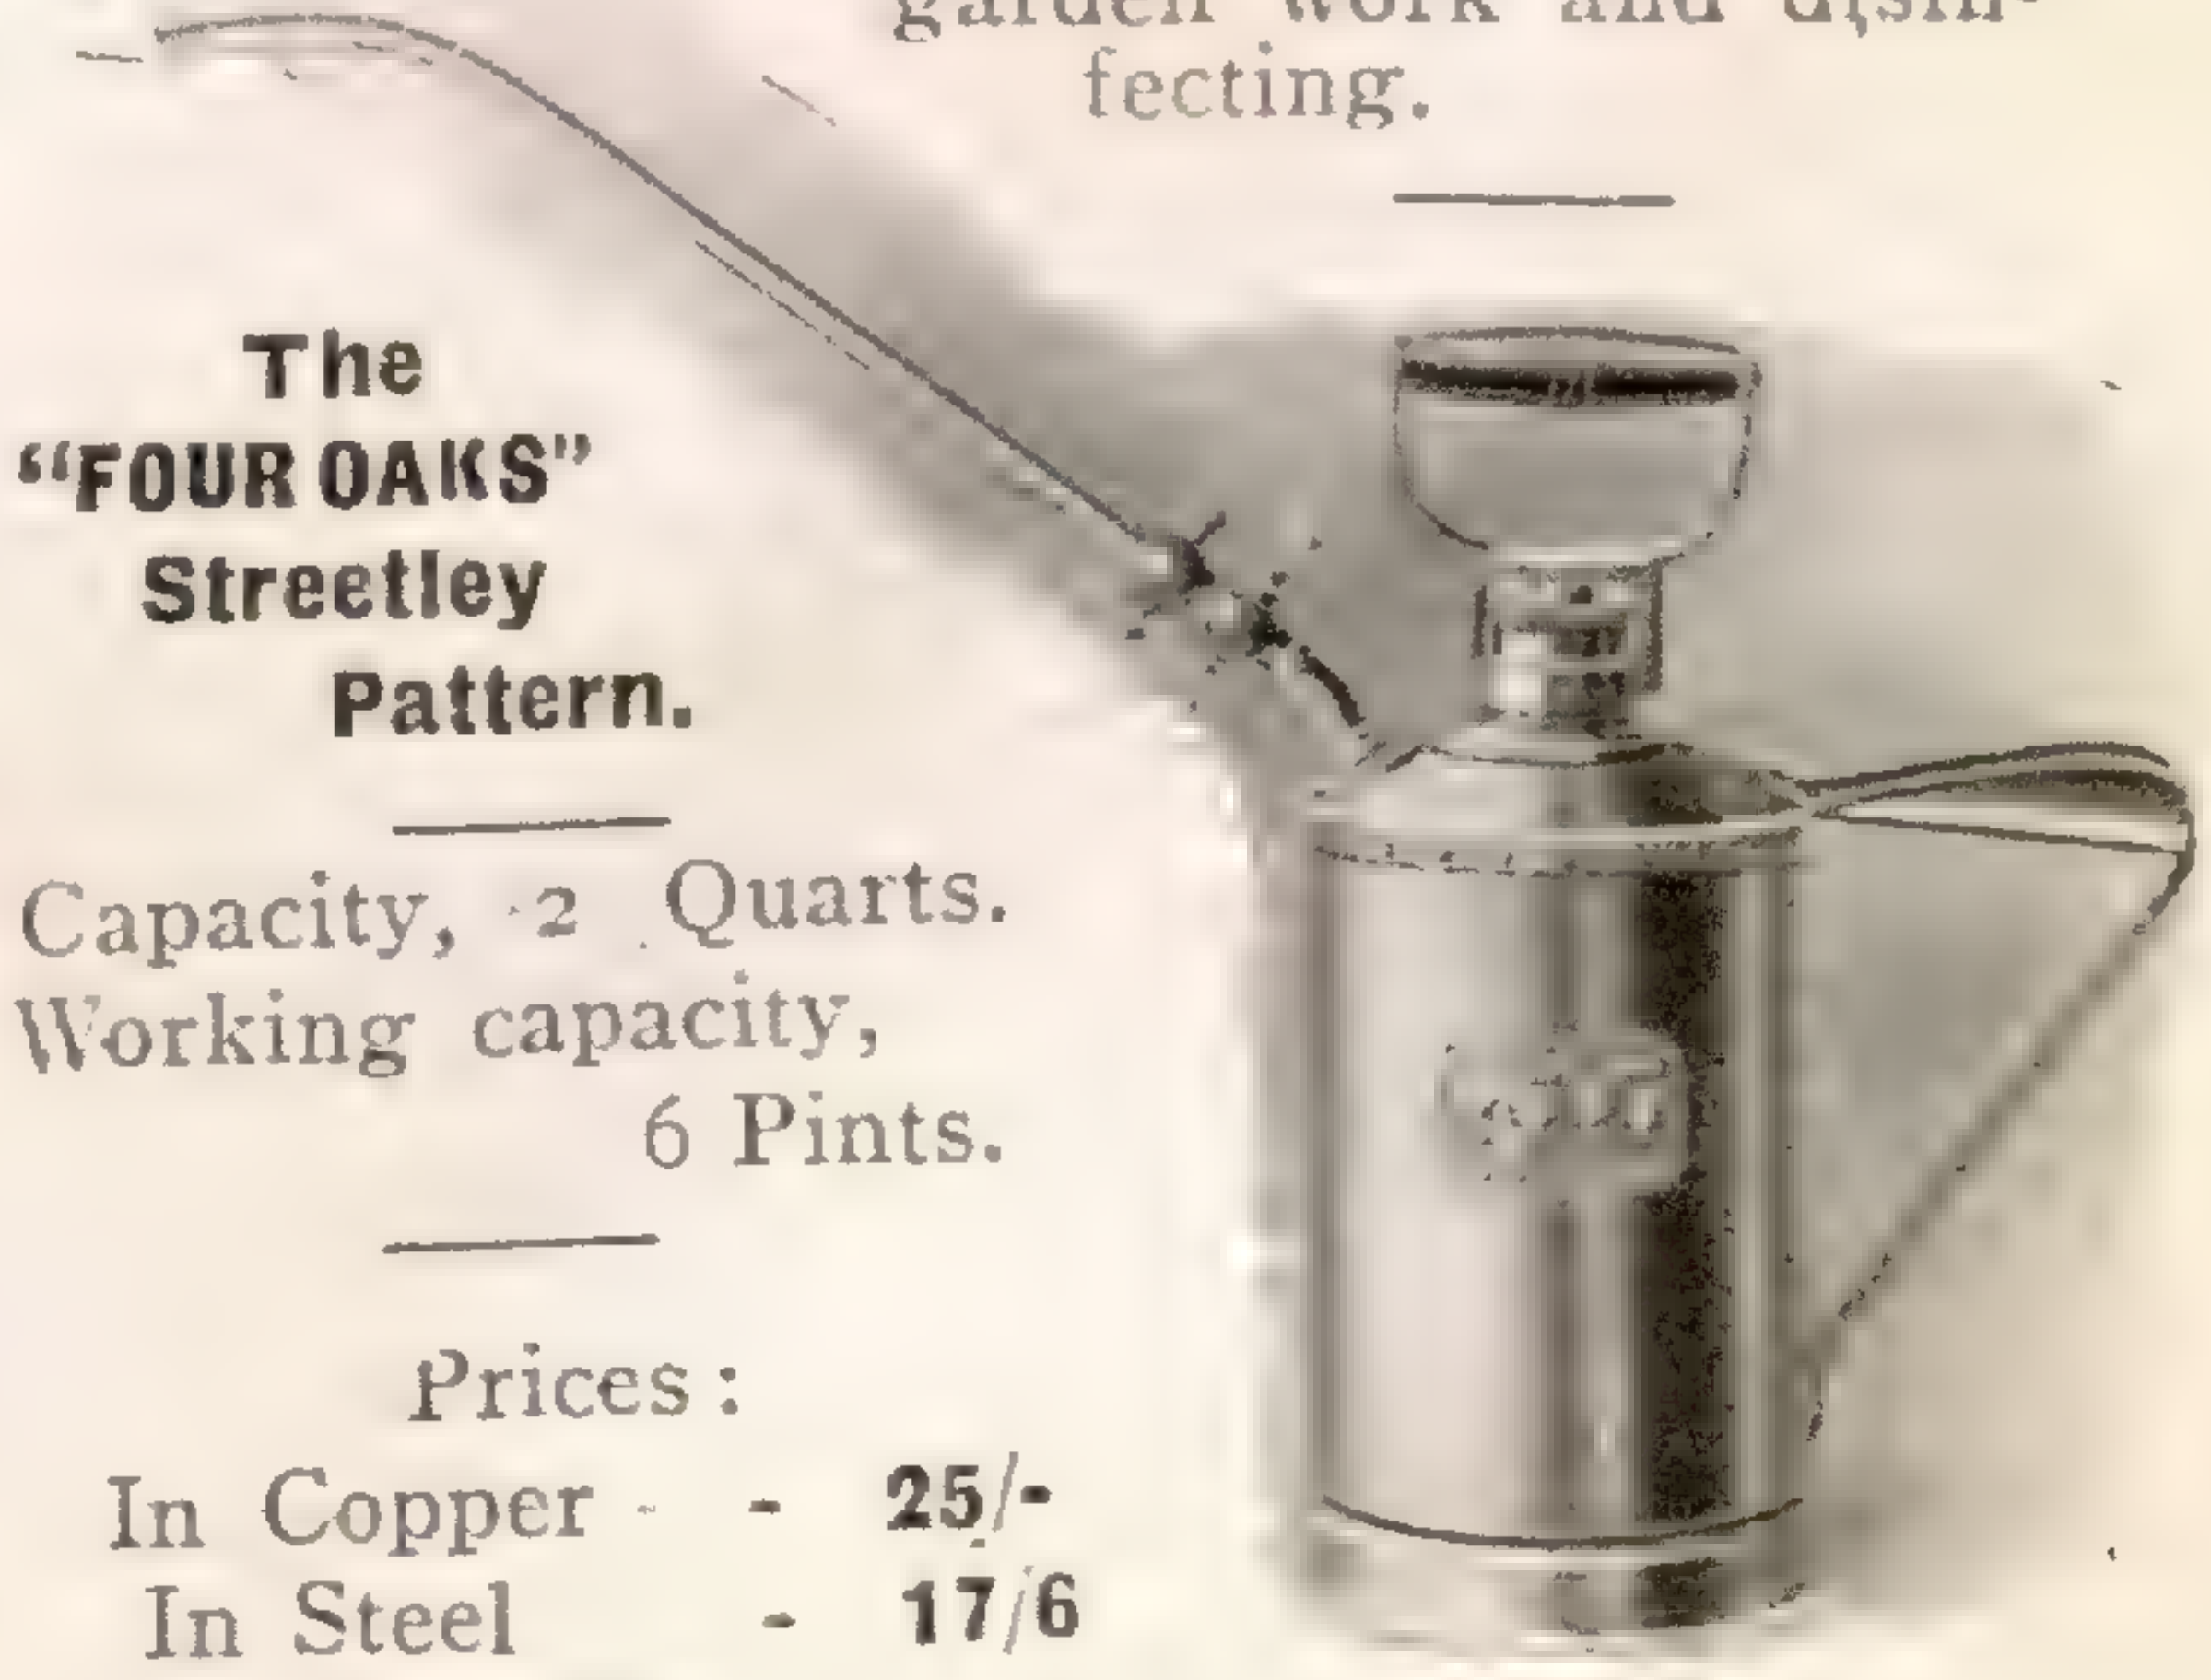
MILDEW ON OUTDOOR VINES.—F. S., Brighton: Some outdoor vines here are suffering from a very bad attack of mildew. Please tell me how best to cure this disease. —Dust the affected leaves with flowers of sulphur, or spray with a solution of potassium sulphide; half an ounce of potassium sulphide, dissolved in a little warm water, and added to a gallon of soft water, will make a good fungicide for mildew.

ONION MILDEW.—C. G. H., Derby: I am sending you specimens of onions that appear to be suffering from a fungus disease; perhaps it is Onion Mildew, but I have no experience with this trouble.—The onions are badly mildewed, and steps should at once be taken to stop the disease. There are two good methods. One is to dust the plants with a mixture of powdered quick-lime and flowers of sulphur, using twice as much lime as sulphur. The other is to spray with sulphide of potassium. It will be necessary to use these remedies every week or ten days, according to the weather. Do not allow badly diseased onions or broken and affected onion foliage to remain on the ground, but burn them at once, because cleanliness in this direction will save a great deal of trouble in the future. Mildew-infected

THE VERY LATEST AND BEST IN HAND PNEUMATIC SPRAYERS.

**The "Four Oaks,"** acknowledged by all users to be far and away the best on the market.

**No separate pump.** Self contained. A great advance over those kinds with separate pump. Cannot get out of order. The easiest, handiest, and most economical sprayer for greenhouse and garden work and disinfecting.



The "FOUR OAKS" Streetley Pattern.

Capacity, 2 Quarts.
Working capacity, 6 Pints.

Prices:
In Copper - 25/-
In Steel - 17/6

The copper machine is recommended where price is not a great consideration. Is **lighter, cleaner, and will not rust.**

Sole manufacturers:—
THE FOUR OAKS SPRAYING MACHINE Co.,
Four Oaks Works,
SUTTON COLDFIELD, BIRMINGHAM.

---

* A list of subjects can be had at Delalain's Library, Paris, or of the Horticultural Library, 84bis, Rue de Grenelle, Paris, VIIe., who undertake to procure these for anyone requiring them.

onion leaves, if allowed to rot on or in the ground, give rise to resting spores, which have a remarkable vitality, and are able to set up a fresh attack if their host plant, the onion, is grown in the same soil within two or three years.

BUD DROPPING IN SWEET PEAS. — J. E. T., Chesterfield: Can you tell me why my sweet peas do not develop properly beyond the bud stage? They appear to be quite healthy, and the buds look well until it is time for them to open, when they turn yellow and fall. I am enclosing a few specimens for your inspection. The plants are very robust, about six feet high, and the leaves are deep green. They have had only farmyard manure, trenched in about three feet deep, two months before planting time, but they have been watered once with weak liquid manure. The ground had previously been occupied by apple trees, which were dug out last year.—Judging from the appearance of the stems and foliage of the specimens sent, the soil in which the sweet peas are growing needs a considerable addition of lime and potash, both of which are very necessary to the successful cultivation of sweet peas. It is rather late in the season to do anything that will be of very great benefit to the plants, but sulphate of potash used at the rate of 1oz. to each gallon of water, given once a week at the rate of two gallons per yard run, may be of service. Give a good dressing of lime between the rows, and lightly prick it in with a fork.

ROCK TOBACCO.—L. N. N., Maidenhead, asks whether we, or any of our readers, know the Rock Tobacco, and can say whether it is hardy or not?—The Rock Tobacco is Primulina Tabacum, a low-growing Chinese perennial of doubtful hardiness. It has purple, primula-like flowers, and if the fresh leaves are gently drawn between the hands they exhale a strong tobacco-like fragrance. If any of our readers have had experience with this plant, we shall be glad if they will send us a note concerning its cultivation.

SOLUTIONS OF COPPER SULPHATE. —M. E. F., Saffron Walden: I shall be obliged if you will inform me how to prepare solutions of copper sulphate, such as are used for spraying farm crops to check certain weeds.—To make a 2 per cent. solution of copper sulphate, 8lb. should be dissolved in 40 gallons of water; for a 4 per cent. solution, 16lb. in 40 gallons of water. To prepare a 15 per cent. solution of sulphate of iron, 60lb. must be dissolved in 40 gallons of water. In either case 40 gallons of solution will suffice for an acre of the cereal crop. To dissolve the sulphates of copper or iron the powdered material should be placed in a bag and suspended in the water by tying the top of the bag to a rod placed across the mouth of the barrel or tub containing the water. Warm water and frequent movement of the bag will aid solution.

## NAMES OF PLANTS.

S. S., Lewes.—Polygonum orientale.

A. P. C., Hereford.—Periploca græca.

G. W. D., Leatherhead. — Evidently a lælio-cattleya, and a very poor form.

R. P., Saltaire.—1, Symphitum officinale; 2, Silphium perfoliatum; 3, not recognised.

T. W., Beverley. — 1, Alnus glutinosus quercifolia; 2, a striped variety of Mirabilis Jalapa; 3, Nothoclæna sinuata.

G. A. G., Royston.—1, Rheum palmatum; 2, Vitis labrusca; 3, Catalpa bignonioides; 4, Carpinus Betulus—the Common Hornbeam.

M. E. H., Keighley.—1, Fuchsia triphylla; 2, Browallia speciosa major; 3, Kalanchoe flammea; 4, Panicum plicatum; 5, Curculigo recurvata; 6, Saintpaulia ionantha.

## GARDENING ENGAGEMENT.

Mr. W. E. Jones, previously for four years gardener to Alfred A. Thorn, Esq., Harcourt, Linslade, has been appointed gardener to W. Gravelly W. Willis, Esq., 25, North Street, Leighton Buzzard.

## MARKETS.

◆

### COVENT GARDEN.

### Flowers.

The demand is but moderate, and there are ample supplies to meet it, although some outdoor flowers are suffering from the continued wet and cold weather.

| | | s. d. | | s. d. |
|---|---|---|---|---|
| Achillea | per doz. bun. | 1 6 | to | 2 0 |

## CATALOGUES RECEIVED.

J. R. PEARSON AND SONS, LOWDHAM, NOTTS. —A first-rate catalogue of bulbs, well arranged, capitally illustrated, descriptive, and instructive.

HERD BROS., PENRITH.—A handy list of the more popular bulbous flowers, together with a catalogue of roses, trees, and shrubs.

WILLIAM BULL AND SONS, CHELSEA.—A bulb list in which the varieties are rigidly selected, and yet collections for special purposes are a feature.

## FORTHCOMING ENGAGEMENTS.

SUNDAY, August 11.—Bruges International Horticultural Exhibition; open until August 18.

MONDAY, August 12.—United Horticultural Benefit and Provident Society.

TUESDAY, August 13.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m. on "The Construction of the Wisley Rock Garden," by Mr. Pulham, jun.; Scientific Committee at 4 o'clock.

Clay Cross Horticultural Society.

The Gladiolus Society will hold an exhibition at the Royal Horticultural Hall.

WEDNESDAY, August 14.—East Anglian Horticultural Club.

Lambourne Horticultural Society.

Harrietsham Gardeners' Society.

THURSDAY, August 15.—Malton Flower Show,

FRIDAY, August 16.—Northern Carnation Show.

TUESDAY, August 20.—Aynho Flower Show.

**NEW DEPARTURE IN FERTILISERS.**

**"CRESCENDO" FERTILISER CABINET.**

**NEW FEATURE I.**—Artificial manures for different purposes, supplied in separate bags.

**NEW FEATURE II.**—Entirely soluble. A pinch in the watering-can daily. No trouble of mixing with the soil.

**NEW FEATURE III.**—Instantaneous action. Effects quickly visible. No waiting.

**NEW FEATURE IV.**—Opportunity for experiment with separate substances. (See directions.) Every garden, every greenhouse, may become an experimental station.

**NEW FEATURE V.**—The most highly-concentrated Fertilisers offered. Each 1s. 6d. cabinet makes 120 gallons of plant food. They **cannot be sold in mixture,** as they spoil one another. The Fertilisers are those employed by the greatest scientific horticulturists, and they are the prescription of a Fellow of the Chemical Society.

**NEW FEATURE VI.**—A substance is included for sweetening the soil, liable to be soured by artificial manures.

**NEW FEATURE VII.**—A Free Box to every customer who introduces five other new customers. (See Directions in the cabinet.)

The "Crescendo" Cabinet is supplied for 1s. 6d., post free, direct from the makers only.

Send P.O. for 1s. 6d. **now,** to

**"CABINET FERTILISERS,"**

SASH BARS.—Special lines in certain lengths only, 1½ x 1, 2/6 100ft.; 3 x 1½, 5/9 100ft.; quotations for special lengths or for any kind of timber, garden lights, greenhouses, and woodwork. Send 5d. for the most up-to-date illustrated list of Builders' Woodwork and Timber in the World; or 1/- for list and rule—worth 2/6.
C. JENNINGS and CO., Timber Merchants, General Woodworkers, 916, Pennywell Road, Bristol.

**Full Instructions on Planting and Propagation of Hardy Plants and Flowers.**
**476 PAGES AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.**

**EASILY-GROWN HARDY PERENNIALS.**

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."
Price **5/-** net; Post Free, packed in box, **5/6.**

*SOME FEATURES OF THE WORK:*

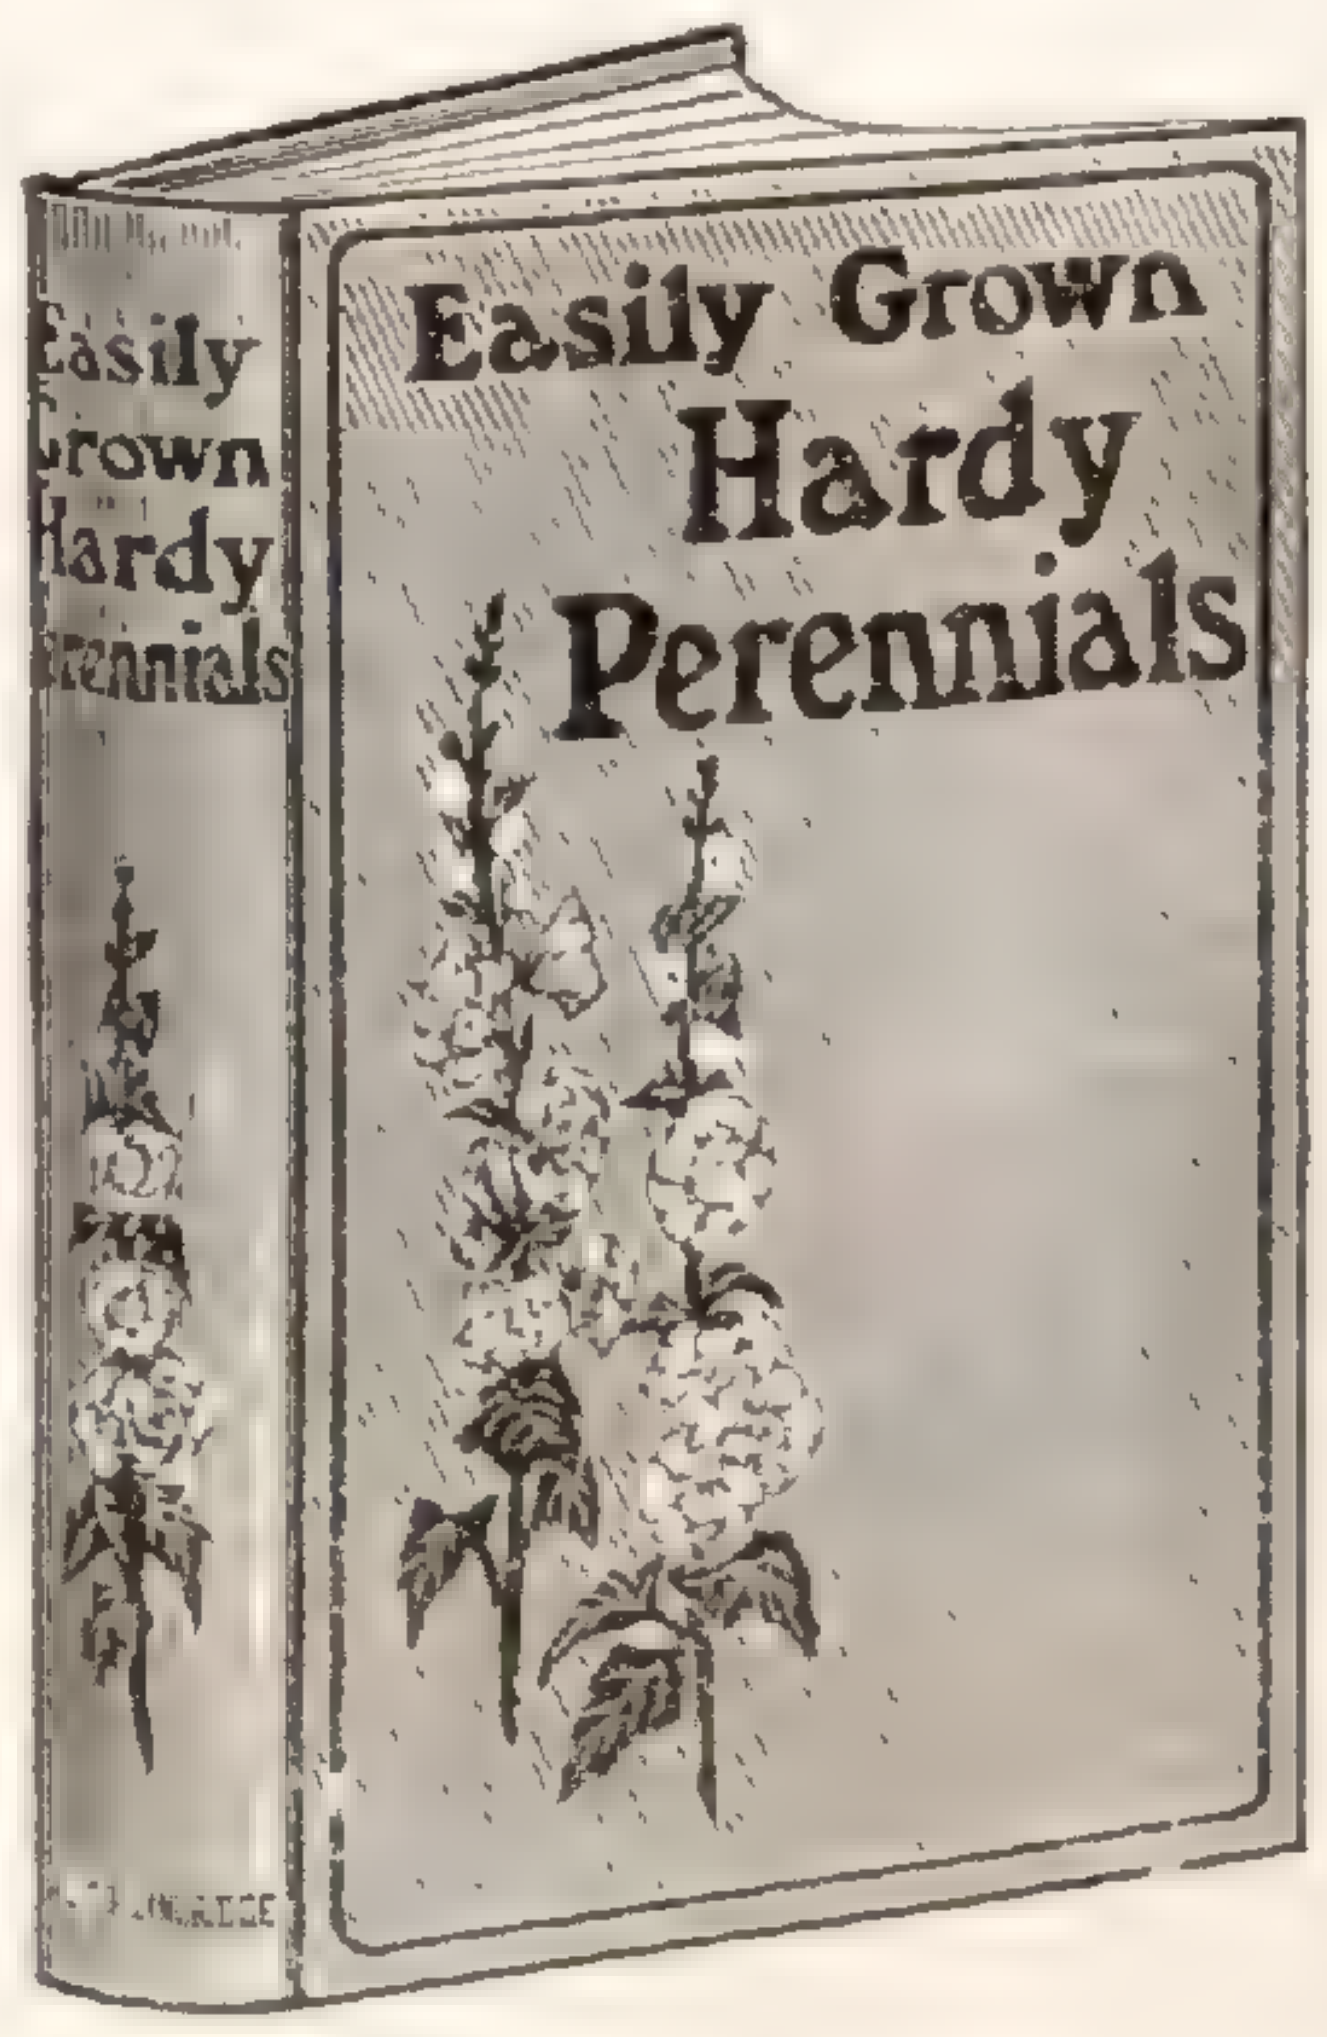
**Soil and Position.**—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

**Planting.**—The best time and method of planting are also clearly set forth.

**Pests.**—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

**Propagation.**—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

**Illustrations.**—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



**Botanical Name.**—Gives the botanical or generic name of each genus of plant described in the book.

**Common or Popular Names.**—Supplies the common or popular English names of all the plants described.

**Natural Order.**—The botanical family to which kind belongs.

**Habit and Uses.**—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

**Species and Varieties.**—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

**"The cultural details are very valuable."**—*Gardeners' Chronicle.*

**ORDER FORM.**

**To the Publishers,** 148 & 149, Aldersgate St., London, E.C.

*Please send me a copy of* **"EASILY-GROWN HARDY PERENNIALS"** *by post, for which I enclose remittance of* **5/6.**

PRACTICAL GUIDANCE IN GARDENING.—Complete catalogue of Books on all Phases of Horticulture will be sent POST FREE upon application to the Publisher of the GARDENERS' MAGAZINE, 148-9, Aldersgate Street, London, E.C.

---

SOW NOW, CYCLAMEN "MRS. BUCKSTON," 2s. 6d. per packet, and our other fine varieties, Salmon King, Giant White, Deepest Red, Rose, etc., 1s. 6d. and 2s. 6d. packet. Perpetual Carnation Seed, 1s. 6d. and 2s. 6d. packet. STUART LOW and CO., Bush Hill Park, Middlesex.

---

ORCHIDS FOR AMATEURS.—A practical guide to the Cultivation of Cool and Warm-house Orchids, adapted for Small Mixed Greenhouses. The author is C. Alwyn Harrison, F.R.H.S., and the book can be obtained, by post, for 2s. 10d., from Publisher, 149, Aldersgate Street, London.

---

WM. DUNCAN TUCKER and SONS, Lim., 27, Cannon Street, London, E.C.; Works, Tottenham. Conservatories. Winter Gardens, Vineries, Peach-houses, portable buildings, etc. Catalogue gratis.

---

SUTTON'S WHITE ROMAN HYACINTHS.
Beautiful White Flowers at Christmas.
Extra large bulbs ... per doz., 3/-; per 100, 21/.
Selected bulbs ...... per doz., 2/-; per 100, 14/.
Fine bulbs ............ per doz., 1/6; per 100, 10/6

---

SUTTON'S BULB CATALOGUE for 1912.
Beautifully illustrated. Now ready. Post free.

---

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

---

A PERENNIAL GARDEN MEANS PERENNIAL PLEASURE, if composed, in whole or in part, of Kelway Artistic Colour Borders. Quotations for any area by return of post, with full particulars. A copy of "Gardens of Delight" for 6d. (post free). Now is the time to plan.

——, Esq., Excelsior, Minn., U.S.A.

"I enclose a photograph of one corner of my 'Kelway' garden, showing some Onperdon bracteatums in the foreground, and Delphiniums and Pæonies in background."

KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

---

"ROSES AND THEIR CULTIVATION." A new edition of this Standard Book is now ready, and every Rose Grower should secure a copy. Cloth, many illustrations, 2s. 10d., post free, from Publisher, 149, Aldersgate Street, London, E.C.

---

WINTER-BLOOMING SWEET PEAS.—The "Télemly" Sweet Peas gained the Gold Medal (1907) of the Hort. Soc. of Algeria, and the

LARGE NEW WAVED VARIETIES the Gold Medal of 1911.—If sown in August or September will flower from December till May in Southern Europe, N. Africa, Madeira, etc. In England must be sown in pots and protected from frost till the end of February, and will flower in April in the open, or at Christmas in a sunny greenhouse. 12 seeds each of 4 plain and 3 waved varieties will be sent on receipt of 4s.
REV. E. ARKWRIGHT, 36, Seymour Street, W.

---

ROCK GARDENS and ALPINE PLANTS.—A new work and a complete guide to the Formation and Management of Rockeries, by E. H. Jenkins, F.R.H.S. Many Illustrations. Cloth, 2s. 10d., post free, from Publisher, 148, Aldersgate Street, London.

---

R. D'E. DAY, The Nursery, Sutton Scotney, Hants, Spanish Iris Specialist. Catalogues on application. Retail only.

---

"WORTH ITS WEIGHT IN GOLD."—Such is a Reader's opinion of THE ENCYCLOPÆDIA OF GARDENING, by T. W. Sanders, F.L.S. Price 3s. 10d., post free, from the Publishers 148-9, Aldersgate Street, London, E.C.

---

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardeners' favourite Fumigant, both Liquid and Cake.

XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are XL ALL WEED KILLER, XL ALL FERTILISER, XL ALL ROSE MANURE. RICHARDS' GREEN SUNSHADE, finest powder shading on the market, 1s. packet does 100 feet of glass. Don't forget to ask your Nurseryman or Seedsman for my small pink list.

G. H. RICHARDS, Manufacturer,
234, Borough High Street, London, S.E.

# BUSINESS CARDS.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Proliferation.

The term proliferation (from proles, offspring, and fero, I bear) might, from its construction, be applied, of course, to all forms of life which produce living offspring directly, but in plants it is confined to those which produce offspring by buds engendered in unusual places. Thus most dicotyledonous trees, that is, those whose seeds produce two primary leaves or cotyledons, bear buds in the axils of their leaves, i.e., in the angle where the leaf-stalk springs from the twig or branch which bears it, but we do not call such trees proliferous, even though such buds may be induced to become independent plants by proper treatment. In numerous ferns, however, we find buds engendered on the upper, or more rarely, on the under, surfaces of the fronds. On Asplenium bulbiferum, for instance, a very common fern for room decoration, young plants appear in considerable numbers, first as small, scaly pimples on the subdivisions of the fronds, and then, under congenially damp conditions, as well-developed youngsters with fronds several inches long, and so precocious that they, too, break out into another generation while still attached, and this may even go a step further and produce a third. Several members of the same genus do the same thing in varied degrees, but the genus is a large one, and the majority present no such phenomena. Some species only assume a proliferous character in conjunction with abnormal variation, the normal type presenting no trace of it. Thus it is with the Polystichum angulare, in which proliferation is developed to the greatest extent in conjunction with reduced and very acutely pointed ultimate segments (acutilobum), though it also occurs in many other abnormal variations on different lines, usually near the bases of the fronds. Among the woodwardias we have two different forms of proliferation. W. radicans produces one or two robust bulbils near the end of each front. These develop while still attached into fair-sized plants, and consequently gradually weigh down the frond tips until they reach the soil, well away from the parent rootstock. This plant, therefore, represents an exaggerated Walking Fern, as the small-growing American species, Camptosorus rhyzophyllus, is called, owing to a similar habit of growth and distribution. W. orientalis, on the other hand, has its fronds profusely dotted over with small plants, produced on pimple lines as with the asplenium above described, but these are very loosely attached, and, having formed two or three tiny round fronds, fall off, sail to the ground, and root themselves fairly freely. The asplenium youngsters, on the other hand, have to wait until the old frond so far decays as to fall to the ground, and so bring some of the plantlets into contact with it. In all these cases, the bulbil plants produced have incipient roots at their bases, and, so far, are perfect little plants. An exotic, but practically hardy lastrea, L. vivipara, has the peculiar and rare faculty, as a species, of producing such bulbils on the frond backs in conjunction with the spore heaps. This is also done by some of our plumose varieties of Lady Fern (Athyrium filix fœmina), but these are very abnormal in other respects. Proliferation, however, may be induced artificially in cases where otherwise it would not appear. Thus the leaves of some plants, the begonias, for instance, possess the peculiar faculty of producing buds, i.e., of becoming proliferous, if they be wounded by cuts through their substance, and then layered. The wounds then heal, and the marginal cells develop buds round the edges, thus affording an easy means of propagation. Hyacinths and other bulbous plants bear proliferous buds if their bases be hollowed out, and the edges of their latent foliage is thus exposed; the principle being the same as in the case of begonia. The Hart's-tongue fern has produced proliferous sports which bear bulbils on the front surfaces or the stalks, such phenomena being confined to abnormal varieties, but all the numerous forms of this protean species, as well as the species itself, possess a latent proliferousness by virtue of which the old frond basis which build up the caudex, can produce bulbils ad libitum if severed and close cultured. On a base an inch long we have counted no less than thirty-six developed plantlets. It has also been demonstrated that even the severed roots of many plants are capable of producing buds under culture, and in point of fact, it seems fairly certain that active plant cells, wherever situated, contain all the essentials of plant creation, and are capable, under certain circumstances, of assuming the function of reproduction if the normal course of that function be obstructed. The materials which it is the function of the leaf to manufacture and distribute thereafter to the general plant system, fails, by the detachment of the leaf, to find its natural channel, and therefore is seized upon by the cells in the vicinity, at the point of least resistance, viz., the wounded edge, as pabulum for a new plant or plants, hence the bulbils. Proliferation, as we have said, may be induced in roots by severance, but it really occurs normally in many instances where tubers are formed. Thus, in the potato each tuber is practically an underground proliferous growth of one or more buds which the foliage above ground has furnished with, thanks to culture and selection, an abnormal amount of nutritive, starchy material. Mere fleshy roots, however, such as the turnip, carrot, etc., devoid of such lateral buds, do not belong to the proliferous category, and, as a general rule, it may be stated that the term "proliferous" is only applied to aerial bud-producing plants, usually on abnormal lines.

MR. SAMUEL GORDON.

**Mr. Samuel Gordon,** whose portrait is given herewith, has for about fifteen years had charge of the gardens at Monreith House, the Wigtownshire residence of Sir Herbert Maxwell, Bart. As becomes one qualified to successfully carry out the duties pertaining to an establishment where hardy subjects are almost exclusively tolerated, it is needless to say that Mr. Gordon, though yet comparatively a young man, has an extensive knowledge of herbaceous and rock plants, trees and shrubs, which, for the most part, thrive remarkably well in the genial climate for which this portion of Scotland is noted. In recent years the grounds surrounding the mansion of Monreith have been largely remodelled, and the various plants so arranged that each enjoys, as far as possible, the advantages of situation, as that of the maximum amount of shade or sunshine, shelter or moisture, according to their respective needs. Away from home Mr. Gordon is well known as a very successful cultivator of fruits and vegetables. At county exhibitions he has been well represented, and, encouraged by success near home, he has sought honours farther afield, notably at Edinburgh, where, at the autumn gatherings of the Royal Caledonian Horticultural Society, conspicuous good fortune has attended his efforts. Among his successes grapes have been prominent, particularly such kinds as Alicante, Alnwick Seedling, Muscats of sorts, and Black Hamburgh. For the latter Mr. Gordon has on two occasions at least been awarded (over and above the schedule prizes) the special medal for high culture which the society instituted some years ago to encourage a higher standard for this most popular grape. The Williams' Memorial Medal for general excellence of produce was also awarded a short time ago to Mr. Gordon at this society's autumn exhibition. Limits of space forbid further detailed reference beyond the statement that at Edinburgh last September, Mr. Gordon gained premier honours for a collection of vegetables (twelve varieties), which were considered by experts to have been of very superior merit. Though essentially an industrious man, and devoted to horticulture and its pursuits, Mr. Gordon spares time for requisite and healthy recreation. Formerly this took the form of cricket, but latterly the Scottish game of bowling has taken his attention, and the change has been to the great advantage of the Portwilliam Club, among whose members Mr. Gordon's name is generally prominent when important contests have to be decided.

**R.H.S. Grapes for Shrewsbury Fete.**—We understand that the Royal Horticultural Society proposes to exhibit about forty bunches of grapes at the Shrewsbury Floral Fete, on Wednesday next. There is now an excellent collection of grapes at the Society's Gardens, Wisley, and many of the varieties are of excellent flavour, and yet comparatively unknown. The collection, to consist of about twenty varieties, should prove very interesting and instructive.

**New Official Guide to Kew.**—The most recent of the publication associated with the Royal Botanic Gardens, Kew, is the "Popular Guide," which has made its appearance on our table within the past few days. Popular in style, as well as in name, this new guide bears unmistakable evidence of good work, and should prove of much value to visitors who take something more than a superficial view of the gardens and their many occupants. It may prove useful to those who regard the gardens as merely an attractive place of public resort in directing attention to the great importance of the work that is being done within their boundaries, and the splendid services they have rendered in connection with the development of tea culture and other great industries in India and the Colonies. The guide is accompanied by an excellent map, and in the earlier pages are given a description of the main features, and a historical sketch extending over the period which has elapsed since Richmond Lodge, which at one time stood in the Old Deer Park of Richmond, was the favourite residence of George II. and Queen Caroline. The functions of Kew are briefly, yet clearly stated, and then follow descriptions of the several departments of the gardens, these latter occupying between seventy and eighty pages. Although primarily provided as a guide to visitors to the gardens, it will be found useful to those who may wish to have a clear idea of the more characteristic features of the gardens, and of the several collections in the open and under glass, and have but few, if any, opportunities of visiting Kew. The guide is published at sixpence, and may be obtained through the booksellers in the usual way.

**National Hardy Plant Society.**—The second annual conference of the National Hardy Plant Society will be held at Shrewsbury on the second day of the show, Thursday, August 22, at the George Hotel, at 3.30 p.m. Mr. T. W. Sanders, F.L.S., will read a paper on "Are Flower Shows Advancing Hardy Plant Culture as they might and ought to do?" There will also be a discussion on the herbaceous species and varieties of the genus veronica. All visitors to the show interested in hardy plants are cordially invited. Certificates will be awarded to new plants of sufficient merit. Particulars of any plants entered should be sent to the secretary, Mr. F. Bouskell, Market Bosworth, Nuneaton, on or before the 20th inst.

**A New Colonial Fruit Farm.**—We understand that the Trade Orchard Company, of St. John, New Brunswick, has taken another step towards the establishment of a model fruit farm in the province. At a recent meeting of the board of the company it was decided to buy a farm of about fifty acres, located within sixteen miles of the city, and a short distance below Brown's Flat. The land is said to be ideal for the growing of apples and other similar fruits. The land is at present under crops, but it will be taken over early in the autumn, and preparations will be made for setting out about 2,000 trees next spring.

**Relation of Light to Advance Growth.**—The recently-issued "Transactions" of the Royal Scottish Arboricultural Society affords evidence that Wiesner's researches on the Lichtgenuss of plants are being followed up by investigators in forestry work. Wiesner's term may, observes "Nature," be rendered as photic ration, or the ratio between the intensity (i.) of the light actually falling upon a plant or its parts, or its habitat, and the intensity (I.) of full daylight at the same time. The ratio between the two intensities (i. : I.) is the specific photic ration. In a paper on the relation of light intensity to advance growth—that is, to the trees which have sprung up in openings in the forest, or under the forest canopy, before regeneration fellings were commenced—Mr. G. P. Gordon, B.Sc., describes observations made by him on oak and beech forests. Graphic representations are given, in which the number of seedlings per 0.8 square pole for each species of tree is plotted vertically, while the specific photic ration is plotted horizontally. The curve for oak indicates that, as the light intensity increases, the number of seedlings per unit area of the advance growth increases, reaching a maximum when the light intensity is one-fourth that of full daylight, and that large variations in light intensity are associated with comparatively small changes in number of seedlings. The curve for beech is very different, there being a comparatively large variation in seedling number for a small variation in light intensity, while the maximum is reached at one-fortieth the full daylight intensity. The author concludes by pointing out the practical importance of the Lichtgenuss method in forestry.

**State Aid for Flower Shows.**—With the exception of a few instances in Ireland, State aid is rarely granted in any form to flower shows in the United Kingdom, but on the Continent considerable financial and other help is extended to the managing body of the larger efforts, for the purpose of encouraging horticulture. At Bruges, the International Exhibition being held this week is being assisted to the extent of something like £1,000 from the State and Provincial Governments, and the site of the show, as well as the laying-on and supply of water and electric light, are provided by the Corporation. All this is done because horticulture is regarded as an important industry, and worthy of all possible encouragement.

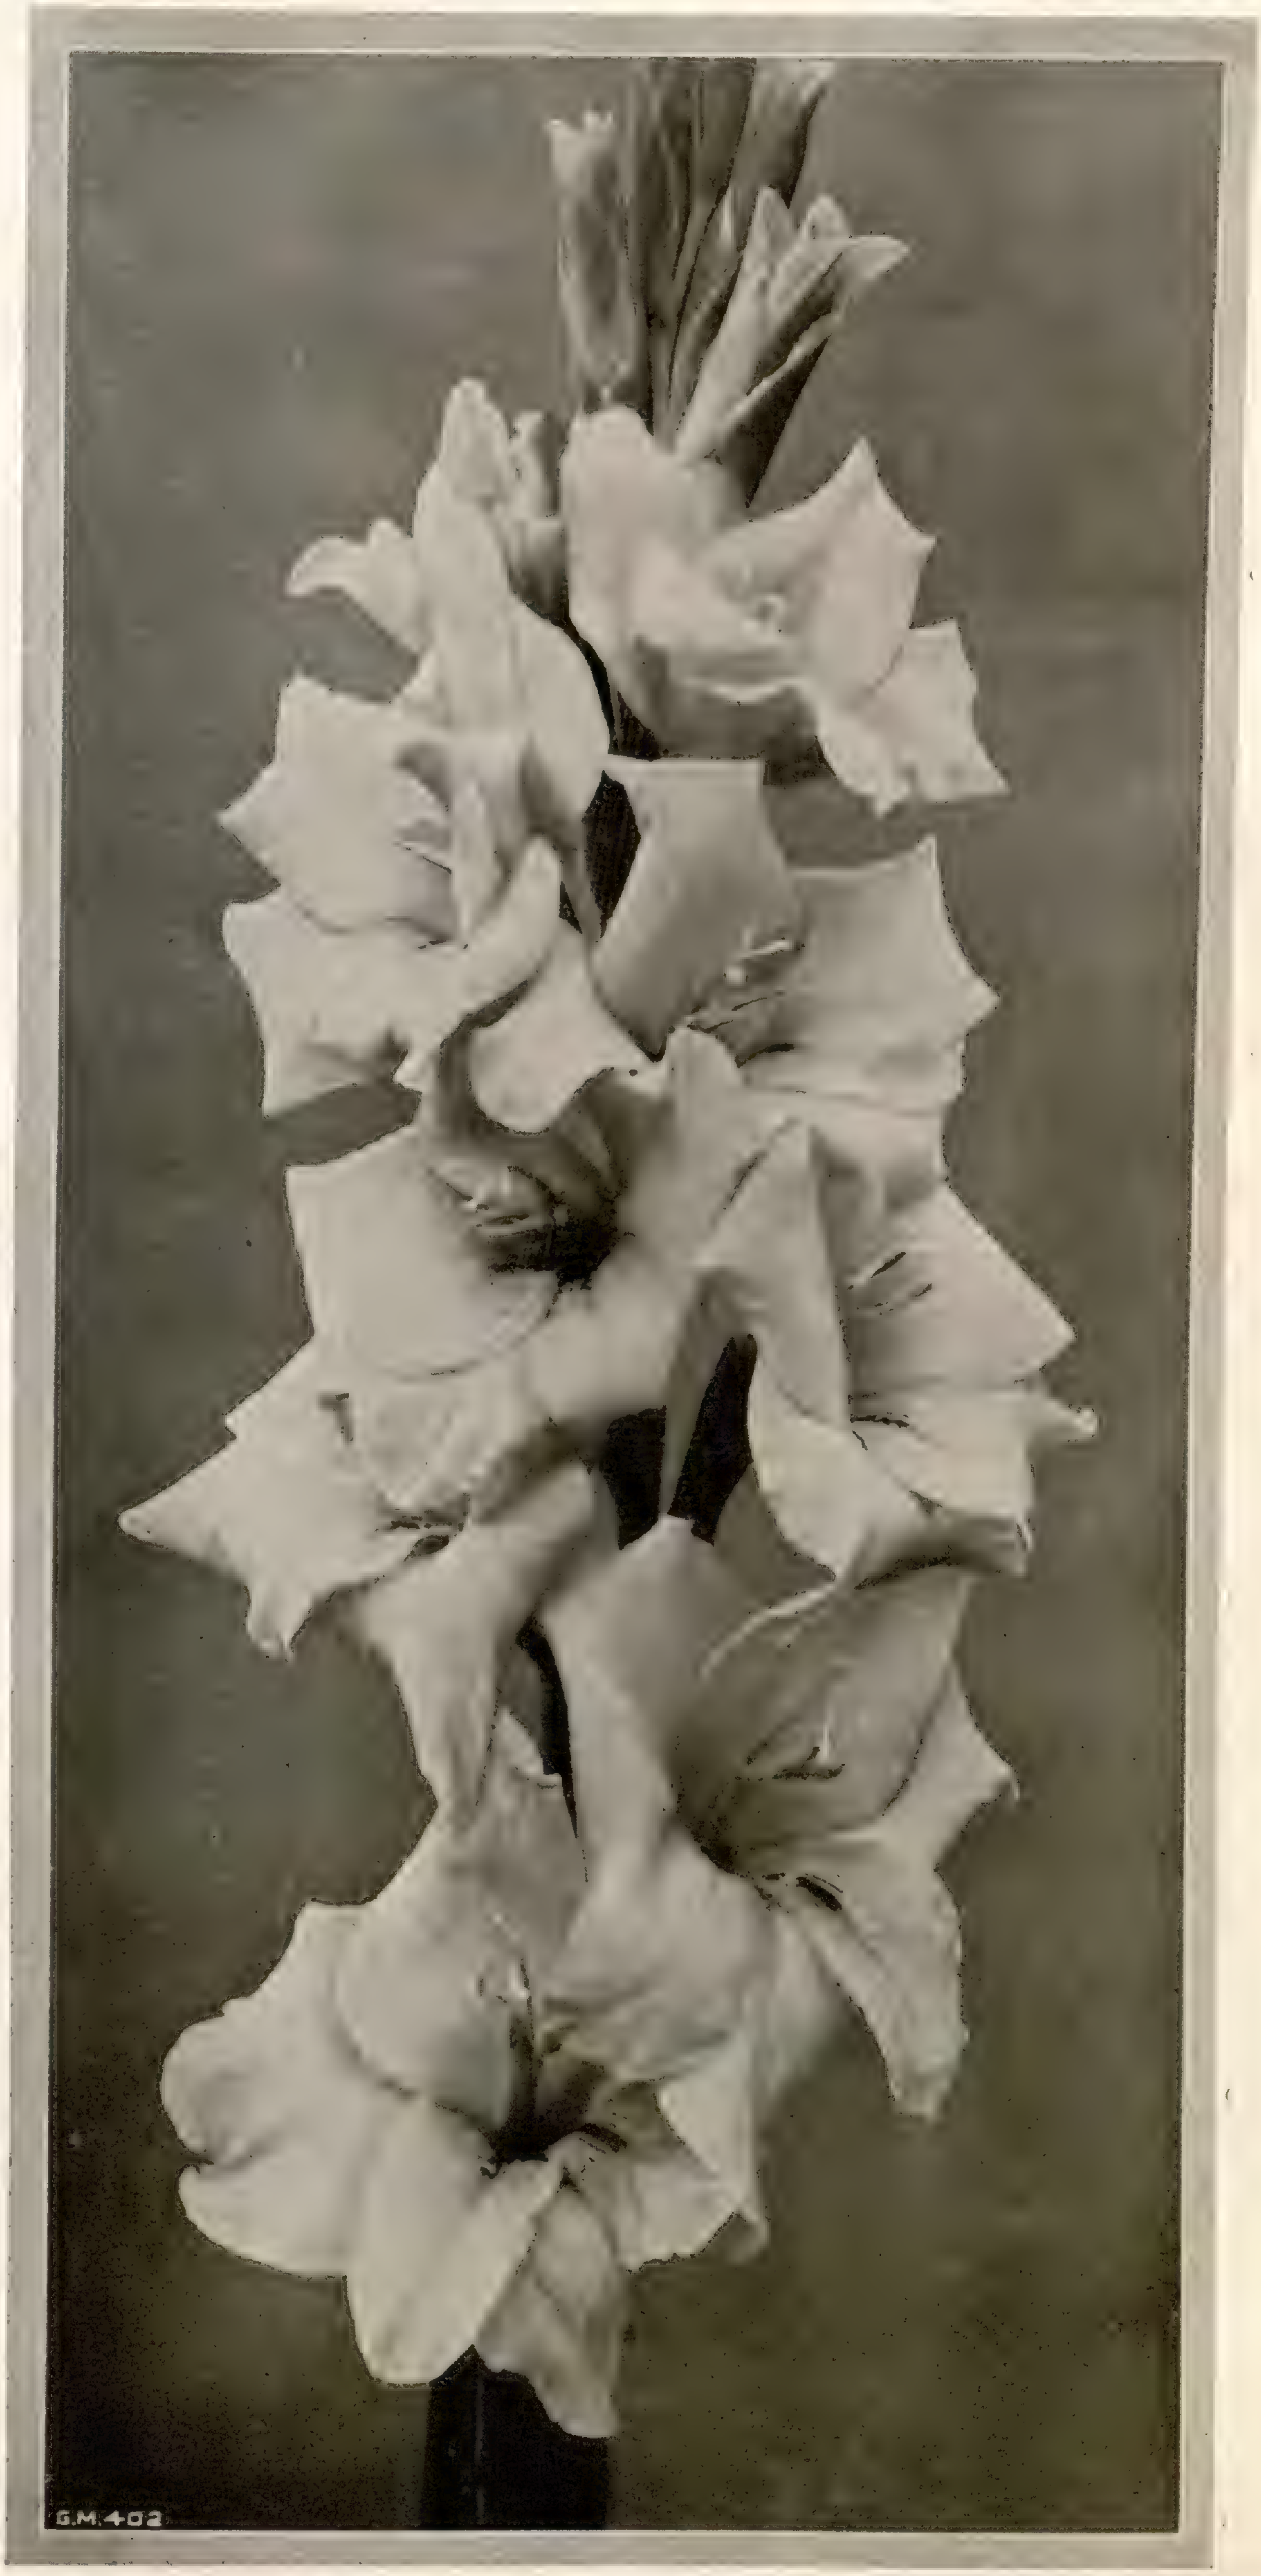
**The Potato Crop.**—The potato disease has made its appearance in a considerable number of the English counties; and, although it has not as yet done any considerable amount of damage to the crop, it has reduced its value somewhat. It has, perhaps, been most active in the Midland and Western Counties of England; but north of York but little, if any, damage has been done, and there is very little potato disease in Scotland. At the present time the Scottish potato crops are very promising, and, with more favourable climatic conditions, they should be heavy and of high quality. The Welsh potato crop is also very satisfactory at the present time. The low temperature which has been experienced of late, and has proved so hurtful in its effects upon many crops of both farm and garden, has rendered good service in connection with the potatoes, as both warmth and moisture are necessary for the rapid spread of potato disease, a fact which some writers appear to overlook.

**Blairgowrie Raspberry Crop.**—According to the "Glasgow Herald," the cold and wet weather that is being experienced in Scotland is having a disastrous effect upon the raspberry plantations in the Blairgowrie district. It is expected that much of the fruit will not ripen, and in the case of one plantation of 15 acres it is computed that the yield will average only one ton per acre. The critical state of the crop has practically caused growers to cease selling, and for present deliveries £35 per ton is being asked. Boilers have not yet obtained their full supplies. The berries are weighing badly, and pickers are complaining of the low wages being earned. Pickers' wages in the district amount to about £460 a day, and wages paid this season already exceed £4,500. The total despatch of fruit in the first week of August was about 618 tons (of which 368 went to England and 16 to Ireland), against 630 for the corresponding week last year, and a record of 915 the previous year. For the season the total railed is 1,318 tons, against fully 1,500 tons at the same time last year, and 1,470 tons the previous year. Prices for the same week last year fell from £42 to between £34 and £40 per ton; in the previous year the price was £16 to £20 per ton; in 1909 no price was quoted, the market being so bad; and in 1908 it was only £12 per ton.

**Instruction in Intensive Culture.**—We are informed that the Education Committee of the Surrey County Council have appointed a sub-committee to consider the question of the adoption of intensive horticulture as a subject of instruction in the various schools under their control.

**Proposed Bureau of Plant Industry.**—In the course of his presidential address at the British Pharmaceutical Conference in Edinburgh, Sir Edward Evans said he had been very much impressed by the fact that the Government of the United States, in addition to being very particular as to the purity of all drugs sold in that country, had a bureau of plant industry in connection with the Department of Agriculture. From this department important bulletins were issued, and, as the result of its investigations, the use of barks, roots, etc., of American origin had to some extent taken the place of the older drugs so familiar to the public years ago. He mentioned this matter as possibly the British Pharmaceutical Conference might think it worthy of consideration that the British Government should form in the Board of Agriculture a department such as existed in the United States to further the growth in this country of roots and herbs, which the small holdings and allotments might be the channels of carrying into effect. The soil of this country seemed adaptable for this purpose, as its produce was superior to any produced elsewhere; for instance, belladonna, peppermint, lavender, valerian, henbane, etc. They could not help noticing that what at first seemed a small industry often came to be one of considerable value, such as the trade in cascara sagrada, which was one of the most popular of drugs. It was estimated that the crop of this valuable bark now reached about 1,000 tons. It was collected almost entirely in the forests of Northern California, Oregon, and part of British Columbia, being obtained from a scrub bush, and some one hundred thousand or more trees were destroyed annually for the production. The consumption of cascara was now almost ahead of the supply.

**New Work on American Nymphæas.**—A memoir on the species of nymphæa indigenous to North America has been published by the Smithsonian Institution, and is an important contribution to the literature on ornamental aquatic plants. The authors of the memoir are Messrs. Miller and Standley, who direct attention to the fact that there are some groups of plants of which the taxonomy cannot be properly understood from herbarium specimens of an ordinary character, and among these are the aquatics. The memoir is of much interest as representing a successful endeavour to revise the knowledge of the American water lilies with the aid of fresh material obtained from all parts of the country. A few hitherto unknown species are described, and these raise the number of American species to nineteen. The descriptions are in all cases accompanied by illustrations of the leaves, flowers, fruits, and seeds. The attractiveness of the memoir is greatly enhanced by a number of finely executed plates showing the plants growing under natural conditions.



GLADIOLUS GOLDFINDER.

A distinct and beautiful variety, the flowers soft yellow, with red markings on the two lower segments. Exhibited by Mr. W. Pfitzer, Stuttgart, at the National Gladiolus Society's show at the Horticultural Hall on the 13th inst., and awarded the Silver Cup for two spikes of the best new seedling not yet in commerce. See page 639.

# GARDENERS AND GARDENING.

## EDUCATION AND TRAINING OF GARDENERS.

The monthly meeting of the Scottish Horticultural Association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 6th inst. Mr. Massie, the president, was in the chair, and there was an attendance of 60 members.

The evening was devoted to a discussion on the training and education of the young gardener, the discussion being opened with short papers by Mr. C. Comfort and the secretary on the practical and technical sides respectively. A general discussion followed, the meeting being substantially in agreement with the views put forward in the papers.

### APPRENTICESHIPS AND PRACTICAL TRAINING.

Mr. Comfort stated that in these days the man who learned his business only by haphazard means would soon find himself elbowed out, and hopelessly left behind in the race of life, and this was emphatically true of gardening, which demanded so wide a range of both practical and scientific knowledge. There were two individuals to consider in this question—the head gardener and the under gardener or apprentice. In selecting an apprentice, the head gardener should see that he was of good moral character and of fair intelligence, that he had received a good elementary education, and that he had some taste for gardening. Fewer lads were now offering themselves as apprentices than was the case some years ago, and he suggested that apprentices should be taken on at an earlier age than was usually the case, say, at fifteen instead of seventeen. At present young lads who intended to become gardeners hung on at odd work for two or three years after they left school, until they reached the age at which they were generally taken on as apprentices, and the best of them often turned their attention to something at which a start could be made at an earlier age.

The only reason for this putting back of the age in gardening, so far as he could see, was in order to obtain the services of a lad who was able to do a man's work for a boy's pay. There were few gardens, however, where a boy of fifteen could not be profitably employed. The change suggested would be of great advantage to the young gardener, and if it were to come into vogue the term of apprenticeship might with advantage be extended to four years, instead of three as at present. Having secured his apprentice, the head gardener should realise that, not only had he taken upon himself the responsibility of grounding the young man in his craft, but also of looking after his moral and physical welfare. So long as plants required immediate attention, the gardeners' bothy would most likely remain a necessity, and, while the almost palatial structures which have been erected in some establishments were not likely to become common, the place in which the young gardener had to live, and for the time being became his home, should, at any rate, be in keeping with modern ideas of health and comfort, and a place to which an intelligent young man would not be ashamed to take his friends. Bothies should also be provided with some literature, and there should be some facilities for recreation, for "all work and no play makes Jack a dull boy."

Too much should not be expected from the apprentice to begin with. Seniors were too apt to forget the gulf which separated them from the apprentice. The reason for doing a thing in a certain way should be explained to the apprentice. Not only should he be taught how to use his tools, but he should also be instructed to keep them clean and tidy, and, in fact, the lesson of tidiness in everything should be strongly impressed upon him. During part of his time the apprentice should have the opportunity of seeing everything that is to be seen in the establishment, though it may not be practicable in a four years' apprenticeship to take part in every practical operation, from weeding to the potting of a fifty-guinea orchid. The establishment in which the young man served his apprenticeship need not necessarily be a large one. In a well-appointed, moderately-sized garden, under the charge of an efficient head gardener, more would be found than the smartest apprentice could take advantage of even during a four years' apprenticeship. The establishment to avoid was one in which a cheese-paring policy was pursued. Economy was incumbent on all, but those who either could not or would not pay the necessary price for what was, after all, largely a luxury, should cut their coat according to their cloth.

Having chosen his calling, the young gardener would do well to remember that very much of his future success depended upon himself. Courteous and polite he should be, and he should learn that submission to those having authority over him was not only necessary to the advancement of his knowledge, but that it was also necessary for the formation of character. "Learn to obey and you will know how to command." Industry, too, should become a trait of his character. "Good striving makes good thriving," and industry should assert itself in every detail of his work. He should take pains to find out things for himself, and should strive to get to the root of everything. There was often a diffidence about asking questions, which might arise from natural shyness or from the fear of being considered ignorant. But no reasonable being expected to find an old head on young shoulders, and those having the charge of young lads should so cultivate their inter-relationships with them that they would have no fear of being snubbed even should they ask what might seem a silly question, so long as it was asked sincerely.

The young gardener's "time" being completed, it would, as a general rule, be well for him to move about a bit for the next few years, and if he could spend some time in establishments where certain subjects calling for skill in their cultivation were made specialities of, it would be to his advantage. He should also visit other establishments and interchange views with his fellow gardeners, and visits to flower shows should not be neglected; neither should the reading of at least one good gardening paper weekly.

### TECHNICAL EDUCATION.

After contrasting the position of the young gardener of to-day, as regards the advantages which he enjoyed in the way of technical education and cheap literature with that of the young gardener of forty to fifty years ago, the secretary said that, though they had to find out many of the secrets of their success as cultivators by rule of thumb methods, and their knowledge of these matters was therefore largely empirical, the old gardeners would hold their own with the younger ones either as cultivators or otherwise. Their average education, too, when they left school was better, he thought, than that of the average of boys leaving the elementary schools at present, and their efforts at self-improvement afterwards were more persistent than those of the present-day young gardener.

Before referring to the technical subjects which the young gardener should apply himself to once he had settled down to the serious work of his calling, the secretary said there was no doubt in his mind that, if the practical and theoretical trainings could not be carried on alongside each other, the practical should come first. It was absolutely wrong to put a young man through a course of technical training, and then to teach him the practice, and in most cases, it would be a hopeless failure. If a lad had made up his mind to become a gardener, he would have to realise that the time would come when he would have to teach other lads the practical part of it, and that, in order to do so, he would require to become a skilled workman himself; and there was no doubt that the most receptive time for practical instruction was at the very commencement of his career. If it were delayed until he had passed through a course of scientific training he would not take to it with the same avidity, if he took to it at all, and he would find himself handicapped at a later period of his career.

Those young men who commenced their gardening careers at the horticultural colleges would find their courses of instruction prescribed for them in the various college curricula, but the young gardener who had no opportunity of attending one of these colleges, provided he had received a good sound elementary education, might make considerable progress in some of the technical subjects without assistance, though it would be all the better for him if he could obtain some tuition, or if he were fortunate to be placed amongst studious companions. Botany, as the subject which would appeal most to him, being the natural science with which he would be most intimately brought into contact in his career, would probably be the best subject to begin with. It had the advantage of being a comparatively easy subject, and he would always have abundance of material for study. Entomology was the next in importance of the natural science subjects, and among the physical sciences perhaps the most important was chemistry, especially in connection with the manuring of plants, but the young gardener should also have a sound knowledge of elementary general physics, including meteorology. Of the other technical subjects which he should study, one of the most important was simple land surveying and levelling. With a good elementary school education the young gardener should know something about mensuration, and with a little tuition elementary land surveying and levelling should not be beyond his powers. It not infrequently happens that a gardener has to make an alteration in or an addition to his garden, or he may be called upon to make an entirely new one, and with a knowledge of this and a little elementary plan drawing he would be in a position to efficiently carry out such work. He should also have some knowledge of horticultural engineering. Lastly, a knowledge of book-keeping was most essential, and, as a gardener's books were not of a complicated nature, this he could get up with some reading and a little practice.

These were what might be called the essentials of the young gardener's technical education, but they by no means exhausted the list of subjects which he should get up, and his reading should be both extensive and varied. If the teaching of horticulture was his aim the more extensive his general knowledge of gardening was the better, and, thanks to an excellent horticultural press, he would have no difficulty in keeping himself abreast of the times whatever branch of gardening he specialised in. It was a mistake to assume, as was often done, he feared, that teachers of practical subjects like horticulture should be merely college graduates. All the better if they were college graduates, perhaps, but they should first of all be practical men, and the better they knew the practical part of their subject the more successful would they be as teachers.

The exhibits were: New pentstemon Mrs. F. Fulford and spikes of Kalanchoe flammea, cut from plants raised from leaf cuttings put in in July, 1911, and grown on in 3in. pots, from Mr. F. Fulford, Montgomerie Castle Gardens, Tarbolton, Ayrshire (awarded a cultural certificate for kalanchoe); Acalypha Sanderiana, from Mr. James Fraser, Bonaly, Colinton (awarded a cultural certificate); ox-eye daisies, from Mr. F. Baillie, Liberton; strawberries, gooseberries, and black currants from the City of Edinburgh Distress Committee's farm at Murieston, Mid-Calder, per Mr. Cairns (awarded a cultural certificate); new tomato, from Mr. G. N. Simpson, Edinburgh; Nephrolepis todeoides Smithi and Pteris incisa, from Messrs. James Grieve and Sons, Edinburgh (awarded a cultural certificate); plants of Onopordon Acanthium and Dipsacus fullonum, each about 6ft. high, from Messrs. Todd and Co., Edinburgh.

## LILIUM BROWNI.

The very beautiful Lilium Browni merits more than passing attention from those who love rare flowers, and especially from those who have a sheltered position and good lily soil to offer it. It dearly loves a mixture of sandy peat and leaf-soil, and s generally at its best when planted among dwarf peat-loving plants, such as heaths, andromedas, rhododendrons, and other so-called "American" plants. When grown among these subjects, suitable conditions of soil and moisture are provided, and the shrubs give that shelter to the advancing growths which so many lilies greatly appreciate.

Lilium Browni grows from 2ft. to 4ft. high, and its purple-spotted stems are abundantly furnished with lance-shaped eaves throughout their whole length. The tems are surmounted by one, two, or three trumpet-shaped flowers, each flower 6in. or in. long, prettily flushed with rosy-purple on the outside, but pure white inside, save for a medium line of purple down each of the three inner segments. The prominent, deep red-brown anthers are a conspicuous feature of a very attractive, refined, beautiful, and noble flower. July and August are the months in which L. Browni usually flowers out of doors. As a pot plant the species is very desirable, as it is charming for conservatory decoration and for grouping. Some idea of its value in beds of peaty soil may be obtained from the accompanying illustration, which represents t at Kew, in the sunk garden on the west side of the Palm House.

A BED OF LILIUM BROWNI AT KEW.

---

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 48, Aldersgate Street, London.

## THE ROSE BEDS AT KEW.

I should like to add a few supplementary remarks to those that recently appeared concerning the roses at Kew. Each recurring season the roses at our National Garden form a much-admired feature, and now that the rambler varieties are practically over, one's thoughts naturally turn to the dwarf plants, of which there is a good and representative selection in the vicinity of the Palm House.

As might be expected, the hybrid teas contribute their share to the floral display, among them being the first of its class, La France, which is flowering with great freedom. New as well as old varieties are there represented, and among the more recent kinds may be mentioned that well-known tea, Lady Hillingdon, which in the bud state is so fascinating, but loose when fully expanded.

Other hybrid teas now in a very attractive stage are, of course, Caroline Testout, whose large, rosy-salmon flowers are borne in a bold and imposing manner; the blush-coloured La Tosca, one of the best of all bedding roses; the bright orange Madame Ravary, charming in the bud state as a button-hole flower; M. Paul Lede, remarkable for the carmine shading on its orange-yellow petals; Duchess of Wellington, deep orange saffron; Earl of Warwick, a beautiful pink flower with a deeper centre; Madame Jules Grolez, perhaps the finest, rose-pink of its class; Liberty, remarkable in this section for its deep coloured flowers; Mrs. A. R. Waddell, grand in its rosy-scarlet buds, but the flowers, which are of a bright salmon colour, are loose when fully expanded; Lady Ashtown, a beautiful, rose-coloured flower that continues well on into the autumn; Joseph Lowe, blush, deeper centre; Antoine Rivoire, a flesh-coloured flower, the base yellow flushed red; and Mrs. Aaron Ward, a peculiar combination of Indian yellow and rose.

Of those usually classed as teas pure and simple, beside Lady Hillingdon, above referred to, there are Corallina, semi-double flowers of a distinct reddish shade; Lady Roberts, reddish-orange, with an apricot suffusion, charming in the bud; Mrs. A. Byas, yellow and rose; Madame Lambard, bright rose, a fine autumn flower; Souvenir de Pierre Notting, apricot yellow and orange; General Schablikine, coppery-rose, a grand garden flower; Princess de Sagan, remarkable for its rich velvety crimson blooms; Anna Olivier, blush and rose; and Marie Van Houtte, a striking combination of yellowish-white, deep yellow, and peach.

The deep colours are at Kew mainly represented by hybrid perpetuals, all of which are good old tried sorts, such as Victor Hugo, Glory of Cheshunt, Dupuy Jamain, and Madame Victor Verdier.

Of sections other than those above mentioned are a bed of each of those pretty dwarf polyanthus, Jessie and Orleans Rose, and also of that rich gold and red-coloured member of the Pernettiana section, Rayon d'Or. Souvenir de la Malmaison is so fine as to well merit a place in the garden, though it must be looked upon as one of the most pronounced veterans. Beside these dwarf varieties, a bed of good-sized bushes of the richly-coloured Gruss an Teplitz, and another of the pure white Frau Karl Druschki are very striking. K.

---

**Lobelia tenuior as a Basket Plant.**—This strong-growing, large-flowered lobelia, of the speciosa section, is usually met with as a pot plant. It, however, forms a very striking feature when grown in a suspended basket, if the long, loose-growing shoots are allowed to dispose themselves at will. There is a rosy form of this lobelia, but to my mind the rich blue, typical kind is the best.—T.

## THE MAKING OF AN IRIS GARDEN.

For a considerable period I have repeatedly urged the greater use of iris as garden plants, and it is in furtherance of their claims that I pen these notes. The value of irises as a permanent garden feature must be fully apparent to all garden lovers. They combine an elegance of design with one of the finest ranges of colour found among hardy flowers. They embrace a great diversity in habit, requirements, and uses, and deserve a keener, closer attention generally.

The making of an iris garden calls for originality and a fair knowledge of the iris species and varieties. I have noted irises grown in formal beds cut in the greensward, but this plan I cannot commend as the season of the irises used is so short as to render the beds practically valueless save just at the time of blossoming. What I wish to urge is the free use of many types of irises, in natural groupings, with the whole surroundings blending to make a perfect picture, and also securing a long season of blossom.

The late Sir Michael Foster's garden at Nine Wells may be taken as a starting point, and the idea given may be elaborated, and additional features introduced, to make a first-class scheme. Sir Michael loved all irises, and the range of species and varieties grown by him a few years back reached a considerable number, and, furthermore, gave him a "long display of flower," a fact which I desire to emphasise.

At Nine Wells the plan followed was to grow the irises in great natural groupings, with broad winding paths intersecting, or running parallel with them. Eremuri and a few other bulbous subjects were grown, in conjunction with the irises, and, save for a background of trees and shrubs, the whole design was of the simplest.

From this one can develop a good idea, and if one also takes into account the effects obtained by the Japanese iris gardens, then an iris garden will become a popular garden feature in the near future. In Japanese iris gardens Iris Kæmpferi and its varieties provide the dominant display; other irises may be used, but only as a foil or a setting to these grand forms. At Hori-kiri, a winding valley, dotted with tiny tea-houses, amid a waving river of iris blossoms, is one of the glories of the Japanese summer, and informal pathways traverse the whole garden, and enable the flower lover to keep in close touch with the blossoms.

And now for the main design of a typical English iris garden. It shall be situate, if possible, on a broken landscape, where one can secure a background of branching tree growth, with gently sloping banks falling to a valleyed depression. In the valley shall run a stream, just broad enough to show off the ripple of the water over the pebbled base. Here in the moist richness of the soil one can grow all the waterside irises, such as I. aurea, I. orientalis, I. Monnieri, I. Monspur, I. spuria, I. Delavayi, I. versicolor, and their hybrid and varietal forms. All the Siberian irises, with I. Kæmpferi, and I. lævigata, and their numerous varieties, should be used as well as I. albo-purpurea, and its forms cœrulea and alba.

Sloping up from the vale one can group great masses of the germanicas, selecting the finer forms of I. aphylla, I. pallida, I. asiaticus, I. neglecta, etc., of which there are so many now in cultivation. One should also include Iris stylosa for its valuable winter display; also such gems as I. cypriana, I. cristata, I. hexagona cœrulea, I. longipetala, and I. missouriensis. Drifts of the early bulbous irises, I. alata, I. reticulata, I. tuberosa, and many others should be utilised, and the Spanish and English irises be freely planted for making additional summertide displays.

I would suggest the acquisition of a stock of the best intermediate irises (hybrids between the I. pumila and I. Germanica groups); Dauphin, Freya, Dorothea, Sarah, Ivorine, and Bosniamac are a few of the many varieties. Then there are the hybrids of the Oncocyclus and Regelia groups, many of which are of easier cultivation than the specific forms. Crosses between these Cushion irises, and those of the I. pallida group are especially interesting, and are free in growth.

With the iris groups I would not hesitate to use a background of eremuri, rising, if possible, in front of a mass of bamboos. Groupings of selected gladioli, hemerocallis, montbretias, and perhaps a few lilies, give other and pleasing colours at times when the irises are on the wane, and afford a contrast which is of value in the garden.

Wander-ways of stepping stones should intersect the iris groupings, winding in pleasing diversity, and carrying one over streamlet, or by the sides of the pool. A low rustic bridge is never out of place in such pictures, and is to be desired if a waterway exists. A rest-house, lightly built, and screened with reeds or light canework from the full sun, with sufficient openings to give a view of the irises at various points, is almost essential. A resting place, a tea-house, if you like, will add greatly to the charm of the garden, but care should be taken to have it in harmony with the garden itself. In size, formation, and design it should fit in perfectly.

And should the outer surroundings consist of a surge of tree greenery against a clear sky line, the iris garden will appear to greatest advantage. It gives the frame to the picture, investing it with a pleasing, softening influence. All else would be comprehended in the term "good culture" (deep digging, an incorporation of suitable manure, and thorough cultivation). Irises are occasionally subject to disease, and badly-infested plants should be isolated, or, better still, destroyed. Given an immunity from disease, the iris garden should be a thorough success. P. S. Hayward.

## SEMPERVIVUM ARACHNOIDEUM.

This is sometimes known as the Cobweb Houseleek, and is one of the most singular of alpines. It has small rosettes of fleshy leaves covered over with a dense white down, which is intertwined all over the leaves like a miniature spider's web. It thrives in an exposed, sunny part of the rockery in a position such as that provided by a ledge of rock. It succeeds in a light sandy loam, and when once established, soon forms an attractive object. In summer the leaves are surmounted by pretty rose-coloured flowers, carried on thick, fleshy stems a few inches in height, and the whitish foliage displays them very effectively. The plant is propagated by offsets, which should be placed singly in small pots and kept in a cool frame for a time. Sempervivum arachnoideum is one of the most interesting members of the Houseleek family; the common S. tectarum is often seen growing on the roofs of old cottages and walls. J. Gardner.

Batsford Park Gardens.

## NOTES FROM KEW.

### Shrubby Begonias.

There is always a good selection of these to be met with at Kew, but just now the most notable feature is the extent to which they contribute towards the embellishment of the greenhouse. In maintaining a display in this structure, it is often difficult to obtain plants sufficiently tall to break up those of lower growth. For this purpose such kinds as the typical Begonia coccinea, B. Luzerna, B. President Carnot, and others are all extremely useful. Of B. coccinea there is a large, bold group in the greenhouse, and in this way it is seen to very great advantage, the large pendulous clusters of handsome scarlet flowers being set off by the ornamental foliage. The deep-toned leafage of B. Luzerna serves admirably as a setting to the clusters of pink blossoms.

Some large bushy specimens, 3ft. to 4ft. in height, of the variety Corbeille de Feu, serve to show this at its very best. It was raised and distributed by M. Lemoine, of Nancy, about twenty years ago, and was announced as the result of a cross between Begonia semperflorens and B. fuchsioides miniata. Corbeille de Feu is, as a bedding plant, decidedly popular, but such large specimens as those at Kew are seldom seen. One more variety needs especial mention, and that is B. carminata, which I have never before met with in such good condition. It is one of the Messrs. Veitch's hybrids, the male parent being the Brazilian B. coccinea, and the female the South African white-flowered B. Dregei. In B. carminata, which forms a decided bush, from 3ft. to 4ft. high, the colour of the flowers is a clear carmine-pink, while, what is of considerable importance, a succession is kept up for a long time. There are also several others, but the above include the most striking.

### Clerodendron fallax.

Being a native of Java, this showy clerodendron is often regarded as a stove plant, but it will do well in the greenhouse during the summer months; indeed, it is at this season seen to better advantage in that structure than under warmer conditions. A fine, bold group in the greenhouse at Kew shows it now at its best. If kept free from red spider it is a plant of easy culture, and can be readily propagated by cuttings or seeds. These last, however, frequently germinate in a most irregular manner.

### Impatiens Herzogi.

This balsam, which was introduced from tropical Africa a few years ago, has already become an established favourite. This is not at all surprising, for it is a remarkably showy species, and its season of blooming extends over a considerable portion of the year. It is of a sturdy habit of growth, with dark green foliage, and the flowers, which are in the way of those of Impatiens Holsti, but larger, are of a bright orange-salmon colour, with a small violet eye. Now in bloom in the intermediate portion of the T range.

### Eranthemums.

Of the members of this genus now in flower in the T range two at least are worthy of especial mention. The first—E. Cooperi, which, by the way, is also known under the specific name of sinuatum, is of a compact, freely-branched habit of growth, and flowers well when not more than a foot in height. The leaves are long and narrow, with a few deeply-cut teeth on the margin, and tinged with purple underneath. The flowers, which are over an inch across and freely borne, are of the purest white, with the lower segment freely dotted with purple. Eranthemum seticalyx is a pretty and distinct species that branches freely, and bears its flowers in terminal heads or panicles. The individual flowers, which are about an inch across, are very bright red, with a crimson stripe in the centre of the lower segment. A singular feature of this species is the resemblance that, at a superficial glance, the flowers bear to those of that pretty little South African bulbs—Anomatheca cruenta.

### Torenia atropurpurea.

Of this uncommon species there is a very attractive specimen in the intermediate portion of the T range. It is grown in a suspended basket, and, compared with the better-known kinds, is of close, compact growth, the dense mass of leafage being plentifully sprinkled with purple flowers, the interior of the throat being of a deeper hue.

### Lankesteria Barteri.

A near ally of the eranthemums; indeed, the Lankesterias are sometimes included in that genus. It forms an upright growing plant, clothed with oblong acuminate leaves about six inches in length, and more or less undulated at the margins. The flowers, which are densely borne in a terminal spike, with, in some cases, two or three supplementary ones, are of a pale yellow colour with a deep yellow centre, and attract attention by reason of their uncommon appearance and the profusion in which they are borne. This Lankesteria is a native of western tropical Africa, and does well in the intermediate portion of the T range, where it is now in flower.

### Dipladenia atropurpurea.

Twenty years ago a large amount of interest was centred in this dipladenia, from the fact that it had been accidentally reintroduced after being lost to cultivation for many years. It is a native of Brazil, and was first grown in this country in 1814, but was quite an unknown plant when given a first-class certificate by the Royal Horticultural Society in 1892. Compared with many of the dipladenias, the flowers are small, being about a couple of inches across, and in colour deep velvety-crimson, a decidedly uncommon tint. It flowers freely in a small state, and in this way may be seen in the T range.

### Achimenes.

A very interesting assortment of these are in flower in the T range, while in the greenhouse there is a striking group of Achimenes grandiflora magnifica. Compared with many members of the genus, this Mexican species is of vigorous growth, as it reaches a yard in height, and the light purple flowers, which are borne in great profusion, are about 2½in. in diameter. While suitable for pot culture, it is also seen to advantage in suspended baskets, where there is ample room for its development. For smaller structures, some of the less vigorous kinds are suitable, one of the best being Achimenes coccinea, a species with small, brilliantly-coloured flowers. It is a native of Jamaica, and is interesting as being the first achimene introduced into this country. As they can be readily increased, and their cultural requirements are but simple, it is surprising that achimenes are not more often grown. One thing to bear in mind in their culture is that, like many other gesneraceous plants, a liberal amount of leaf-mould in the soil is very beneficial.

K.

## EUCRYPHIA PINNATIFOLIA.

This is one of the most distinguished of July flowering shrubs, for the flowers are large and conspicuous, and a well-developed bush may be considerably more than 12ft. high and 6ft. to 12ft. or more in diameter. Unfortunately, good specimens are rarely met with, and even small plants are not common, a condition, doubtless, due to the difficulty of propagation and the doubtful hardiness of very young plants.

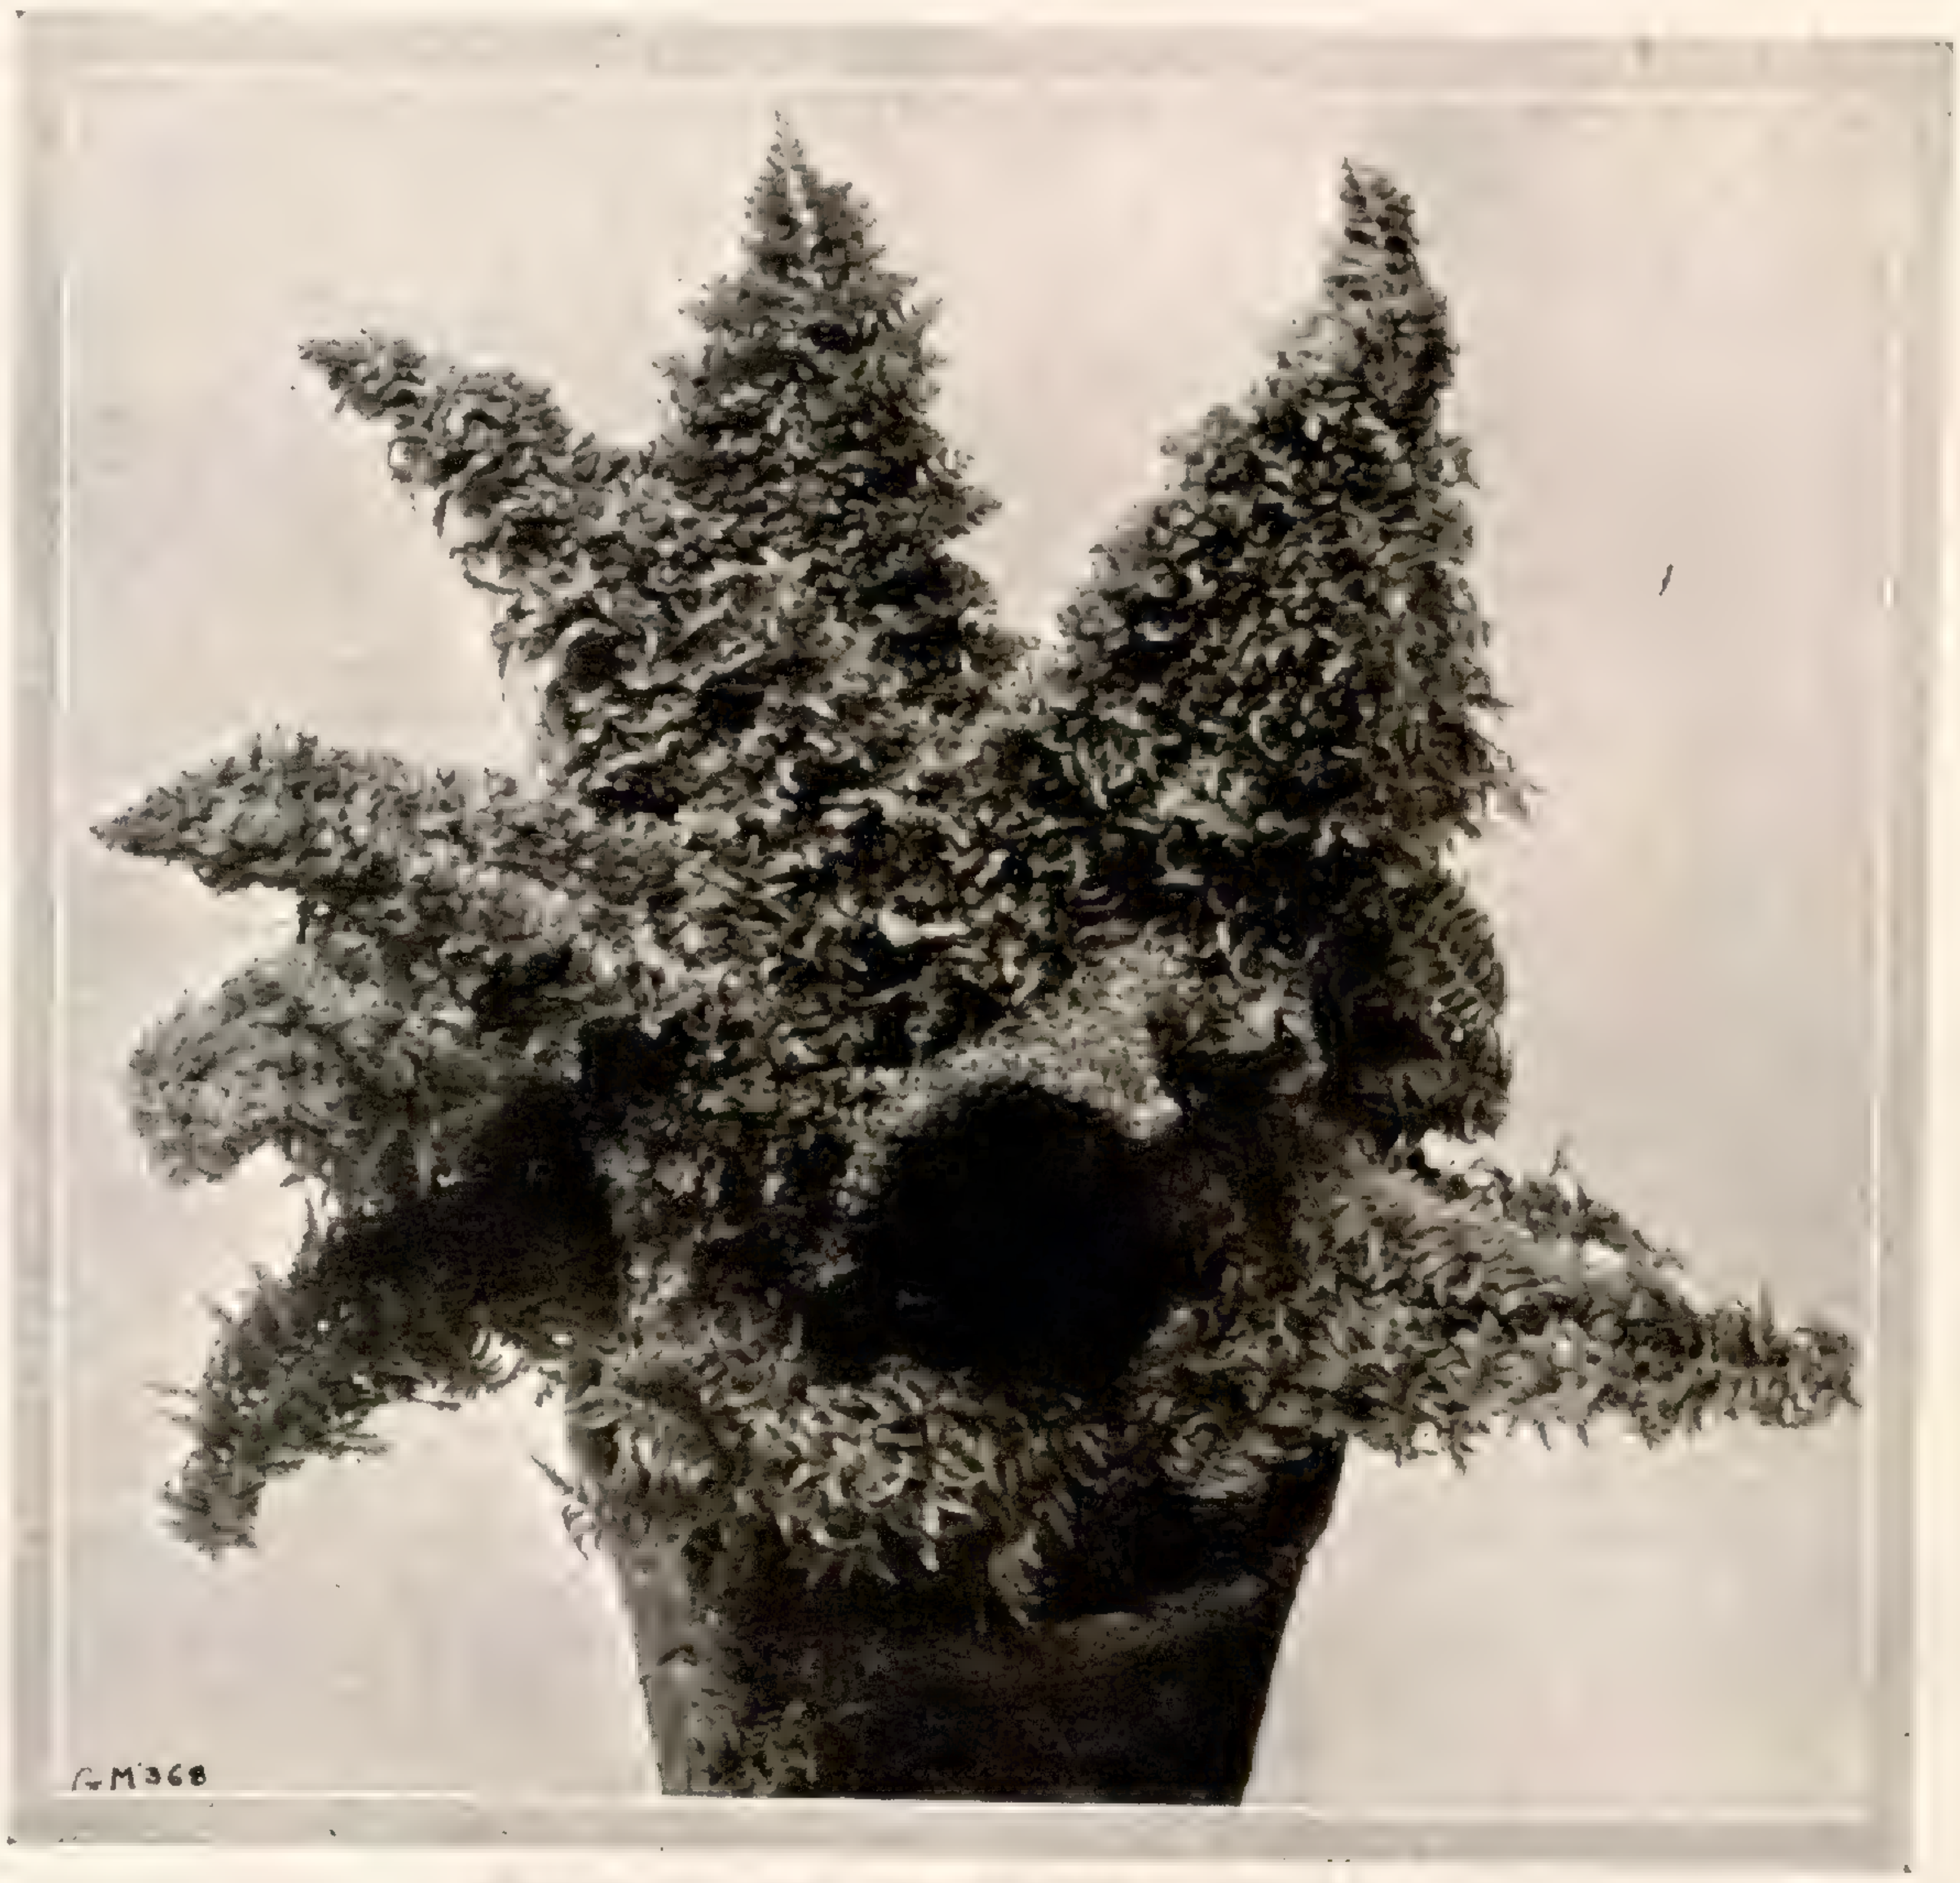
A native of Chili, the species belongs to the order Rosaceæ, the white flowers resembling those of a single rose, 2in. to 3in. across, or a single camellia. The short pinnate leaves are made up of narrow, dark green leaflets, which are evergreen in mild climates, but deciduous in moderately severe winters. E. pinnatifolia thrives in well-drained, loamy soil, but is partial to a little peat about the roots. Layering has been the usual means of propagation in the past, but it has not been very satisfactory, for after the branches have taken two years to form roots, many of the young plants have been lost in the effort to establish them after being severed from the parent plant. Seeds are sometimes ripened in the country, and these form the most satisfactory means of propagation. One of the finest plants in the country is to be found in the gardens at Trewidden, near Penzance, whilst Messrs. J. Veitch and Sons, of Chelsea, have one or more fine examples in their Coombe Wood Nursery.

W. Dallimore.

"Carnations, Picotees, and Pinks" will tell you plainly how to grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## NEPHROLEPIS EXALTATA MUSCOSA.

It is very rarely a varietal form of a fern receives a first-class certificate at the hands of the Royal Horticultural Society, and the possibility of such an award is materially reduced when the species is known to be extremely variable, and several forms of it are already on the market. When, therefore, a newcomer secures the highest award obtainable, in view of these circumstances, it must possess merit and beauty quite out of the common. There is no doubt about the fitness of the award made to Nephrolepis exaltata muscosa on July 16 last, when it was exhibited by Messrs. H. B. May and Sons. This variety is of sturdy, dwarf habit, and its light green fronds are well divided, but they possess a tougher texture than found in many plumose nephrolepis; and, consequently, there is excellent promise that this fern will occupy a very high position among those so generally grown for use in the home and for market cultivation.



NEPHROLEPIS EXALTATA MUSCOSA.

An elegant, dwarf variety, with sturdy, somewhat erect light-green fronds. F.C.C., R.H.S., July 16. Messrs. H. B. May and Sons, Upper Edmonton.

**Aphelandra tetragona.** — This, also known as Aphelandra cristata, is remarkable among aphelandras for two reasons, first, because it is one of the largest growers in the genus; and, secondly, because it is really the oldest of them all, having been introduced from the West Indies in 1733. Like most of the others, it is of upright growth, and the erect stem which reaches a height of a yard or more, is clothed with dark-green, broadly ovate leaves. The flowers, which are borne in a terminal decussate spike, subtended by three or four smaller ones, are of a deep scarlet colour. They are produced at different seasons of the year.—W. T.

# AMONG THE ALPINE FLOWERS.

> "Season of mists and yellow fruitfulness,
> Close bosom-friend of the maturing sun."
> —*Keats.*

Sometimes the poets are in happier mood than the gardeners, who find that the seasons do not always come as the bards would lead us to believe. As this is written the "maturing sun" has ofttimes been forsaking its bosom-friend. Instead of the rock garden being bathed in the mellow sunshine of the time, it has been too often shoulder in rain, and has had all its brighter colour tones dulled by the cloudy skies. Yet, despite all this, our alpine flowers have tried their best to give us good cheer, and they are able to bestow upon us some joyfulness of heart as we see their winsome flowers. Few they are compared with those which gladdened us in the earlier months, yet their flowers are welcome indeed, even though we are feeling that the hopes of the future bulk more largely in our minds now than in the earlier months. Truly the alpinist is in his seventh heaven early in the year, and already he thinks hopefully of what will meet his eyes in spring, though these thoughts are almost heresy towards the flowers of the present time.

### Campanula excisa.

From among the comparatively few flowers which meet our admiring eyes in the fast-shortening days we may choose for notice the curious, yet pretty, little bell-flower called Campanula excisa, which is flourishing here in what may be called a modified moraine, this only consisting of a thick covering of whinstone chips on an ordinary flat part of the rock garden. The moraine is in fashion now, but the system of cultivating in the moraine is one which may be overdone. It is not so necessary with many plants as may be supposed, and many of these will thrive equally well with simply an inch or two of gravel or chips above the ordinary soil, through which they will grow and luxuriate. The charming little Campanula excisa will doubtless flourish in the moraine, but it will grow quite well under the conditions indicated, and here there is a nice little specimen, not only thriving, but spreading among the chips which cover the light sandy soil in which it is planted. Very quaint are the drooping pale blue flowers, each with a bit taken out of each petal, just as if some envious insect had eaten a piece out of it. With its narrow foliage, its dwarf habit, and its curiously pretty flowers, Campanula excisa makes a strong claim upon us now.

### Tunica olympica.

Our familiar little friend—for we can call it nothing but a friend, indeed—Tunica saxifraga, which spreads its lace-like rosy flowers so gracefully over the rocks and stones at this time, has now a worthy companion in the sister flower, Tunica olympica. In T. olympica, however, the dainty little flowers are white, and the two together form a pleasing feature of the alpine garden at this season. Of the most graceful foliage and of slenderest habit, these Olympian and rock tunicas are delightful little plants, and are, withal, easy to grow in any light soil, loving the sun, yet not detesting comparative shade, and delighting to throw their delicate trailing branches over the rockwork to its adornment, and our corresponding delight. They are easy plants to raise from seeds, and, with the double form of T. saxifraga, form a trio of good and appreciated rock plants.

### Erica vagans.

As the flowering term of the alpines draws to an end we learn to appreciate more and more the autumnal heaths, of which we have now a considerable number. Without appearing to deprecate any of these one would like to draw the notice of the reader to the Cornish heath, Erica vagans, and its varieties. They are excellent plants for the rockery, and by reason of their accommodating ways are valuable for rock gardens large and rock gardens small, seeing that they can either be allowed to grow into large and handsome bushes, several feet across, or kept to a few inches in width. There are several varieties besides the type, which has pretty racemes of purplish-red flowers, with projecting, chocolate-coloured anthers. The white variety, E. v. alba, is very attractive with the contrast afforded by the white bells and the chocolate anthers. In E. v. grandiflora we have a larger-flowered variety of much beauty. Peat is not necessary for this Cornish heath, and it can be grown in some rough parts among stones and loam, quite as well as in richer soil—if not better, in fact. Like its allied forms, E. vagans stands clipping or pruning back well, and this should be performed as soon as the flowering is over. With the writer E. vagans and its varieties always come in earlier than the lovely forms of Calluna vulgaris, the common heath.

### Veronica Allioni.

There are three claimants in the field for the name of Veronica Allioni. It is not difficult to account for the fact that this is the case, as the foliage of each of the three resembles so nearly that of the others that confusion is not difficult unless the plants are seen in flower.

The plant I grow here as V. Allioni came to me a good many years ago from a good nursery, where it was catalogued as having erect little spikes of blooms like pencils. This was a figure of speech, intended, one would say, to express the narrowness of the little spikes of blue flowers and their erect habit. Whatever may have been in the mind of the cataloguer, this plant is a most desirable one, though a trifle shy of flowering when it grows into a large plant. It makes a close cushion of deep green leaves with incised margins, and bearing bonny little spikes of deepest purple-blue only some four inches or so high. Another claimant is a trailing, creeping speedwell, with small and inconspicuous light blue flowers, and not worth growing. Still another is the Llandudno form of Veronica spicata, a lovely little plant, deserving consideration for itself alone, but with taller and more pointed spikes of flowers.

Such are some of the flowers of the time when alpines grow fewer, and when we relish all the more those which are in bloom or are yet to come in the still shorter days.

S. ARNOTT.

---

**Isolepis gracilis.**—Though botanists tell us that the correct name of this pretty, drooping, dark-green, grass-like plant is Scirpus riparius, the name at the head of this note is that by which it is generally known in gardens. It is a plant of very easy culture, provided it receives a good supply of water. For some reason or other it does not seem to be grown as generally now as it was at one time, yet for the edging of decorative groups it is both distinct and pretty. A striking group of Statice profusa and Malmaison carnations at the International Show, from the gardens of Mr. Leopold de Rothschild, Ascott, Bucks, owed not a little of its attractiveness to the edging of this isolepis. —T.

---

# SCENTED-LEAVED PELARGONIUMS.

It is not often now that one sees the scented-leaved or Cape pelargoniums grown to any extent in our gardens, though there are places where they constitute a special feature. There is such a diversity of shape and size in their foliage, that one would think this alone was sufficiently interesting to cause them to become more popular than they are at the present day. The neat trusses of bloom that some of them produce are also worthy of notice, and this, combined with the fragrance of the foliage, ought to make them popular.

Some of the kinds have a neat, compact habit of growth, which renders them valuable as basket plants, particularly when in bloom, while others make grand subjects for decorative purposes. The variety of uses to which these plants can be employed are many, and the only drawback to their popularity that I am aware of is their being so subject to the attacks of green-fly. This, however, can easily be kept down if temperature and other conditions are favourable to growth. As some of the kinds, when liberally treated, give ample supplies of green sprays suitable for mixing with cut flowers, large plants grown against the walls, pillars, or trellises of the greenhouse or conservatory will be found most useful. As these strong growers must be liberally treated, the roots must not be restricted to small pots; therefore, where they cannot be planted out, they should be provided with pots of large dimensions. Varieties most useful for cutting are those having light, deeply-cut foliage, such as denticulata and the old lemon-scented form. Most people know Rollisson's Unique, which is an old variety producing large trusses of rich crimson flowers. Then we have Dale Park Beauty, Duchess of Devonshire, Fair Ellen, Pretty Polly, and a whole host of others, so that there is ample choice for those who are desirous of forming a collection.

Those who visited the International Horticultural Exhibition no doubt observed the fine collection of well-grown plants staged by Mr. Hudson, of Gunnersbury House Gardens. They were, indeed, grand specimens, the like not often seen, thus showing to what uses these plants may be put, especially if trained with a special object in view. For ordinary purposes such plants as these are not needed, though specimens when well grown are often useful for decorating large conservatories, etc., where ample air can be admitted. Pelargoniums will not thrive in a close atmosphere; neither will they grow in winter where the temperature falls too low, but, given suitable conditions, such as light and air, together with sufficient warmth, they make good headway. This class of pelargonium can be propagated at any season of the year except in the dull months of winter, therefore plants of any size may be had at all seasons, from those growing in small 60's to large specimens. These latter, however, take time to produce, especially in the case of slow-growing kinds. A light, rich soil and ample supplies of water during the growing season are essential, and, above all, it is absolutely necessary that the plants be kept free from insect and other pests at all times.

A light, rich, sandy soil, not rammed too firm, is best while the plants are small, but when older a good turfy loam, with a liberal supply of thoroughly decayed manure, is preferable, especially for those that make large foliage and ample growth. Potting is an operation that must receive careful attention.

H. C. PRINSEP.

## SOME POPULAR ERRORS.

It is needless to say that we all make mistakes in our gardening practice, for no one knows the best methods of treatment for every plant in the garden, and if he did there would soon be others introduced, the cultivation of which he would have to learn in part from experience. But there are numerous wrong practices which are so common that we might describe them as popular errors. Any intelligent amateur who observes the methods in vogue in the gardens he visits will have noticed a good many, and the experience may or may not suggest to him the possibility that visitors may notice not a few mistakes in his own garden also. Let us look at a few samples from bulk. We have often seen a man

### Putting Out Plants

when the ground is very dry, and watering each one separately, or pouring on as much water as will soak in, perhaps watering over the whole bed of plants with a rose. In such a case, the water goes little or no distance into the ground. Certainly not enough to moisten the soil round the roots, whereas if the ground had been soaked before being prepared for planting—and that is an easy matter when nothing is growing in it—there would have been moist earth all round the roots, and a little water applied to each plant would have freely run into the loosened moist soil, and settled it among the roots. Nothing looks so deplorable as plants newly put out apparently dying in the heat of early summer, with little patches of puddled soil round their withering stems.

### The Sowing of Seeds.

Similarly, one sees people watering the powdery earth after the seeds are sown, and the water very soon begins to run off. It has gone in no distance, perhaps not even as far as the seeds in some cases, and after one day's sun the surface is dry and caked together, thus facilitating the rise of moisture from below by capillary attraction, so that the soil rapidly loses any little moisture it contains, and the watering has to be repeated daily while the dry weather lasts, the surface shooting off the water almost like asphalte. If the soil had been soaked before it was prepared for a seed-bed there would have been no need to water it after the seeds had been sown, and the breaking up of the moist soil would have cut off the channels of conduction, and enabled it to retain enough moisture for germinating seeds and young seedlings for a week or two of dry weather.

### The Sowing of Annuals.

When little children begin gardening, the sowing of annuals is usually one of the first things to be tried, and the mistakes they make are commonly made by grown-ups, even when they are past the stage of beginners, such as sowing too late in the spring and too thickly at all times, with too much watering, and too little thinning. Though the sowing of annuals is considered such a simple matter, many, if not most, of them need to be very well grown to be worth growing at all. Sown in the open ground at the end of April they have little chance of becoming established before dry weather comes, with the result that they run up to flower in a weedy fashion. When the seed is sown too thickly, the seedlings become leggy before they are big enough to thin, almost as soon as they are up, in fact, and that is the ruin of any seedlings. Watering should be dispensed with altogether until the weather really becomes dry, as surface watering draws the roots to the surface, when, if not kept watered, they will succumb to a few hot days. There are other cultural disadvantages in unnecessary watering, and the best thing is to reduce the need for it to a minimum by deep cultivation, when many annuals in a fairly retentive soil will go through an ordinary summer without any attention in this respect, and will grow more sturdily and produce more blossom than if subjected to the frequent sprinklings to which the suburban gardener too often subjects them.

### Mulching

is another operation that is often wrongly practised, even by gardeners of experience. We see mulches put on late in the autumn or early in winter, with the result that the goodness is, for the most part, washed away before the plant can begin to make use of it in the spring, and when this time comes it prevents the soil being warmed by the sun, which is especially necessary if the soil is a cold and wet one, and, in such circumstances, harbours slugs. The time to apply a mulch is in dry weather, so that it may not only feed the plants and trees when the next rain comes, but keep the soil moist both by shielding it from the hot sun and lessening evaporation from its surface. If the soil is loosened before the mulch is put over it in June it will then facilitate the passage of water into the soil, and the latter will not run together as it does when the water is poured directly upon the surface. In the case of fruit trees a heavy mulch is often applied, and copious waterings given when the fruit is approaching maturity, and though the fruit may obviously swell as a result of the treatment, it is the reverse of what should be done, as it prevents the fruit acquiring its full flavour. Have a mulch over the roots during what may be called the growing season by all means, but in the case of late summer and autumn fruits, at any rate, it is better raked away, unless it has already crumbled to pieces, before the fruit begins to ripen, so that it may have all the benefit possible from sun and air to the soil about the surface feeding roots, fruit always acquiring a better flavour if the soil is dry at the time of ripening. In the case of late apples and pears, especially, the effect of feeding and watering late in the summer, to say nothing of autumn, is often disastrous in its effects, as by prolonging growth it delays maturity, with the result that the fruits do not "finish," as fruit growers term it, before gathering time comes, and the result is that they shrivel before they are properly in season.

### The Removal of Foliage.

The cutting down of plants and the removal of foliage generally, show that many people are quite ignorant of the functions of leaves, though it seems almost unnecessary to state here that it is by them that the digestive and respiratory processes of the plants are performed. If people realised this they would not so ruthlessly strip tomato plants of their foliage, but would so arrange matters that every possible square inch of leaf surface should receive the maximum amount of sun and air. Most people seem to know that bulbs should have the benefit of their foliage as long as possible, consistent with their minimum standard of tidiness, but they do not carry out their knowledge so far as to apply it to the cutting down of plants generally after they have flowered. Perennials like larkspurs and Chinese pæonies, for instance, need their foliage most of the summer to strengthen the roots and form the flowering crowns for next year. The cutting off of dead flower-heads and spikes should be done as soon as possible, but the more foliage which can be left to ripen the better. This applies to border chrysanthemums and others, the young growths from the base of which benefit by the stems being left till the foliage on them is finally destroyed by frost. Though some perennials, if partially cut down and well fed, will flower again to some small extent the same season, this is partly at the expense of the following year, and it is perhaps better to regard the roots as bulbs or tubers which need the foliage to be left as long as possible to give them the best chance of gathering strength for next year's display.

Alger Petts.

## ASSISTING NATURE.

To obtain a full measure of success the gardener must, to a large extent, work hand in hand with Nature. He certainly cannot perform tasks that are contrary to Nature's laws, but rather has to assist Nature materially. A close study of plant life, and the way Nature deals with it, is most desirable, for without a knowledge thereof he cannot possibly obtain results that would otherwise be within his reach. The requirements of plants differ so largely as regards position, soil, and general treatment that much information on their respective requirements is essential in assisting them to attain their perfect development.

Observation is a faculty to be cultivated by all who would achieve success, and unless it is fully exercised the cultivator will not be able to give the plants under his care so much assistance as he could wish. Left to herself, Nature is capable of creating very charming scenes and features in field and woodland, and it is only by a knowledge of her methods that artistic and otherwise satisfactory effects can be produced in the garden. Plants and flowers, growing naturally in the fields and hedgerows, often produce effects that in their simplicity and beauty are equal to the most highly-considered examples of the gardener's art. The semi-wild garden is, perhaps, the department where Nature, assisted by one who is fully acquainted with her moods, produces the most delightful effects.

In such a garden Nature should be allowed a certain degree of freedom, or, in other words, plants should be permitted to grow away in much the same manner as they would in the wild state, a check only being placed on the rampant growers that have been included in the scheme of planting and upon undesirable invaders of the domain. The arrangement of the various subjects should be such as to suggest that they had sprung up naturally, instead of being located in a stereotyped manner, as natural grouping is one of the great charms of the semi-wild garden.

An intermingling of species can often be permitted, but breadths of distinct kinds are generally preferable; their form and blending, however, must be studied from a natural point of view. How often it happens that a group of some diminutive plant in an odd corner gives a sense of completeness. Many forms of plant life would produce but poor effects if it were not for man's assistance; they would frequently be but one wild, tangled mass of worthless growths.

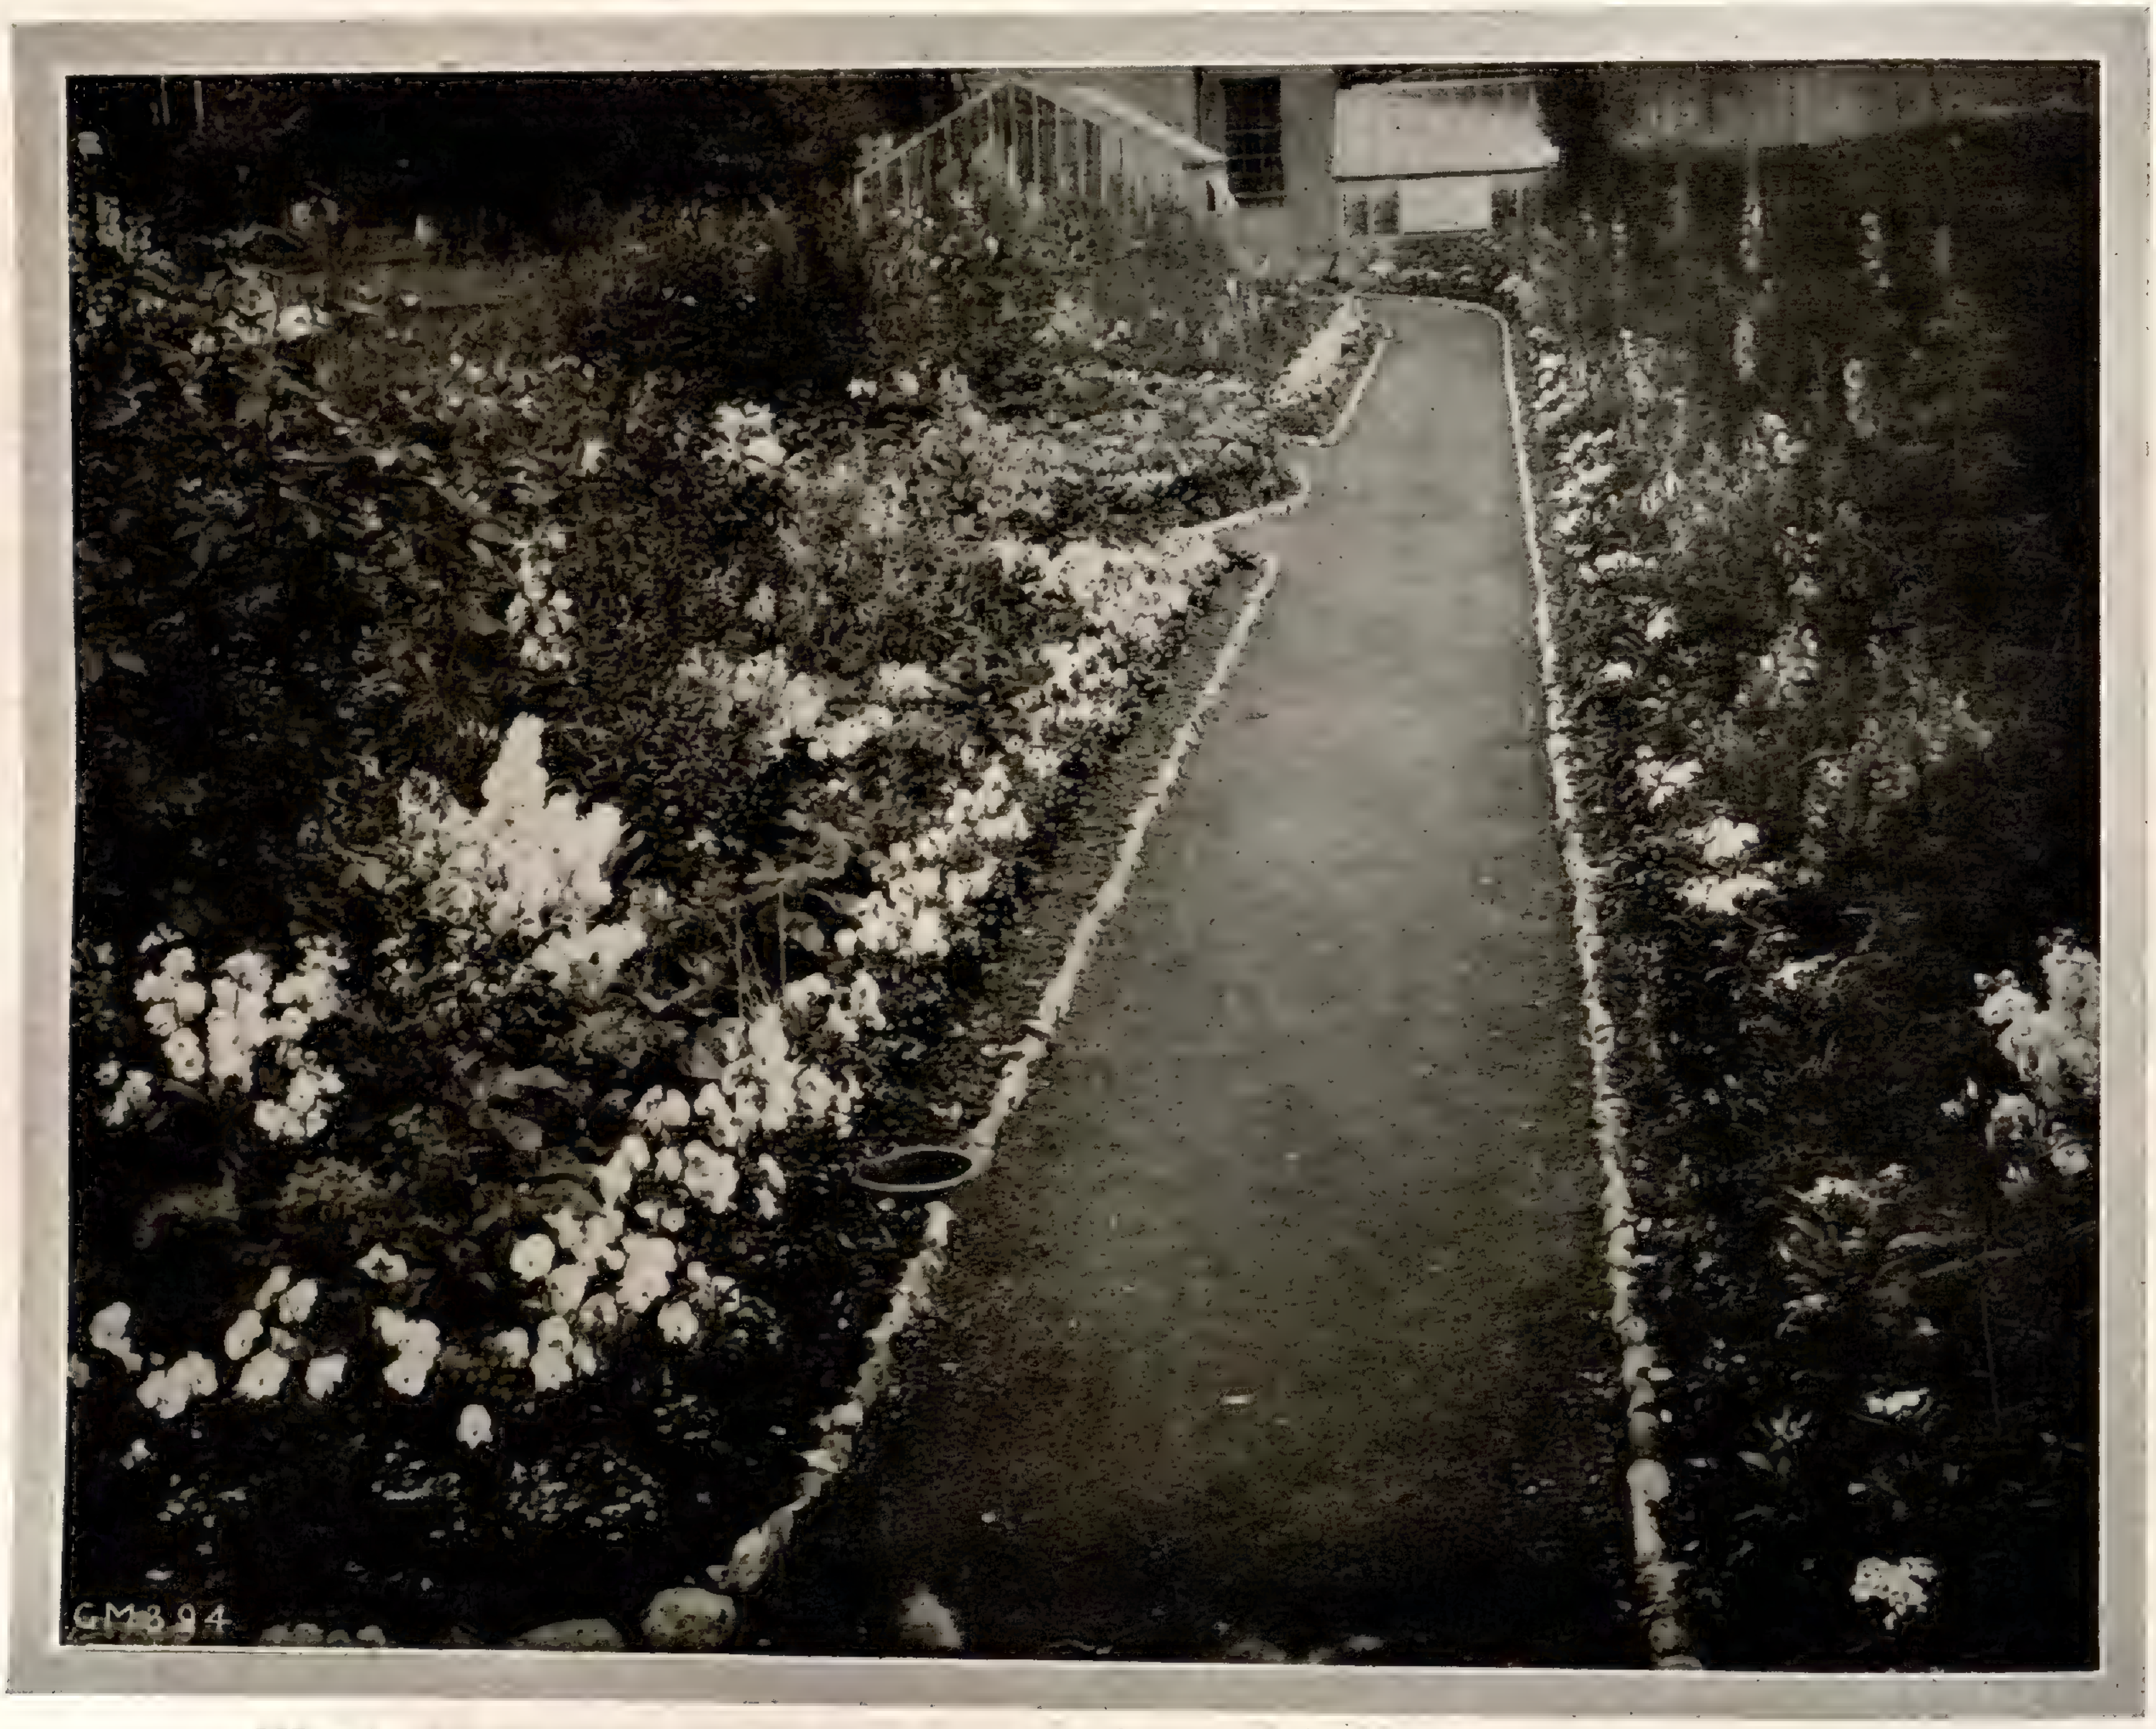
How vast is the number of Nature's products that are turned to account and rendered serviceable, knowledge and skilful manipulation being brought to bear upon them; products that would in many instances be of little or no benefit to mankind without expert assistance.

J. Gardner.

## A FIRST-CLASS COTTAGE GARDEN.

If a man is really in love with his hobby it is wonderful how successful he may become, and if that hobby is gardening then success is not only pleasurable to himself, but affords a great deal of pleasure to others. It does more, it stimulates the love of gardening in others, and creates a friendly rivalry that results in a general improvement of the surroundings of many homes in the neighbourhood.

The two illustrations given herewith indicate in some measure what can be done by an enthusiast. One represents an almost full-length view, and the other shows the large central bed, in the garden of Mr. John Stringer, at Hope Cottage, Sumner Road, Croydon. Mr. Stringer is a bricklayer, and has to leave home between five and six o'clock each morning to reach his work in good time, and he arrives home again in the evening about seven o'clock. His opportunities for gardening are, therefore, not exceptionally good, but by utilising every spare moment, early and late, and devoting his Saturday half-holiday to the work, he manages to keep his garden in first-rate condition over a long period. This year Mr. Stringer has secured the first prize offered for cottage gardens by the Thornton Heath and Norbury Horticultural Society, and he has also won the still higher honour of first prize offered by the Croydon Horticultural Society.



MR. J. STRINGER'S FIRST PRIZE GARDEN AT HOPE COTTAGE, CROYDON.

Mr. Stringer has long since found out that the best strains and the best varieties of flowers cost no more to grow than the poorest and oldest, and though they may cost a little more to purchase, they give first-rate results. In the border by the fence Mr. Stringer has splendid ten-week stocks, white, rose, and blue larkspurs, delphiniums in variety, pentstemons, antirrhinums, campanulas, sweet peas, nemesias, violas, pansies, and tropæolums. The rest of the garden is divided into three portions, and here the two end blocks have a central group of the best H.T. roses, clumps of sweet peas, grand Canterbury bells, a splendid lot of pure white ten-week stocks, delphiniums, larkspurs, a few dahlias, pelargoniums, calceolarias, and a bordering of violas.

The large central bed has a fine Dorothy Perkins rose as centrepiece, and around this are sweet peas and cactus dahlias. A belt of Paul Crampel pelargonium provides a rare display of rich colouring, while Verbena Miss Willmott, nemesias, and golden violas complete the bright and attractive scheme.

Cowper's observation that "he who loves a garden, loves a greenhouse too," is quite true, so far as Mr. Stringer is concerned, for he has two small greenhouses, one at either end of his garden. The larger one, near the house, gives shelter to a variety of pot plants. Ferns and tuberous begonias are very much in evidence, but there are also quite good specimens of several cool cypripediums, cœlogynes, and other orchids. The smaller greenhouse is used chiefly for raising the many tender and half-hardy plants that Mr. Stringer grows so successfully.

Close attention, enthusiasm, a good general knowledge of the more popular plants, and a proper understanding of what is implied by "good cultivation," are necessary to produce the results here indicated. But Mr. Stringer can grow vegetables as well as flowers, and devotes his surplus energy to the cultivation of excellent table produce on an allotment some distance from the bright surroundings of Hope Cottage C.

---

## SPIRÆA HENRYI.

There are so many hardy, shrubby spiræas that a new one has to possess exceptional merits if it is to become popular, and it appears as though S. Henryi were of the number. Belonging to the canescens group, it has the advantage of blossoming between the time when the majority of the early kinds are over, and the later ones are approaching their time of flowering. Of vigorous growth, it attains a height of 5ft. and a diameter of 6 or 8ft. in about eight years from the sowing of the seed; therefore it should be planted in a position where it can have plenty of room for development. The leaves are ovate in outline, up to 1½in. long, and ¾in. wide, the upper part being serrated. White flowers are produced in dense heads from short, axillary growth, which appear from the previous year's shoots. Although individually, the flowers are small, they are made conspicuous by their numbers.

S. Henryi is a Chinese shrub, which was introduced early in the present century by Messrs. J. Veitch and Sons, through their collector, Mr. E. H. Wilson. In Vol. XXVIII. of the "Journal" of the Royal Horticultural Society, p. 61, an illustration of the plant appears, and on several occasions the species has been seen at the Horticultural Hall. W. D.

## STRAWBERRY CULTURE.

The abnormally dry summer of 1911 was most disastrous to many strawberry plantations, as the foliage in some districts was so affected with red spider that the plants failed to make runners, while in others, owing to a lack of moisture in the ground, many of the roots were killed. All this has accounted, in a measure, for the short crop of 1912, as many growers were unable to renew their plantations. On some soils the strawberry is not a profitable crop if allowed to remain on the same site more than two years in succession, for after the second year the plants make too much foliage. Where this is the case it is well to make a fresh plantation each season, doing away with a portion of the old one.

Where strong runners can be procured in July there should be no difficulty in obtaining a full crop the first season after planting, but where this is not practicable it is well to take a catch crop from the same ground, which can be done by planting lettuces or the like between the rows. If, however, runners can be procured early there will be no necessity to do this. It is a good practice to plant a row or two in a convenient place, where the runners can be layered into small pots, and a season is saved. Young plants usually make runners earlier in the season than old ones, and these, if layered in 4in. pots, would make strong plants ready for putting out in the open ground by the beginning of August. Choose a plot on which strawberries have not been grown for several years. The ground ought to be liberally manured and deeply trenched in readiness for the runners, so that they may be planted as soon as rooted, for they will grow more rapidly when planted out than if kept in the pots. In many gardens it is not always convenient to provide a plot just at the right time, and when this is the case one cannot obtain a full crop the first season after planting. Strawberries, if liberally treated, make good progress between the end of July and October, therefore if strong plants are put out at the end of the first-named month, or early in August, they will make strong crowns by the end of the season, before growth is checked by the cold weather. Some growers place three plants together to form a clump, and where they are intended to stand only two seasons this is good practice, as by so doing a full crop may be obtained the first season after planting. Others prefer to place the plants a foot apart in the rows, taking away alternate plants after the first season.

Varieties of strawberries, like other fruits, vary very much, some being of robust habit, and making ample foliage, while others are of compact growth. Soil and situation, too, have much to do with the growth of these plants. Where the ground is of a dry, gravelly character the plants do not increase so rapidly as they do on that of a more retentive nature, and this being so more room should be allowed for development when the soil is of the latter kind. Before planting is commenced the grower should determine the distance he intends the plants to be apart. For general use two feet six inches between the rows and two feet between the plants will be found ample, though where the crop is to remain on the same ground for three or four seasons it may be well to plant such strong-growing kinds as Royal Sovereign and others of that class three feet by two feet six apart, for more fruit is spoiled during a wet season by having the plants too close together than there would be were a greater distance allowed between the rows. Where the soil is of a light sandy nature it is well to make it as firm as possible previous to planting in order that the roots may the more readily take hold of it. After planting, should the weather be hot and dry, give the plantation one or two good soakings, after which they will be able to take care of themselves. All runners should be removed as they appear.

Where it is not possible to layer strawberries into pots the runners should be pricked out into nursery beds, and while here they should receive every attention until established. In some instances, owing to circumstances over which the cultivator has no control, planting has to be deferred until spring, but I do not recommend planting at that time of the year as a season is lost, the plants not being able to carry a full crop of fruit until the summer of the following year, but in such cases it is well to take a catch crop of some kind from the ground between the rows, which will, in a measure, compensate for the loss of fruit.

Varieties of strawberries are so numerous that there should be no difficulty in making a selection to suit any particular soil, though for general use not more than half a dozen need be grown. Of these some should be early, others mid-season and late, so as to extend the season of their usefulness as long as possible, and where the situation will allow it some of the latter kinds should be planted on a north border or like place.

P.

THE CENTRAL BED IN MR. J. STRINGER'S GARDEN AT HOPE COTTAGE, CROYDON.

---

**Sedum spectabile atropurpureum.** — This sedum is not as well known as its merits deserve, for it must be given a place among the best of the late autumn perennials. It is a counterpart of Sedum spectabile itself, except that the flowers are of a deep red colour.—T.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

DENDROBIUMS.—Many of the dendrobiums, especially those of the D. nobile section, are now completing their growths. It will be necessary to examine them frequently, in order that those which have ceased growing and have the terminal leaf at the extremity of the pseudo-bulb fully expanded, may be removed to a cooler and drier atmosphere where they will receive the benefit of extra light and more air. They should be exposed gradually to full sunshine in order to thoroughly mature the newly-made growth. To retain these plants in a healthy and vigorous condition it is essential that the growth be thoroughly, but gradually, ripened and matured. The plants will be perfectly safe for a few weeks in a house where the night temperature is about 60 degrees, but after that time they should be removed to a structure where a cooler and drier atmosphere is maintained. The night temperature during the autumn months should range between 60 and 50 degrees, or, in very cold weather, it may drop as low as 45 degrees without any harm. If a house can be devoted entirely to such species as D. Wardianum, D. crassinode, D. Findleyanum, D. nobile, and their numerous hybrids, it will be an easy matter to choose a position on one side for the plants which have completed their growths, where they will enjoy more light and air but less moisture. It will also be easy to regulate the temperature as the plants complete their growth. Do not withhold water entirely from the roots immediately the new pseudo-bulbs are completed. The plants should be examined daily, and immediately any sign of shrivelling in the pseudo-bulbs is observed give a thorough watering, but this should not be repeated until the whole compost becomes again quite dry.

D. FORMOSUM, now opening its flowers or in bloom, should be well supplied with water until the flowers fade. This species produces its flowers at the apex of the current year's growths, the blooms remaining a long time in good condition.

EVERGREEN DENDROBIUMS, such as D. thrysiflorum, D. densiflorum, D. Farmeri, D. Bronkarli, etc., will now be in the middle of their growing season, and therefore must have generous treatment. Every inducement must be given them during the cold sunless weather we are experiencing to make their growths as quickly as possible. When growing freely they form large roots, which delight in a good depth of compost.

COOLER - GROWING DENDROBIUMS, such as D. infundibulum, D. Jamesianum, and others of this section will still be growing in their summer quarters, and do not require as much light or air as those of the deciduous and semi-deciduous types. When at rest these should be shaded from strong sunshine, and given sufficient water at all times to keep the pseudo-bulbs plump and the leaves green and in good condition. D. Falconeri and its fine variety giganteum should be suspended from the roof of the cattleya house, in a position where it is not subjected to a strong light. It should receive liberal treatment, and be syringed overhead several times a day with tepid soft water to prevent attacks of red-spider.—J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

GLOXINIAS.—As these pass out of flower remove them to a cool house where they will receive full sunshine. Although it is advised to reduce the amount of water at the roots after flowering, the plants should on no account be dried off suddenly. Let them go gradually and naturally to rest, then store them on their sides in an intermediate house for the winter. Those that flowered first should be marked as the earliest batch to be started into growth next season. Spring-raised plants still flowering should be kept going for as long a time as possible. During dull, sunless weather a little warmth should be maintained in the structure by fire-heat, in order to dispel damp.

ERANTHEMUM PULCHELLUM. — This beautiful blue-flowering subject requires good culture during the summer months, and frequent stopping to induce bushy plants. Stopping should, however, be discontinued in time to allow the after-growth to grow a few inches, and become ripened before dull, wintry weather sets in or the plants will not flower freely.

HIPPEASTRUMS.—To ensure free flowering when forced early in the year, the bulbs must be thoroughly ripened in the previous summer. New growth is made immediately after flowering, and as soon as this is completed in a genial temperature the plants should be duly hardened by placing them in a cold frame or pit exposed to full air and sun until they go gradually to rest, when they should be stored on their sides in a dry position in a cool house until restarted into growth next year. The largest bulbs should be chosen for the earliest batch, and if they are in good condition no repotting will be required. Seedlings should be kept growing for as long a time as possible in order to build up good bulbs.

FITTONIAS.—These prettily-marked foliage plants are well adapted for edging the stages, and for growing in baskets suspended from the roof. Wire baskets may be lined with green moss from the woods, and filled with a compost of two parts loam and one part each of peat and leaf-soil, with sand added. Insert the cuttings about four inches apart over the whole basket, well water in, and place in the propagating house, where they will quickly become established. When new growth commences peg the shoots into the moss, so that the whole surface of the basket may be quickly clothed, and pinch out the point of each shoot. The best way to afford moisture to all basket plants is to immerse them in a tub of water for a few minutes. Fittonia argyroneura has bright green leaves, lined with silvery white, whilst F. Pearcei is a capital companion to it, having markings of rosy-carmine. — H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

YOUNG POT VINES.—When the canes are fully developed—which should be about the middle of this month—remove them to their outside quarters, placing them in a sunny position to thoroughly ripen the wood and foliage. The method we adopt here is to fix galvanized pea trainers tied horizontally to strong stakes, about two feet from the level of the ground. The vines are then detached from the wire trellis in the house, and the pots and canes are carefully removed, and secured to the pea trainers outside. By adopting this method, there is always a free current of air around the canes, which materially assists the ripening of the wood. The pots are placed upon a good hard ash surface, and copious supplies of clean water given to the roots as required. In this position they are allowed to remain until the foliage begins to fall off, when the canes are then cut back with a sharp knife, leaving the rods about twelve feet in length. If they are not required for immediate forcing, place the pots close together under a wall, and protect with long stable litter. Tie securely in a perpendicular position to the wall, where they can remain until required for forcing purposes.

PINE APPLES.—The final potting of the successional plants should, generally be completed this month. After this work is accomplished, the house should be kept close, and the plant be shaded lightly. If necessary, water sparingly until the roots have commenced to push into the new soil, and lightly spray every afternoon with clean tepid water, the spraying being done after the ventilators have been closed. Maintain a bottom heat of from 80deg. to 85deg., and pot up crowns and suckers as soon as they are taken off. Plants swelling their fruits should be watered occasionally with weak liquid manure. Stake and tie all fruits as required, and admit plenty of air when possible, but not in such a manner as to cause cold draughts, or a sudden lowering of the temperature.

TOMATOES.—The plants generally have borne heavy crops of fruit, but we hear many complaints in this locality of the leaf disease, in spite of periodical sprayings with the Bordeaux mixture. Careful attention must be paid to the supply of water to the roots, and also admit plenty of air at all times; leaves badly infested with disease should be cut off, placed into old boxes, and immediately consigned to the fire. Towards the middle or end of this month sow seed for the production of plants for early spring supplies, using a light sandy compost, and grow them as near the glass as possible.—Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

PERPETUAL CARNATIONS.—These are continuing to make a bright display of bloom where planted out in the open, and as a result of their good behaviour as bedding plants they will be more largely grown for this purpose in the future. It is necessary to keep the plants neatly tied, and to remove dead blooms as they occur. The present is a good time to root cuttings to secure strong vigorous plants for next season; we invariably obtain our best specimens from plants rooted now. If inserted singly in thumb pots, filled with a light sandy compost, and kept close in a cold frame for two or three weeks, they will soon take root, provided they are afforded a light shade, and not allowed to become dry. For planting out of doors Britannia, Winsor, May Day, Mrs. C. W. Ward, and White Perfection are good.

PROPAGATION.—The present is a good time to propagate a number of hardy shrubs from cuttings of the half-ripened wood, or from layers, as by this means nicely-rooted specimens are obtained before winter, and these grow away freely the following spring. It is an advantage to remove the growths with the heel of the old wood attached, as roots are then emitted readily. Cuttings can be inserted near the edge of 48-size pots, or in a bed of soil in a cold frame, whichever is the most convenient, but a liberal quantity of sand in the soil is essential, and the compost must always be pressed down moderately firm. Keep the frame close until roots are emitted, and use the syringe freely to maintain a moist atmosphere.

SEASONABLE NOTES.—The flower beds require constant attention at this time of year to keep them attractive, and must have all dead blooms removed regularly. Tie up all subjects that need it, and keep the various plants employed for carpeting pinched back, while those planted to form designs will need frequent and careful treatment to preserve the correct outlines. Yew and other hedges can now receive their final clipping, but in carrying out this work it is important to keep them perfectly true to shape. A sharp pair of shears is the best tool to use, except in the case of large-leaved subjects like laurel, when secateurs are more suitable to avoid cutting the leaves. Lavender should be cut and dried as soon as it is in flower, and cuttings of this sweet-scented subject can be rooted easily at the present time. Lose no time in completing the layering of border carnations, so as to obtain strong-rooted plants before winter. In case of dry weather keep them regularly damped over to facilitate quick root formation. Sweet peas should have all the seed pods removed, so as to prolong the flowering period; if this is done and the plants are kept regularly supplied with liquid manure, a continuation of bloom can be expected for many weeks.—J. Gardner, Batsford Park Gardens.

# EXHIBITIONS AND MEETINGS.

## Bruges International Horticultural Exhibition.

As far back as 1651 Bruges had a horticultural society, and there are catalogues or schedules dating from that early time to prove that the society held exhibitions with some degree of regularity. In those days every member was expected to bring a plant to each exhibition, one plant—no more, no less. Years rolled by for a long period, and the numerous trade members gradually drew together, and at the same time drew apart from the old parent society, devoting their attention to plants and flowers of commercial value, and troubling their heads little about plants notable for their curious character, botanical interest, or extreme rarity. At last there came to be two societies, and the tendency for them to stray farther and farther apart grew stronger and stronger with the procession of the years.

For centuries a great horticultural industry had been growing up in and around the old Flemish city of Ghent, but the trading spirit seemed to be very scant in the rival city of Bruges; indeed, in this, as in many other things, Bruges seemed to be satisfied with its ancient glory, its beauty, picturesqueness, and wonderful interest. On the one hand Ostend developed into a thriving port, and an immense and fashionable seaside resort; on the other hand, with modern methods added to unique business ability, handed down from generation to generation, the Gantoise made their city the great horticultural centre on the Continent. Bruges slept peacefully between the two.

In later times a few keen business men saw the possibilities of Bruges as a business centre, and especially as a fine district for the development of horticulture on commercial lines. M. Vincke, M. Beernaert, and Mr. F. Sander may be cited among those who knew when to take occasion by the hand. Under the guidance of such master minds business increased, acre was added to acre, and glass house to glass house outside the old gates or "ports" of the moat-encircled city, and Britishers found it was worth while to stop at Bruges, even though Ghent was their ultimate destination. Everyone who has a close acquaintance with the history of horticulture during the last score of years knows that Bruges has taken a very prominent part in the development of trade, especially in the cultivation of palms, orchids, and bay trees, but it needs a visit to Bruges ere one can understand the possibilities and prospects for the future.

The idea of holding an international exhibition at Bruges found birth in the fertile brain of Mr. F. Sander, sen. He had endeavoured to bring the two horticultural societies together, believing that a community of interests would be of the greatest possible advantage, and be the means of bringing business to all those interested. Two difficulties appeared; who would be the best individual to bring everyone together harmoniously and where could a big exhibition be held? Mons. Chas. Steinmetz, well liked and highly respected, was obviously the man for the business. The place? The audacious idea of securing the loan of the old market place—the largest market place in Europe so the people of Bruges say—was conceived. The city fathers granted the request and so eleven years ago the first international, a quite modest affair, was duly held.

Success breeds success, and so, notwithstanding the great exhibition at Chelsea in May last, the horticulteurs of Bruges resolved to hold a great exhibition this year. Again the city lent the market place, permitted many alterations, and gave financial help. The Province and the Government also lent their aid, and, in addition to the market place, the use of the great hall that runs along three sides of the courtyard of the famous Belfry of Bruges, was granted.

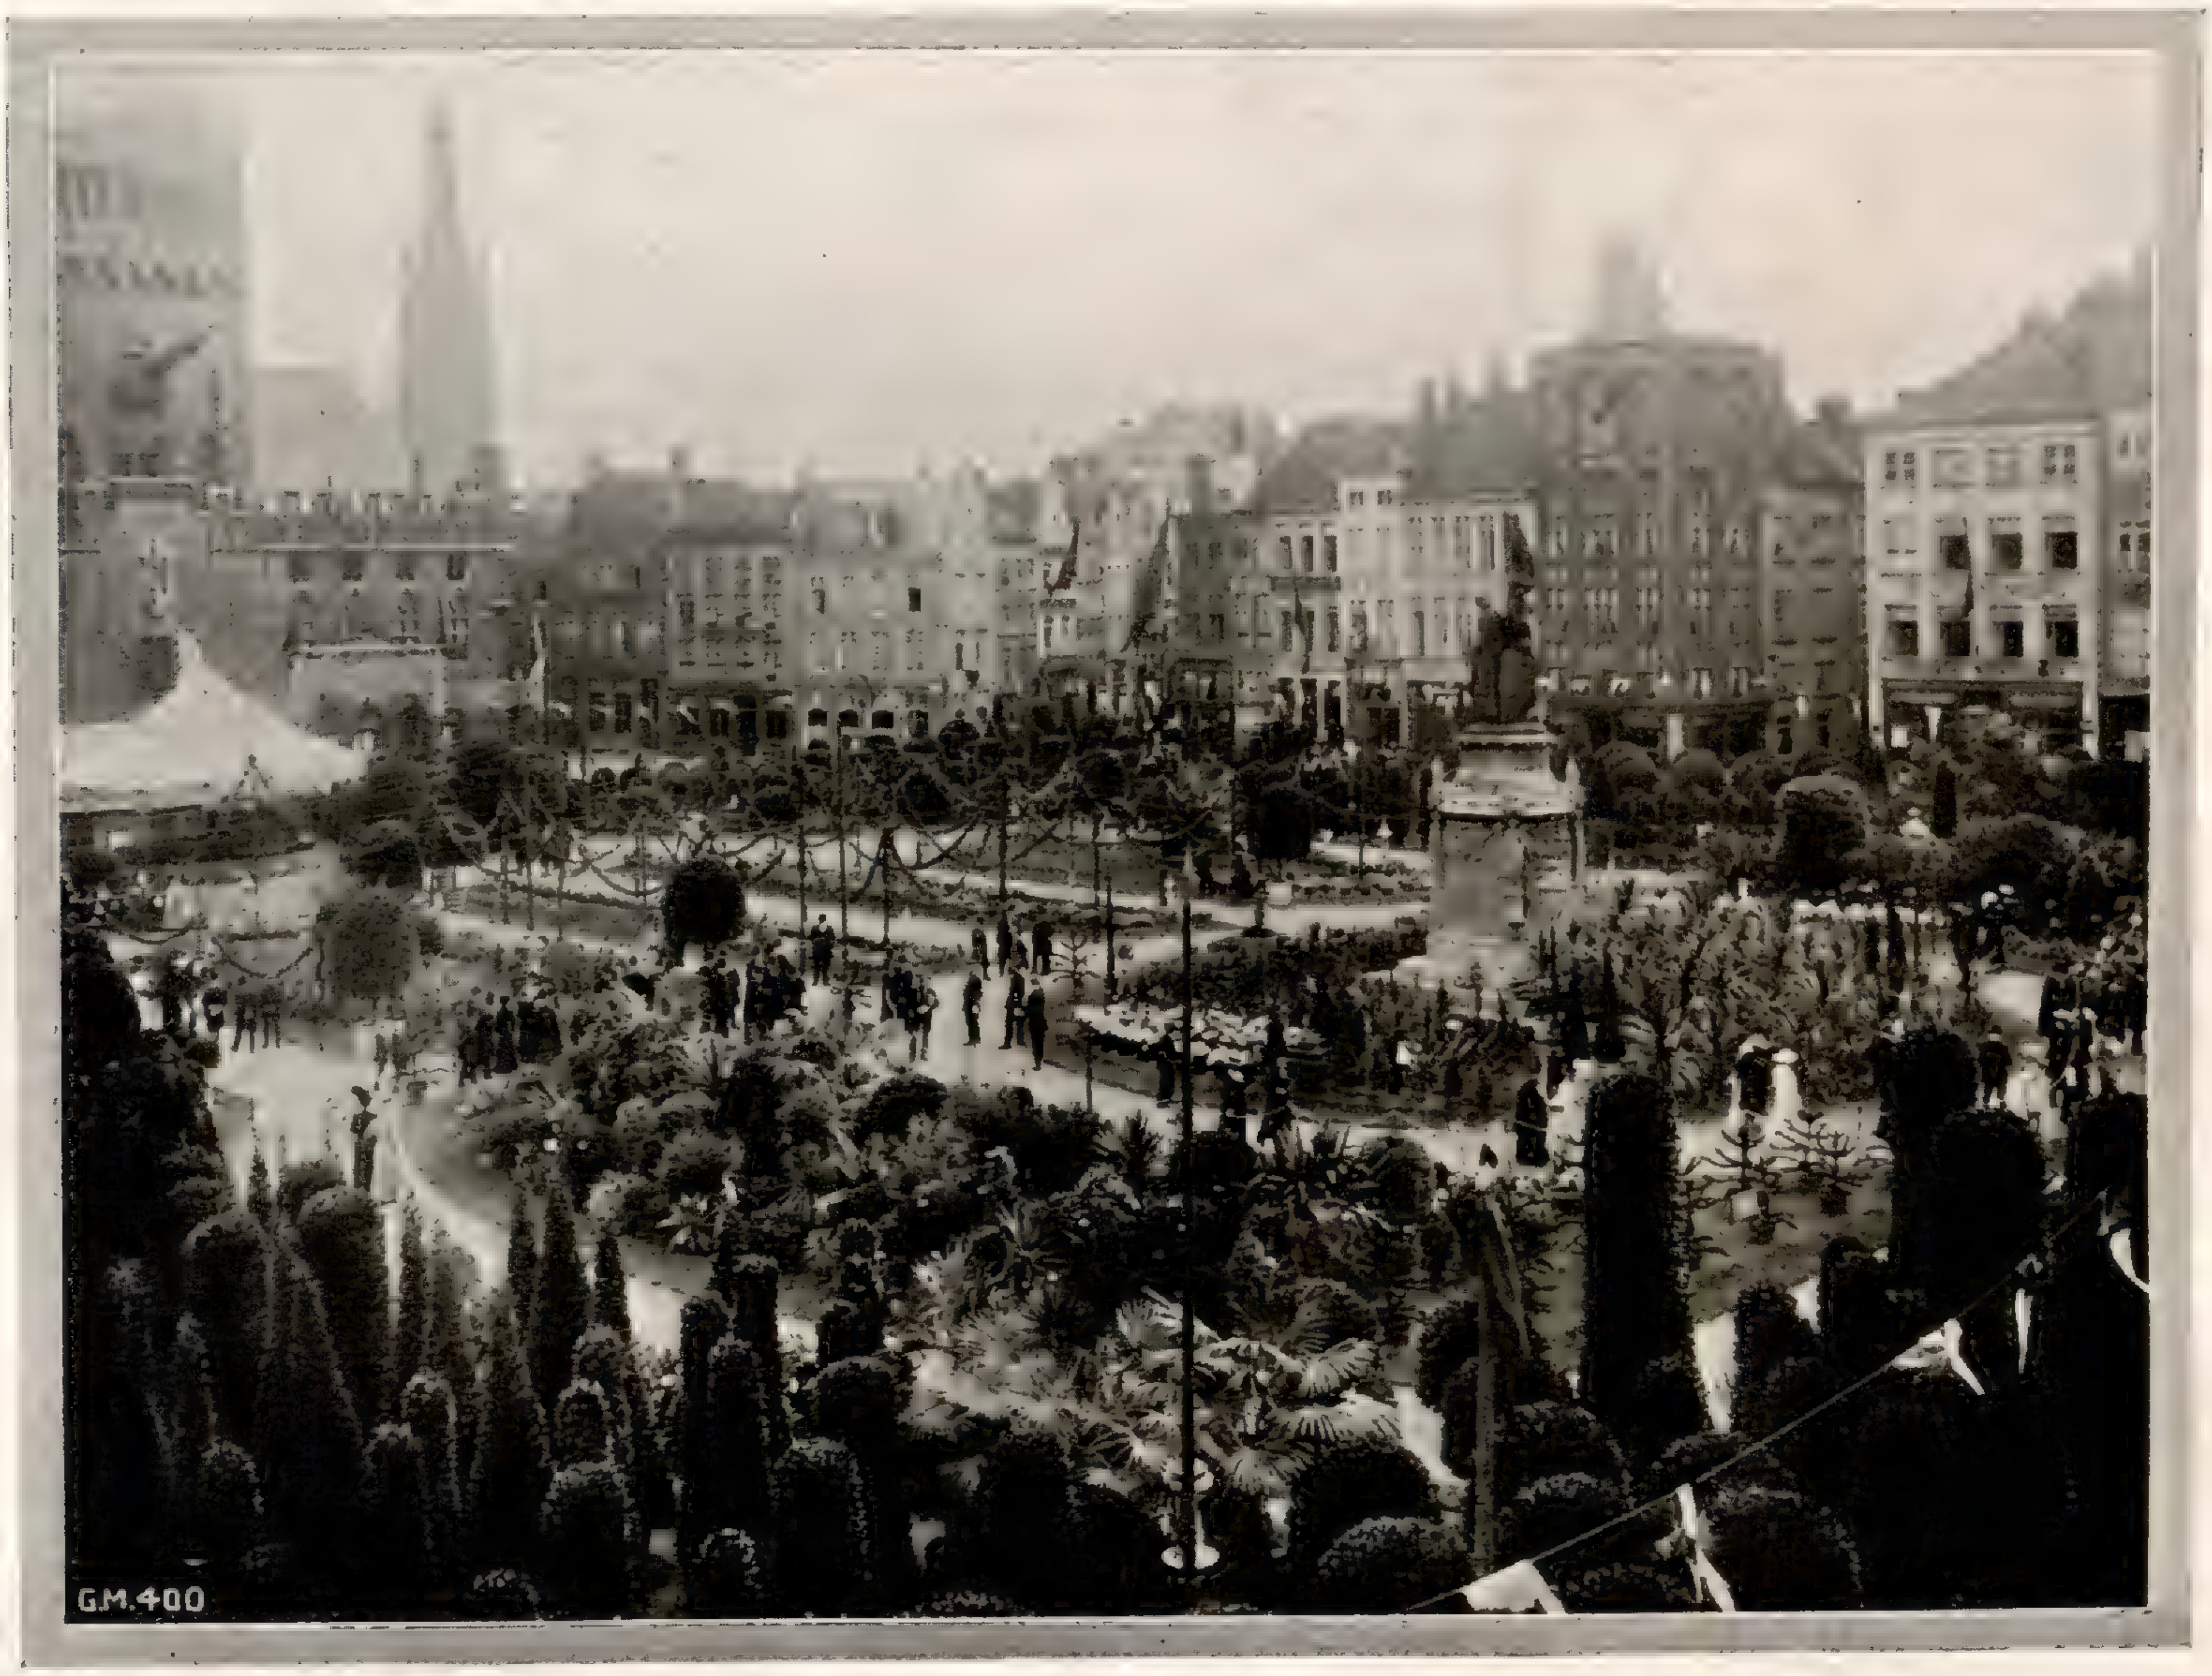
> "In the market place of Bruges stands
> the Belfry, old and brown;
> Thrice consumed and thrice rebuilded,
> still it watches o'er the town."

From Sunday, August 11, to Sunday, August 18, the historic belfry had a new watch to keep, i.e., over an horticultural exhibition of great importance, and there seemed to be an added gaiety in the carillons rung out by the smaller bells, and an added dignity in the sonorous notes of the great bells.

### THE EXHIBITION.

With that special genius which our horticultural confrères on the Continent seem to possess, the great Market Place of Bruges was transformed into a large garden. Half a dozen rows of stout wire strained to iron uprights, with some thin green canvas attached to them, formed the fence to enclose this part of the exhibition—a fence that was fully respected at Bruges, but which London gamins would have swarmed through or over with huge delight.

In the centre of the Market Place stands a large monument surmounted by statues of Bruges' two famous heroes, Jan Bradel and Pietar de Coning, and all round is cobble-stone paving. On this occasion the stones were completely covered and hidden by roads and paths of firm sand, by green turf lawns, by beds of gay tuberous begonias, of zonal and ivy-leaved pelargoniums and of cannas, and by great groups of dracænas and masses of fine shrubs from Australasia or the Mediterranean region. Just inside the fence, and ranged high in each corner were quantities of wonderful bay trees, their deep green colouring harmonising finely with the grey and brown of the surrounding buildings. The pathways and the temporary en-

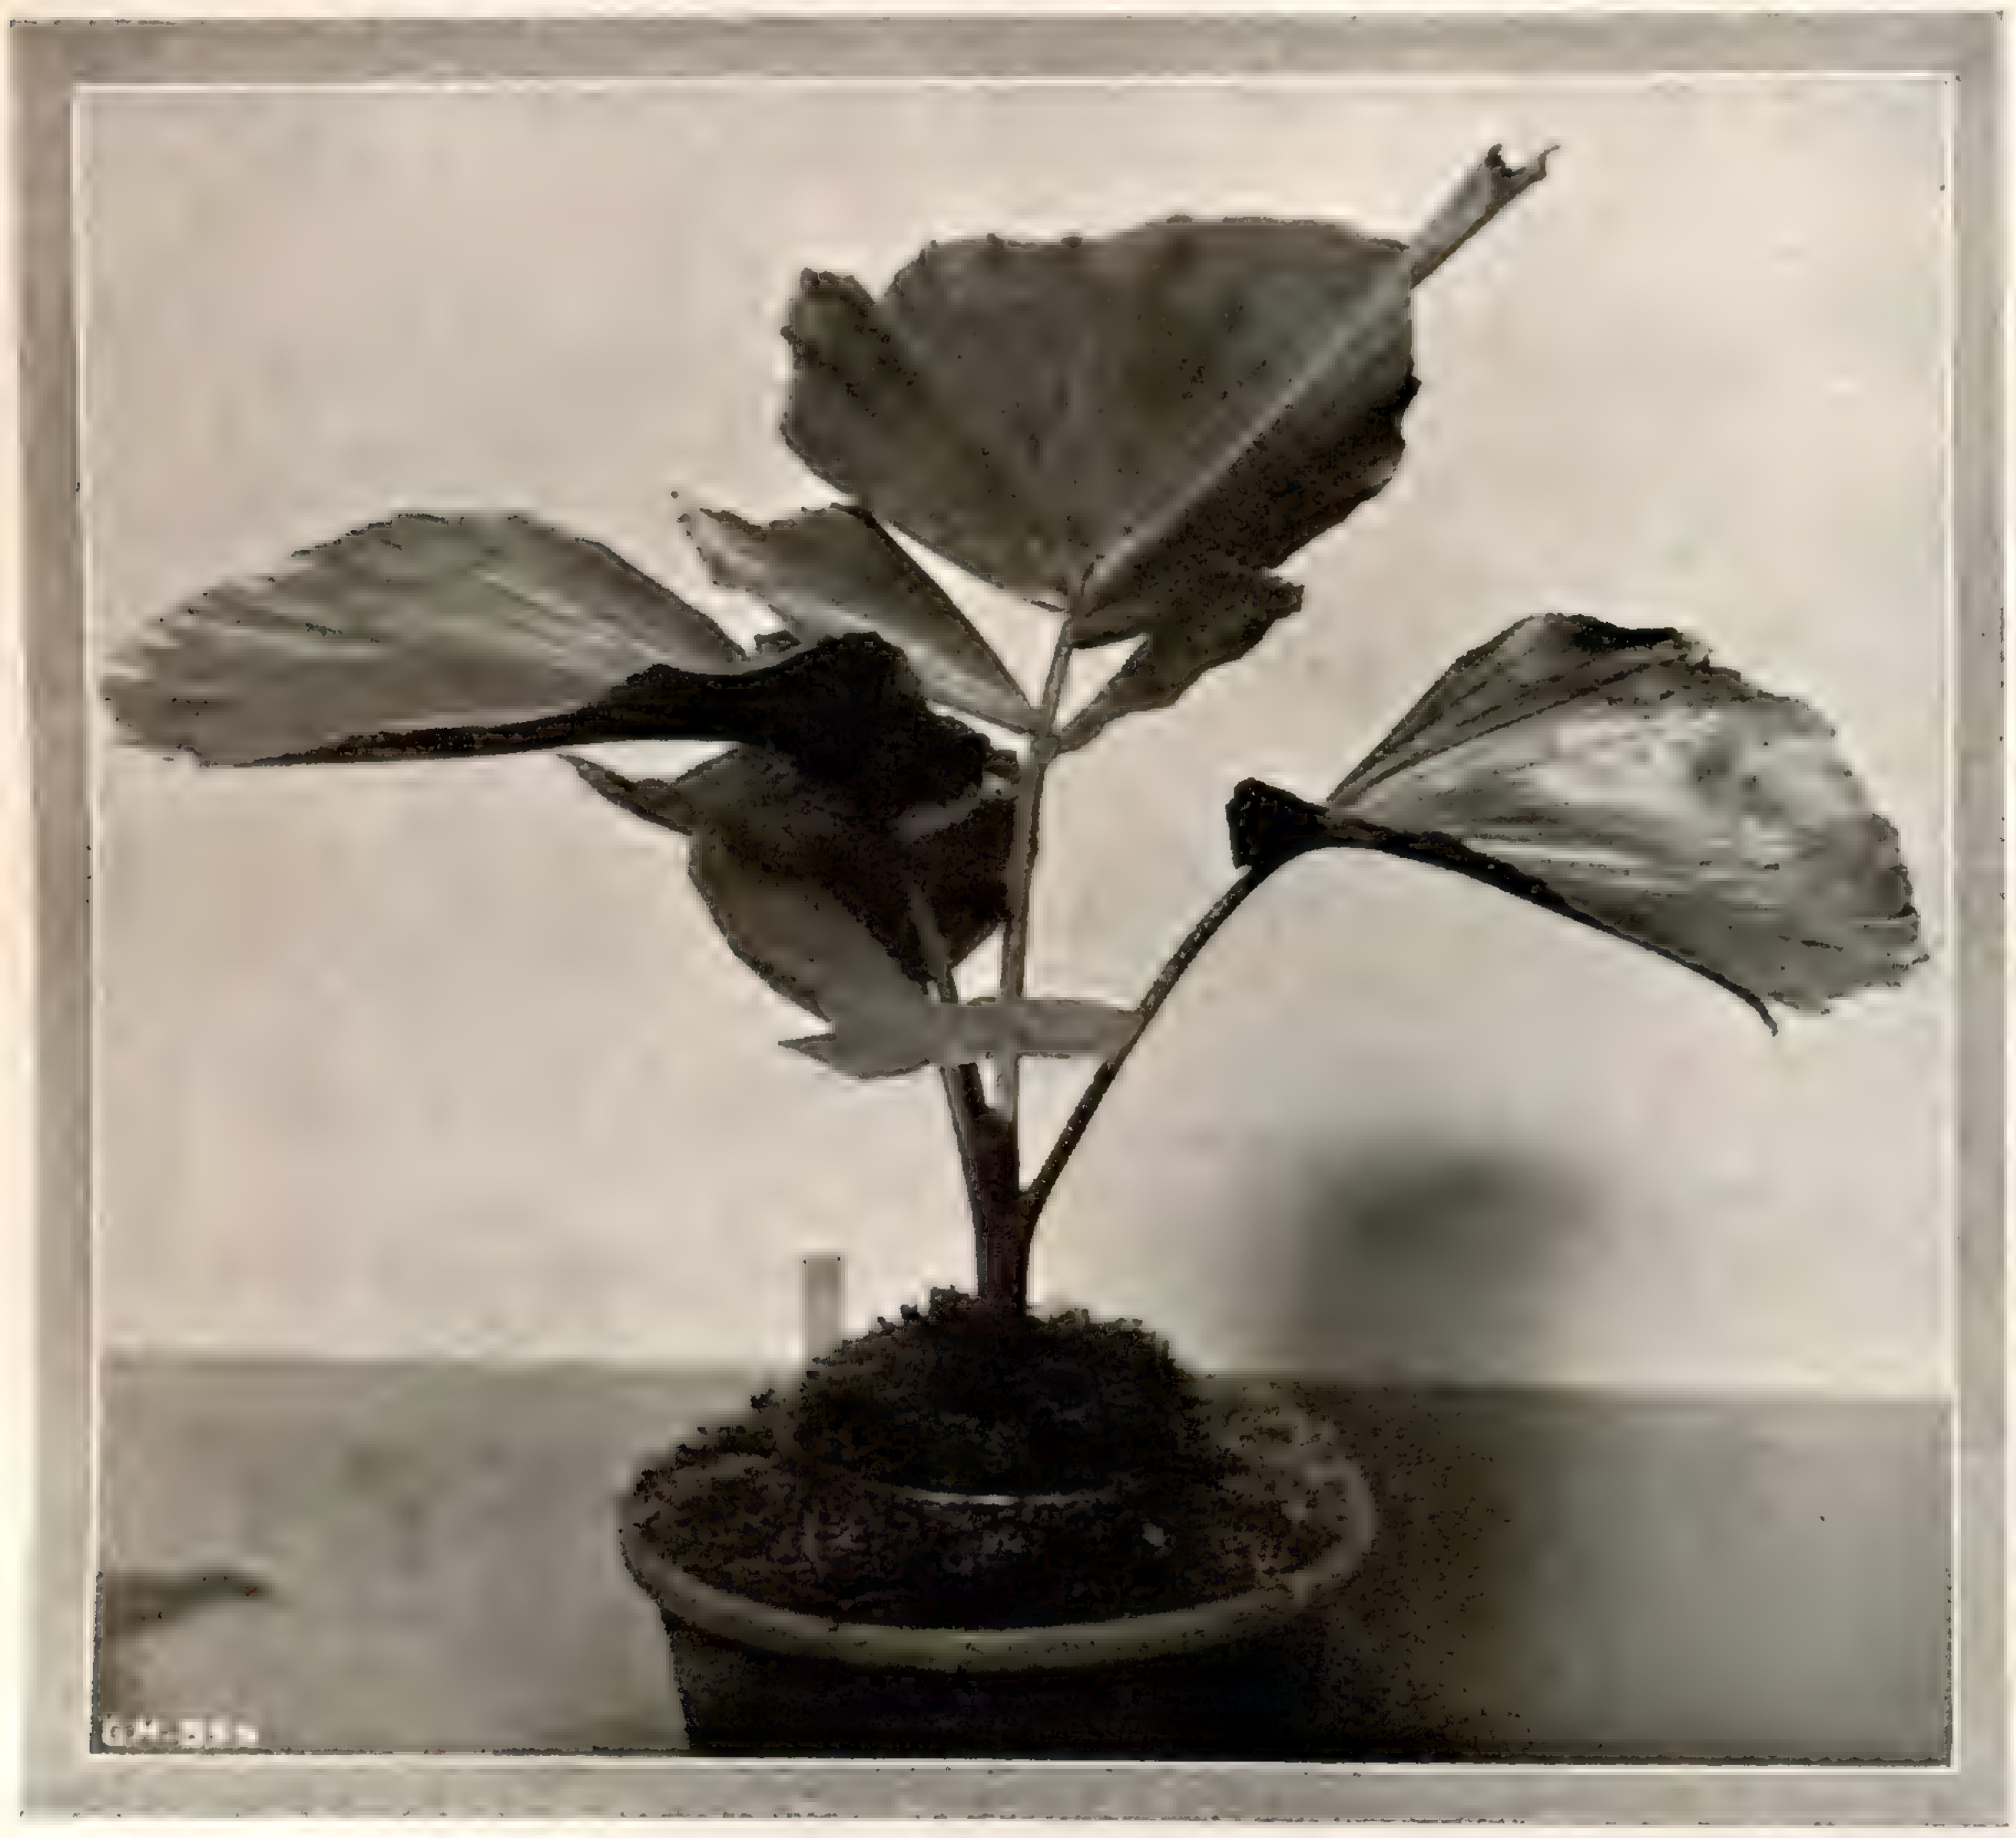


INTERNATIONAL HORTICULTURAL EXHIBITION AT BRUGES.

View of the Market Place, showing a large part of the Outdoor Section of the Exhibition.

trance gates were picked out with electric lights, and so at night the Market Place presented a quite pretty picture. Our illustration shows the monument with the competitive displays of pelargoniums and marguerites, grouped in flower beds, with fuchsias and dracænas behind them. It also shows one of the bay-tree corners, and the lower part of the Belfry filling the background. In the halls it was practically impossible to take photographs because of the subdued light.

The arrangement of the exhibition was on the usual continental lines, everything being disposed so as to ensure an effective and harmonious whole. In the Belfry Halls, as in the open Market Place, the same idea of general effectiveness was kept in view, with excellent results, but the lighting in the halls was not good, and during the numerous showers that occurred on the earlier days of the exhibition, the clouded skies made it difficult to read the labels on the plants. Palms, new plants, ferns, orchids, bromeliads, stove plants, dracænas, crotons, and anthuriums were among the leading features in the great halls, and these were all capitally grown and shown, indeed it was not possible to find a poorly-grown plant anywhere.



SOCRATEA FORGETIANA.

A distinct and attractive new palm exhibited at the International Horticultural Exhibition, Bruges, by Messrs. Sander and Sons, St. Albans and Bruges.

Cut flowers were not a large section, and it must be stated that in quality and in arrangement this was by far the weakest section of the exhibition. The roses were shown in little bunches on large flat boards or boxes. Gladioli were present in large numbers; each spike was stuck in a wine bottle, and the bottles set quite close together. It is a little pleasing to our insular vanity to know that we can display cut flowers better at home than at Bruges, and, so far as we could gather, at this season, we can also grow roses, gladioli, and phloxes better at home. Perpetual carnations were conspicuous by their absence at Bruges, and yet no British exhibition is complete without them. There was on exhibit of marguerite carnations in the courtyard of the Belfry, where bays, standard euonymuses, etc., were disposed in grass-bordered beds.

After our own great international horticultural exhibition at Chelsea, the Bruges show was a small affair, and, of course, it was not so large as the last Ghent Quinquennial Show. But everything must have a beginning, and for the third attempt it was an excellent effort.

## GENERAL ARRANGEMENTS.

A schedule of four hundred and sixteen classes means a large show, and much care in the disposition of the exhibits, but the committee, with the secretary, Mr. C. Steinmetz, and the president, M. Dumon, made their arrangements with the greatest completeness the position for everything being marked out boldly, the shape of every group carefully defined, and the name of every competitor marked on his place, so that there was no confusion.

Saturday, August 10, was devoted to judging, but it was quite a good while after the advertised time before the jury commenced work. M. Dumon addressed the members of the jury, and extended a hearty welcome to the seventy-five who had come from all parts of Europe, and one from America. As usual the judges were divided into groups, each with its own president and secretary. Judging was finished in good time, and then followed luncheon in the Provincial Government Buildings. During the whole of this day the exhibition was reserved for the officers and judges, and in their honour there was a special musical entertainment in the evening by a first-rate regimental band. This was all very pleasant, as was the banquet the following evening, but we should have been even more grateful had the award cards been placed in position fairly early during Saturday afternoon, so that the decisions of all the judges could have been known and noted.

Those who came over from England and acted on the jury were: Messrs. J. S. Brunton, Burnley; G. D. Clark, Dover; C. H. Curtis, of the Gardeners' Magazine; Jas. Hudson, V.M.H., Gunnersbury House, Acton; W. Iceton, Putney; Gurney Wilson, Haywards Heath; and Rev. J. Cromblеholme, Accrington, Manchester. Continental horticulturists on the jury included: Mdme. la Comtesse Louis de Hemptinne, Ghent; MM. Jules de Cock, Meirelebeke; Firmin de Smet and Romaine de Smet, Ghent; Jules Hye Ghent; Firmin Lambeau, Brussels; C. Pynáert, Ghent; Philippe de Vilmorin and A. Truffant, of Paris; H. Lambert, Trier; and M. Sibert, of Frankfurt; while Mr. T. Tyson came from Madison, New York.

There were sixty different competitors, representing Belgium, France, Holland, Germany, England, Luxembourg, and Switzerland.

## ORCHIDS.

Notwithstanding the late season, orchids were really well shown, and a goodly number of exhibitors came forward. The largest competitors were Messrs. Sander and Sons, St. Albans and Bruges, and they secured the Work of Art and the large gold medal offered for the best trade collection. This exhibit was a large one, and in it the specially fine things were Dendrobium superbiens, beautifully flowered, associated with hybrid odontoglossums, Lælio-cattleya Aphrodite, the charming Dendrobium Sanderæ, Cattleya Dowiana, Brasso-cattleya violacea, the aromatic and waxy flowers of Anguloa eburnea, Ærides Sanderiana, a fine example of Vanda Lowi, with three of its long spikes; Vanda cærulea, Acineta densa with numerous pendant spikes of golden flowers, Cypripedium Maudæ, and many other fine things.

The same firm had the best specimen Phalænopsis, a wonderful plant of P. violacea with seven huge leaves, and two spikes of its violet-centred flowers. For a collection of cypripediums, the Messrs. Sander led the way, and here the best things were C. Edwardi superbum, C. Felicity, C. A. de Lairesse, C. Warnhamense, C. Oakes Ames, and C. Lord Derby. The best specimen cypripedium was a large C. Lord Derby with four spikes and ten large green and white and rose-purple flowers. Another award fell to the St. Albans firm for a collection of cattleyas and lælias; here the flowers were rather small, save in the cases of C. Gaskelliana alba and Brasso-cattleya Thorntoni.

Miltonias were quite well shown for the season, and gold medals were granted to M. Jules Hye, Ghent, and Mons. C. Vuylsteke for their contribution of these effective flowers. The latter gained a medal for his four seedling miltonias, all from a cross between M. Hyeana and M. Phalænopsis, the one named M. Reine Elizabeth de Belgique being very pretty, with rosy-violet markings on the lip and on the petals. Cattleya gigas, Frau Melanie Beyrodt, with four beautiful blooms, the pure white sepals and petals forming a grand setting for the bright violet-purple lip, was exhibited by M. Jules Hye.

M. Firmin Lambeau was awarded a large gold medal, with felicitations, for a lovely collection of orchids. Vanda cærulea was capitally shown, and so were C. Gaskelliana, C. Juliet—white-flowered, Cattleya Baron Delbeke, a fine secondary hybrid, giving large evidence of C. Dowiana influence, and with a glorious combination of ruby, purple, and gold in the lip. The very pretty Oncidioda Charlesworthi, and Odontioda heatonensis added grace to colour and beauty, and Miltonioda Harwoodi, and Phalænopsis Rimestadiana were also very fine in this collection.

Messrs. Charlesworth and Co., Haywards Heath, contributed a table of orchids, and in this collection the branching spikes of Odontoglossom Solon, O. armainvilliersense xanthotes, O. Epicaste, and O. ardentissimum were conspicuously beautiful. O. crispum Golden Gem, with bright yellow lip, and yellow spottings on the sepals, was another beautiful and striking plant. Cattleya Rhoda, Lælio-cattleya eximia, Cypripedium Daisy Barclay, Odontionia Lairessæ, and Oncidioda Charlesworthi were other good and interesting plants in this gold medal display. M. G. Vincke, Bruges, was awarded a gold medal for a collection of orchids, composed chiefly of cattleya and lælio-cattleya hybrids.

M. Charles Dietrich, Anderghem, presented a handsome, if rather small, collection of orchids, containing fine examples of Cattleya Comet, C. Dupreana, Brasso-cattleya Maroniæ, Lælio-cattleya Lucida, L.c. calistoglossa, Miltonia Bleuana, and Cypripedium Massaianum.

## PALMS.

Palms were superb. There is no other word for it. On every hand there were specimens of all sizes, and of wondrous grace and variety. For eight specimens the Flandria Company and Messrs. Sander and Sons had a close fight for first place, but the latter won the premier award with gigantic examples. They had far and away the finest Latonia borbonica aurea we have ever seen, some of its leaves six feet across, and of a distinct yellow shade. The other kinds were Phœnix Roebelini, the grey-green Cocos Yatai, Phœnix canariensis, Kentia Forsteriana, 20ft. high, Latania borbonica robusta, Kentia Belmoreana, Corypha australis, and Sabal Blackburniana.

The Flandria Company put up a great corner group of twenty large palms, showing kentias, phœnix, coryphas, and rhaphis of a size and beauty rarely seen at home. This first prize group and the one previously noted, would have added very materially to the effect of the show at Chelsea in May last. Mons. H. C. Dumon, of Menten, is an amateur, who has a great love for palms, and grows them as a hobby, just as one grows orchids, or carnations, or sweet peas at home. He has wonderful specimens, and was awarded a special first prize for ten splendid plants of Brahia Roylei, B. dulcis, Latania borbonica, Kentia Forsteriana, K. Belmoreana, Corypha australis, etc. He also gained a special award for a splendid Phœnix canariensis, of enormous size, and finely grown. It was said that this had been grown from seed by M. Dumon, in whose collection it had remained forty-four years, and during the greater part of that time had been grown out of doors. Eighteen rare palms proved an interesting class, Messrs. Sander and Sons leading with Ptychoraphis Sieberti, Ceroxylon andicola (the wax palm), Linospadix Petrieanum, Pinanga Hencklei, etc. M. E. Leys Simoens was unbeatable for the fan-leaved latanias, palms that have almost gone out of fashion in Great Britain.

A palm that is daily growing in popularity is the graceful Phœnix Roebelini, most beautiful of all the date palms. As small plants it is largely used for table decoration at home, but we scarcely know it as a large specimen. At Bruges, however, there are many fine plants, 4ft. to 6ft. high, and furnished to the pot with elegant deep green leafage. It is a somewhat slow grower, but even so, it seems destined to quite displace the pretty Cocos Weddelliana from the position it has so long held. The Flandria Company had the best twenty specimens, and Mr. Story, Ghent, was a good second; the best single specimen, however, was a marvel of high culture submitted by M. Alloncius, Ghent. What makes Phœnix Roebelini so useful is its hardiness when used continually in dwelling rooms, restaurants, and hotels.

The best Rhapis humilis was a giant about 16ft. high and 10ft. across near the top, and carrying scores of its erect leafy stems; this, from M. G. Vincke, was greatly admired.

## BAY TREES.

All around the Market Place, just inside the wire fence, bay trees of all shapes and sizes were staged by the leading growers of Bruges and Ghent. There were bay trees dwarf, 18in. high; bay trees tall, 20ft. high; columnar, pyramidal, bushy, standard, mop-headed and three-tiered bay trees, all in the pink of health, and thickly covered with dense green fragrant foliage. One wonders where in the world all these bay trees go to, for obviously they are not grown for the fun of the thing. Some of the giants must be 50 years old. They have a value for the decoration of restaurants and winter gardens and also for terrace gardens in kindly climates, but in Bruges and Ghent there are literally millions of bay trees, and we heard of one firm putting in 20,000 cuttings this year. There must have been nearly a thousand bay trees at the exhibition. The finest large examples were four columnar ones and four pyramids from Messrs. Sander and Sons, but for round-headed standards M. G. Vincke scored for size, and he had a grove of huge specimens. Messrs. Sander and Sons; the Flandria Company, Bruges; and M. Vincke were the chief exhibitors of these wonderfully attractive and finely-grown and beautifully-trained specimens.

## NEW OR RARE PLANTS.

In this section Messrs. Sander and Sons, St. Albans and Bruges, scored almost all along the line. The word "recent" as applied to the introductions, was not, however, taken too seriously by the competitors. This firm gained the special award for a dozen plants of recent introduction, and their set consisted of Maranta Sanderæ, M. Veitchi, Eriobotrya japonica variegata (the variegated Loquat), Asparagus gracillima, a very light form of A. plumosus; Dieffenbachia Sanderæ, green, mottled with cream, and with the leaf-stalks of the very broad oval leaves clasping the stem curiously; Adiantum Siebertianum, that may be likened to A. Lawsonianum, but with all the pinnæ undulated; Polypodium irioides corymbiferum; Alocasia Micholitzi; Chamædorea pumila, a dwarf palm; Heliconia insignis, with dark bronzy-green leaves; Anthurium Sanderi; and Trevesia Sanderi, an extraordinary plant from Annam, with long-stalked, palmate leaves of dark, purplish-green colour, but with the lobes sculptured out in quaint fashion, here and there, often leaving several inches of the thick midrib quite naked; the young leaves are pinkish, and the tips of the lobes droop prettily ere the leaf expands fully.

The same firm scored for a dozen non-flowering plants of recent introduction, and here they showed Dracæna Deremensis Warnecki, already seen several times at home; Leea macropus, with broad leaflets; the prettily creamy-marked Ficus australis variegata; Dracæna perelegans, from the Solomon Islands, with long, recurving, narrow leaves, coloured red, pink, and green; Alocasia colossea, a noble plant, with large heart-shaped, light green leaves, on pale creamy-green stalks; and a much divided form of Polypodium irioides named Bartelsi. The best non-flowering plant not yet in commerce was considered to be the variegated Loquat; and the best flowering plant not yet in commerce was a yellowish form of the now popular Marguerite Mrs. Sander; it has full-centred flowers, the centre being soft yellow, and the outer ring of ray florets creamy-white.

Begonia Sanderæ gained the prize as the best new flowering greenhouse plant; it is after the character of B. semperflorens gigantea, and has red-tinged leaves, and neat, bright crimson-scarlet flowers in clusters. Socratea Forgetiana was adjudged to be the best palm of recent introduction; it is very distinct, and has broadly-rounded, rich green leaves, that are quite entire in the plant as shown. The best new seedling dracæna was D. tricolor, somewhat after the character of D. Baptisti. All the foregoing were from the St. Alban's firm, but Mr. Vincke scored for a new seedling aroid with Anthurium Mdme. Dumon de Menten; this has flattish, rounded spathes of fair size, and of a beautiful pink shade, and belongs to the A. Andreanum section.

## VARIOUS PLANTS AND FLOWERS.

The special gold medal and work of art offered by the Royal Horticultural Society of Bruges for the best collection of twenty-five flowering and non-flowering plants was worthily won by Messrs. Sander and Sons with a splendid collection, in which were remarkable specimens of the rare Dracæna Broomfieldi, Bilbergia Forgetiana, with broad creamy bands down its deep green leaves; Fourcroya Watsoniana, with long leaves handsomely variegated with green and white; Aphelandra undulæfolia, finely flowered; Adiantum Glory of Moordrecht, Dendrobium Sanderæ, a variegated form of Vanilla plomlatris, Cocolobea pubescens, the showy Solanum Wendlandi, Alocasia argyrea, Sansievera Laurenti with golden bands along margins of its erect bronzy-green leaves; Disa grandiflora, Dracæna Sanderiana, and Phynium variegatum.

Plants suitable for cool houses were very largely shown, and proved very interesting. Phormium tenax variegata, Acacia verticulata, oranges, myrtles, Clethra arborea, Metrosideros floribunda, Agapanthus umbellatus carrying its spikes of rich blue flowers, pomegranates, Eugenia australis, variegated euonymuses and oleas, eurya latifolia variegata, and oleanders full of bloom were among the subjects staged in the Market Place by Messrs. Sander and Sons and other firms.

In the matter of cordylines or cool-house dracænas the Flandria Company exhibited remarkably well, and set up fine plants of D. Doucetti, D. atro-sanguinea, D. Buyssei, something like D. Bruanti; the yucca-like D. Prince Albert; the elegant D. lentiginosa, and the yellow variegated D. Princess Elizabeth. These were handsome plants from 3ft. to 8ft. high clothed to the pot or tub with fine leafage.

In a small collection of conifers from M. Camille de Coninck, Maldegen, we noticed the white-tipped Sequoia sempervivum albo spica, the elegant Cupressus Lambertiana aurea, and Cedrus Deodara argentea-verticulata, all distinctly coloured and effective.

The range of colouring and form now to be found in Hydrangea Hortensia was very evident in a collection of neat specimens exhibited by M. de Coninck; especially good were the pink La Lorraine, the fringed Mdme. E. Mouillere, and the smaller Mdme. Renée Gaillard.

Mr. Charles Steinmetz, St. Andre, Bruges, put up the best collection of pomegranates, oranges, Eugenia australis, Clethra alnifolia, C. arborea, myrtles, euonymus, and other plants of like character, suitable for an orangery or for terrace decoration, and his collection was a very fine one.

Cycads and bromeliads are not often seen at home, outside botanic gardens, but they are grown on the Continent still. Messrs. Sander and Sons had noble specimens of Zamia Kirsteniana and a big double-crowned Eucephalartos Altenstieni. M. Jules Hye de Cock put forward a nice collection of bromeliads that included quite good examples of Vriesia hieroglyphica, V. fenestralis, Cryplanthus zonatus Bruarni, and Bilbergia rhodocyanea superba.

Ferns were not much in evidence, but a lovely group of Adiantum Farleyense Glory of Moordrecht, shown by Messrs. Bier and Ankersmit, Melle, attracted a great deal of attention by reason of its elegance and beautiful light yellow-green colouring of the fully-grown fronds, and the reddish-pink hue of the young half-expanded fronds.

Begonias were quite good, as shown by several firms; the largest double blooms were those displayed by M. Louis van Houtte, Ghent, and Fœmina, light pink, frilled; Raphael, golden-buff, frilled; and Madagascar, a big double orange-scarlet were outstanding varieties.

Among the gladioli staged by M. Alphonse Braeckman, Wetteren, were many of quite distinct colouring that should look well if highly cultivated; Bellfroi, blue and cream; Gastenbauinspector Fox, dark purple; Fanfaron, violet and blue; Argyrite, white; and Aboriginé, deep violet-purple, were a few we made a note of.

Some very good cactus dahlias were staged extensively by Mr. J. G. Ballego, Leiden, Holland, who displayed a large number of cactus and pompon varieties that are well known at home, and also set up a large decorative variety named Hortulanus Fiet that may be described as a salmon Gustave Douzon.

## Royal Horticultural Society.

There would have been only a moderate exhibition at the Royal Horticultural Hall on August 13, but, as the exhibits of the National Gladiolus Society filled considerable space, the hall was fairly well filled. Hardy flowers, gladioli, trees and shrubs, and a few orchids were the subjects chiefly shown, but there were a number of novelties, Montbretia Star of the East, and Lælio-cattleya Godmani being the best.

### FLORAL COMMITTEE.

An extraordinarily fine exhibit of ornamental trees and shrubs, flowering and foliage, was staged across the end of the hall by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. All the kinds displayed were represented by cut specimens, and in many cases a large number of specimens were grouped together so as to produce the same effect as a goodly plant or bush. We cannot find space to mention other than a small proportion of the subjects shown, but some of the most effective were Buddleia variabilis, B. v. Veitchi, B. v. superba, B. v. lilacina, Rhamnus frangula, Catalpa Kaempferi purpurescens, Spiræa silicifolia, S. callosa rubra, S. Douglasi, Hydrangea radiata, H. paniculata grandiflora, Colutea istria crowded with green bladders, Olearia Haasti, the graceful white Deutzia corymbosa, John Downie crab apple, Pyrus lanata, the purple beech, Cornus alba variegata, Rubus fruticosa fl. pl., Ceanothus azureus Indigo, Ligustrum medium with long, loose panicles of white flowers, Rhus cotinus—the Burning Bush, the golden-flowered Potentilla micranda, Myrtus Ugni, Fuchsia Thomsoni, Lavendula spicata alba, Clematis coccinea, and the yellow-fruited Coriaria terminalis. Altogether there were about three hundred distinct species or varieties of hardy trees and shrubs on view, representing a wonderful collection of rare and beautiful things.

Gladioli filled a very important place in the large group of hardy flowers contributed by Messrs. Barr and Sons, Covent Garden, and over a groundwork of double gypsophila the spikes looked very well indeed, especially those of the varieties La Comite, Etincella, Alice, Ledrines, and the dark plum-coloured Martinique. A fine pan of Acaena microphylla gained a Cultural Commendation. Other good things were Lilium sulphureum, L. nepalense, L. tigrinum splendens, and white agapanthuses. Messrs. H. B. May and Sons, Edmonton, showed neat pot plants of such useful large-spiked veronicas as Pearl, Lavinia, Reine des Blanches, Violette, Mauvena, the almost black-leaved and purple-flowered Favourite, La Merveilleuse, Admiration, fine deep blue; Mont Blanc, pure white; and Eveline, bright rose.

Though so late in the season for the southern counties, Messrs. S. Bide and Sons, Farnham, put up a fine lot of sweet peas, in vases, and some of the best varieties represented were R. F. Felton, Mrs. C. W. Breadmore, Scarlet Monarch, Clara Curtis, Edna Herbert, Mrs. W. J. Unwin, Queen of Norway, Florence Nightingale, Mrs. Hallam, and Elfrida Pearson. Messrs. Aldersey and Marsden Jones, Tilston, Malpas, were also exhibitors of sweet peas. Herbaceous phloxes from Messrs. W. Wells and Co. included big stands of Selma, the dark purple Le Mahdi, Bacchante, Iris, and Crepuscle; Linaria dalmatica from this firm was well shown.

Messrs. Jas. Kelway and Son, Langport, put up a very fine lot of large-flowered gladioli, some spikes having nine or ten fine opened flowers on them. Golden Measure was again in fine form, and so were the blush Duchess of Wellington, the purple Le Nuit, White Giant, Kelway's Purple, Melton, mauve; and Edward V., red. Some wonderfully fine flowers of double tuberous begonias were shown by Mr. A. L. Gwillim, Sidcup, and Marguerite Gwillim, clear soft yellow, was particularly fine among a number of good varieties.

Pentstemons were largely and extensively shown by Messrs. T. S. Ware, Feltham, who again grouped together large numbers of spikes of such varieties as Salomé, Ideal, Dolabella, Capella, Lady Hallé, Diana, Sylvaine, the brilliant red and white Diamond, Urania, and Palmira. A bank of dwarf celosias, set up by Mr. L. Russell, Richmond, was greatly admired; the colours represented were rose, yellow, scarlet, and purple. Mr. Russell's collection of hardy fuchsias proved interesting, but we should be inclined to question the hardiness of some of the varieties staged; F. myrtifolia minor, F. globosa, F. Riccartoni, F. Thompsoni, and F. gracilis were all good.

Messrs. R. Wallace and Co., Colchester, submitted some beautiful new montbretias, notably the splendid Star of the East, Prometheus, Comet, King Edmund, Lady Hamilton and Germania; they also contributed Kniphofia Unique, a neat, somewhat small-spiked coral red variety; gladioli, and liliums. Mr. Davison, gardener to Colonel Petre, Westwick, Norwich, showed a gloriously fine new montbretia named Star of the East. This was deservedly granted a First-class Certificate. It has blooms about four inches across, and of a rich yellow colour, with a little orange shading, and the flowers are borne on tall, sturdy, branching spikes. It is unquestionably the finest of the many beautiful varieties of montbretia with which Mr. Davison has enriched our gardens. Coleuses and Rex begonias from Messrs. H. Cannell and Sons, Swanley, showed how great is the range of leaf colouring in these useful plants. The Guildford Hardy Plant Company and Messrs. S. Low and Co., Enfield, respectively brought exhibits of hardy flowers and carnations.

Messrs. Felton and Sons, Hanover Place, W., had a fine exhibit of the large rose-pink flower of Neluarbium speciosum, with a number of the big circular leaves and curious seed vessels. This aquatic is grown in most botanical gardens, and in a few private gardens—Mr. Hudson has flowered it at Gunnersbury House, but we do not remember having seen flowers imported from the Orient before. We understand they are five days on the journey, and on arrival the buds are opened as one might open a water lily, and they will then keep well for a week or ten days in water. When held up on a wire frame for a day or two the big leaves become more or less rigid, and they then add to the beauty and interest of any bold decoration made with the flowers.

Mr. Amos Perry was a large exhibitor of gladioli and delphiniums, staging these in alternate groups. The lovely pale-pink America was one of the finest varieties of gladioli shown, but for the most part, the flowers were not labelled, and the spikes were a trifle crowded in the vases.

Rhodostachys ardina, a bromeliad, with spiny leaves, and a rosette of rose-pink flowers, set amid silvery bracts, was shown in flower by Mr. J. T. Bennett Pöe, Holmwood, Cheshunt. The pure white Cosmos, White Queen, from Messrs. Dobbie and Co., Edinburgh, gained an A.M. Messrs. Fells and Sons, Hitchin, contributed a small collection of rock plants.

### ORCHID COMMITTEE.

Very handsome was Lælio-cattleya Godmani (F.C.C.) (C. Iris x L.-c. callistoglossa), from F. Du Cane Godman, Esq., South Lodge, Horsham; this has lovely broad, deep rosy-purple sepals and petals, and a big royal purple, ruby-shaded, yellow-throated lip. Mr. H. A. Tracy, Twickenham, sent a few plants, including Oncidium Crœsus.

Messrs. Charlesworth and Co., Haywards Heath, were represented by Vanda Sanderiana, Stanhopea convoluta with four fragrant, ivory-white flowers; Oncidium luridum guttatum, and the pretty Platyclinis filiformis. Mr. E. H. Davidson, Borlases, Twyford, exhibited Cattleya Venus Golden Glory with yellow sepals and petals, Odontoglossum Pamela, Odontioda Ruby, O. Schroderi Davidson's var., O. Thwaitesi, and O. Empress Eugenie (A.M.), white, with dainty heliotrope markings.

Two handsome plants brought up by Mr. H. Alexander, grower to Sir George Holford, Westonbirt, Gloucester, were Lælio-cattleya luminosa Mandarin (A.M.), a fine thing with deep yellow sepals and petals, and dark purple lip; and L.-c. Glaucus (F.C.C.) (L. purpurata × L.-c. rubens), with bright deep purple sepals and petals and dark crimson-purple lip. A Cultural Commendation for Cattleya Tacitus with nine splendid flowers, fell to Mr. Alexander. Messrs. J. and A. McBean, Cooksbridge, showed Odontoglossum nigrescens, with small black-maroon sepals and petals, each of the latter having a tiny white base: a golden crest on the triangular lip was very conspicuous.

Mr. White, grower to Sir Trevor Lawrence, Bart., Dorking, put up capital plants of the lovely Lælia monophylla, Bulbophyllum odontissimum, Brasso-cattleya Joan, and a curious bulbophyllum with flattened racemes, allied to B. lupulinum.

### FRUIT AND VEGETABLE COMMITTEE.

Some early fruits from Messrs. S. Spooner and Sons, Hounslow, included attractive dishes of Langley Pippin, Early Strawberry, Worcester Pearmain, White Transparent, Beauty of Bath, Cellini, Williams' Favourite, Lady Sudeley, Jas. Grieve, Cardinal, Red Quarrenden, and Red Astrachan apples.

Numerous melons and marrows were brought from the Wisley Gardens, and awards granted to them after trial were confirmed at this meeting, as shown below.

### CERTIFICATES AND AWARDS.

First-class Certificate.—To Montbretia Star of the East, from Mr. Davison, gardener to Colonel Petre, Westwich, Norwich; to Lælio-cattleya Godmani, from F. Du Cave Godman, Esq., South Lodge, Horsham; to Lælio-cattleya Glaucus, from Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury; to melons Hero of Lockinge and Frogmore Prolific, from Messrs. Jas. Veitch and Sons, Chelsea.

Award of Merit.—To Kniphofia Unique, from Messrs. R. Wallace and Co., Colchester; to Cosmos White Queen, from Messrs. Dobbie and Co., Rothesay; to Rhodostachys andina, from J. T. Bennett Poë, Esq., Cheshunt; to Odontoglossum Empress Eugenie, from Mr. Davidson, Borlases, Twyford; to Lælio-cattleya luminosa Mandarin, from Lieut.-Colonel Sir G. Holford, Westonbirt; to melon Royal Favourite, from Messrs. Sutton and Sons, Reading; to marrow Bush Green, from Messrs. Barr and Sons, Covent Garden; to marrow Moore's Cream, from Messrs. R. Veitch and Sons, Exeter; to marrow White Bush, from Messrs. W. Nutting and Sons, Southwark Street, S.E.

Awards of Merit were confirmed in the case of the following flowers tested at Wisley, but not shown on this occasion: Hollyhock Newport Pink, from the Messrs. Dreer, Philadelphia; to sweet peas Isobel Malcolm, Mrs. Routzahn, and Tennant Spencer, from Messrs. Dobbie and Co., Edinburgh; to sweet peas Hercules and Premier, from Messrs. G. Stark and Son, Great Ryburgh; to violas Jubilee, Lavender Queen, Mrs. Chichester, and Snowflake, from Mr. M. Cuthbertson, Rothesay; to violas Edina, Maggie Mott, and Walter Walsh, from Messrs. Dobbie and Co., Edinburgh; to violas Bessie and Kingcup, from Messrs. A. Dickson and Sons, Newtownards; to violas John Quarton, Mrs. Davidson, and W. H. Highgate, from Messrs. J. Forbes, Lim., Hawick; and to viola Palmer's White, from Mr. Palmer, Derby.

### MEDALS.

Silver-gilt Flora.—To Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Aldenham House, Elstree, for cut hardy trees and shrubs.

Silver Flora.—To Messrs. Felton and Son, Hanover Square, W., for nelumbiums; to Messrs. R. Wallace and Co., Colchester, for montbretias, etc.; to Messrs. T. S. Ware, Feltham, for pentstemons, etc.; to Mr. L. R. Russell, Richmond, for celosias and fuchsias.

Silver Banksian.—To Messrs. H. B. May and Sons, Edmonton, for veronicas, etc.; to Messrs. S. Spooner and Sons, Hounslow, for apples.

Bronze Flora.—To Messrs. S. Bide and Sons, Farnham, for sweet peas.

## Aberdeen and Northern Counties Sweet Pea Society.

Sweet pea cultivators and others interested in these flowers have much reason for gratification at the splendid success achieved on the occasion of the second exhibition of this society, which was held in the Music Hall Buildings, Aberdeen, on the 9th and 10th inst. Both in entries and quality of blooms the show was much superior to that of last year. Despite the atrocious weather experienced of late, the flowers staged were marvels of horticultural skill. There were over 200 entries, comprising upwards of 500 vases, apart from the bouquets, table decorations, and other sub-divisions, and of the latest and best, all were included. Mostly of the Spencer type, the professional sections included some exquisite vases of Mrs. H. Sykes, Barbara, F. R. Felton, Mrs. Routzahn, Edna May, Thomas Stevenson, Nubian, Charles Foster, Elfrida Pearson, etc. All were particularly notable for their large, finely-shaped petals, beautifully set on fine stems. The blue riband of the show, a magnificent silver cup presented by Lady Fleming, of Dalmuinzie, for the twelve best vases of waved sweet peas, was gained by Lady Burnett, Crathes Castle, Aberdeenshire (gardener, Mr. J. Petrie). The winning exhibit was one of particular merit, and evoked great praise. The varieties shown included R. F. Felton, Thomas Stevenson, Nubian, Elfrida Pearson, Charles Foster, and Edrom Beauty. Mr. Petrie was warmly cheered when he stepped forward to receive the cup. Lady Burnett was closely followed by Mrs. Dunbar Dunbar, Seapark, Forres (Mr. J. Grigor, gardener), whose splendid record in sweet pea culture has become famous throughout Scotland. The third place went to Mr. A. M. Williamson, Monboddo (Mr. J. Tullo, gardener). For six vases, Mrs. Dunbar Dunbar gained first place with an entry of exceptional merit, and in Class 3 this same lady quite outclassed her competitors. In the fourth class—three vases of novelties—Lady Aberdeen, Haddo House (Mr. J. M'Kinnon, gardener), had a capital win. Mrs. Dunbar Dunbar, was the principal winner in the fifth, sixth, and seventh classes, her lavenders, scarlets, and pinks having no compeers. For picotee-edged sweet peas, Mr. John Roy, Kingsford, Alford, Aberdeenshire, had a meritorious win.

In the amateur sections, the Rev. E. V. Kissack, Aberlour Orphanage, Banffshire, was the outstanding prize-winner. Mr. Kissack's flowers were exceptionally fine, large, beautifully-grown specimens, and, indeed, there was little difference to be observed from those shown in the professional classes. Mr. Kissack practically gained all the leading honours among the amateurs with the exception of that for best bunch of white sweet peas. Here Mr. James Mitchell, Arbeadie Terrace, Banchory-Ternan, could not be denied the premier place, his entry being composed of exquisite sprays.

The section devoted to floral decorations proved one of the most interesting in the show. Limited to ladies, and judged by ladies, it formed a delightful feature. In the class for dinner-table decorations, leading honours were obtained by Miss May Fleming, Dalmuinzie, for an exceedingly chaste display, the blooms used being creamy-pink, and all of one variety, interspersed with lovely sprays of gypsophila. The judges passed warm encomiums on the simplicity of the arrangement and the fine taste displayed. Mrs. Porter, Monaltrie Gardens, Ballater, Aberdeenshire, proved a very good second. Mrs. Sinclair, Wellbrae Terrace, Aberdeen, won for best bowl of sweet peas with an exquisite arrangement of mauves and lavenders, which were deservedly admired. This same lady also led the way for the best large vase, any two varieties, arranged with appropriate foliage. This was a much-admired entry, and was composed of lavenders and orange-pink. The baskets were remarkably well shown, premier place going to Mrs. Porter, Monaltrie Gardens, Ballater, for a really capital entry. For shower bouquets, composed of pink sweet peas, any foliage, Mr. J. D. Smith, 127, Union Grove, Aberdeen, won handsomely, the taste displayed being much admired. For lady's spray and buttonholes, Mrs. Porter had another meritorious win. In the best display of sweet peas, arranged for effect, some very fine work was shown, and the premier place was occupied by Mrs. Dunbar Dunbar, but Lady Burnett and the Earl of Aberdeen made a capital second and third.

Thanks to the arrangements made by the enthusiastic secretary, Mr. H. Sinclair, F.R.H.S., Union Street, Aberdeen, the show went splendidly, and to that gentleman no little credit is due for once again giving Aberdonians an opportunity of seeing what can be done, and is being done in the culture of the sweet pea in the north-eastern corner of Scotland.

## National Gladiolus Society.

This society held its chief exhibition on August 13 at the Royal Horticultural Hall, Westminster. Large numbers of superb spikes were exhibited, and eleven classes were arranged for them. So far as we could gather the classes were not arranged consecutively, or, if they were, some exhibits were moved as soon as judging was finished somewhat late in the day. Class cards indicating the particular class to which any exhibit belonged were conspicuous by their absence, and so we had great difficulty in preparing a report; we did our best, however, and can only hope that good luck has attended our efforts.

For two dozen gladioli, three spikes of each, the Messrs. Kelway and Son gained the gold medal, and here showed immense spikes and grand flowers of Edward VII., salmon-scarlet; Princess Louise, white and cream; King of Gladioli, scarlet; J. C. Craigie, salmon-pink and cream; Aldebaran, heliotrope and pale red; Mrs. Alfred Mond, white and cream, etc. Mr. W. Pfitzer, Stuttgart, gained the silver-gilt medal for two dozen varieties of gladiolus; Muriel, blush and blue; Goldquelle, yellow; Erica von Barczay, maroon; and Gastenbauinspector Fox, heliotrope, were capital varieties in this set.

Mr. Pfitzer had a silver-gilt Kelway medal for a group of gladioli, 12ft. by 3ft., and here staged some glorious spikes of varieties grouped in their colour shades, with a mass of the yellow Schwaben in the centre.

For a dozen vases of gladioli Messrs. Warnaar and Co., Sassenheim, scored with Baron Hulot, l'Immaculé, Willy Wigman, Sieger, America, and other good things.

Mr. Wilhelm Pfitzer, Stuttgart, gained the silver cup for two spikes of the best new seedling not yet in commerce, with the beautiful soft yellow Goldfinder, a lovely variety with a few red-brown marks towards the base of the two lower segments. Mr. E. Stewart gained a silver-gilt medal for Gladiolus Michigan, bright salmon-red, with red-brown markings.

A silver trophy was awarded to Gladiolus Golden Measure from Messrs. J. Kelway and Son, Langport; this appeared to be first prize for a yellow gladioli. A bronze medal fell to the same firm for the bluish-purple La Nuit, and this latter award appeared to be the second prize in the "blue" class. The best spike of a late-flowering pink gladiolus was Panama, soft silvery-pink, from Mr. W. F. Banning, U.S.A.; Evolution Perfection, a large pink with deeper stripes, from Mr. H. H. Groff, Canada, gained second prize.

The premier spike of a late-flowering, blue variety was a spike carrying six opened flowers of Badenia, a finely-formed gladioli to which we have recently referred; this was shown by Mr. K. Velthuys, Hillegom, Holland.

The premier group of late-flowering gladioli was unquestionably the handsome collection staged by Messrs. J. Kelway and Son, Langport, and in their collection they had grand spikes of Duke of Richmond, Prince of Orange, the pink Duke of Buccleuch, Western Glory, crimson, Purple Rod, and Brooklands, salmon. We believe this exhibit won the cup offered by Sir F. Burdett, Bart., the society's president.

The Dutch Gladiolus Society put up a splendid exhibit, and used asparagus freely with their spikes. Baron J. Hulot, violet; Princeps, scarlet; Badenia, bluish; Niagara, cream; Albion, white; Faust, crimson, were especially noteworthy.

## Royal Lancashire Show.

The horticultural section of this important exhibition was held in a large marquee in Moor Park, Preston, and proved one of the best shows in the county. The trade growers were present in strong force, and greatly augmented the quantity and materially enhanced the interest of the show.

### PLANTS.

The class for a group of miscellaneous plants, with the liberal prizes of £25, £20, £15, and £10, brought three competitors, and Messrs. J. Cypher and Sons, Cheltenham, secured the chief award with a tasteful arrangement. In this were kentias, crotons in grand colour, liliums, odontoglossums, and other subjects. Lælias were effectively utilised. Mr. W. A. Holmes, Chesterfield, was second, having good liliums, roses, and crotons. Mr. J. Sharp, Almondbury, third. In competition for the prizes for twelve stove or greenhouse plants, not less than seven in bloom, Messrs. Cypher again took the lead with a good all-round collection, having Kentia Belmoreana, K. Fosteriana, and K. australis, in especially fine form; especially meritorious also were Croton Queen Victoria, C. Warreni, Allamanda noblis, A. Hendersoni, Statice intermedia, S. profusa, Ixora Regina, Clerodendron Balfouri, and Chironia ixifera. For twelve stove or greenhouse plants in pots, not exceeding ten inches, Messrs. Cypher again occupied the post of honour with well-developed plants, including a fine specimen of Phœnix Robelina.

In the class for twelve plants suitable for table decoration, the prizetakers were Messrs. W. A. Holmes, Jas. Sharp, and Jas. Cypher and Sons. For six orchids, the last-named exhibitor again occupied the first place, having Lælio-cattleya Wellsiana, Epidendrum prismatocarpum, and Anguloa Clowesi; Messrs. A. W. Holmes and C. Parker, Preston, secured the remaining awards. For the best specimen, Messrs. Cypher led with Lælio-cattleya callistoglossa, and Messrs. Holmes and Parker were second and third.

### CUT FLOWERS.

These were staged in large numbers, and on the whole in fine condition. For the best table of cut flowers with a superficial area of 100 square feet, Mr. W. G. Eastham, Preston, was a splendid first; and Mr. W. J. Garner, Altrincham, and Mr. J. Saul, Preston, staged well for the second and third awards. In the class for one bride's bouquet, Mr. Garner led with odontoglossums, and Mr. Eastham was second. In the class for a ball-room bouquet, the prizes were awarded to Messrs. W. G. Eastham, W. N. Wood, and P. W. Heyes, Preston. The winners for a bouquet of roses were Messrs. P. W. Heyes, S. M. Wood, and W. G. Eastham. The prize-takers for a dinner-table decoration, from which orchids were excluded, were Mrs. J. Nixon, Miss Newsham, and G. F. Hallett; for the table, open, Messrs. W. J. Garner and F. Newsham were first and second; and for the table of sweet peas, Miss Newsham, Mrs. J. Nixon, and Miss Eastham were the successful competitors.

Sweet peas were well shown, and for eighteen vases, distinct varieties, Mr. W. Bond, gardener to J. Herron, Esq., Freshfield, gained the premier award, staging excellent flowers of Earl Spencer, Sunproof Crimson, Mrs. J. Unwin, Clara Curtis, and Mrs. H.

Dickson; Mr G. T. Hallett, gardener to Sir R. Graham, Bart., Carlisle, was second; and Mr. T. Hindley, Lymm, third. In the class for twelve vases, Mr. G. T. Hallett led, with Mr. T. Leadbetter, gardener to Mrs. S. S. Rigg, Bowdon, second; and for twelve vases, private growers only, Messrs. F. A. Robinson, Styal, and Mr. B. Birch were first and second. For a similar class for amateurs the winners were Messrs. R. Kellett, G. F. Hallett, and W. Bindloss, Formby.

Collections of hardy perennials occupying a space of fifteen feet by five feet, formed a good feature, and Messrs. Harkness and Sons, Bedale, occupied the first place with a most imposing display, the liliums and poppies being excellent; Messrs. G. Gibson and Co., Bedale, and Mr. J. Saul, were successful in winning the remaining prizes. For twelve bunches hardy flowers, trade excluded, Mr. R. L. Garnett led; and for a collection of tree carnations, Mr. C. F. Waters, Balcombe, won with a fine display; Mr. J. Hathaway, gardener to J. Brennard, Esq., Thirsk, was a strong second.

Roses were of great excellence, and for twenty-four, Messrs. Alex. Dickson and Sons, Newtownards, were easy winners with fresh blooms, Mr. G. Dickson and Earl of Dufferin being especially noteworthy; Messrs. G. Gibson and Co. second. In the class for twelve varieties, the same order was continued; and for twelve varieties, the trade excluded, Messrs. R. L. Garnett and E. Brooks were placed in the order of their names.

### FRUIT.

In competition for the prizes for a collection of twelve varieties, Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, led with excellent dishes of Muscat of Alexandria and Madresfield Court grapes, fine melons, Pine Apple nectarines, Barrington peaches, etc.; Mr. Hathaway was a close second with richly-coloured grapes; and Mr. A. Wright third. For two bunches of Black Hamburg grapes, Mr. Gibson won with well-finished clusters; Mr. Marr second. For two bunches of any other black variety, Mr. Gibson was again the principal winner with Madresfield Court, Mr. J. Hathaway second. For two bunches of Muscat of Alexandria, Mr. J. Hathaway obtained premier honours with fine bunches; and for two of any other white, Mr. Gibson was first with Foster's Seedling. Mr. D. McKelvie, gardener to J. Stone, Esq., was first in both classes for melons.

### VEGETABLES.

This proved the weakest section of the show. For nine distinct kinds, Mr. R. Moss, Preston, was first, and Mr. G. Barrow, Carnforth, second. For the collection of six kinds, Mr. G. F. Hallett secured the first prize in Sutton's class, likewise Messrs. Webbs' first prize for six kinds. Messrs. G. Barrow, R. Wright, J. Hathaway, and W. Wetherall had the premier awards made in their favour in the minor classes.

### NON-COMPETITIVE.

The executive were generous in their acknowledgements by awarding twelve gold medals. These were awarded as follows: To Messrs. C. M. Young and Co., Cheltenham, for a charming display of carnations; to Messrs. A. Dickson and Sons, Newtownards, for cut roses, including very fine blooms of G. Dickson and Edward Bohanne, a new variety, which was awarded a silver medal and certificate; to Messrs. H. B. May and Sons, Edmonton, for a choice display of ferns; to Mr. R. Bolton, Warton, for a large display of sweet peas; to Messrs. Dickson and Robinson, Manchester, for sweet and culinary peas (the latter including about sixty varieties, set up in cone form); to Messrs. Blackmore and Langdon, Bath, for tuberous begonias of high merit; to Messrs. Sutton and Sons, Reading, for a choice display of fruit and vegetables; to the King's Acre Nursery Company, for fruit trees in pots, well furnished with excellent fruit; to Messrs. Dickson, Brown, and Tait, Manchester, for a good collection of potatoes and onions; to the Lancashire County Council, for fruit trees, vegetables, etc., from their experimental grounds; to Mr. J. Saul, Preston, for a rock and water garden, well furnished with flowering and foliage plants, including a good display of water lilies.

Silver Medals were awarded as under: To Mr. H. Middlehurst, Liverpool, for sweet peas; to Mr. S. R. Crompton, Macclesfield, for violas and pansies; to Mr. H. N. Ellison, West Bromwich, for ferns; to Mr. W. Wright, Formby, for sweet peas; to Messrs. Castle Bros., Carnforth, for sweet peas; and to Messrs. Bolton Bros., Carnforth, for ferns.

## Dumfries Sweet Pea Show.

AUGUST 6.

For an opportunity of seeing a competition among sweet pea growers, and thus studying the progress in the sweet pea, the inhabitants of the Dumfries district are indebted to the Dumfries Agricultural Society, who again arranged an exhibition of these flowers in connection with their annual show. This was held at Dumfries on August 6, and proved quite a success, both in point of numbers and quality. Despite unfavourable weather, good blooms were the rule, and the exhibits would have done credit to a much larger show. In the class for professionals, Mr. C. Murray, Cowhill Tower Gardens, came first, with a close second in Mr. R. A. Grigor, Dalswinton Gardens, Dumfries. Mr. T. Carruthers, Cargenholm Gardens, Dumfries, was third. Some honorary awards were also given in this and the next class. In that for exhibitors who had not won a first prize, Mr. J. Smith, Netherholm House, Dumfries, came in first, with Mr. J. M. Wyllie, Cresswell Place, Dumfries, second; and Mr. Varney, Craigmorin, Troqueer, third. This exhibition seems to have quite established itself in the locality.

## OBITUARY.

### MR. WM. YATES.

Mr. Wm. Yates, head of the firm of Messrs. W. Yates and Sons, Cheltenham and Evesham, died at the end of July, after a long illness. He was 72 years of age, and was a seedsman of high standing. He took a keen interest in the production as well as the sale of seeds and was an exceedingly well-informed man. His two sons, Messrs. William and Stanley Yates, will continue the business, in which they have for some time been partners.

**The Double Pink Bramble.**—Given a dry and stony place, where but little else will thrive, this double-flowered bramble will hold its own, and, what is more, flower freely during the latter part of the summer. The individual flowers are very double and quilled, after the manner of a double daisy. From this feature it is sometimes known as Rubus bellidiflorus. Associated with choice subjects, it would be, of course, somewhat out of place, but for unfavourable spots it merits a note of appreciation.—W. T.

**Rhus cotinus.**—When furnished with its dense wig-like masses of inflorescence this, the Venetian Sumach, is not likely to be confounded with any other hardy shrub, as it is so perfectly distinct from them all. It is sometimes called the Burning Bush, and Smoke Tree, from the smoke-like character of its floral appendages when viewed from a distance. Besides the normal form, with its light reddish inflorescence, there is another, purpurea, in which the leaves are purplish, and the plume-like masses of a deeper tint than in the ordinary kind. This rhus will grow in hot, dry places better than many other shrubs, and in common with most members of the genus, the leaves die off in autumn very brightly coloured.—S. W.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

TRANSACTIONS OF NATIONAL CHRYSANTHEMUM SOCIETY. — A Thirty-five Years' Subscriber, St. Leonards-on-Sea: I shall much appreciate your kindness in informing me where I can obtain the "Transactions" of the National Chrysanthemum Society.—This publication can be obtained of the secretary of the society, Mr. R. A. Witty, 72, Savernake Road, Gospel Oak, N.W.

ANCHUSAS.—W. T. H., Suffolk: I much appreciate the beauty of the tall, free-branching variety of Anchusa italica, known as the Dropmore variety, and I should be much obliged by your informing me whether the form introduced from the Continent under the name of Opal is quite distinct from it. Some of my friends say that the two are quite distinct, but I have seen in some gardens plants which were supposed to represent the Dropmore variety and Opal, and failed to detect any great difference between them.—These two anchusas are perfectly distinct, and there should be no great difficulty in determining the points of difference. The Dropmore variety has deep blue flowers, while those of Opal are rather light blue, and the difference in the shade of colouring can be seen at a considerable distance from the plants. Probably your friends were under some misapprehension with regard to having both varieties. However that may be, there can be no question as to their distinctness, or the desirability of having the two in the same garden.

SPREAD OF WART DISEASE OF POTATOES.—W. M. B., Cheshire: With much regret I find that in one part of my garden my potatoes are attacked with the fungus causing the disease known as wart disease or black scab. Fortunately, a small proportion only of the tubers appear to be infected. I am naturally anxious to know whether the disease spreads rapidly, and what should be done to prevent it finding its way to other parts of the garden.—In reply to your first question we have satisfaction in being able to state that the wart disease does not spread with the same degree of rapidity as many other diseases to which vegetable crops are liable. Investigations of this disease have been conducted at the Harper-Adams Agricultural College during the past two or three years, and some interesting and useful results have been obtained. One of the experiments that have been made was carried out with a view to determine the point about which you require information. Briefly stated a piece of ground was purposely infected by removing at one place a cubic foot of soil and filling the hole then made with soil from an infected area. The whole piece was afterwards dug over, and potatoes planted to see how rapidly disease would spread from the centre of infection. It was found that it had only extended eighteen inches in the direction in which the soil was dug, while on the opposite side there was only a trace of disease on a plant nine inches from the infected soil. It was concluded from these results that the disease does not itself spread rapidly in the soil, but is soon spread over great areas by careless methods of dealing with affected plants, particularly the picking off of warty growths from tubers and throwing or leaving them about instead of destroying them, and the careless disposal of haulms from affected crops. In lifting the crop exercise the greatest care to ensure the whole of the tubers being removed from the soil and to separate every diseased tuber from those which are sound. The whole of the diseased tubers should be burnt, for if they are used for feeding pigs or other animals the spores will pass uninjured through the digestive system, and may, by means of the manure, be distributed over the garden, and infect those parts to which, as yet, the disease has not found its way. The haulm should be disposed of in a similar manner. No potatoes should be grown on the infected quarters for two or three years. It will also be advisable to limit the varieties grown to those which have been proved to be immune, notably Crofter, Chiswick Favourite, and White City among the maincrop varieties; Abundance and Conquest among the midseason varieties; and Snowdrop, Southern Queen, and Southern Star among the early varieties.

PLAGIANTHUS LYALLI.—M. B., Leicestershire: I have been much interested in the illustration and description of Plagianthus Lyalli, which appeared in the Gardeners' Magazine of July 27. The shrub certainly appears to be deserving of more widely-extended cultivation, and I shall in due course add it to my shrubbery border, or give it a place with some other choice shrubs against a warm wall. I shall be much obliged by your giving me the year of introduction, and stating whether you know of any really large specimens in the United Kingdom.—This species of Plagianthus was introduced from New Zealand in 1871, and, like several others of the beautiful shrubs from the same colony, requires a kind climate for their successful cultivation. Whether it would succeed in the open in the Midlands is rather doubtful, and we do not know of any specimens in that part of England which are so grown. The shrub may be successfully grown in the southern and western parts of England, and in some parts of Ireland, in the shrubbery border. In districts less favourable to plants that are not perfectly hardy it may be planted against a south or south-west wall with the prospect of considerable success. The largest specimen with which we are acquainted is the one in the gardens of Castlewellan Castle in co. Down, Ireland, the seat of the Earl of Annesley. This is about 15ft. in height, and rather more in diameter, and blooms with considerable freedom annually. One of the difficulties associated with the cultivation in this country of shrubs from New Zealand is their inability to withstand the effects of a severe winter. County Down is in the north-east of Ireland, but it is on the coast, and the temperature experienced during the winter months is greatly modified by the influence of the sea. In Leicestershire some very low temperatures are usually recorded during the winter months, and in consequence thereof the best results in the cultivation of Plagianthus Lyalli are likely to be obtained by planting against a warm wall, and giving a little protection during the coldest part of the winter.

SLOW RIPENING OF GRAPES.—L. S., Sussex: Owing to the low temperature that has been experienced of late, and the deficiency of sunlight, my grapes are not ripening so satisfactorily as I would wish. The Muscats, which are usually assuming a golden hue by the middle of August, are quite green. There are also signs of mildew in some of my vineries. What had I better do?—There is but one course for you to take and that is to use sufficient fire heat to maintain a temperature ranging between 70 and 75 degrees, and ventilate freely. It is a rather common practice to allow the temperature of vineries to drop during periods of cold, dull weather at this season of the year, and to greatly reduce the ventilation for the purpose of husbanding what little warmth is derived directly from sun heat, but this is a mistake. Grapes, with but few exceptions, cannot be brought to such a degree of maturity as will ensure their distinctive flavour being fully developed, and also keeping well after they have ripened. Therefore, when the warmth of the sun is deficient, the deficiency must be made good by the use of additional artificial heat. The closing of the ventilators during cold periods for the purpose of husbanding the warmth is usually followed by an attack of mildew that does considerable damage. When the artificial heat is brought into requisition ventilate sufficiently to maintain a dry and buoyant atmosphere. Gros Colmar cannot be ripened properly without the assistance of a brisk temperature, and the sparing use of artificial heat at this season is one of the causes of the indifferent flavour of this grape of which we hear so much.

FASCIATED ASPARAGUS. — Mr. W. Goddard, Holly Bank, Hunton Bridge, King's Langley, has kindly sent us a photograph of an interesting case of fasciation, which has occurred in his asparagus bed. The fasciated stem, he informs us, attained a height of 6ft., and was about two inches in breadth. The stem was forked at the apex, and, as is usual in such cases, the side shoots were arranged at right angles to it. Such cases of fasciation in asparagus are rather common, several specimens reaching us every year, but they are nevertheless very interesting, and we appreciate Mr. Goddard's kindness in giving us an opportunity of seeing the photograph.

POETAZ NARCISSI.—H. D., Southampton: We have usually grown a considerable number of the polyanthus narcissi for conservatory and house decoration, and they have invariably been much appreciated, although my employers would prefer them with a less pronounced fragrance. The varieties that have of late obtained promi-

Time's all but up!

August 23rd is the last day for sending in entry forms and coupons for the Guaranteed Gardenalities Show. :: The Show opens on the 28th.

**You have just time**

to get a coupon out of a tin of Carmona and a Schedule from Robinson Bros., Ltd., and lodge your entry form.

**You never had a better chance**

to win a substantial money prize. £350 is divided between four Sections especially provided for (A) All Comers; (B) Amateur and Single-handed Gardeners; (C) Allotment and Cottage Gardeners; (D) Market Gardeners.

**The best money prizes offered anywhere in the Kingdom.**

The opportunity of one or more is still open—until the 23rd. Time's nearly up.

**Enter at once——send your entry for the**

*IS THE LAST DAY*

Address your application and your forms to ROBINSON BROS., LTD., WEST BROMWICH, STAFFS.

nence under the designation of poetaz narcissi appear to possess much merit, and are not so strongly scented. Would you advise me to grow the latter instead of the older forms?—We should not recommend you to discontinue the culture of the old bunch-flowered narcissi and substitute the poetaz narcissi for them until you have ascertained from your employers that it is their wish that this should be done. They will be in a better position to give their decision when they have seen the two classes in bloom and arranged within a short distance of each other. We consider the poetaz varieties as distinctly superior to the others, for they have larger and more finely-formed flowers, and they have a pleasant but not an overpowering perfume. They have also the advantage of being quite hardy, and they can be successfully grown in moss fibre for house decoration, as well as in the ordinary compost. Alsace, Aspasia, Elvira, Irene, Klondyke, and Triumph are all of much merit, and afford a full range of colour. Jaune à Merveille is an exceedingly fine variety, but as yet it is too expensive to be grown in quantity.

ANTS IN LAWN.—N. C. B., Handsworth Wood, Birmingham: Could you kindly give me any information that will help me to get rid of ants in lawn? We have tried almost every remedy we can think of, but without success.—Ants are very troublesome pests to get rid of when they have become established in large numbers on a lawn. Petroleum poured into their nests will quickly dislodge them, as also will a decoction of quassia chips and a solution of alum. We have within the past few years adopted the following method with success in dealing with an ant-infested lawn. When it is seen where the nests are located pieces of old virgin cork are laid over the nests, rough side downwards. The ants congregate in immense numbers under them, and on lifting up the pieces of cork the ants, with their eggs, can be readily swept into a pail of hot water, and thus made an end of. The pieces of cork should be taken up every second day for the purpose of drowning the ants that have congregated under them, but they should not be disturbed in the interval.

| Lincolns | per cwt. | 3 | 9 | | 4 | 6 |
| Blacklands | per cwt. | 3 | 0 | | 3 | 9 |

## TRADE NOTE.

Messrs. Jas. Kelway and Son, Langport, have enriched our gardens with many beautiful varieties of a number of useful flowers, and among the latter their gladioli must be given a very high position. The firm has staged several remarkably fine exhibits of these stately flowers recently, and a few days ago they sent us a few spikes, each a yard long and carrying fine flowers. Some of the most striking varieties were Carlton, crimson; Velocity, warm salmon-red; Sir H. D. Wolff, brilliant scarlet; Captain Clive Coates, salmon-pink; and Aviator, rosy-lilac, prettily veined with pink.

## FORTHCOMING ENGAGEMENTS.

TUESDAY, August 20.—Aynho Flower Show.

WEDNESDAY, August 21.—Shrewsbury Floral Fête; two days.
Hatherley and Reddings Horticultural Society.
Caerphilly Summer Show.

Spraying
The question to-day is not "Shall we Spray," as every gardener knows he must Spray, but "What machine or syringe shall I spray with?" All the world answers, Use only the reliable tested "FOUR OAKS" which have won 30 Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, 45/-. No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—THE FOUR OAKS SPRAYING MACHINE CO., No. 3 G, SUTTON COLDFIELD.

**NEW DEPARTURE IN FERTILISERS.**

## "CRESCENDO" FERTILISER CABINET.

**NEW FEATURE I.**—Artificial manures for different purposes, supplied in separate bags.

**NEW FEATURE II.**—Entirely soluble. A pinch in the watering-can daily. No trouble of mixing with the soil.

**NEW FEATURE III.**—Instantaneous action. Effects quickly visible. No waiting.

**NEW FEATURE IV.**—Opportunity for experiment with separate substances. (See directions.) Every garden, every greenhouse, may become an experimental station.

**NEW FEATURE V.**—The most highly-concentrated Fertilisers offered. Each 1s. 6d. cabinet makes 120 gallons of plant food. They **cannot be sold in mixture,** as they spoil one another. The Fertilisers are those employed by the greatest scientific horticulturists, and they are the prescription of a Fellow of the Chemical Society.

**NEW FEATURE VI.**—A substance is included for sweetening the soil, liable to be soured by artificial manures.

**NEW FEATURE VII.**—A Free Box to every customer who introduces five other new customers. (See Directions in the cabinet.)

The "Crescendo" Cabinet is supplied for 1s. 6d., post free, direct from the makers only.

Send P.O. for 1s. 6d. **now,** to

**"CABINET FERTILISERS,"**
**4, Hill Road, Wimbledon, S.W.**

## MERRYWEATHERS'

**"VERY BEST"**

## Watering Hose

FOR GARDENS, LAWNS, &c.

MERRYWEATHERS'
"VERY-BEST"
LONDON.

Made on the lines of Fire Engine hose, therefore good for hard wear and long life. Customers find it good after 10 years' use.

*Beware of cheap and flimsy imitations.*

**Write Merryweathers', 63, Long Acre, London, W.C.**

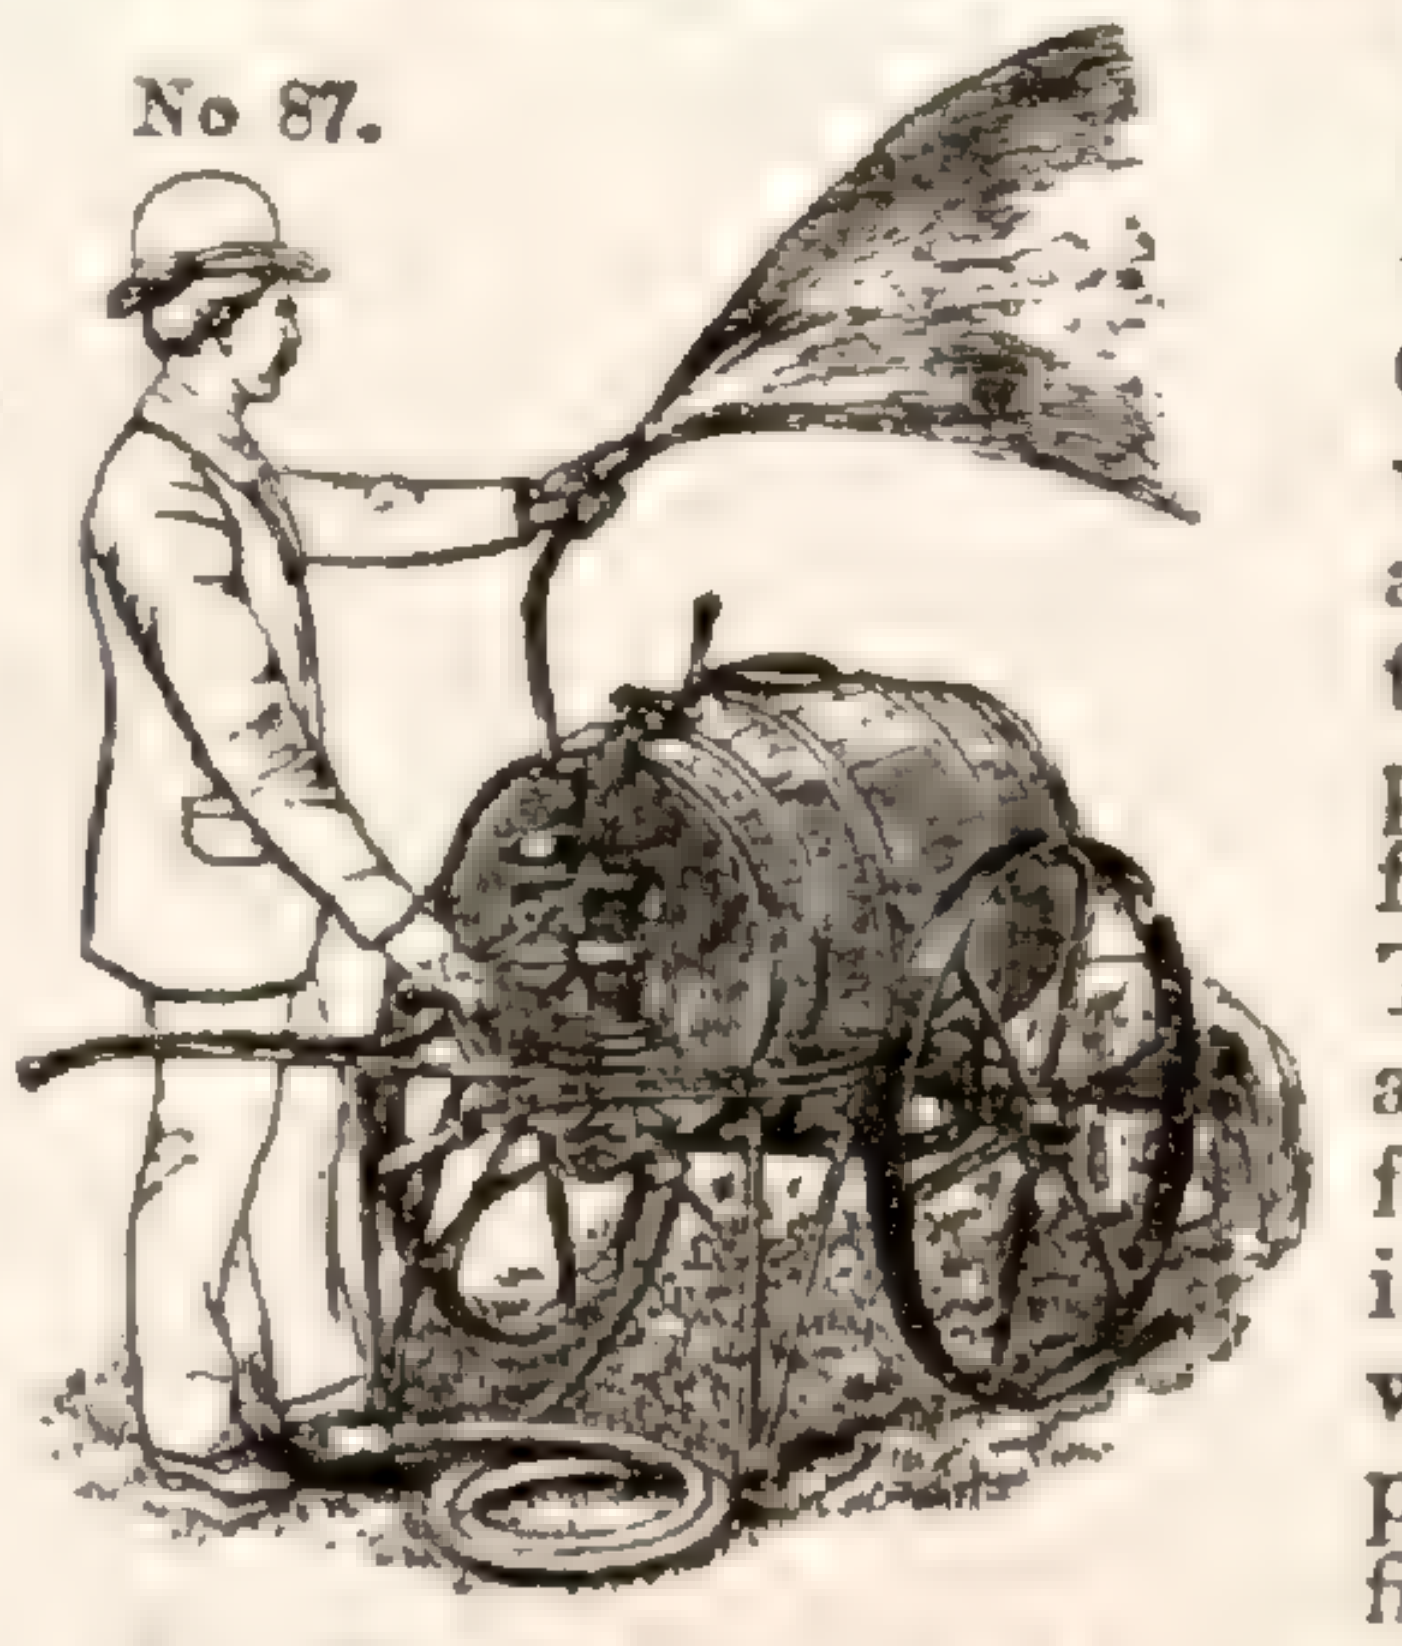
**REDNALL'S INSECTICIDE**

An ideal spraying fluid for the Garden and Greenhouse. Instant death to all Aphides, Red Spiders, Scale Insects, Thrips, Mealy Bugs, Ants, Caterpillars, etc., but absolutely non-injurious to plant life. Non-poisonous, pleasant odour, no trouble to prepare, mixes readily with cold water. Trial bottles, 9d., post free; quarts, 2/6; gallon, 7/6 (carr. paid.) Rednall, Chemist, Wokingham. Agents wanted.

## An Indispensable WATERING MACHINE

**FOR LAWNS & LARGE GARDENS**

No 87.



A most valuable implement, and very complete. Can be used for watering lawns and paths, or destroying garden pests on rose or fruit trees. Throws water a distance of 60 feet. Oak barrel, iron frame, steel wheels, well painted and finished.

No. 87.—CASH PRICES.—CARRIAGE PAID.
To hold 36 gallons, with Galvanized Spreader, Pump, and 10ft. of Suction Pipe, complete **£6 0 0**
Without Pump ... ... ... ... ... **4 8 0**

**FOR NURSERYMEN.**

No. 87A SPRAYING MACHINE, as above, but fitted with extra powerful pump, and automatic arrangement for keeping insecticide preparations well mixed during use:—

No. 87A.—CASH PRICE—CARRIAGE PAID.
To hold 36 gallons, with Galvanized Spreader, Pump, and two ⅝in. delivery hoses, each 6ft. long, with Spreaders ... ... Complete **£8 16 0**

Write for Catalogue No. 153A, showing other Machines, Hose and Hose Reels, Water and Liquid Manure Carts, Garden and Sanitary Barrows, etc.

**BOULTON & PAUL, Ltd.,**
**NORWICH.**

## ONTARIO

(CANADA).

**FARMERS and FARM HANDS WANTED.**—To any qualified man willing to work on the land employment is guaranteed at good wages. Domestic Servants are in great demand (wages £2 to £4 per month).

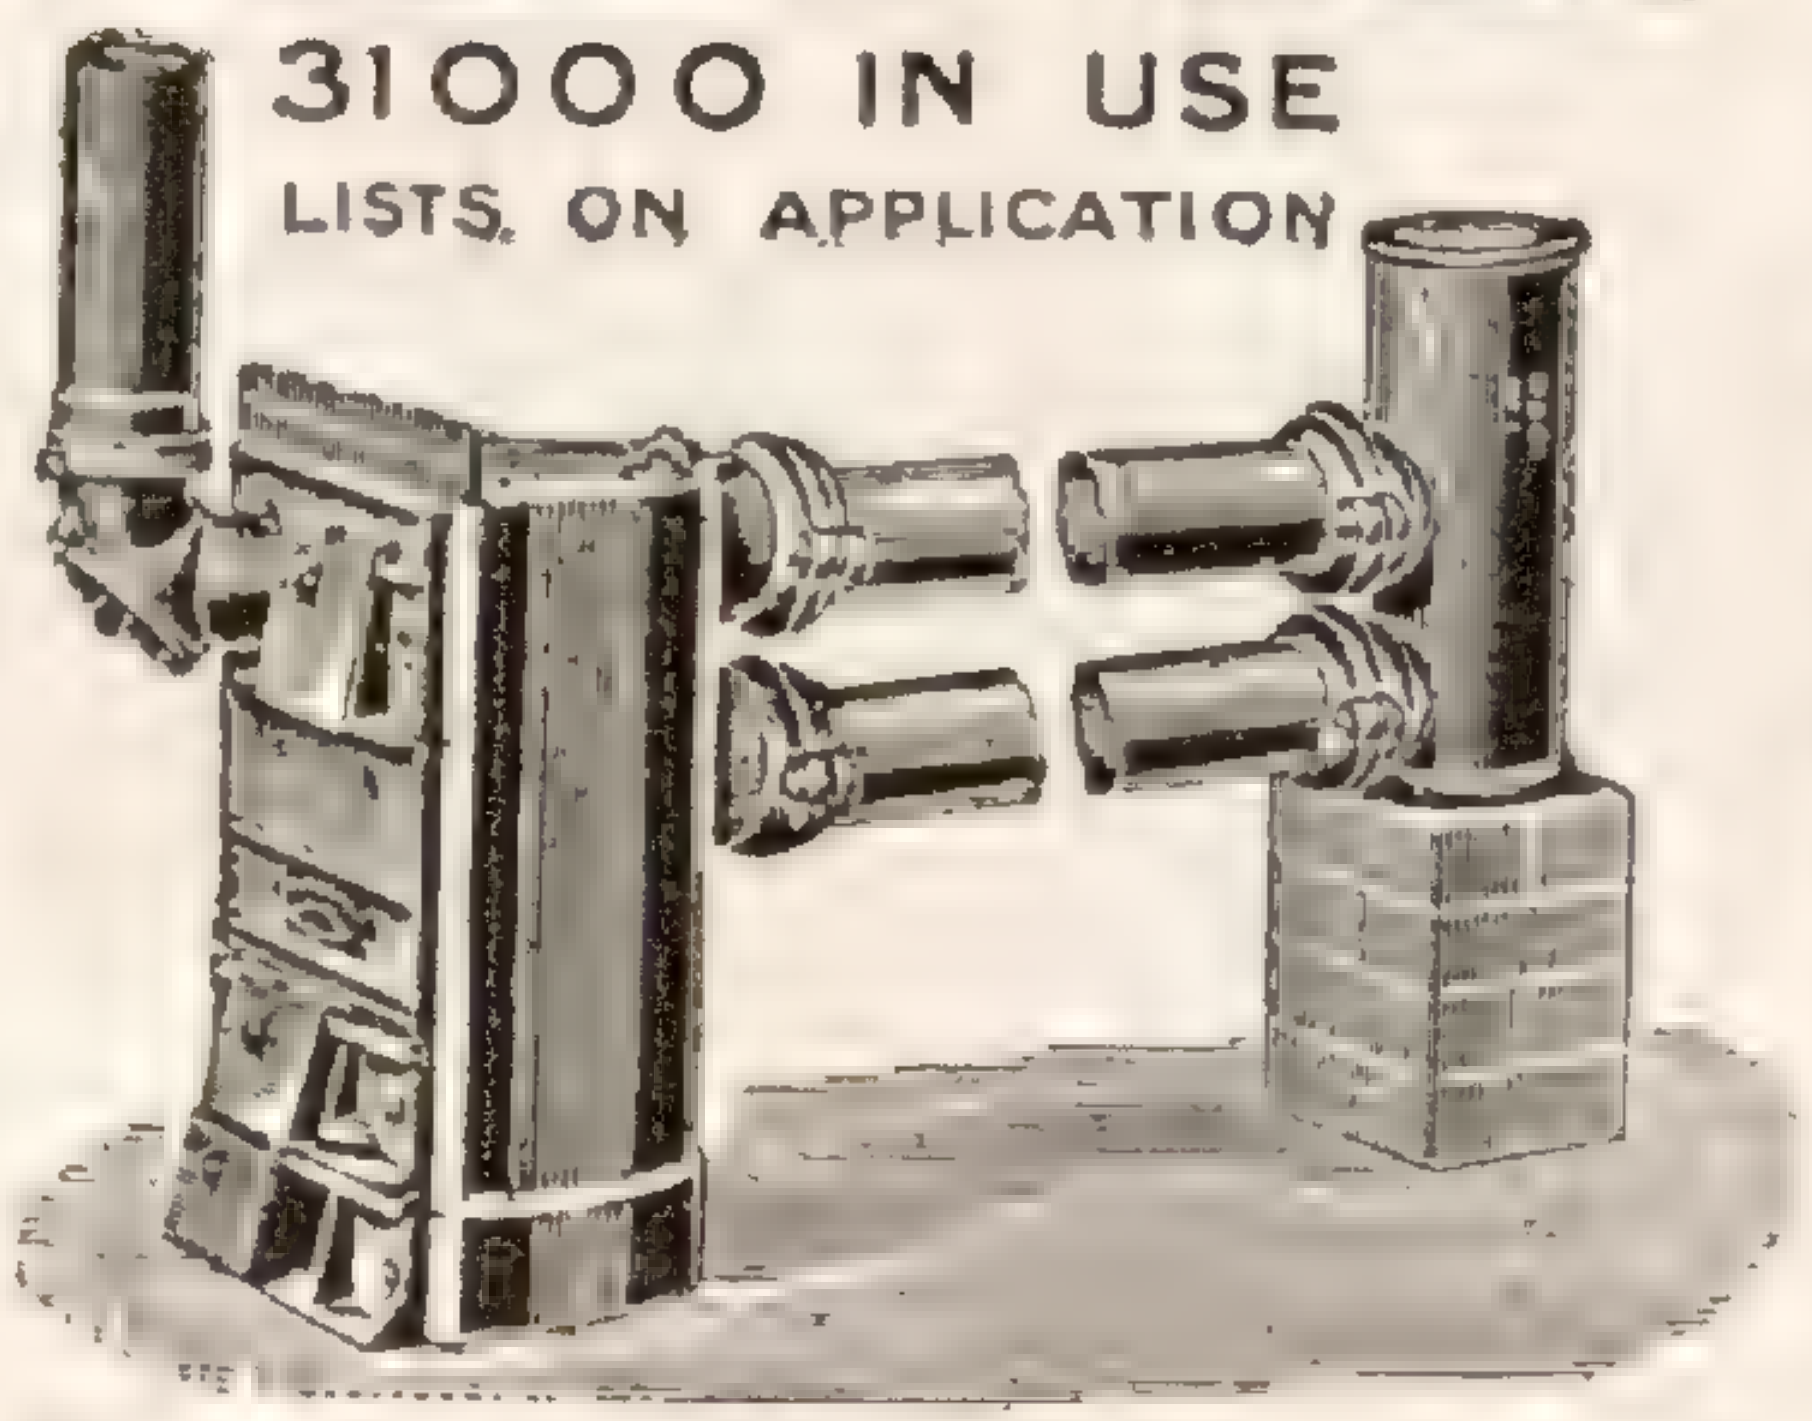
Ontario produces ⅓ to ½ of the Field Crops of all Canada, ⅔ of the Fruit and ⅔ of the Dairy Produce. **In 1910 the Grass and Hay Crops of Ontario were worth more than the entire wheat crop of all Canada.**

Twenty million acres of Crown Land waiting for settlement. Write—

Mr. N. B. Colcock, Ontario Government Agent,
163, Strand, London.

## The Loughborough BOILER

31000 IN USE
LISTS ON APPLICATION



The pioneer of cheap, simple and effective heating for small greenhouses. Complete Apparatus from £3.19.6. The immense sale of this boiler, and its numerous imitations are the best testimony of its undoubted success.

THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Nomenclature of British Ferns.

MR. CHARLES COMFORT.

Although we are not in sympathy with the views of those who would abolish scientific names from the literature of the garden, and substitute for them so-called popular designations, of which but a small proportion of plant lovers have any knowledge, and which, in some cases, would be more difficult to remember than those of a scientific character, we hold a strong opinion as to the importance of simplicity in the nomenclature of plants. The more simple the names of both genera and species, provided they are in other respects satisfactory, the better. In the first place, such names impose less strain on the memory, and the linguistic powers of cultivators, than do those that are more or less cumbrous, and, in the second, the plants are more quickly distributed over a wide area, provided they possess sufficient merit to obtain the attention of the general body of cultivators. It is not difficult to understand why plants bearing names that are at once distinctive and simple should become well known within a short period of their introduction, when it is recognised that before a plant can attain to any considerable degree of popularity it must be freely talked about, and before this can be done the name must be such that it can be readily remembered and pronounced. The opinion is held by some that the name has but little effect on the popularity to which a plant may attain, and if contrary views are expressed they will probably ask, with Shakespeare, “What is in a name?” and possibly may adapt his answer to this question, and suggest that “A rose by any other name would smell as sweet.” Such answer to the question is, of course, perfectly correct, for a name, however cumbrous it may be, will not in the smallest degree lessen the fragrance or reduce the charm of the colouring of the flowers. The point to consider, however, in discussing the question of the influence of names upon the popularity of plants is not whether they will affect some attribute, but whether a particular method of naming is conducive, or otherwise, to the plants becoming popular in proportion to their relative merits. We have no doubt that names have a considerable influence upon the future of plants, and proofs are by no means wanting in connection therewith. We have especially in our mind at the present time the nomenclature of British ferns, which, from the earliest days of the cult, has been so far unsatisfactory as to have proved a hindrance to their attaining the position in the garden their merits would warrant. We learn from the report which was published in our issue of the 17th inst. that the society formed a few years since in the interest of those who fully appreciate the ferns indigenous to the British Isles has now assumed proportions that would justify work of a more serious character than that in which it has hitherto engaged. We suggest the society should give the most careful attention to the nomenclature of the varietal forms, with a view to affecting such revision as would result in its simplification. At the present time, as, indeed, during the past half-century or more, the varieties of which a large proportion are of exquisite beauty, are shut out of many hundreds of gardens because of the cumbrous, and to many unintelligible, names that the past and present authorities have thought proper to give them. The authorities have been consistent in their method of naming from the earliest days of the cult until the present time, but the method was not a good one. Latin names have been given throughout, and, with the addition of immense numbers of varieties and sub-varieties, the nomenclature has become increasingly difficult. To those who have a representative collection, and devote much of their spare time to it, the Latin names have the simplicity of the first three letters of the alphabet. But it should be borne in mind that these plants, in their marvellous diversity of form and wondrous beauty, should not be confined almost exclusively to the gardens of experts, but should take their place in all gardens in which hardy plants are grown and appreciated. This is a consummation much to be desired, but highly improbable until a reform has been effected. To the expert such names as Athyrium filix-fœmina congestum minus cristatum, Lastrea pseudo-mas crispa cristata anguslata, Polypodium vulgare cornubiense trichomanioides, Polystichum aculeatum hybridium aculeato cruciatum Lowe, P. angulare acutilobum proliferum Allchin, and Scolopendrium vulgare limbospermum cristatum, will be easy enough. Not so to the majority of the owners of gardens, who shrink, and not unnaturally, from such names, and exclude the ferns from their gardens because of the burden laid upon them by their sponsors. We have during the past twenty years striven to extend the cultivation of the British ferns, and the progress the cult has made during this period is largely due to our endeavours. We have also discussed their merits with our personal friends, and on more than one occasion have been told there was but little interest associated with the cultivation of plants having names that render it difficult, if not impossible, to talk about them with one's friends. We commend this point to those who consider the existing system all that could be desired, for it is one worthy of attention. To state a case in favour of reform is one thing, but to show how a reform may be effected is another matter, and is frequently beset with difficulties not readily surmounted. In this case there does not appear to be an insuperable difficulty in making a change of a most beneficial character. Twenty-five years ago the daffodil began to obtain prominence as a garden flower, and numerous varieties were being introduced under Latin names. Happily, the undesirability of such a method of nomenclature was recognised by some of the leading experts, and the matter was brought before the conference held by the Royal Horticultural Society, April 1, 1884. The matter was discussed, and at the close of the discussion a resolution adopted to the effect that garden varieties of narcissi, whether known hybrids or seedlings, should be named or numbered in the manner adopted by florists, and not in the manner adopted by botanists. The resolution was accepted by all concerned, and the varieties that had received scientific names were renamed, and the new system adopted in the case of subsequent varieties. What was so satisfactorily accomplished with the daffodils might surely be also done with the British ferns.

---

**Mr. Charles Comfort,** whose portrait we have the pleasure of giving in this issue, has long occupied a prominent position among the practical horticulturists of Midlothian, and is esteemed not less for the services he has rendered in the cause of horticulture than for his commanding ability as a gardener. Commencing his horticultural career as an apprentice in the gardens at Dalvey, near Forres, the seat of the late Norman McLeod, Esq., Mr. Comfort passed through, in the course of his training, the gardens of Aberlour, Banffshire; Donibristle, Fifeshire, one of the seats of the Earl of Moray; and Goodrest, near Reading. He then received the appointment of head gardener at Raasay House, Isle of Raasay, Inverness-shire, then the property of the late George Grant Mackay, Esq., and remained there five years. The gardens and grounds of Raasay House are extensive, and are remarkable for the magnificent hedges of Fuchsia Riccartoni, also for the single specimens of this fuchsia, which range up to fourteen feet in height, and are as much in diameter. The hydrangea, eucalyptus, and some other plants with a similar constitution, prove quite hardy. During the five years Mr. Comfort had charge of these gardens he carried out several improvements, not the least important being the planting of large numbers of the finest hybrid rhododendrons. In 1879 Mr. Comfort was appointed head gardener to the late W. H. Haig, Esq., at Cameron House, Windygates, Fife, where he laid out a considerable extent of pleasure grounds, and constructed a large rockery. Mr. Haig having acquired Broomfield, Davidson's Mains, Mr. Comfort accompanied him there at the end of his second year, where he has since remained. During the thirty-one years Mr. Comfort has had charge of the Broomfield gardens he has carried out many alterations to adapt them to the requirements of his employers, and, among other things, he converted the old kitchen garden into a mixed garden with roses of all classes, herbaceous plants, half-hardy annuals, dahlias, gladioli, and bearded irises. He has also planted ornamental trees and shrubs extensively, and the glasshouses have been erected under his direction. Mr. Comfort has been a member of the Scottish Horticultural Association for upwards of twenty years, fourteen years as a member of council. During this period he filled the presidential chair, and was three times a vice-president. Three years since he was elected, in recognition of his services, a honorary life member. Mr. Haig, who died in 1884, evinced the greatest interest in the gardens, and Mrs. Haig takes a great pleasure in them. Mr. Comfort attributes much of the success he has achieved to the encouragement he has received from his employers.

**"Gardeners' Magazine" Bulb Number.**—We have much pleasure in informing our readers that our next issue (August 31) will be chiefly devoted to bulbous plants that flower during the spring season. The contents will include articles on the value of spring-flowering bulbs, the newer daffodils, inexpensive daffodils for exhibition, hyacinths in the flower garden, choice bulbous flowers for indoor decoration, May-flowering tulips, lilies for general culture, spring-flowering bulbous plants for massing, and bulbous iris. The number will be profusely illustrated.

**Northern Counties Fruit Congress and Show.**—On September 4 and 5 a fruit congress and show will be held by the North of England Horticultural Society, at Carlisle, in conjunction with the annual exhibition of the Carlisle and Cumberland Horticultural Society. The congress will be held in the Arcade Room, adjoining the markets, and the Speaker of the House of Commons will perform the opening ceremony at 2 p.m. on September 4. The following is the programme: Wednesday, September 4, 4.30 p.m., Demonstration in the bottling of fruit, by Mr. J. S. Chisholm; 5 p.m., Paper on "Soils, in Relation to Fruit Growing," by Mr. G. P. Berry; 7.30 p.m., Paper on "The Washing and Spraying of Fruit Trees as a Means of Combating Insect Pests and Diseases," by Professor F. V. Theobald. Thursday, 3 p.m., Demonstration in the bottling of fruit, by Mr. G. P. Berry; 5 p.m., Paper on "Canker and other Bark Diseases of Fruit Trees," by Mr. F. J. Chittenden; 7.30 p.m., Demonstration in pruning fruit trees and bushes, by Mr. Chisholm. Spraying demonstrations will be given by various firms during the mornings of the 4th and 5th prox. in the Victoria Park.

**American Gooseberry Mildew in Kent.**—American gooseberry mildew has spread so freely in Kent during the present summer that large areas under gooseberry culture that were previously free have become affected with this destructive disease. A report of the extension of the disease was submitted to the recent meeting of the Kent County Council, and in this report it was stated that the disease reappeared this year in its summer stage on April 19, and spread so rapidly that when the inspectors reported on July 6 1,773 acres were already known to be affected. The committee added: "The discouraging feature of this year's outbreak is that the disease has already appeared in sixty-seven fresh plantations. In one district where the disease has hitherto been restricted within narrow limits 200 plantations have been already attacked. Much of the fruit has been attacked, and growers have not always been successful in excluding the diseased berries from their market consignments. It is advisable that for the protection of next year's crop growers should at once cut out and destroy all infected shoots." During the subsequent discussion it was stated that the disease had even made its appearance in one of the plantations attached to the Wye Agricultural College. The majority of the Council were of opinion that much more drastic measures than have been hitherto adopted would have to be enforced.

**Floral Portraits.**—The portraits of the King and Queen, which have been produced with the aid of coloured leaves and flowers in the South Park, Darlington, are now attracting much attention from visitors. The beds containing the portraits are circular in shape, and the portraits are set in a light ground-work. We admire the loyalty and the perseverance displayed by Mr. J. Morrison in carrying out such difficult arrangements, but we have no sympathy with this particular style of gardening.

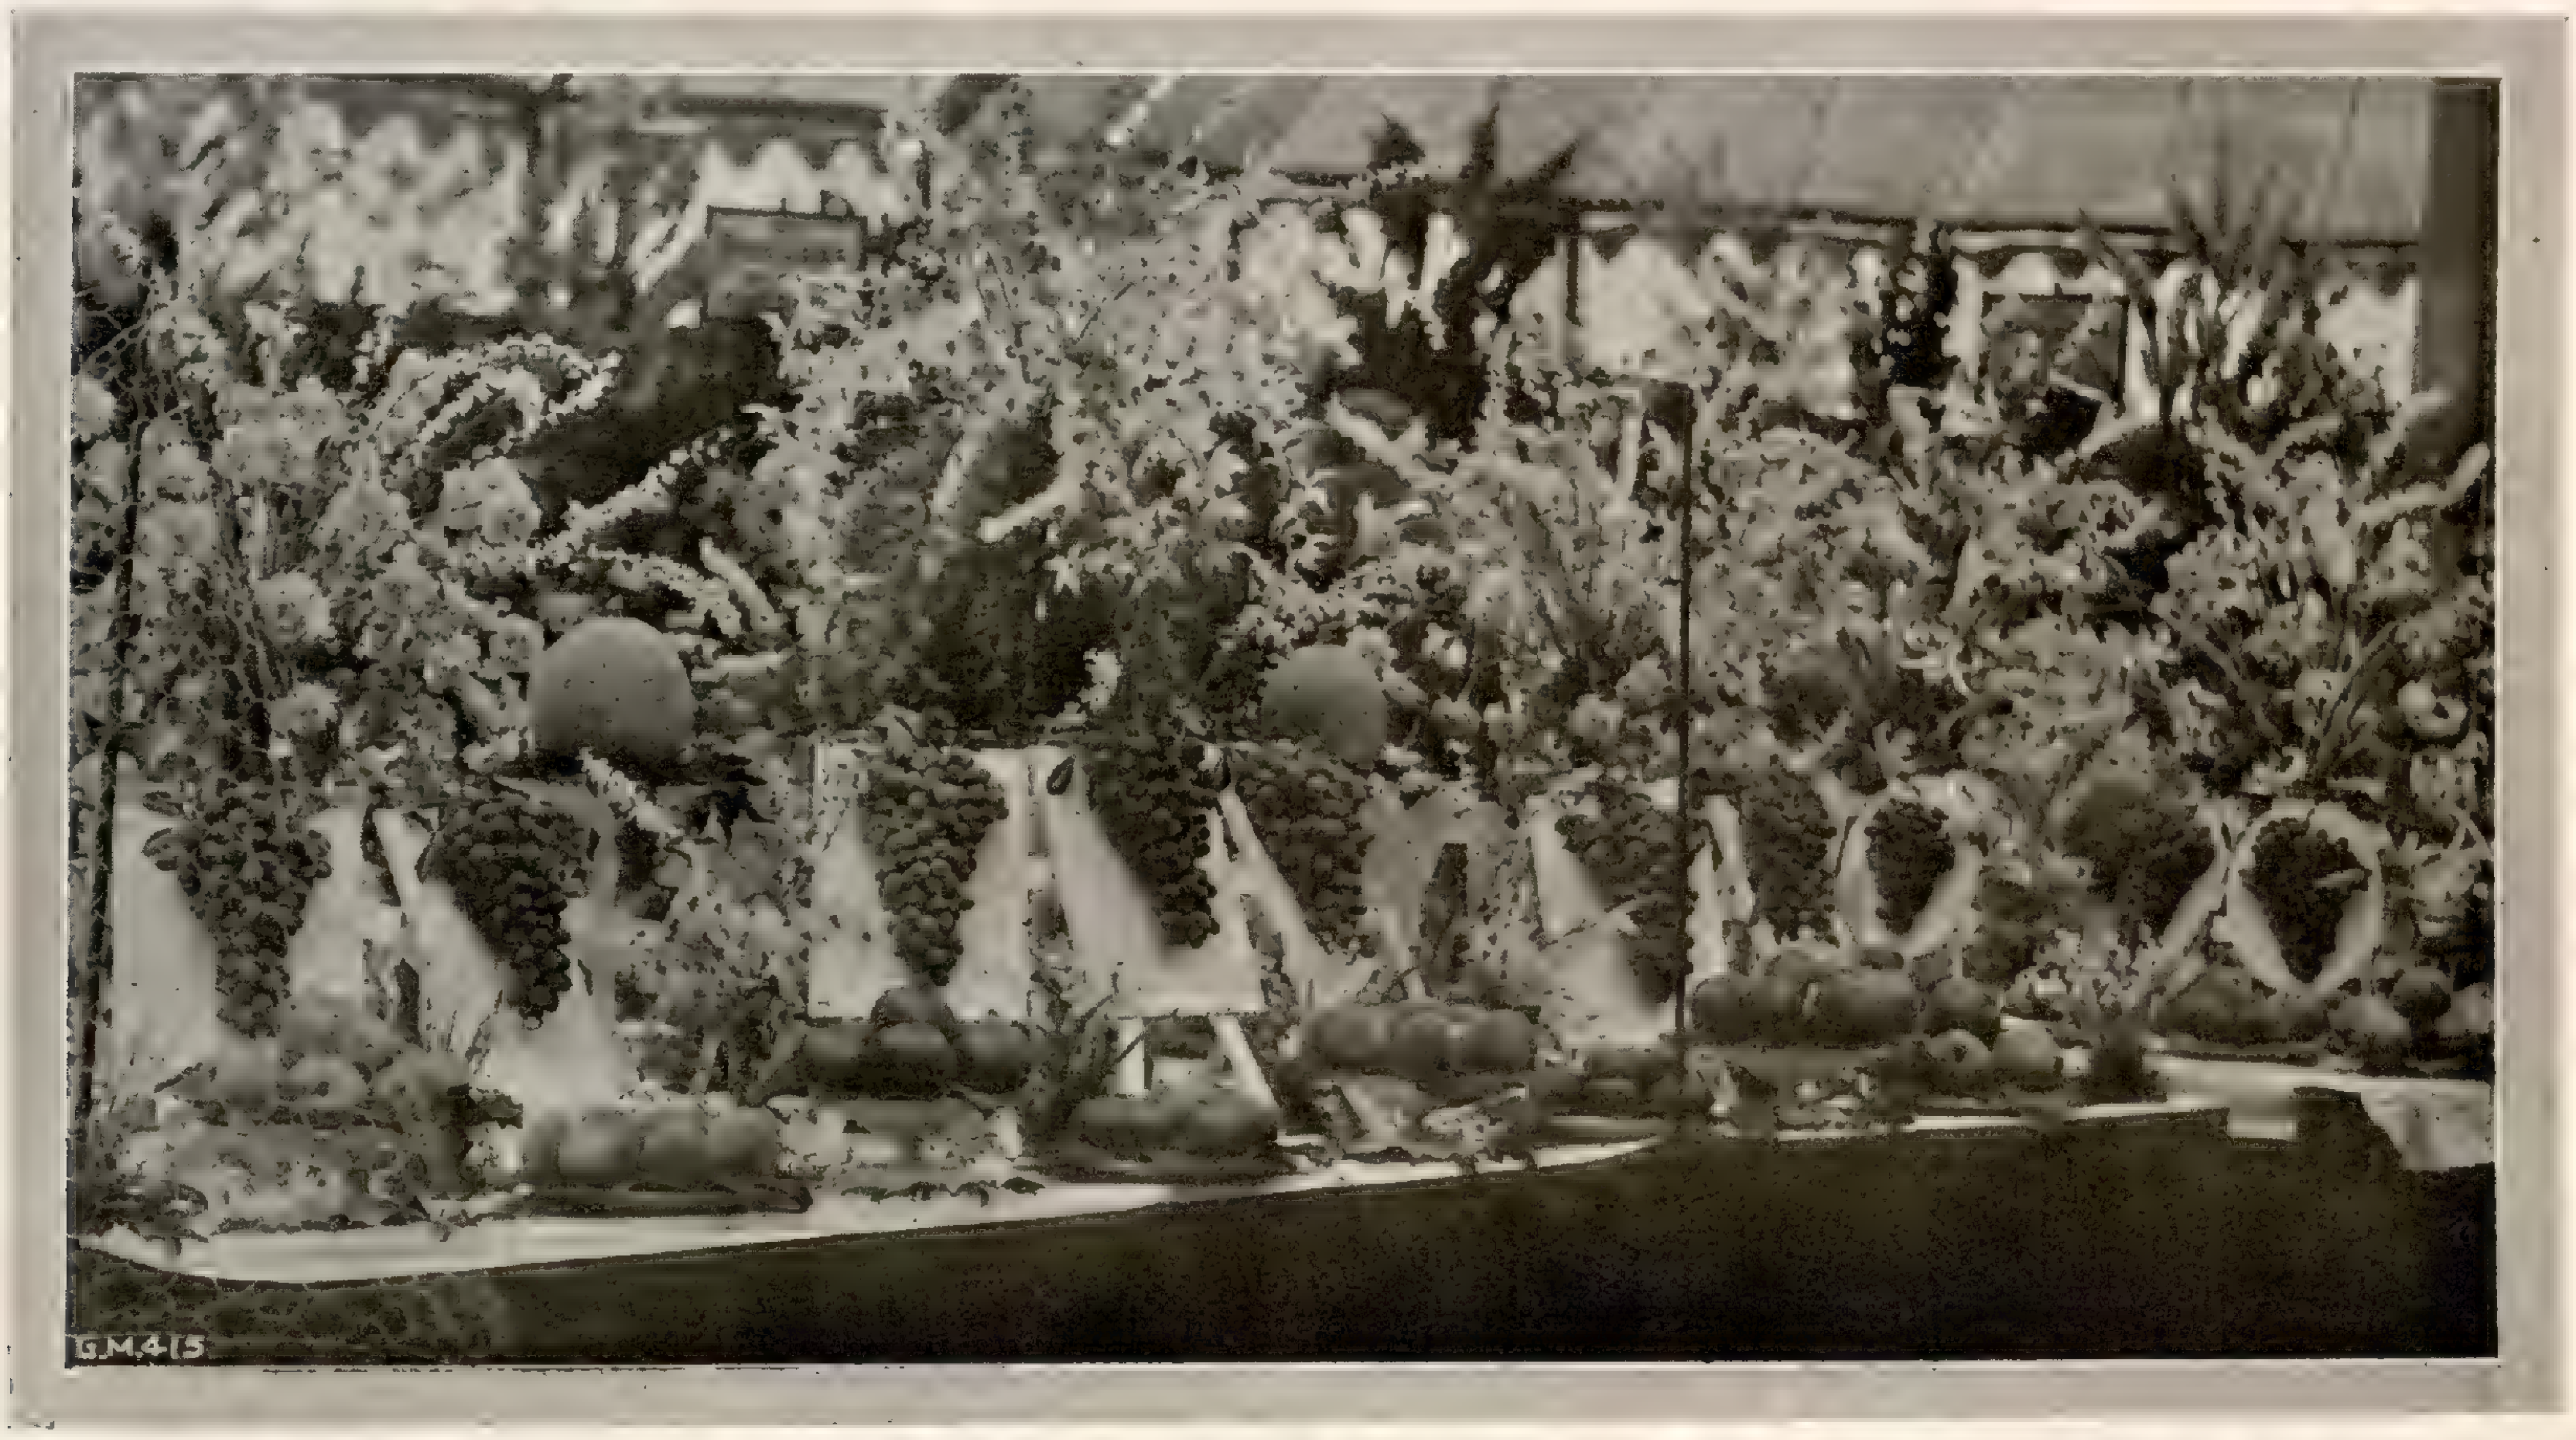
**The Weather in the North.**—Writing under Saturday's date, 17th inst., our Aberdeen correspondent says: A journey into the rural parts of the north of Scotland at present reveals a sad state of affairs. On every side one sees the effects of the unseasonable weather. In place of the acres of waving corn, gradually ripening to a golden hue, there are rain-saturated stretches of land, the crops on which have been much laid by the wind and rain that have for many weeks now been mercilessly beating upon them. The sowing of the crops this year took place in almost ideal weather, and all went well with the husbandman for a time. The grain crops came away very promisingly, and a month ago the farmers, accepting the fact that they would have a late harvest, were nevertheless looking forward to a successful issue. Then entered an August the like of which has not been experienced in the North for twenty years, and one that all sincerely hope will not be experienced for a similar period at least. Wind and rain became the order of the day, blighting the crops and the farmers' hopes at the same time.

**The King's Visit to Abbeystead.**—The King is visiting Abbeystead, the seat of Lord Sefton, near Lancaster; and, on his return from Lancaster to-day, the railway station will be elaborately decorated with flowering and ornamental plants. Messrs. Herd Brothers, nurserymen, of Penrith, have been commissioned to carry out the decorations, and the ornamentation of the platforms and corridors will be carried out in groups and panels of specimen palms, and ferns, fine-foliage, and flowering plants in great variety.

**National Dahlia Society.**—With the approach of the dahlia season, this society is resuming its activities, and on Tuesday next it will co-operate with the Royal Horticultural Society in making its awards to new dahlias. A joint committee has been formed by the combination of given numbers of the members of the Floral Committees of the two societies, and this committee will sit at the Horticultural Hall on Tuesday next, and proceed to consider the merits of novelties at 11.15 a.m. This committee will also sit on the occasion of the two September meetings of the Royal Horticultural Society. The annual exhibition of the society will be held at the Crystal Palace on September 17 and 18; and, as the dates are rather later than usual, they appear to be well suited to the incidence of the season, and a remarkably fine exhibition may be anticipated.

# SHREWSBURY FLORAL FETE.

"Better than ever," was the general verdict upon the Shrewsbury Floral Fête of 1912, held in the Quarry Grounds on Wednesday and Thursday, August 21 and 22. The specimen plants were grand examples of the highest cultural skill; grapes were good, though not superlatively so; groups were excellent, and cut flowers extremely beautiful and good; choice dessert fruits were displayed splendidly, but there seems need for some slight alteration in the schedule specification, for at present it is quite possible for a competitor to win or lose in the decorated dessert fruit table class on his flowers and decoration alone; indeed, it is possible for a man to win the first prize, and yet stage fruit several points inferior to that of his opponent. The show was altogether worthy of the old Salopian town and of the secretaries, Messrs. Adnitt and Naunton, who have laboured hard ever since the society started about thirty-four years ago. Judging commenced about 10 o'clock, and the members were admitted at 11.30, before judging was finished, and at 12 o'clock the tents contained solid masses of humanity, making judging, reporting, etc., well-nigh impossible. This year the first day was a beautifully fine one, and during the greater part of the day the ten big tents were crowded with those who appeared to take a keen interest in the magnificent collections of plants, flowers, fruits, and vegetables displayed. Entries were larger than usual, and trade exhibits more numerous than ever before.



G.M.415

FIRST PRIZE DECORATED DESSERT TABLE, EXHIBITED AT SHREWSBURY BY MR. JAS. GIBSON, GARDENER TO THE DUKE OF PORTLAND, WELBECK ABBEY, NOTTS.

## CHAMPION DECORATED FRUIT TABLE.

In this class a table 10ft. by 4ft. 3in. has to be filled with thirty dishes of ripe fruits, with suitable added floral decorations. There were three competitors, and rarely has there been so close a fight for the championship as on this occasion. Mr. Jas. Gibson, gardener to the Duke of Portland, Welbeck, secured the premier award with 253½ points. All the exhibits were very fine. Mr. Gibson's points were: Washington, Rival, Gascoigne's Scarlet, James Grieve apples, 6, 6, 6, and 6 points; Brown Turkey and Negro Largo figs, 6 and 5½; Muscat of Alexandria grapes, 8, 8, 7, and 7; Buckland Sweetwater grapes, 6½ and 6; Madresfield Court grapes, 8, 7, 7½, and 7½; Prince of Wales grapes, 8½ and 7½; Mrs. Pince grapes, 7½ and 7; Ringleader, Seedling, and two Royal Sovereign melons, 7, 7, 7, and 6½; Humboldt, Pitmaston Orange, and two dishes of Pineapple nectarines, 7, 6, 5½, and 4½; Crimson Galande, two dishes of Bellegarde, and Royal George peaches, 7, 7, 6, and 6½; two dishes of Souv. du Congrès, Marguerite Marillat, and Triomphe de Vienne pears, 6, 6, 5½, and 5½; Kirke's plums, 4; beauty of flowers and foliage, 5½; general arrangement for effect, 5½; total, 253½ points.

Mr. J. H. Goodacre came second with 252½ points, losing two points (4½ and 4½ against 5½ and 5½) on his flowers and decorations, which were a trifle heavy, and consisted of francoa and Lilium speciosum. He made, it seems to us, a point more on his fruit as a whole than did Mr. Gibson, his grapes scoring finely and bringing him well up. Mr. G. Mullins, gardener to Lady Henry Somerset, Easton Castle, Ledbury, third, with 235½ points.

## GREAT GRAPE CLASS.

A sum of £67 is awarded in six prizes for a collection of a dozen bunches of grapes in four or more distinct varieties. The floral decoration of each exhibit is judged separately. For the grapes a maximum of 11 points is granted for Muscat of Alexandria, 10 points for all other Muscats and Black Hamburgh, and 9 points for all other varieties.

There were seven competitors, and the premier award was made in favour of Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, who had shapely, fairly large, and finely finished bunches, as follows:

| No. of Bunch. | Variety. | Max. Points. | Points Awarded. |
|---|---|---|---|
| 1 | Black Hamburgh | 10 | 7 |
| 2 | Muscat of Alexandria | 11 | 10 |
| 3 | Appley Towers | 9 | 7 |
| 4 | Appley Towers | 9 | 7 |
| 5 | Muscat of Alexandria | 11 | 10 |
| 6 | Black Hamburgh | 10 | 7½ |
| 7 | Madresfield Court | 10 | 9 |
| 8 | Madresfield Court | 10 | 8 |
| 9 | Muscat of Alexandria | 11 | 10 |
| 10 | Muscat of Alexandria | 11 | 9½ |
| 11 | Madresfield Court | 10 | 8 |
| 12 | Madresfield Court | 10 | 8 |
| | | 122 | 101 |

Mr. Barnes also led for decorations, with Francoa ramosa, Gloriosa superba, and Oncidium sprays.

Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, came second, and his set scored as follows:

| No. of Bunch. | Variety. | Max. Points. | Points Awarded. |
|---|---|---|---|
| 1 | Black Hamburgh | 10 | 9 |
| 2 | Muscat Hamburgh | 10 | 9 |
| 3 | Muscat of Alexandria | 11 | 7½ |
| 4 | Muscat of Alexandria | 11 | 7 |
| 5 | Madresfield Court | 10 | 8 |
| 6 | Muscat Hamburgh | 10 | 9 |
| 7 | Muscat Hamburgh | 10 | 9 |
| 8 | Muscat of Alexandria | 11 | 7 |
| 9 | Madresfield Court | 10 | 8 |
| 10 | Muscat Hamburgh | 10 | 8½ |
| 11 | Muscat of Alexandria | 11 | 7 |
| 12 | Black Hamburgh | 10 | 9 |
| | | 124 | 98 |

Third prize fell to Mr. T. Bateman, gardener to C. A. Cain, Esq., Welwyn, with 97½ points out of a possible 123. Mr. W. H. Cook, gardener to Lord Belper, Derby, came fourth with 95 points out of a possible 120. Mr. J. R. Tooley, gardener to H. Andrews, Esq., Winchcombe, fifth with 90 points out of a possible 121; Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Worksop, sixth with 89 points out of a possible 124. Mr. S. Barker was second for the decoration of his exhibit; and Mr. Tooley third. Seven competitors.

## GRAPES.

Mr. J. Jones, gardener to R. J. Corbett, Esq., Towyn, had the finest four bunches of grapes, two white and two of black, and he scored with superb bunches of Gros Maroc, finely-coloured and berried, and Muscat of Alexandria; Mr. J. Mills, gardener to Captain Heywood Lonsdale, Shavington, second with Muscat of Alexandria, finely coloured, and Madresfield Court; Mr. T. Lambert, Brogyntyn, third. Nine entries.

Mr. W. H. Wilson, gardener to J. Brenton, Esq., Stourport, had the finest pair of bunches of Black Hamburgh, and he was followed by Mr. G. Mullins, and Mr. J. H. Goodacre among eight competitors. Mr. G. Mullins, Eastnor Castle Gardens, had the best single bunch of Black Hamburgh, Mr. Goodacre and Mr. Wilson following. For a pair of bunches of black Muscat grapes Mr. E. Jones, gardener to G. C. Lomax, Esq., Huyton, led the way with large-berried clusters of Madresfield Court; Mr. W. H. Wilson second, and Mr. J. H. Goodacre third. Madresfield Court grapes, as such, were best displayed by Mr. A. J. Cooke, gardener to Colonel H. C. Legh, Knutsford; Mr. N. F. Barnes, Eaton Hall Gardens, second, and Mr. Goodacre third, all showing well.

Mr. J. Barker, gardener to J. W. Raynes, Esq., Old Colwyn, led for two bunches of Alicante, showing weighty clusters; Mr. H. Cotton, Ledbury Park, second, and Mr. E. Jones third.

In the "any other black" class Mr. T. Lambert scored with Alnwick Seedling, particularly fine, the berries large and richly coloured. Mr. J. Jones, second with Gros Maroc, and Mr. J. H. Goodacre third with the latter variety.

Mr. N. F. Barnes led for a pair of bunches of White Muscat grapes with Muscat of Alexandria, and also scored for a single bunch with the same fine grape. Mr. J. Newton, gardener to D. W. Graham, Esq., Hilton Park, was second in the former class, and Mr. J. Jones in the latter. Buckland Sweetwater grape won first prize for Mr. J. T. Curtis, gardener to Sir H. Davies, Bishop's Stoke, Bristol, in the "any other white" class.

FIRST PRIZE FIFTEEN SPECIMEN PLANTS, EXHIBITED AT SHREWSBURY BY MESSRS. J. CYPHER AND SONS, CHELTENHAM.

In the county grape classes Mr. G. Mullins won for a pair of bunches of Black Hamburgh. Mr. Lambert, Brogyntyn Gardens, led for two bunches of Madresfield Court, for two bunches of white grapes, and in the "any other black" class. Mr. J. Mills had the best pair of Muscats.

### CHOICE FRUIT.

The best collection of nine dishes of fruit came from Mr. J. Mills, gardener to Captain Heywood Lonsdale, Shavington, who succeeded with fine bunches of Muscat of Alexandria and Madresfield Court grapes, Barrington and Royal George peaches, Pineapple and Stanwick Elruge nectarines, Rival apples, Countess melon, and Brown Turkey figs; Mr. W. Catt, gardener to A. H. Heber Percy, Esq., Hodnet Hall, second with good Madresfield Court grapes and Elruge nectarines. The awards for the floral decoration of the exhibits fell in similar order. Mr. Mills using Irish Elegance rose, Francoa ramosa, and Lilium speciosum, and Mr. Catt using carnations.

Mr. S. Barker, gardener to the Duke of Newcastle, Worksop, led for peaches with grand fruits of Crimson Galande; fourteen entries. For nectarines Mr. G. Mullins scored with Pineapple in fine form; nine entries. For apricots Mr. W. Catt, gardener to A. H. Heber Percy, Esq., Hodnet Hall, led with very fine examples of Large Early; nine competitors.

Hardy fruits were capitally shown in the local and county classes, the plums, cherries, red currants, and raspberries being unusually large and fresh.

### PLANTS.

A spendid set of fifteen specimen plants, ten to be in flower, secured for Messrs. J. Cypher and Sons, Cheltenham, the premier award of £20. The examples were among the very finest we have seen this firm stage over a goodly series of years. They were Kentia Fosteriana, Kentia Belmoreana, Crotons Mortefontaineasis, Warreni, and Countess, two giant examples of Ixora Duffi, with massive heads of deep orange flowers; two of Clerodendron Thomsonæ, Allamanda nobilis, very fine; two of Rondeletia speciosa, a very fine Statice profusa, and a S. intermedia, 7ft. across; Ixora Shawi, and a grandly-grown specimen of Chironia ixifera. Second prize fell to Mr. W. Vause, Leamington, whose large plants were not so well flowered as his competitors.

For thirty plants, in 10-inch pots, the Cheltenham firm scored again, and here their finest examples were Statice profusa, Ixora Shawi, Chironia ixifera, marvels of fine culture; Phœnix Roebelini, Acalypha hispida, and Allamanda Hendersoni; Mr. Vause, second.

Mr. T. Lambert, Brogyntyn, scored for a dozen stove and greenhouse plants, and showed good specimens of Ixora Duffi and Croton interruptum aureum; Mr. J. Farrant, Shrewsbury, second. Mr. Lambert was a large prizewinner in the county classes, and Mr. E. Bridge and Messrs. J. Knight and Sons, Wolverhampton, were also very successful, and both showed zonal pelargoniums in excellent style.

Premier award for six specimen stove and greenhouse plants was won easily by Messrs. James Cypher and Sons, with grand examples of Clerodendron Thomsonæ, Statice profusa, S. Gilberti, Allamanda nobilis, a mass of golden flowers; Rondeletia speciosa, and a splendid Ixora Duffi with a dozen heads of bloom. Mr. W. Vause, second; and Mr. W. R. Manning, Dudley, third.

### GROUP CLASSES.

The premier award for a group of hardy perennial plants, in and out of flower, with background of bamboos, etc., with pool of water, nymphæas, etc., arranged for natural effect, fell to Messrs. Gunn and Sons, Olton. The group had to occupy a space of 300 sq. feet, and the first prize was £25. The Messrs. Gunn had a charming background, well filled, and yet so arranged that the great groups of hollyhocks, Lilium auratum, L. speciosum, L. tigrinum, helianthuses, veronicas, phloxes, Chrysanthemum maximum, gladioli, etc., did not block out or clash with each other. Phloxes, scabious, astilbes, pyrethrums, and campanulas came to the edge of the little pool, with its complement of white, red, and yellow water lilies, while a rockwork edging, with Viola cornuta, sedums, veronicas, liatris, and heaths, formed the foreground, with corner groups of Lilium auratum. A very fine effect. Mr. John E. Knight, Wolverhampton, was placed second, and he had a rather sombre background of conifers, against which Galtonia candicans, kniphofias, liliums, phloxes, etc., were effectively grouped. In the foreground was a central group of Crinum Powelli, C. P. album, anemones, liliums, and montbretias, and behind this came a little stream, with its nymphæas and little bridge. Mr. T. R. Hayes, Keswick, gained third prize, and his pool, with its fine water lilies and bed of orange-berried Nertera depressa was a fine feature. Messrs. W. Artindale and Son, Sheffield, were awarded a special prize. Five entries.

The class for a group of miscellaneous flowering and foliage plants, arranged for effect on a space of 250 sq. ft., is always an attractive one. On this occasion there were four competitors, and Messrs. J. Cypher and Sons, Cheltenham, won the chief award

(Continued on page 655.)

## AUTUMNAL-FLOWERING CROCUSES.

It is somewhat singular that these very lovely flowers have not in the past received much notice. Even at the present time not nearly so many are cultivated in our gardens as might be. They have so many points in their favour at a season when out-of-door flowers are not, as a rule, any too plentiful. The colours, varying from dark to light-blue and white, are most distinct and attractive at a season when flowers of these shades are decidedly scarce.

### Positions.

No provision need be made in beds or borders for their culture, as it is better to plant them upon odd corners of grass. Here they will flower freely, but in order to secure a continuance for a few years afterwards a fair amount of sunshine is desirable. I prefer a warm, sunny slope, where, after planting, the grass can be left undisturbed, or not even mown. It is possible also to grow them close up to the boles of trees. We have grown them thus for several years, both under tall cedars and elms. The drought in such positions does not militate against their well-being.

CROCUS SPECIOSUS.
A fine breadth of this beautiful blue-flowered species at Gunnersbury House, Acton, W.

### Planting.

With respect to the time of planting, it is better to secure the corms during August, before any indication of growth commences, and plant them without delay. Should the growth have started more care is required in planting. We usually try, as far as possible, to avoid any semblance of formality in their arrangement. It is a very good plan to drop the bulbs indiscriminately, and plant them where they fall. In planting a small dibber is the best tool; with this holes should be made, about three inches deep, into which the corm should be placed, and some finely-sifted soil then be spread over the surface and worked in with a broom. Before using incorporate some fine mortar rubble with the soil. In most cases it is possible to leave the grass unmown, but at the depth of three inches one mowing afterwards will not do any harm, if done within a week or ten days. It is also well to tread the ground over firmly after planting.

### After Management.

Should the ground be bare of grass, I find it a good plan to sow some seed of a quick-growing lawn grass. This, if done at once, will start into growth and be sufficiently advanced to support the slender stems of the flowers. These autumnal crocuses all have somewhat elongated stems which easily bend over with the weight of the flowers after a heavy rain, there being no foliage of their own to give support to them. This foliage does not appear until early in the spring. With the object of preserving the foliage intact until it fades, it is most essential to leave it undisturbed, hence the grass must not be mown until the leaves turn yellow.

### Species and Varieties.

Two species, I find, stand out prominently above all others for general utility and reliability, viz.: Crocus speciosus, a bright blue, handsome, and distinctly showy species. It is excellent for the purpose I have indicated, i.e., for naturalising in grass. The illustration given with this article was from a group grown under these conditions, it being the fourth year of flowering after planting. As many as five flowers to a corm, and sometimes six, were to be counted. C. speciosus is usually at its best during the first half of October. Of this species there is a finer form, somewhat more vigorous in growth—C. sp. Aitchisoni—which can be strongly recommended. C. zonatus is the other species that I can specially recommend with confidence to be grown. It is of a pale-blue or lilac shade, with a distinct orange zone at the base of the flower, most distinct and effective. Its period of flowering is at least a week earlier than C. speciosus, if both be planted at the same time. C. nudiflorus, with flowers of a clear purple, can be strongly recommended. At one time it was naturalised in the Midland counties. C. cancellatus albus, with flowers of a satiny white, and a touch of purple at the base, is another somewhat showy-flowering and excellent variety. C. Saundersianus, a form of C. adriaticus, is another pretty species, white in colour, with violet at the base, and a yellow throat. It is not too late now to plant these crocuses.

Jas. Hudson, V.M.H.
Gunnersbury House, Acton, W.

## CLETHRA ARBOREA.

This is, in general appearance, widely removed from the hardy North American members of the genus, which are all deciduous. Clethra arborea is, however, strictly an evergreen, and of quite treelike habit, and bears a certain amount of resemblance to an arbutus. The white, drooping, bell-shaped flowers are borne in spikes, as a rule, during the latter part of the summer.

There are apparently three forms of this clethra, firstly, the type; next, one that flowers more freely in a small state than the other; and, thirdly, a variety with variegated leaves, but with markings not sufficiently clear to make it effective as a decorative plant. Clethra arborea itself is very suitable for growing in large tubs and standing outside during the summer months, when its lily-of-the-valley-like spikes of flowers are much appreciated, while the dwarfer variety (if variety it is) may be flowered well in pots six inches to eight inches in diameter. During the winter it needs to be kept safe from frost. This evergreen clethra is a native of Madeira, from whence it was introduced as long ago as 1784, but, strange to say, it was given an Award of Merit by the Royal Horticultural Society as recently as July 30 of this year. S. W.

## SOME GOOD PILLAR ROSES.

The variety found among climbing roses is very great, and at times it is difficult to give them just representation in garden decoration without overcrowding. With due regard to the habit of each, and by judiciously placing the different kinds, it is often possible to include a very great number in a comparatively small space, and if the colours are selected with care many spots in the garden will have their interest and beauty increased by planting some of these roses.

Climbing roses may be grown in the minimum space in pillar or pyramid form, and in this manner admit of being used in herbaceous borders or among hardy shrubs. In pillar form the only requisite necessary is a good stout pole of larch or oak; while pyramids are readily erected with three poles, extended 6ft. to 8ft. apart at the base, and having the points meeting together to form an apex. The latter system admits of each pole carrying a plant, so that every pyramid will carry three distinct varieties when necessary, and if these represent early and late varieties the maximum season of bloom is obtained.

When grown in single pillar form, climbing roses require close attention, particularly with regard to pruning, for if neglected in this respect they soon become over-grown, and their beauty is marred. As soon as they pass out of flower the old wood should be cut out as far as this can be dispensed with, retaining the best-placed shoots for covering the top of the pole and tying in all the current season's shoots. It will be obvious that in tying roses we should avoid any suspicion of lumpiness, and always have an eye to a light effect, and to this end I always favour leaving a foot or two free at the points, as this entirely destroys all suspicion of stiffness or undue formality when in flower.

Among roses suitable for pillars and pyramids there are Ard's Pillar, a variety having large, full flowers of a deep velvet crimson colour, Ard's Rover, dark crimson shell-like petals, and Ard's Rambler, having large flowers of orange-crimson, with a paler shade at the base of the petals. Bardou Job is one of the largest of semi-double roses, of a glorious crimson colour, and is an old, well-known variety. American Pillar, introduced four years ago, is one of the finest roses for garden decoration; the single flowers are large, of a fine rose-pink tint, that becomes paler at the base, and the trusses of flower are full, like huge bouquets. Billard et Barre is golden-yellow in bud, paler when expanded. Buttercup, deep yellow in bud, lemon when open, is not a vigorous grower, but a distinct and attractive flower. Cramoisie Superieure is an old favourite China rose, velvet crimson in colour, and one that flowers in great abundance; the climbing form is most suitable for pillars. Crimson Rambler, rich bright crimson, in dense sprays, must be lightly trained, or is liable to mildew. Goldfinch has large flowers, orange-yellow in bud, but almost white when open. Gruss an Teplitz, scarlet crimson, with dark foliage, is a sterling variety for autumn. Helene, early flowering, produces immense sprays of rose-pink flowers. Mdme. Berard has full flowers of a curious shade of yellow, much in the way of Gloire de Dijon.

Mrs. F. W. Flight bears immense trusses of semi-double flowers, blush-pink in colour, that last a long time in perfection. Psyche flowers in trusses of great size, and is pale rose-pink, flushed at the base with yellow. Rubin, a rich deep crimson flower, comes in huge sprays, and is very effective with the accompaniment of dark foliage. Tausendschon, one of the best of recent additions to climbing roses, has large flowers, bright satin pink, in large heads, and carried on stiff stems. Tea Rambler is a curious mixture of yellow, salmon, and pink; flowers small, in moderate trusses; the foliage is pale green and glossy. Thalia has rather small flowers, almost pure white, and flowers continuously all the summer and autumn. W. Allen Richardson, deep orange-yellow in centre, paler at edges of petals, is the finest rose of this colour and extremely floriferous.

THOMAS SMITH.

Coombe Court Gardens.

## THE COTTAGE GARDEN.

"Yes, there is holy pleasure in thine eye!
The lovely cottage in the guardian nook
Hath stirred thee deeply; with its own dear brook,
Its own small pasture, almost its own sky!
But covet not the Abode; forbear to sigh,
As many do, repining while they look—
Intruders—who would tear from Nature's book
This precious leaf, with harsh impiety.
Think what the Home must be, if it were thine;
Even thine, though few thy wants! Roof, window, door,
The very flowers are sacred to the Poor;
The roses to the porch which they entwine.
Yea, all that now enchants thee, from the day
On which it should be touched, would melt away."

—*Wordsworth.*

The cottage garden has become a proverb. The luxuriance with which plants grow, the way in which every inch of space is utilised, and the brilliance of the displays often obtained, are all quoted against those of us who have larger gardens, as if the standard attained in cottage gardens were something to be aimed at, but not likely to be reached. They are one of the characteristic features of the English wayside and almost peculiar to it, and to anyone travelling through the country at a sufficiently moderate pace, they constitute by no means one of its least attractive features if he has an eye for flowers, or even for natural beauty of any sort.

The praise bestowed upon cottage gardens is certainly well deserved, though anyone going frequently along the same road from spring to autumn will notice that their owners have not solved the problem of keeping the mixed border presentable throughout the season any more than their more favoured countrymen have done, a garden which compels one's attention in June being often lacking in colour in July. Still, there are certain elements in the way the cottager manages his garden which are not unworthy of our consideration.

One of its attractive features is the way in which the vegetable quarters are set off with flowers. Alongside the paths there are generally to be found large clumps of old-fashioned flowers, which grow with the greatest luxuriance on account of the annual manuring of the adjacent vegetable ground, and the abundance of sun and air in their partly isolated positions. There are not only masses of sweet williams, goat's rue, columbines, or white lilies along the margin of the onion bed—to the improvement of the latter without spoiling the effect of the former—but sometimes there are beds of these flowers cut out of the area assigned to cabbages and potatoes. Roses, too, there are in all sorts of odd corners, sorts that were more common a generation ago than to-day, and these, also, respond to the generous treatment they receive. Nothing is wasted, and by restoring to the soil all refuse that will decay within a reasonable time, besides importing a fair quantity of manure from outside, the soil tends to become more and more fertile owing to the incomings exceeding the outgoings, as is shown by comparing the level of the soil with that of the paths.

One of the secrets of the success of the cottage garden is the same as that of the "little farm well tilled." Everything is daily under the owner's eye during the main part of the gardening season, and the claims of the garden are, as a rule, no greater than he is able to satisfy, so that everything gets done just at the right time. Seeds and cuttings are put in "just between too early and too late." The ground rarely being shut in by walls or high hedges, the soil works well in the early spring, often before that in many larger gardens, and, given an early Easter for making a start, the cottager is always ready to take advantage of it.

Another reason why the flower garden is so often all successes and no failures, to judge from appearances, is that the cottager, as a rule, only grows those things which will do really well with him without an undue amount of coddling. There is a certain element of the survival of the fittest in this kind of gardening, for a plant that will not quickly get established is liable to be smothered and never seen again. Probably he does not know, though it might be regarded as a truism, that there is no garden so unfavourably situated but what some things will grow well in it, but he acts upon it, and the things that flourish with him are plants that, in most cases, have similarly flourished in his soil, or in that of his neighbours, for a generation or more. There is a good deal to be said for the system of confining one's attention to those subjects for which our soil and conditions are best suited, without wasting time in pampering and petting plants that, at the best, will only be a modified success, but it is a counsel of perfection only, for we all have our favourites, and too often they are plants which do not particularly like what we have to offer them.

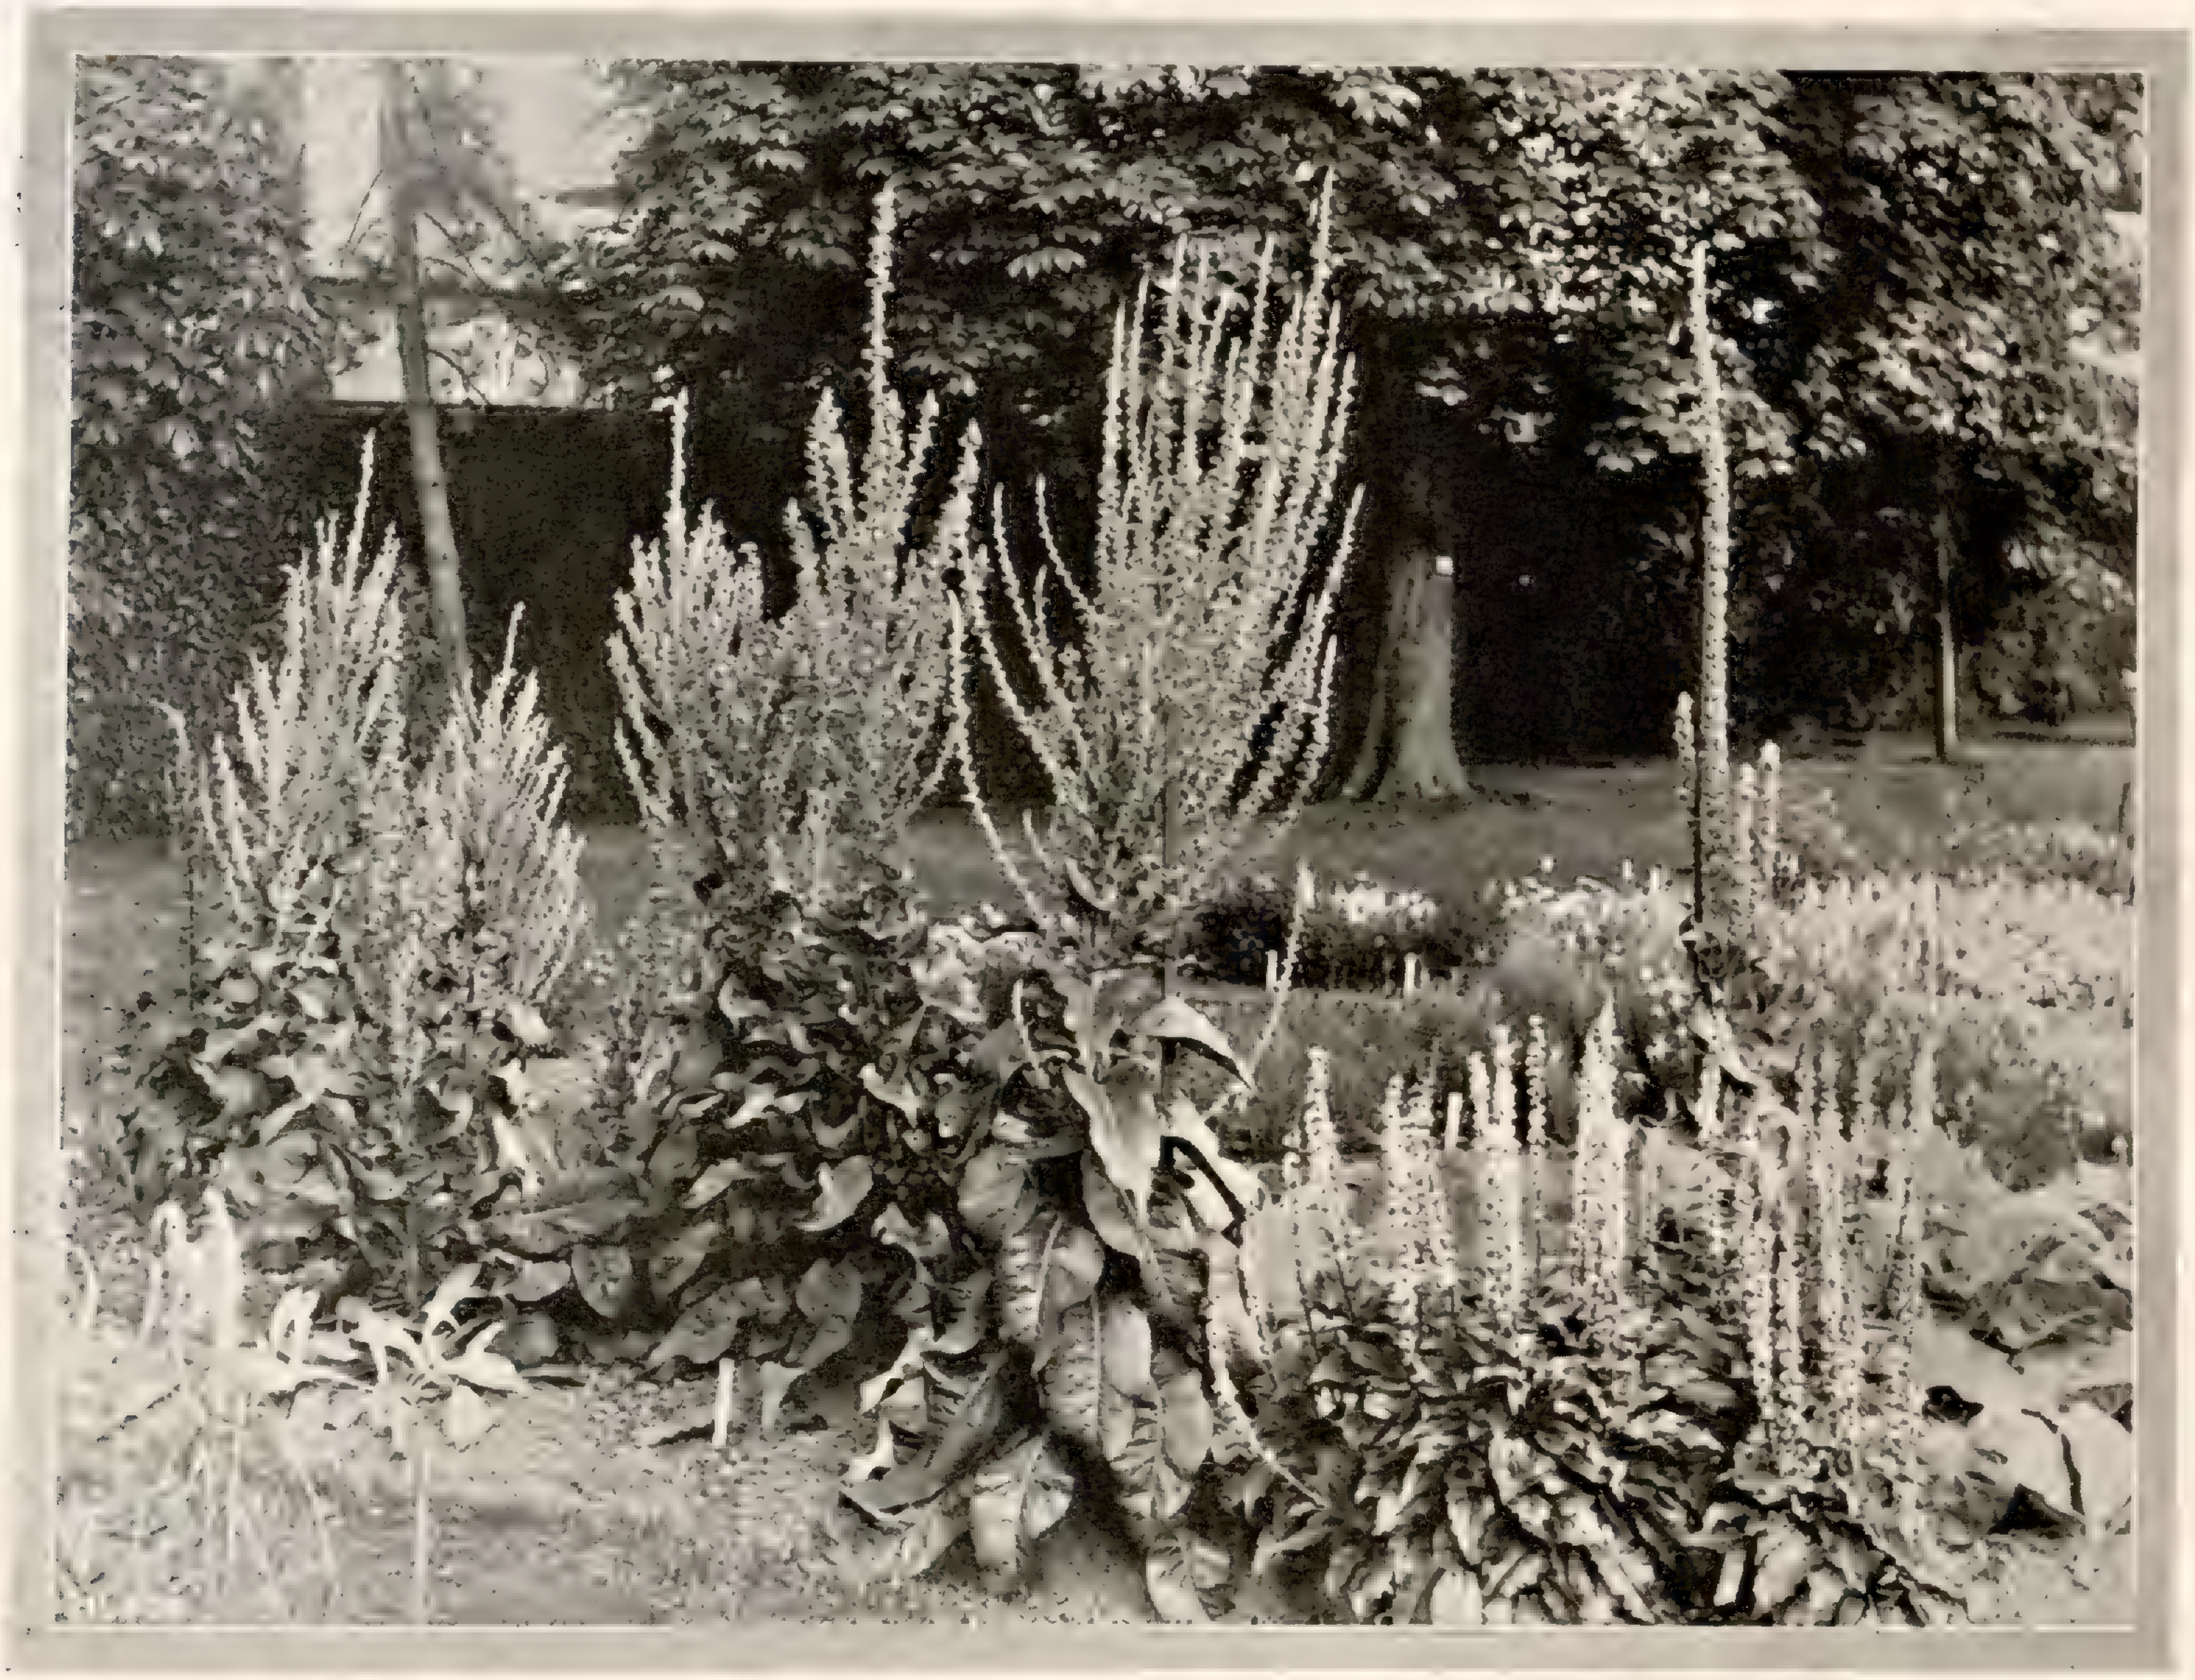
In conclusion, the cottage garden at least teaches us that great expense is not necessary for deriving much pleasure from our gardens. It is the professional flower show, with all its deceptions, that makes us run into so much wasteful expense, which is too often followed by disappointment rather than pleasure, while the cottage gardener rarely visits more than one show a year, and that the local one, where he sees the exhibits of other people like himself, with displays from the big gardens, which he is content to admire without envy or emulation. When a cottager acquires a plant from somewhere it is soon seen in many of the gardens of the neighbourhood, so ready is he to share with his neighbours. The ubiquity of a comparatively recent introduction like Doronicum plantagineum Harpur Crewe is a case in point. It brings to mind a passage from "The Garden that I Love," where the Poet Laureate says: "A flower border thus becomes a living record and diary of your wanderings, your visits, your friendships, a perpetual reminiscence of the generosity of the rich, of the graciousness of the poor."

ALGER PETTS.

"CARNATIONS, PICOTEES, AND PINKS" will tell you plainly how to grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams. Price 2s. 6d. net by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

# VERBASCUMS.

The verbascums, or mulleins as they are more commonly called, when occupying suitable positions and grown well, are among the most stately of hardy plants, and some of them are well worthy of a place in the garden. The genus is an extensive one, comprising species that range in height from the pretty little V. phœniceum, about two feet high, to the giant V. olympicum, which often reaches a height of ten feet or more. For forming groups of an effective character, like that shown in the accompanying illustration, some of the taller kinds are well adapted, while for woodland or wild gardening they may be classed amongst the most useful subjects on account of their noble appearance when planted in well-selected positions. Several of the tall species may be used with advantage in the shrubbery border, where the shrubs are not too thickly planted, while the smaller ones like our native Moth Mullein (V. Blattaria), are very attractive in the fern border. In such positions this species will quickly become naturalised, and at the same time will not become spread in such manner as to become a nuisance.



A GROUP OF SPECIES OF VERBASCUM IN THE HERBACEOUS GROUND, KEW.
The stately Verbascum olympicum occupies a central position in the group.

For the purpose of cultivation all the mulleins may be regarded as biennials, although there are a few exceptions, such as V. nigrum. They are mostly of strong and rapid growth, requiring plenty of room for leaf development, and, if raised from seed sown outside, they require early attention in the matter of thinning out the plants. Only by attention to this detail will the finest effect and stately plants be produced. While they will grow in almost any position, they will repay good cultivation and a deep, well-worked soil. The seeds may be sown broadcast in the woodland or shrubbery where large quantities are required, but it must not be forgotten that early thinning is essential to success. A good method is to sow the seed in boxes, and prick off the seedlings either into pots or boxes, then when large enough plant them in the positions in which they are to flower. In planting it must be remembered that V. olympicum and similar large-growing species often have a spread of leaves from 4ft. to 5ft. across.

During recent years attention has been devoted to the improvement of some of the members of this genus, with the result that some five forms have been produced, of which one of the most desirable is a white form of V. phlomoides. Another is V. Caledonia, with bronzy-buff flowers, a most distinct plant of the habit of V. nigrum. The following are among the most ornamental species:

V. Blattaria, or Moth Mullein. — This species is one of our native plants, with dark green, shining leaves, and stems about 3ft. high. It has bright yellow flowers, about 1in. in diameter, with purple filaments. There is also a very pretty white variety.

V. Chaixi, or Nettle-leaved Mullein, is a rather stronger grower, and attains a height ranging from 4ft. to 6ft., with numerous yellow flowers disposed in dense branching spikes. This plant is more of a perennial than most of the others.

V. cupreum is a rare and beautiful hybrid between V. phœniceum and V. ovalifolium, with the dwarf habit of the former and distinct coppery-coloured flowers in slender spikes. It is a very old plant, having been raised about a hundred years ago. It flowers from May till July.

V. longifolium.—This plant may be seen on the right of the picture with rather a close spike. It was past flowering when the photograph was taken, but is a stately species with very large, white, woolly leaves, and a massive columnar inflorescence. The flowers are rich yellow and large, and closely packed together on stems 4ft. to 5ft. high. Also known under the name of V. parmosum, this plant is a recent introduction, being a native of Italy and the Balkans.

V. nigrum is a native plant, and well worth a place in the border. Only about 2ft. high, it is of neat habit, with yellow flowers and bright purple filaments. A group of the white-flowered variety of this species may be seen in the foreground on the right-hand side of the illustration, and this admirably shows the distinctive characteristics of the species.

V. olympicum.—This species, which occupies the centre of the group in the picture, is one of the noblest of the family, with large rosettes of white, woolly leaves and giant pyramids of rich yellow flowers, reaching to a height of 10ft. or more. Lasting in flower for a considerable period, with its candelabra-like inflorescences, it is very valuable and stately.

V. phomoides, with yellow flowers, and its white variety are also worth growing.

V. phœniceum.—A very pretty species with light, graceful spikes of flowers, which vary in colour from rich purple to white. It is well worth a place in the rock garden or select border, on account of its dwarf and neat habit. It flowers freely from May to July. Closely resembling this plant is V. Wiedmannianum, from Asia Minor, with deep purple flowers.

There are many other species in cultivation, one of the most recent introductions being V. leianthum, from Asia Minor, a tall-growing, somewhat slender-branching plant with small yellow flowers.

W. I.

## NEW PLANTS, ETC.

### LÆLIO-CATTLEYA GODMANI.

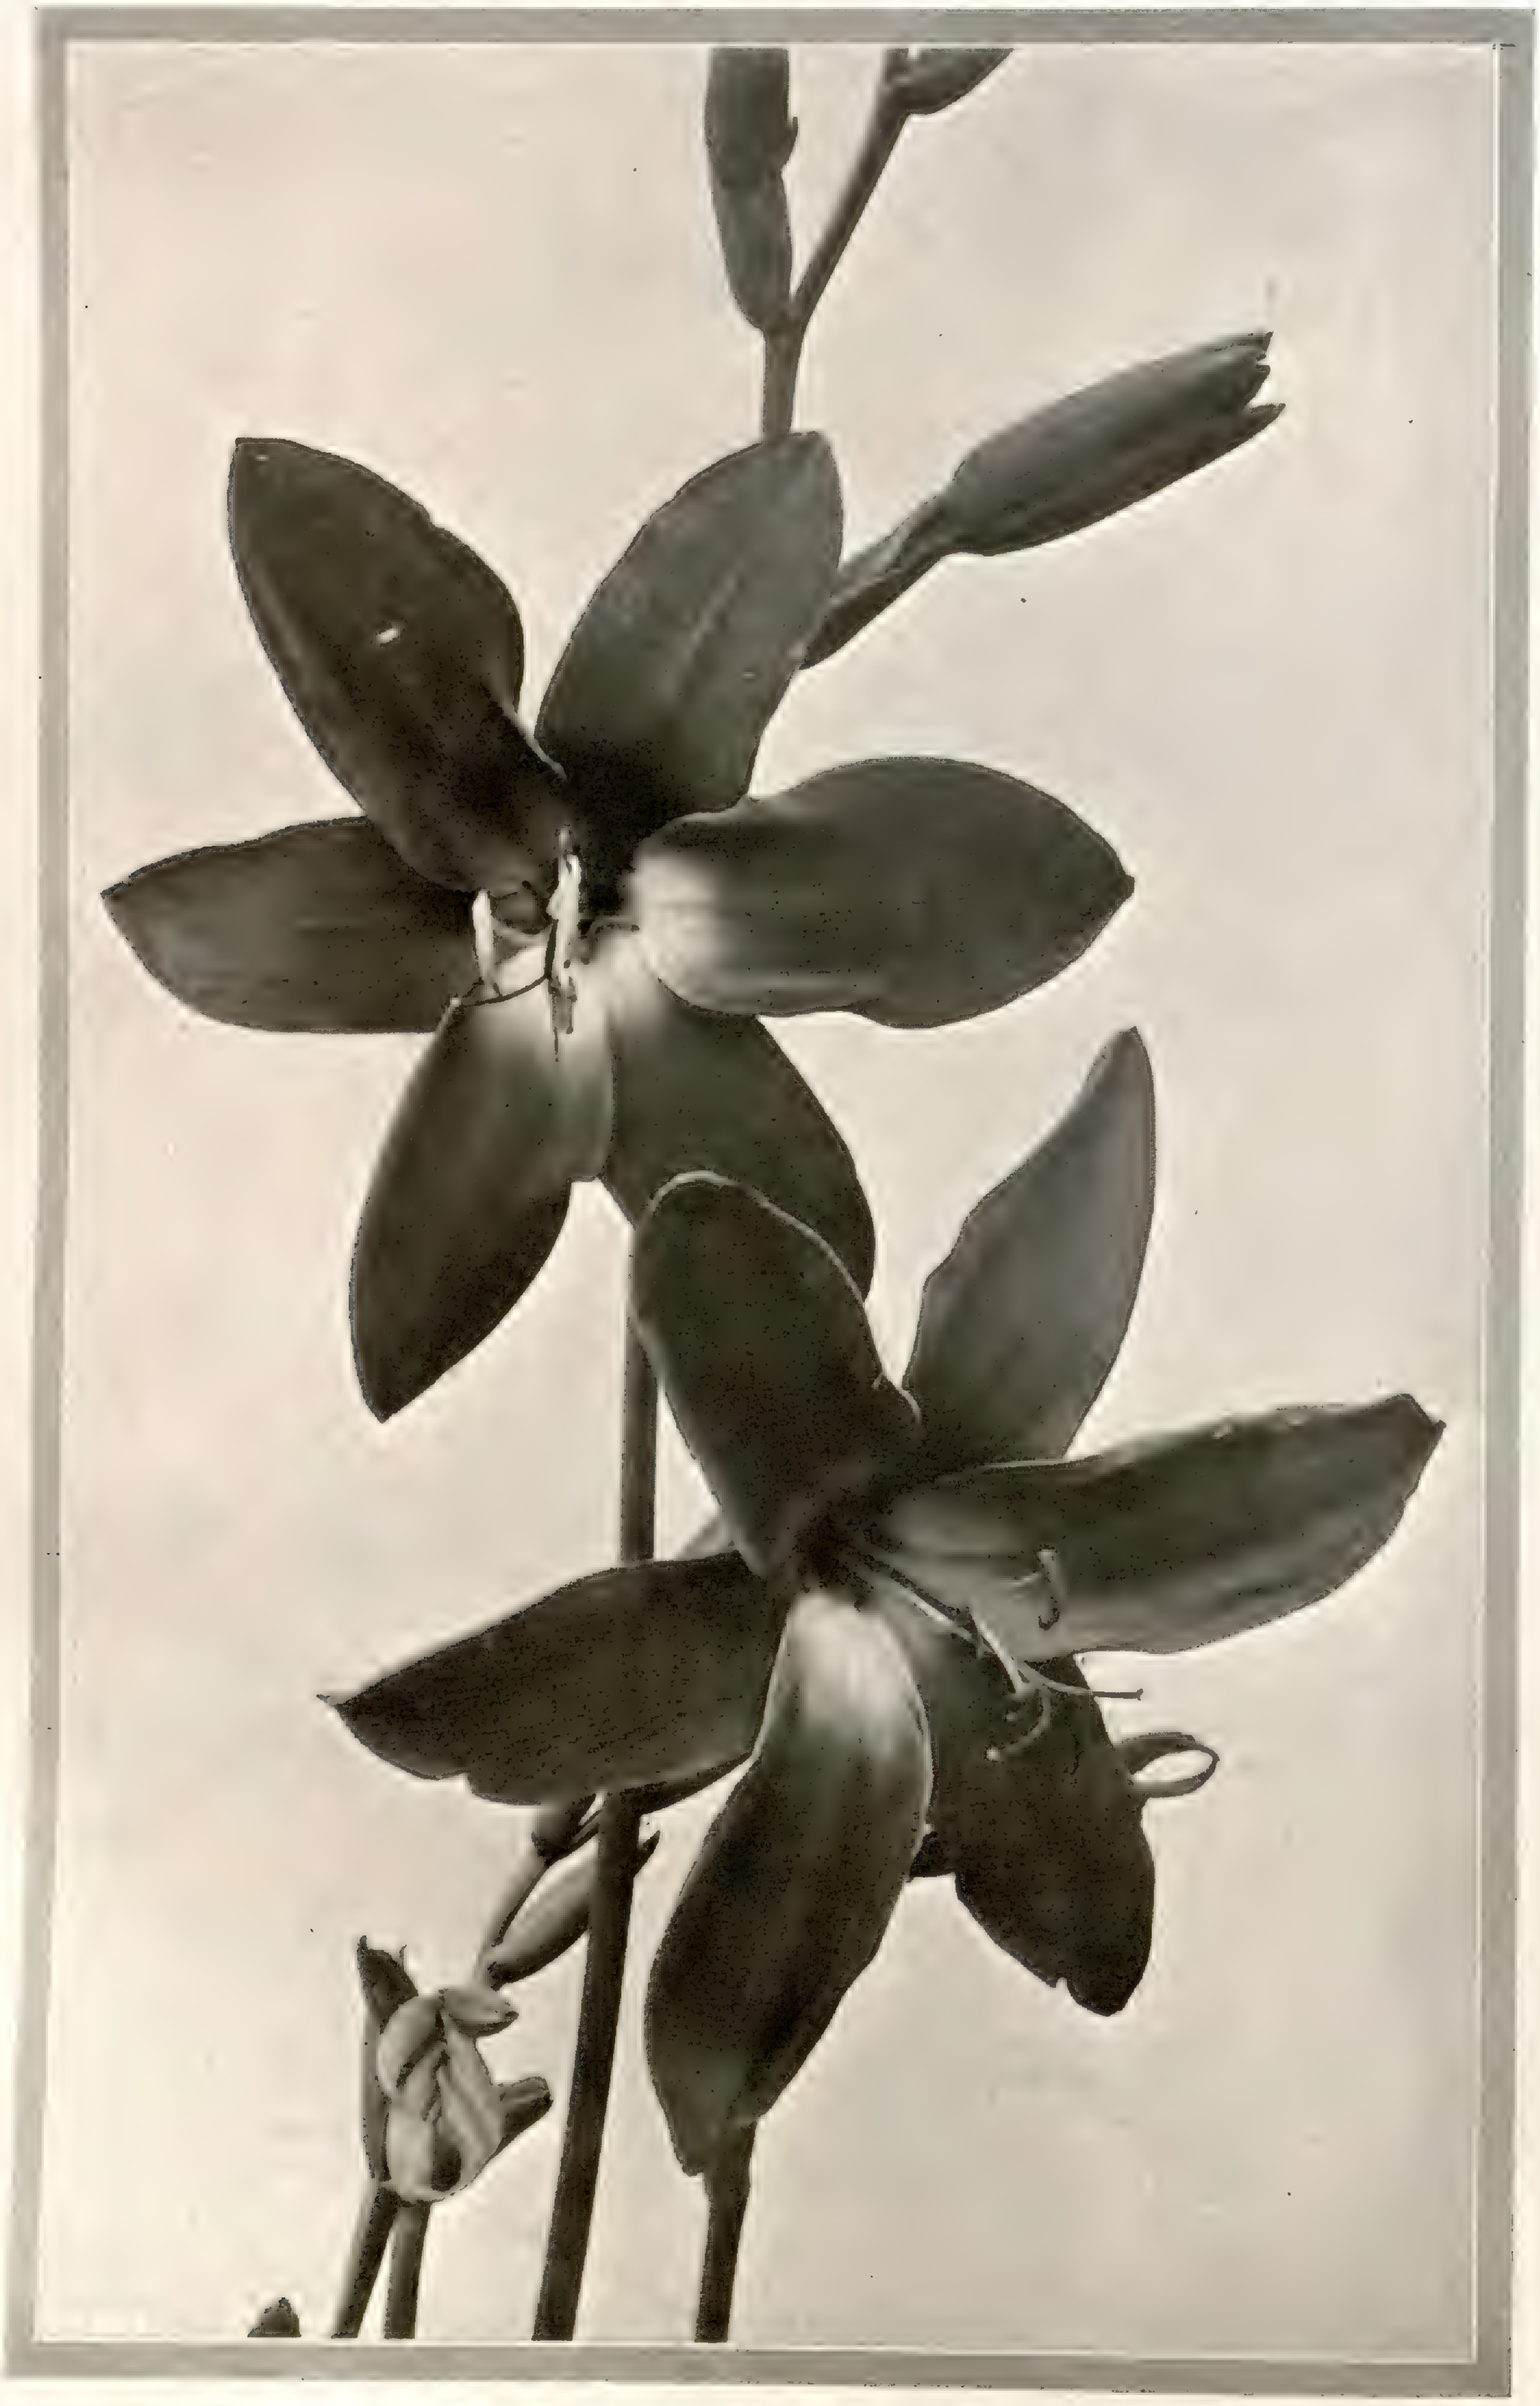
This particularly beautiful and shapely orchid has been obtained by crossing Cattleya Iris with Lælio-cattleya callistoglossa, and it takes rank as one of the finest secondary hybrids in this large group. The deep rose-purple sepals and petals are broad and substantial, and the splendid lip is rich royal purple, and shaded with ruby-crimson near the yellow-blotched throat. F.C.C., R.H.S., August 13. F. Du Cane Godman, Esq., South Lodge, Horsham.

### MONTBRETIA STAR OF THE EAST.

An exceedingly beautiful montbretia, and easily the finest member of the family. It has tall, branching spikes a yard high, and the individual flowers are four inches across, though some have measured over five inches across. The blooms stand up well, and are very regular in shape, deep rich yellow, suffused with orange. This is Mr. Davison's finest result among montbretias. F.C.C., R.H.S., August 13. Mr. Davison, gardener to Colonel Petre, Westwick, Norwich.

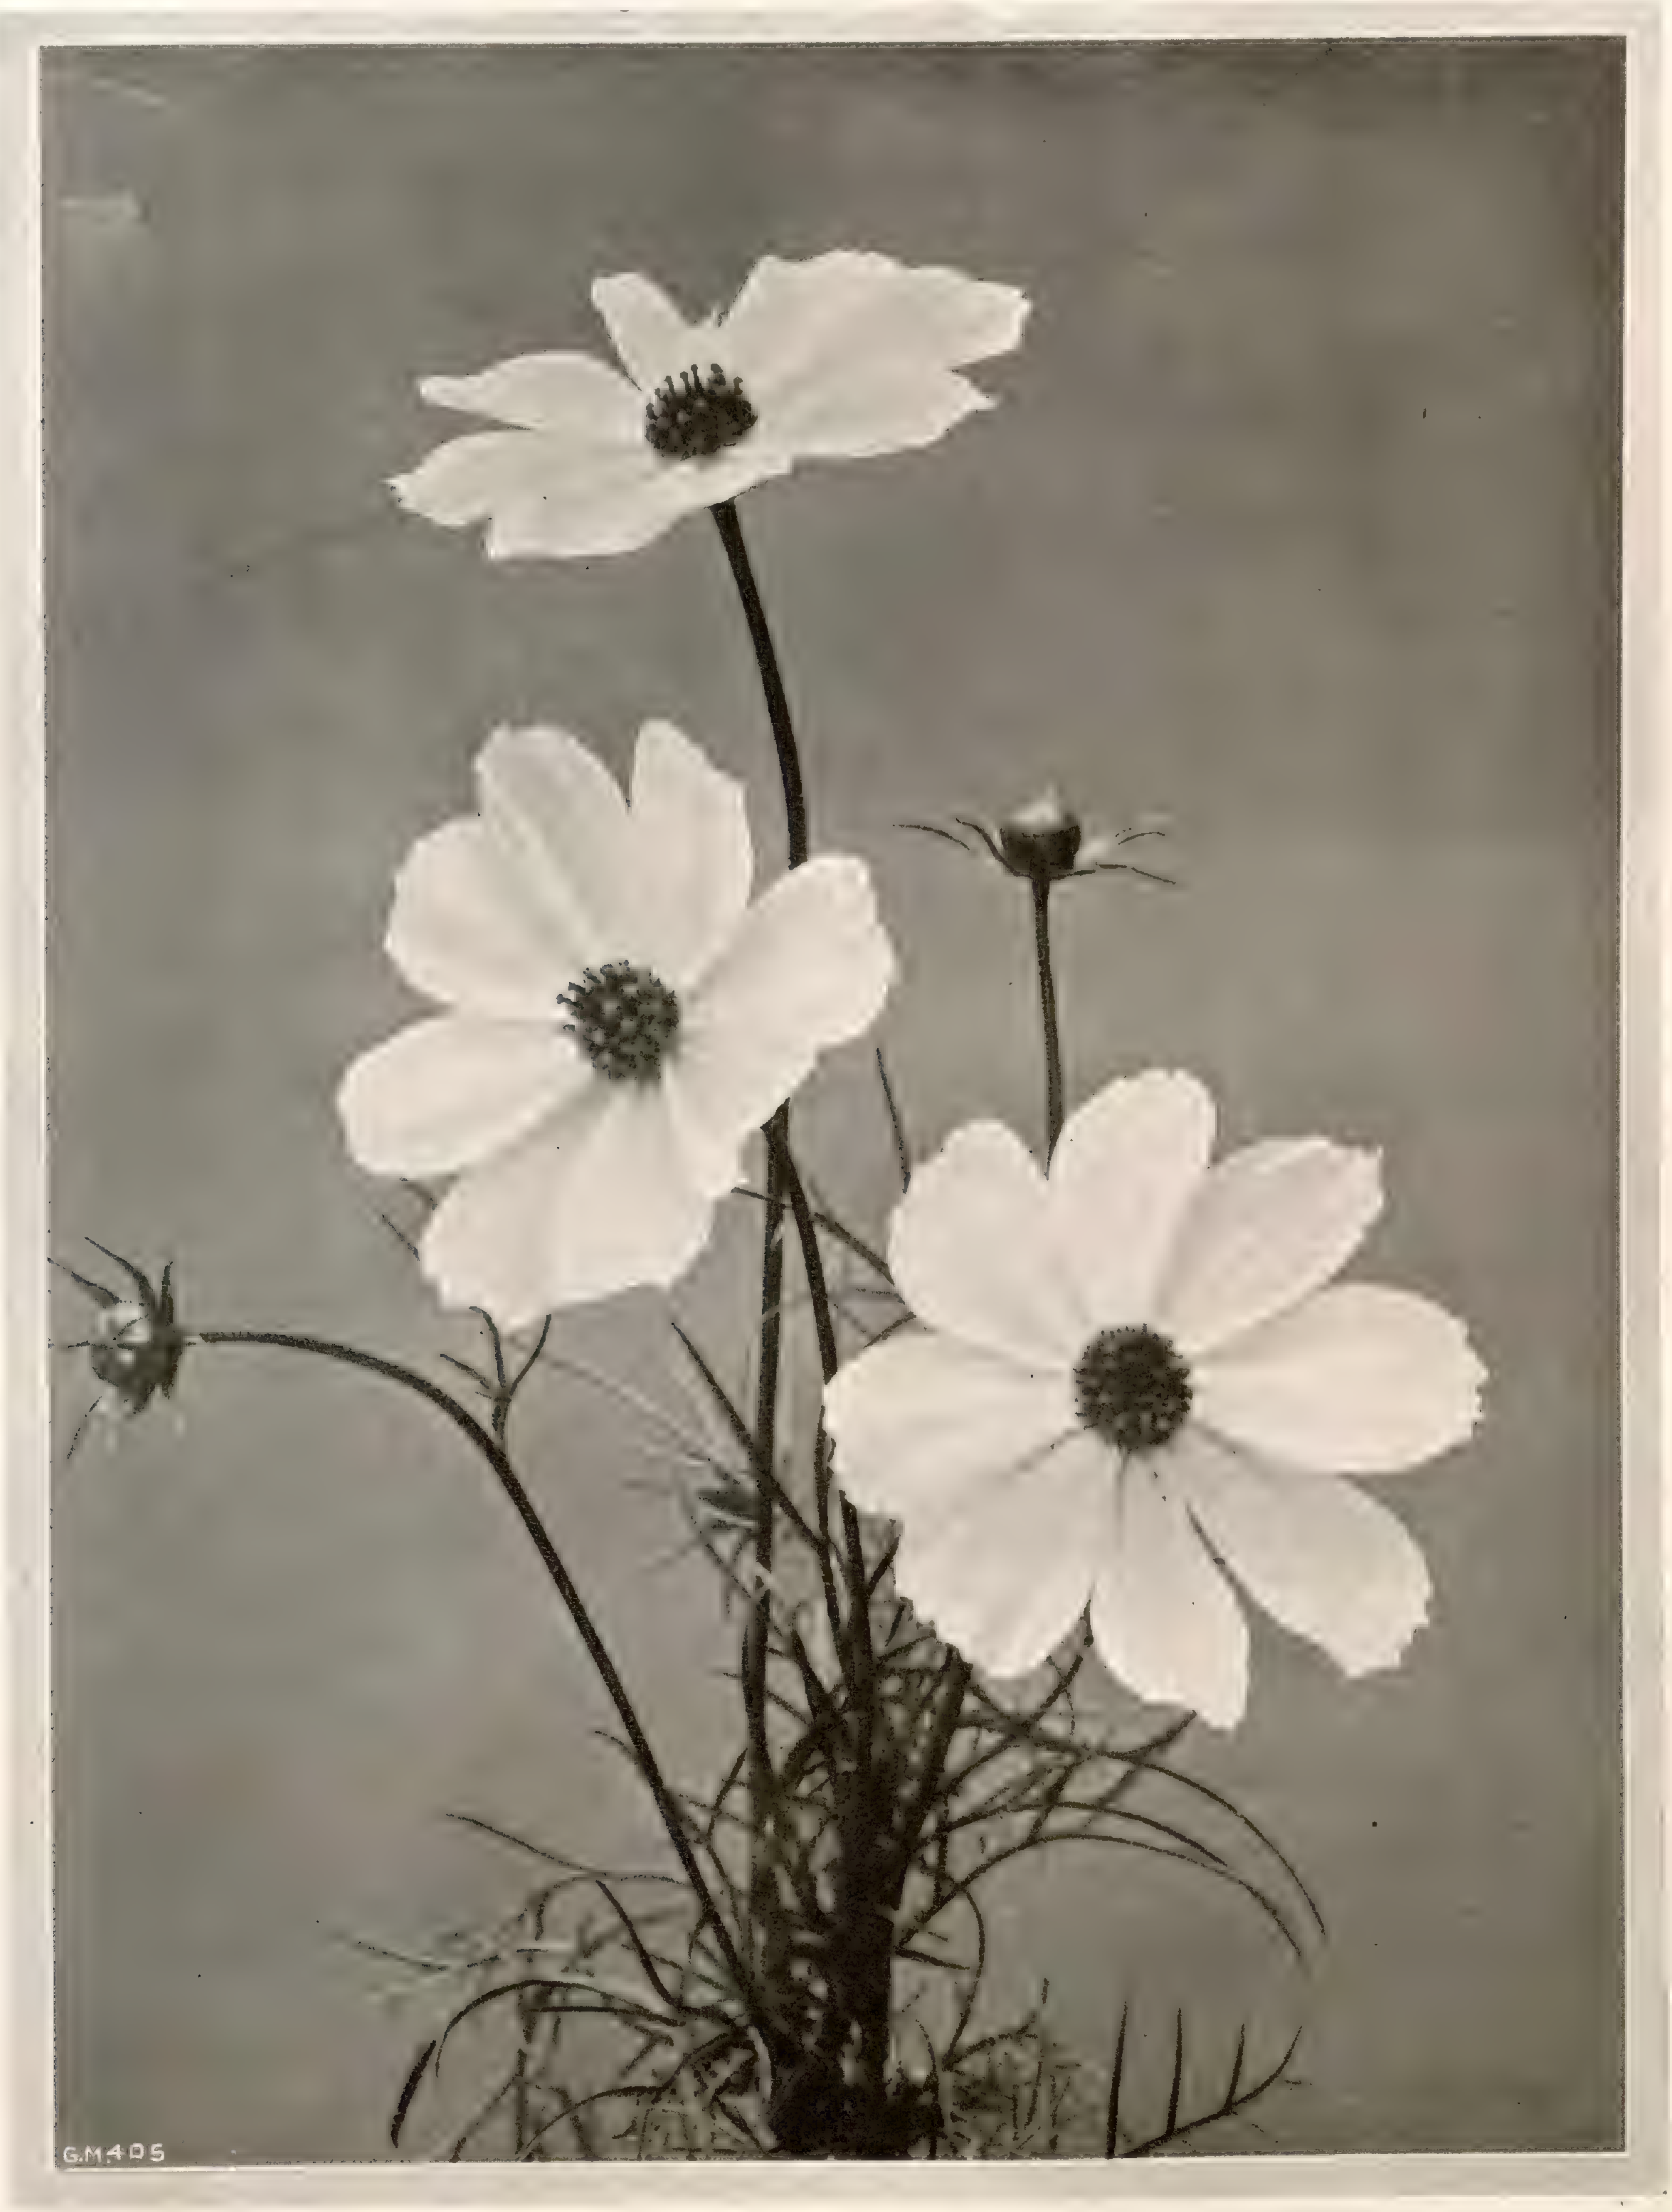
### ODONTOGLOSSUM EMPRESS EUGENIE.

A very pretty odontoglossum, carrying a number of good-sized flowers on a sturdy, tall spike. The segments are all broad and rounded, white, blush shaded, and lightly and daintily marked with little spots of heliotrope. A.M., R.H.S., August 13. Mr. E. H. Davidson, Borlases, Twyford.



MONTBRETIA STAR OF THE EAST.

A great advance among montbretias, with large, deep yellow, orange-suffused flowers over four inches in diameter. F.C.C., R.H.S., August 13. Mr. Davison, gardener to Colonel Petre, Westwick, Norwich.



COSMOS WHITE QUEEN.

A finely selected form, with regular and dainty flowers of purest whiteness. A.M., R.H.S., August 13. Messrs. Dobbie and Co., Edinburgh.

### LÆLIO-CATTLEYA GLAUCUS.

A very fine orchid, the parents being Lælia purpurata and Lælio-cattleya rubens. It is a stately hybrid with large flowers; the sepals and petals deep rich purple, and the lip dark crimson. F.C.C., R.H.S., August 13. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

### LÆLIO-CATTLEYA LUMINOSA MANDARIN.

An unusually showy variety, with large flowers. The sepals and petals are deep rich yellow, and the lip dark purple. The Walton Grange variety of Lælia tenebrosa was one parent of this effective hybrid. A.M., R.H.S., August 13. Lieut.-Colonel Sir George Holford, Westonbirt.

### KNIPHOFIA UNIQUE.

A comparatively dwarf, neat-growing variety, with spikes of coral-red flowers, each tubular blossom in the poker-like head being quite self-coloured. A.M., R.H.S., August 13. Messrs. R. Wallace and Co., Colchester.

### COSMOS WHITE QUEEN.

Of good form and purest whiteness, this variety is certain to make the Cosmos family more popular than it is at present. The flowers resemble those of a dainty white single dahlia, and they are set amid graceful foliage. A.M., R.H.S., August 13. Messrs. Dobbie and Co., Edinburgh.

### RHODOSTACHYS ANDINA.

An interesting Chilian bromeliad that was introduced into England about 1850. It has a dense rosette of arching, narrow, grey-green, spiny leaves, and in the centre of the rosette is produced the globose head of small rose-pink or rose-red flowers set amid silvery bracts. A.M., R.H.S., August 13. J. T. Bennett Poë, Esq., V.M.H., Holmwood, Cheshunt.

# GARDENERS AND GARDENING.

## A Practical Educational Foundation.

The welfare of a gardener, especially with reference to his education, is engaging a good deal of attention, but a spirit of disappointment seems to pervade nearly all the communications on the subject. It seems to be generally agreed that a diploma in horticulture, if instituted, would go in most cases to the college-trained men. Few writers, however, go to the root of the matter and endeavour to point a way out of the apparent difficulty of the position.

It seems to me that every ambitious young gardener should have had four years' practical experience in a good garden or gardens before being allowed to enter for a college course. This method would give a young man many advantages, and he would be the better able to grasp and adapt his college education because of his practical experience. I have come into contact with several young men who have been college-trained, and, to my surprise, have found them inferior to practical men of similar age.

Could not the Royal Horticultural Society lead the way by means of co-operation with head gardeners? The latter would be able to point out specially intelligent young men who would profit from a college course, and such young men should be assisted, if necessary, to take such a course of training. An arrangement of this kind would cause young men to take a keener interest in their work, so that they might qualify for the special educational course. I believe a two years' college course, following four years' practical experience, would work wonders in the education of gardeners, but I am also quite sure that college-training alone will not enable a man to manage a private garden of any importance. H. E.

Colchester.

## What is a Gardener?

Being much interested in the correspondence that has been going on in the "G.M." lately, under the above heading, I ask the favour of being allowed to make a few remarks on this all-important subject.

In the first place, what is a gardener, and how did he obtain that designation? We often hear persons styled gardeners who have to feed pigs, clean boots, milk cows, and so forth; others call a man a gardener who simply works as a labourer in a garden, but in my opinion none of these are gardeners, and until we can define what a gardener really is, it is impossible to assign him his right position. Those who are acquainted with gardeners and gardening, know full well that we can find more and better qualified men who are unable to procure first-class situations than there are filling them, and this through no fault whatever of their own. I am not making statements without a full knowledge of the subject under discussion, when I say it is not always the qualification of the person that procures him a good berth, but the influence he has at his back. It would not be difficult to name instances where good men have been passed over in favour of those who have been personally recommended; this being so, I fail to see what use a diploma in horticulture would be.

Supposing all gardeners were compelled to pass an examination before being engaged, it would be interesting to know how many of them would be able to keep their situations. We want to raise the status of the gardener, and how to do so is puzzling the minds of many of us. The other day the writer was asked by an aristocrat to recommend him a good gardener; on obtaining particulars I informed him that he could get a good labourer at the wages offered, but not a gardener! Here are the particulars: Seven men kept; foreman in houses; glass, kitchen, and flower gardens, etc. Wages 23s. per week, with house; no firing. Employer to engage all under-men. I could name several such instances that have come under my notice. It is well known that there are at the present time men filling head positions in some large places, where from twenty to twenty-five men are employed, whose wages are but £65 per year. While men can be found to work for such wages it is not diplomas that are so much needed as Trade Unions, to prevent a man filling such positions for a mere pittance. There are few gardeners in such places that work less than seventy hours per week, including Sundays. Seventy hours at 4d. per hour would amount to 23s. 4d. per week—not the wages of a bricklayer's labourer, yet such men must keep themselves respectable, be fully qualified, have a diploma, pass an examination, and so forth!

Now, let us consider how many years it takes a man to acquire sufficient knowledge to become qualified to fill such a place. I will just state my own personal experience. Years gone by it was the custom to apprentice young men, and gardeners used to take premiums from them; the greater the reputation the place had, the larger the premium; but the usual figure was either £5 or £10 down, of 2s. per week stopped out of the pittance received in the way of wages. The writer was in the fortunate position of being able to pay the lump sum, but others had the 2s. per week deducted; and, as the wages paid to youths was 12s. per week, it left but 10s. to keep them. Times fifty years ago were not as they are now, and young fellows were compelled to work much longer hours, and a day's holiday was unknown. Having served my apprenticeship under one of the most exacting men that ever entered a garden, I was sent to a nursery to await a change. Going from the north to a London nursery was a change indeed; and after being in the nursery three months, I obtained a situation at 16s. per week, and bothy. The earth served for the floor, and the only entrance to the bothy was by a plank across the stoke-hole, over a tubular boiler. A premium of £10 and a good recommendation had obtained me this. Time wore on, and, after several ups and downs, extending over about fifteen years, I was offered a head gardener's situation. The dwelling-house was a shed at the back of a north wall, but, needless to say, I did not go there.

Some no doubt still believe in the old apprenticeship system; but those who have passed through the mill hold different views. Some advocate college training, others examinations in horticulture; but, gentle reader, you may rest assured the finest diploma you can possess is a friend at court; therefore, if you aspire to something higher than 23s. per week have a friend in your pocket. S. H.

Sussex.

# HYPERICUM REPTANS.

Several of the hypericums are suitable subjects for the rock garden, and when planted so that their drooping growths can trail among the boulders of a large rockery they are very attractive. H. reptans is one of the best for this purpose, and its clear, rich yellow flowers are produced in profusion at the present time, rendering the plant an object of especial beauty. This variety proves quite hardy in our locality, although in certain districts it may not be so, being, in some instances, partially killed back by frosts. Fairly light soil, containing leaf-mould and road grit, suits it very well, but it must be pressed firmly around the roots. Dry weather does not harm the plant, for last season our specimens withstood the drought without any ill-effects, and they are planted rather high up between boulders of rock with their growths carpeting the spaces between. J. Gardner.

Batsford Park Gardens.

# NOTES FROM SCOTLAND.

## The Season.

The inclement weather of late has very materially changed the aspect of the flower department in many gardens, as well as the excellent prospects in regard to crops that prevailed but a short time ago. Whether, providing an improvement, climatically, comes shortly, things in general will be as bad as many growers at present contemplate, is, of course, uncertain; but, all the same, much damage has been done which no ameliorating influences that may follow can possibly entirely efface this season.

Amateur cultivators, especially, have just cause to bewail the destruction wrought among their highly-cherished productions, more particularly those of taller growth, as some species of herbaceous plants, dahlias, and sweet peas. The latter, grown in isolated clumps had, owing to the excess of moisture, following upon a dry, warm period, and probably over-liberal supplies of nutriment by way of manures, made vigorous growth which, over-topping and extending much beyond the supports, appeared most promising while calm weather lasted, but as such in exposed positions were unable to offer sufficient resistance to strong gales of wind many of these have been brought to a recumbent position, which contrasts very adversely with their former erect and trim appearance.

Roses of the dwarf-growing types were past their best, as relating to summer bloom, ere the worst effects of the storms were experienced, but such gave the finishing touch to what may well be described as a brilliant period of inflorescence, as seldom, indeed, have finer blooms or greater numbers of them been witnessed.

In contrast with these large-flowering kinds, it may be remarked how well most of the rambler varieties pass through periods of inclement weather conditions, even when the growths sway considerably under the influence of strong winds, and, although some individual blooms may receive damage, others are ready to expand and take their place.

Bedding-out plants in general have suffered severely, and the accustomed colour brightness at this season is conspicuous by its absence. Owing to the cold nights, growth has been much retarded, and, except where very close planting out was practised, the beds, as yet, are not nearly filled. A change to warmth and drier conditions may, of course, alter this, and enable the plants to recover and present a prolific display of foliage and blossom. The usefulness of the begonia as a bedding plant is at present very striking, more particularly the small, profuse-flowering varieties, several beds of which show to much advantage, for, although in full bloom, heavy storms of wind and rain have passed over them, leaving them almost undamaged. James Day.

Galloway House, Wigtownshire.

**Potentilla Nepaulensis Willmottiana.**—With each succeeding season, the decorative value of Potentilla Nepaulensis as a border or rock garden subject appreciably increases. The form I most favour is known as Willmottiana, which, with its palmate, rugose leaves of deepest green and brilliant rose-carmine flowers, proclaim it a plant of sterling merit when in season during July and August. It is a free-growing subject, succeeding in any good soil that is well drained; it produces abundant foliage, from which arise stiff, branched stems some 15in. high, on which the flowers are borne. It ripens seed freely, and the resulting plants are true to the variety.—Thomas Smith.

# PRUNING ORNAMENTAL TREES.

There is probably no subject connected with horticulture which is so imperfectly understood, or so much abused, as the pruning of ornamental trees, and few young gardeners receive any systematic training in this branch of their profession, yet the proper development of many trees is only possible when strict attention is paid to pruning and general cultivation.

Undoubtedly trees would be better without pruning if they assumed their best proportions by natural means, but in the same way that a deformed child must be surgically treated if it is to develop into a good specimen of humanity, so must a deformed tree be pruned in order to allow it to develop in the best possible manner. Too often the nursery pruning of trees is neglected, and this leads to more pruning being necessary in after life than would be the case were pruning attended to during the early years. Some nurserymen, however, turn out really well-grown trees, and the pruning of such examples amounts to very little.

## Necessity of Pruning.

Pruning is condemned in some quarters on account of the severe measures adopted with street trees. This ought not to be, for the proper pruning of trees is a very different matter from the method employed in our streets. Street trees are certainly cut in such a fashion as to make them look very ugly, but it would be difficult to suggest a better plan. A municipal gardener is handicapped in many ways. He is limited to a few kinds of trees for street planting, and those are usually large-growing ones. They must be trimmed high enough to be clear of traffic, and their heads must not be large enough to shut out the light from adjoining houses or prevent the roadway drying in wet weather, therefore, as soon as the heads are really attractive they have to be cut hard back. A fault which might be remedied is that of planting too closely in streets. Trees are sometimes placed twelve to fifteen feet apart, and these, if not cropped hard, soon form a sort of hedge along each side of a road, whereas had they been placed fifty or sixty feet apart they might have been allowed to grow much larger, and would not have required the severe pruning which is necessary in the other case.

Again, it is a great mistake to plant trees in comparatively narrow streets where the traffic is heavy, for there is no room for them. The trunks are easily damaged, and the heads frequently cropped until the effect is painful. In such cases it would certainly be better to be without trees at all.

The pruning of park and garden trees, however, is another matter, and there is no excuse for its being neglected or performed in an improper manner.

## Pruning Young Trees.

As previously stated the nursery is the place where pruning must be strictly attended to if a good foundation for the future tree is to be laid. The object during this time must be the production of a tree with a strong trunk and rather narrow head of branches, which is capable of supporting its weight without the aid of a stake when planted permanently. To obtain such a tree it is necessary to exercise great care in the early pruning. Should this be left alone too large a number of leaders will be formed, and the central one will suffer accordingly. Side branches may also develop unduly, and rob the leader. On the other hand, if side branches are dealt with very severely the trunk will grow rapidly in height, and soon become too weak to support itself. The correct way to proceed is to keep the leader clear, and retain as many side branches as possible, the latter being shortened occasionally. If this shortening process is persisted in a considerable leaf area will be maintained to help in building up the trunk, and the branches will not increase very rapidly in thickness. As the trunk becomes strong enough to support itself a branch or two may be removed now and then. These must not be taken from the bottom only, but rather thinned out from those close together. By continuing this treatment for three or four years good trees are formed which will give little trouble when planted in permanent places. The subsequent pruning of such trees usually means keeping the leaders clear of side growths, thinning the branches occasionally, and removing the lower branches gradually as they advance in height.

Young ornamental trees which have been left unattended for several years are often wide-headed, with no distinct leading shoot, and such trees require rather severe treatment for a number of years to get them into the right condition for forming well-grown specimens. The tendency is for an isolated tree to develop in width more rapidly than in height, therefore the side branches have to be checked in order to give additional strength to the trunk. This might be done by simply taking the ends off all the branches, but a tree treated in such a manner would present a stiff and unnatural appearance, therefore it is a better plan to cut a few strong branches clean away where they can be well spared, and shorten the remaining ones back to side branches. The holes made by the removal of whole branches help a tree to retain something of its natural character, whilst by cutting the remaining branches back to side shoots it is relieved of stiffness.

## How to Prune.

If no distinct leading shoot exists, the branch nearest the centre of the tree should be selected for the leader, and be secured in an upright position by means of a stake fastened to the trunk. Should the branch be too strong for this, it might be wired up to a stake driven into the ground a few feet from the trunk. The same method is often successful when adopted for straightening a leaning tree. Branches which are likely to interfere with the development of the new leader must either be removed or shortened. New leaders may be formed fairly easily from side branches of broad-leaved trees, but less easily on conifers, and it is usually better to remove a damaged leader from a conifer, shorten the side branches round about, and try for a new upright leader from a dormant stem bud. When branches have to be tied or wired up care should be taken to place a stout piece of rubber or felt between the wire and the bark, and all such places should be examined annually in order to ascertain whether the ties are becoming too tight and are likely to cut into the bark.

The method of removing a branch from a tree has a considerable bearing on the healing of the wound, therefore care should be taken to make the cuts in such a way that they will heal most rapidly. In all cases when branches are cut out the wound should be cut quite parallel with the bark of the trunk. Some people are very fond of leaving an inch or two of the bottom of the branch, or of cutting it off at right angles with the trunk, but both ways are bad, for wounds so made, although small in comparison with wounds made parallel with the bark, fail to heal properly, whereas in the method recommended a complete healing may be looked for in a comparatively short time. In all cases it is desirable that the rough edges of a wound should be pared smooth with a sharp knife, and the whole wound painted over with coal tar as soon as possible after being made. If such a protective covering is not given, fungus spores are likely to obtain a footing, and decay may spread into the tree. When branches are shortened care should be taken to shorten them to a side branch, and in no case should they be reduced so as to look like long bare sticks.

## Removal of Dead Wood, etc.

Another important matter in regard to the pruning and upkeep of trees is the regular cutting out of dead and dying wood, and the removal of branches injured by wind, for the neglect of these seemingly trivial matters often results in permanent injury, and sometimes early death.

The time for pruning may be given as any period between the time when the young leaves are fully expanded and Christmas. There is a great deal to be said for performing the work in summer, for whilst the leaves are on the trees the operator is better able to judge of the amount of pruning actually necessary than when the branches are leafless.

In conclusion, one would urge that proper attention should be paid to young trees in order that severe pruning in after life will not be required; that the work be done in a careful and thoughtful manner, with due regard to the present appearance and future welfare of the trees, and that everything should be done to assist the healing of the wounds.

Kew. W. Dallimore.

# FLOWERING PLANTS AS STANDARDS.

A notable feature of the present day is the number of greenhouse decorative flowering plants that are now grown as standards. Fuchsias have always been so treated, as the drooping nature of their blossoms enables them to be seen to great advantage when they occupy a more or less elevated position. Concerning abutilons, too, much the same may be said, while in addition to these one frequently meets with standards of heliotrope, Salvia splendens, pelargoniums of zonal and ivy-leaved sections, lantanas, shrubby veronicas, and others. Apart from the fact that the flowers are brought nearer the eye on standards, these tall plants, when employed for grouping purposes, serve to break up any flatness or formality.

From their comparative novelty, as well as for other features, standards often attract a good deal of attention, and one is frequently asked how they are obtained. It is, in most cases at least, a very simple matter, all that is necessary being to strike good vigorous cuttings, and grow them freely, taking care that the growing point is not injured in any way. To prevent any mishap the plants should each be secured to an upright stick, and all side shoots removed till the required height is attained, when they may be allowed to branch out. Where these standards are used out of doors care must be taken that they are securely fastened. S. W.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

CATTLEYAS.—As Cattleya gigas, C. Rex, C. Gaskelliana, C. Dowiana, and its variety aurea, C. Hardyana, and many others which flower at this season pass out of flower, they should be kept rather dry for some little time. They may also be exposed to more light and air than at other seasons. The compost should not be allowed to become dust-dry, or there will be loss of roots and of energy. Those plants that are in need of new rooting material should have attention as regards repotting, as soon as new roots are seen to be developing. A compost as advised in the issue of March 23 will answer the requirements of the whole of these orchids. Each plant should be potted firmly, with the rhizome placed just on a level with the rim of the pot or pan. When repotted, the plants should be placed at the cool end of the cattleya or intermediate house, where they will be exposed to the light and air; but should the weather be bright, care must be taken that they are not scorched by the sun. Until the plants are re-established only sufficient moisture is necessary to prevent shrivelling. Every care should be taken to keep the plants at rest, and to prevent secondary or autumn growth. When these secondary growths insist on pushing, the plants must be kept in their growing quarters, and every inducement given them to complete growth as soon as possible.

C. SPECIOSISSIMA should be treated in the same manner; although these remarks are made especially for C. Warscewiczi, which in so many cases fails to give a return of flowers for the room occupied. If this so-called shy-flowering cattleya is treated as advised, and not allowed to suffer from either too much or too little water during the winter months, and placed in a good light position at the warmest end of the cattleya house, I feel confident a fair percentage will produce flowers. I have from time to time observed that plants which have been kept dry, and did not push their growths early in February, failed to flower; while those which commenced to grow at that date rarely failed to do so. If this cattleya is potted now and treated as advised it will get well established before the winter months.

LÆLIAS.—L. purpurata, L. tenebrosa, L. cinnabarina, and many of their hybrids, should also be examined in order to see if more root room or new material is required. By this time their new growths will have reached a few inches in height, and will be pushing forth new roots. When giving plants larger pots, the old back pseudo-bulbs should be cut away; and, should the eyes be good, they may be potted up in small pots, when many will make new growths and soon become useful plants. Enough space should be allowed in the receptacle for at least two seasons' growth. Old plants that need renovation should also receive attention at this season. All exhausted or worn-out pseudo-bulbs and dead roots should be cut away, the old decayed compost removed, and the pieces potted separately into pots as small as possible, so that, when they become well rooted, they may easily be placed into larger receptacles.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

SCHIZANTHUSES.—Seeds of this useful annual should be sown at once for next spring display. Choose a seed-pan, clean and well crocked, fill it to within one inch of the rim with a sandy compost, sow the seeds thinly and evenly over the surface and slightly cover them with compost. The pan should then be placed in a slightly-heated frame and covered with a piece of glass. Directly the seeds have germinated the pan must be moved to a cold frame or the seedlings will become drawn and spoilt. When the seedlings are large enough the most forward should be taken out and potted sepa- be kept frost proof. The early batch will be possible to obtain three batches of plants from the same sowing. The seedlings must at all times be grown quite cool. During the winter a good position for them will be found on the top shelf of a vinery, where they will obtain the maximum of light and be kept frost proof. The early batch will be ready for a shift into flowering pots about the end of October, but the later batches are best kept in the small pots until the spring.

ARUM LILIES.—The time has arrived for these plants to be examined. There are two distinct systems practised for the resting or summer treatment. Some growers favour planting out, while others prefer to let them remain in their flowering-pots, simply drying them off by withholding water. I prefer and practise the former treatment. Those which have been planted out have, owing to the heavy rains we have experienced, started to grow much earlier than usual, and are now rooting freely. They should be carefully lifted with a fork, commencing at one end, and taking the row right through. Pots and soil should have been prepared beforehand. Arums are gross feeders, and require a rich, rather heavy compost, consisting of two parts loam, one part well-decayed manure, and one part coarse sand. They are very fond of soot, therefore a good dusting should be added at the time of potting. When lifted the plants should be sorted into three sizes. A ten-inch pot will accommodate four of the largest plants, and a five-inch pot will easily hold one strong-flowering plant. Arum lilies are very valuable at Christmas and Easter for church decoration, and they are equally valuable for house adornment. If they are potted in sizes, all the plants in each large pot will bloom at the same time.

LILIUM LONGIFLORUM.—Some bulbs should be obtained at once and potted, if required for Christmas display. These lovely lilies are always welcome, and especially in the winter when all outdoor flowers are over.

VALLOTA PURPUREA.—This is finely in bloom now, and should also be put into the conservatory. I have before stated in this calendar when vallotas and nerines are grouped together they produce a glorious effect.—Lewis Smith, Norwich.

## HARDY FRUITS.

RASPBERRIES.—The fruiting season is now over, and every effort should be made to remove the old canes as soon as possible; these should be cut out, and, at the same time, weakly young growths should be removed where a sufficient number of stout, healthy growths are available for the purpose required. When tied to individual stakes, five or six growths are ample; these should be loosely tied up to prevent breakage from strong winds. Where trained on wires a sufficient number of young canes should be laid in, allowing ample space between the growths to permit the thorough maturing of the rods. Manurial assistance will prove most beneficial, particularly so where no previous feeding has been afforded. If the soil is naturally deficient in lime, a dressing should be applied forthwith. During the fruiting season weeds spring up in abundance; these should now be cleared off and the plantations made clean and tidy.

LOGANBERRIES, ETC.—The various kinds of fruits similar in habit of growth to the loganberry should receive similar treatment to that advised for raspberries. The thorough ripening of the young growths is of the utmost value, and greatly enhances the prospects of a good crop of fruit for another season. Overcrowding should be strictly avoided. As a successional fruit to the raspberry the wineberry is well worthy of more extended culture, and should certainly be grown wherever space can be afforded, even if it is but a row or two. The plants present a most pleasing sight when carrying a crop of fruit.

SUMMER PRUNING.—By this time growth has practically ceased, and the operation of summer pruning should now be completed. Cordon and espalier pears and apples, unless regularly pinched back, will have made a considerable amount of growth, and, apart from such growths which may be required for extension or filling up vacant spaces, all unnecessary shoots should be cut back fairly close; much depends, however, upon the condition of each individual tree as to whether hard pruning should take place or otherwise. Trees carrying an average crop of fruit may, with advantage, be closely pruned; those with a vigorous habit of growth and little or no fruit will, if cut too hard, make a secondary growth, which is not desirable; but by leaving a certain number of growths evenly distributed over the tree, the risk of secondary growths will be obviated. Bush trees require similar treatment, and to obtain fruits of high colour and quality there must be free admission of light and air; it is therefore obvious that growths which interfere with the due passage of sun and air must be removed, and as soon as possible, to gain the desired results.

PROTECTING PLUMS.—Choice plums should be netted to ward off the attack of birds; if wasps are troublesome it will be necessary to use special protecting material, and to closely envelop the trees, as the least hole is quickly found out and made use of. The best plan is to search for and destroy wasps' nests.—W. Messenger, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

TOMATOES OUT OF DOORS.—The weather of late has not been over favourable to the ripening of this crop. Remove side growths and large leaves that prevent sun from reaching the fruits. Stop the leader to encourage every bunch to perfect its fruits. If only good-sized green fruits form at the tops of the plants, these can be ripened late inside or, if desired, can be used for tomato chutney or pickle. Any fruits that are now colouring should be gathered and stored in boxes to ripen, placing them on a shelf in an ordinary greenhouse or frame.

INDOOR TOMATOES will need a little fire heat should the weather remain cool. Pay strict attention to watering, or cracked fruits will be the result. Young plants for winter fruiting should now be shifted into their fruiting pots. Guard against excessive moisture. These will do well in any cold house for some time to come.

SPINACH.—The principal sowing of this crop can now be made for winter and spring supplies. Sow again two weeks hence, when much ground will be vacant after the lifting of maincrop potatoes. Sow in drills eighteen inches apart. Do not forget to sow a row or two of the perpetual spinach beet at the same time as the Winter Prickly and the Carter Spinach.

TURNIPS will grow readily after this date; treat as advised for spinach. Red Globe and Snowball are two good varieties.

ENDIVE.—Late-sown plants should be put out without delay so as to form fair-sized plants before winter sets in. Make still another sowing, this time in a cold frame or hand-light, finally planting the seedlings under lights so that, should severe weather set in, and spinach is at a standstill, they can very conveniently be used as a substitute for the latter.

ONIONS.—This crop is keeping its foliage very late this year; hardly a plant has fallen down yet; consequently they will be later in ripening than usual. With continuous wet weather afford a little help by lifting their foliage occasionally; should it fall too thickly or rot, mildew and decay will set in, whereas the regular movement of the leaves will help to dry and ripen the crop.

LATE PEAS.—Pay attention to this crop as the gales which usually occur from now onwards may blow them over; treat runner beans likewise, securing them safely.—G. Ellwood, Swanmore Park Gardens.

## SHREWSBURY FLORAL FETE.

(Continued from page 646.)

of £25, with a charming exhibit. An extremely beautiful kentia formed the centre of the background, and around and under it were lightly grouped elegant crotons, ixoras, and Lilium speciosum. A light archway carried more crotons and Fuchsia triphylla. Right in front brilliant crotons combined with Oncidium Marshallianum, O. flexuosum, odontoglossums, cattleyas, lælio-cattleyas, and liliums to produce a light, graceful, and yet rich effect. Ferns, small caladiums, and low crotons formed the groundwork and margin of this delightful contribution.

Mr. J. V. Macdonald, gardener to Sir G. H. Kenrick, Whetstone, Edgbaston, came a close second, and once more included beautifully-grown crotons, handsome palms, oncidiums, odontoglossums, cattleyas, angræcums, ixoras, liliums, Francoa ramosa, and Selaginella cæsia in his finely-arranged exhibit. Mr. W. Vause Leamington, came second; and Mr. W. R. Manning, Dudley, was awarded a special prize.

FIRST PRIZE DISPLAY OF ROSES AT SHREWSBURY, EXHIBITED BY MESSRS. GUNN AND SONS, OLTON.

There were two competitors in the class for a group of tuberous begonias, arranged on a space 15ft. by 4ft., foliage plants and ferns allowed among the begonias. The two exhibits made a rare display of colour. Messrs. Blackmore and Langdon, Bath, were awarded the first prize for superb flowers on beautiful plants, their Royal George, Princess Victoria Louise, Lady Cromer, Lady Tweedmouth, and Mrs. Lockwood being a few of special merit. Messrs. T. S. Ware, Lim., Feltham, came a close second, and showed wonderful flowers of Mary Pope, Lady Cromer, Lady Ashdown, Dr. Hamilton, and King George IV.

Messrs. Hayes and Sons, Keswick, led the way in the class for a collection of alpine plants, arranged on a space of 100 square feet, on the ground. The fulfilment of the schedule requirements did not permit of a bold or fine effect, and the season was late also for a showy display. Veronicas, heaths, saxifrages, meconopsis, and campanulas were the plants most in evidence. Second prize was won by Mr. W. R. Hayes, Grasmere, whose violas, campanulas, hypericums, and heaths gave a fair amount of floral colour. Messrs. W. Artindale and Sons, Sheffield, third.

### FLORAL DESIGNS.

Messrs Dicksons, Chester, secured the first prize for a collection of floral designs, and so won the gold medal. This firm used Lilium longiflorum and Cattleya Harrisonæ freely in wreaths, harps, crosses, anchors, crowns, chaplets, etc.; asters and carnations combined beautifully and the "gates ajar" of white stocks and a base of odontoglossums, cypripediums, oncidiums, and croton leaves formed an attractive centrepiece. Bouquets and hanging baskets were also finely arranged. Mr. F. W. Johnston, Manchester, came second, and his cross of stephanotis, lily of the valley, and Anthurium Andreanum was very finely executed; the King's Acre Nurseries, Worcester, third.

Messrs. Felton and Sons, Hanover Square, London, W., led for a bouquet composed of Phalænopsis Rimerstiana, lælio-cattleyas, Oncidioda Charlesworthi, and hybrid odontoglossums; Mr. A. Adshead, Gatley, second, and Mr. W. J. Garner, Altrincham, third. Messrs. Felton scored for a basket of flowers with fine lælio-cattleyas and oncidiums beautifully arranged; Mrs. J. Nixon, Alderley Edge, second.

In the class for a basket of flowers, orchids excluded, Mr. A. R. Bide, Farnham, led with roses, and Mr. W. J. Garner was second.

For a table decoration Miss J. Jenks, Codsall, led with buff and pink roses. Mrs. J. Nixon, Alderley Edge, second with Gloriosa superba and francoa spikes. Mrs. A. H. Bide third with Lady Hillingdon rose.

### CUT FLOWERS.

The class for a collection of cut roses, arranged on a space 12ft. by 4ft., and 7ft. high, was a great one, seven competitors staging. Messrs. Gunn and Sons, Olton, secured the premier prize of £7 with a beautiful exhibit with arches of rambler roses and towering stands of Frau Karl Druschki, Irish Elegance, Lyon, A. R. Goodwin, Mrs. T. Roosevelt, and other fine things, with small vases of yellow and light roses in front. This exhibit was particularly bright and effective. Second prize was won by Mr. J. Mattock, New Headington; Messrs. W. and J. Brown, Peterborough, third; Messrs. Hugh Dickson, Lim., Belfast, fourth.

Messrs. A. Dickson and Sons, Newtownards, scored for a dozen bunches of decorative roses with Irish Elegance, Harry Kirk, Lady Pirrie, Mrs. Alfred Tate, and other good things; Mr. J. Mattock, New Headington, second.

Mr. Charles Wall, Bath, scored for a collection of carnations, and put up a splendid lot of popular varieties of the perpetual class. Mr. Wallace, Saffron Walden, a good second; and Mr. C. Waters, Balcombe, third.

Gladioli are fine exhibition flowers, and they were finely shown by Messrs. J. Mair and Son, Prestwick, and Mr. T. Lambert, Brogyntyn, the former winning for two dozen spikes, and the latter for twelve. Mr. J. Walker, Thame, scored for two dozen show and fancy dahlias, with large, gay floral globes of fairly good quality for the time of year. Mr. H. Woolman, Shirley, had the finest set of twenty-four cactus dahlias, but Mr. H. Peerman, well known at London dahlia shows, led the way for eighteen, and for a dozen cactus blooms with flowers of great merit. Messrs. Bullough and Bolton, Elland, won the chief award for a dozen cactus dahlias, six blooms of each, arranged with suitable foliage.

Messrs. Keynes, Williams, and Co., Salisbury, scored for a collection of cactus or decorative dahlias with a very bold exhibit of fine flowers staged with grasses and gypsophila in tall stands; the exhibit was a very pretty one. Mr. H. Woolman, Birmingham, third.

Messrs. W. and C. Bull, Frome, won first prize for two dozen bunches of hardy flowers, and did so with a fine contribution. In a similar class, but for a dozen bunches, Mr. W. Taylor, gardener to S. Bibby, Esq., Harwicke Grange, was the fortunate first-prize winner. Mr. W. H. Banks was the winner in a class for a dozen bunches of annuals, but he omitted to label his flowers. Mr. A. Myers, Shrewsbury, succeeded in the class for a dozen trusses of zonal pelargoniums, with a very bright contribution of excellent varieties.

For a display of border carnations and picotees the chief award fell to Messrs. M. Campbell and Son, High Blantyre, who had a very pretty exhibit. In the amateurs' class Mr. W. H. Banks, Kington, secured the chief prize, in creditable fashion, for carnations. For a dozen vases of carnations Mr. C. Wall was the leader. Mr. G. Bowness, Glasgow, scored well for eighteen bunches of sweet peas, and had quite bright clean flowers; Mr. J. Smellie, Busby, was second.

### VEGETABLES.

We very much doubt whether there has ever been a finer display of high-class vegetables than that at Shrewsbury on this occasion. A number of seed firms offer substantial prizes, and these are eagerly competed for. In the Messrs. Suttons' class for nine kinds, Mr. David Gibson, gardener to Captain H. Spender Clay, Lingfield, Surrey, was a splendid first with beautifully grown produce, and Mr. W. Gaiger, Elstree, was second. In Messrs. Carter's class Mr. E. Beckett led, with Mr. F. J. Barratt following. Mr. J. Hudson, Leicester, and Mr. J. R. Tooley, were first and second respectively in Messrs. Webb's class for nine kinds, and in Messrs. Clibrans' class Mr. Searle, gardener to the Marquis of Northampton, Castle Ashby, beat Mr. H. Turner, of Wellington. Mr. F. Sanderson, of Whittington, and Mr. E. E. Arnold, Wellington, were first prize winners in classes provided by Mr. E. Murrell. Mr. Searle and Mr. T. Jones, Ruabon, were first and second respectively in Messrs. Dickson and Robinson's class for nine kinds, and in the local class Mr. W. Taylor was the leader.

In the society's class for twelve kinds of vegetables, Mr. E. Beckett, V.M.H., Aldenham House, Elstree, led with superb leeks, celery, carrots, parsnips, peas, cucumbers, tomatoes, onions, cauliflowers, potatoes, beet, and runner beans; he gained 77 points. Mr. J. Hudson, Leicester, second with 72½ points; and Mr. J. R. Tooley third. Seven competitors. In Robert Sydenham Limited's class for nine kinds of vegetables, Mr. E. Deakin, Haymills, Birmingham, won.

### MEDALS.

Large Gold.—Messrs. E. Webb and Sons, Wordsley, Stourbridge; King's Acre Nurseries, Worcester; Royal Horticultural Society, Wisley Gardens, Ripley; Messrs. Sutton and Sons, Reading; Mr. Amos Perry, Enfield; Messrs. T. Rivers and Sons, Sawbridgeworth; Messrs. Clibrans, Altrincham; Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree.

Gold.—Messrs. H. B. May and Sons, Edmonton; Messrs. Gunn and Sons, Olton; Messrs. Young and Co., Hatherley; Messrs. A. Dickson and Sons, Newtownards; Messrs. Dickson and Robinson, Manchester; Messrs. Jarman and Co., Chard; Messrs. Bakers, Old Hall Nurseries, Codsall; Messrs. Isaac House and Son, Bristol; Messrs. Dobbie and Co., Edinburgh; Messrs. Hobbies, Lim., Dereham; Messrs. Jones and Sons, Shrewsbury.

Silver-Gilt. — Messrs. J. Forbes, Lim., Hawick; Messrs. R. Wallace and Co., Colchester; Messrs. Pritchard and Sons, Shrewsbury; Mr. L. R. Russell, Richmond; Messrs. Fred Smith and Co., Woodbridge; Mr. A. W. Thorpe, Birmingham Road, Lichfield; Messrs. Barr and Sons, Covent Garden; Mr. Robert Bolton, Carnforth; Mr. H. N. Ellison, West Bromwich; Messrs. Dicksons, Lim., Chester; and Mr. E. Murrell, Shrewsbury.

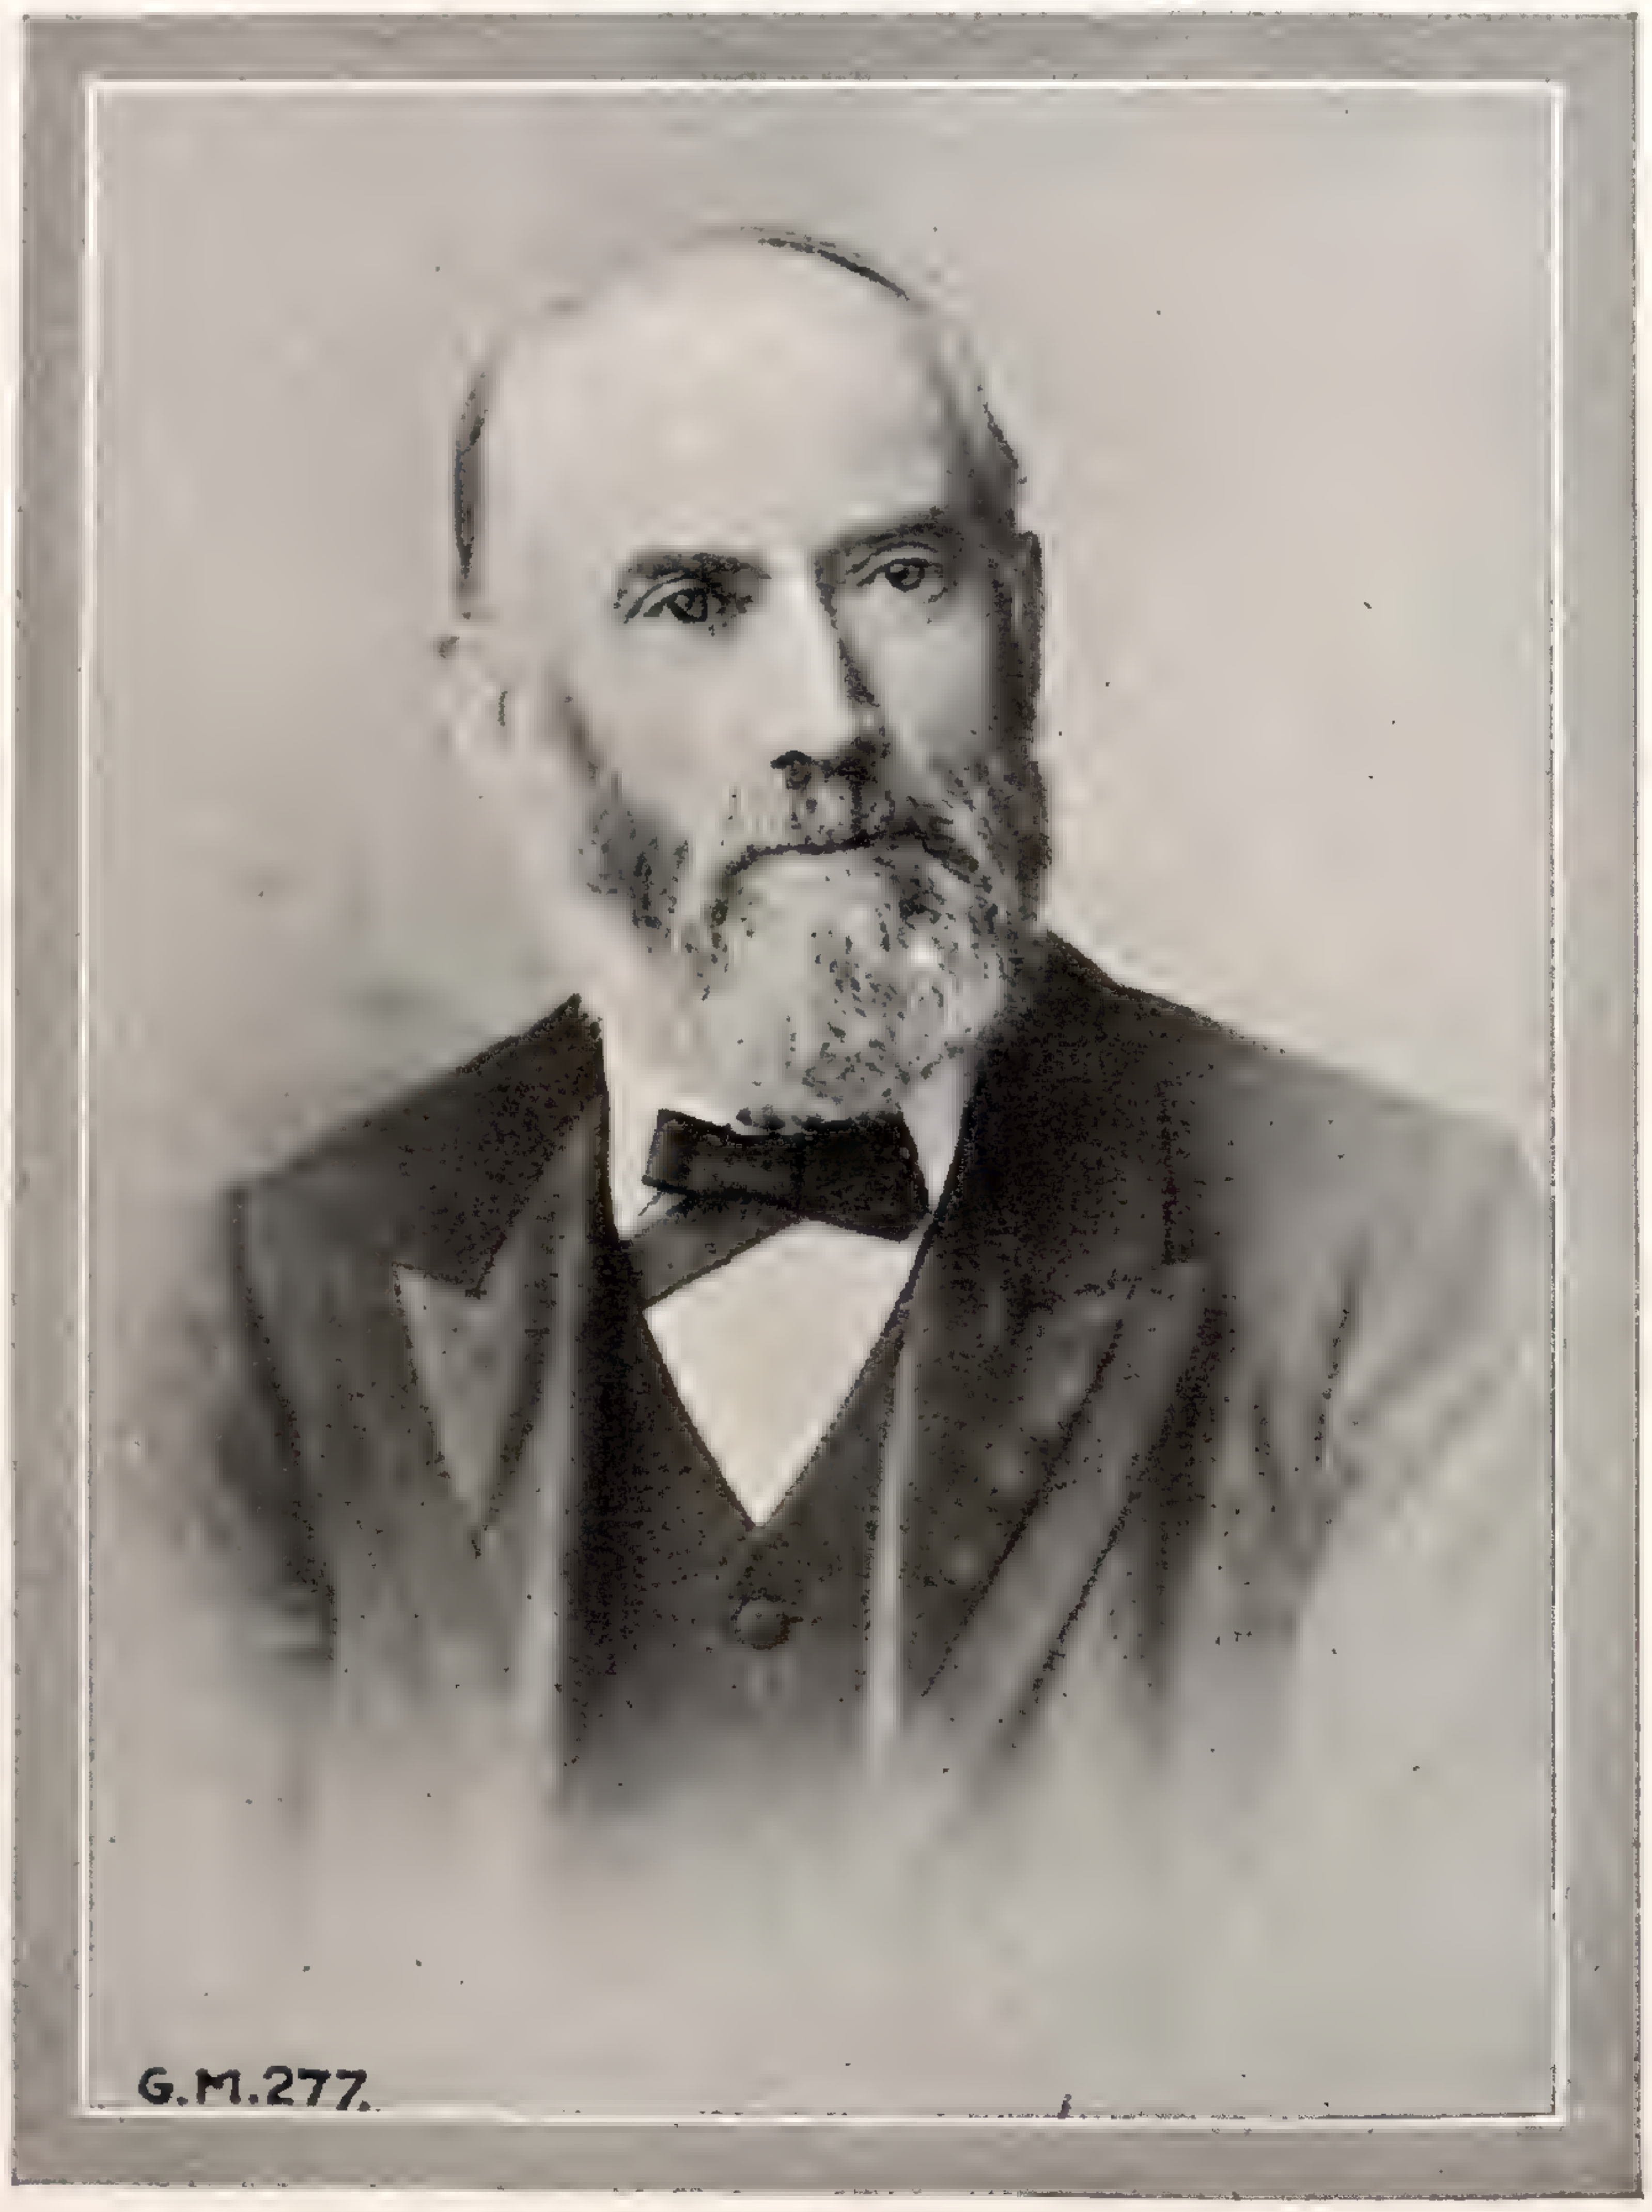
Silver.—Messrs. S. Bide and Son, Farnham; Messrs. Hewitt and Co., Solihull; Lapworth Nurseries, Hockley Heath; Mr. R. Hayes, Grasmere; Messrs. Hogg and Robertson, Dublin; Messrs. Conways, Halifax; Messrs. Webb and Brand, Saffron Walden; Messrs. Rich and Co., Bath; Messrs. A. R. Brown and Co., King's Norton; Messrs. Aldersey and Marsden Jones, Malpas; Mr. W. A. Manda, St. Albans; Messrs. G. Gibson and Co., Leeming Bar; Mr. A. Myers, Shrewsbury; Messrs. Caldwell and Sons, Knutsford; Messrs. Felton and Son, Hanover Square; F. Bibby, Esq., Hardwick Grange (for shrubs and climbers); Mr. W. L. Paterson, Shrewsbury; Mr. G. Underwood, Aylestone Park, Leicester.

We are compelled, by the pressure on our space, to leave over the non-competitive section until our next issue.

## OBITUARY.

### MR. ALEXANDER DEAN, V.M.H.

With deep regret we record the death of Mr. Alexander Dean, V.M.H., which occurred at his residence, 67, Richmond Road, Kingston, Surrey, on Tuesday, the 20th inst., in his eighty-first year.



THE LATE MR. ALEXANDER DEAN, V.M.H.

Mr. Alexander Dean, who was a striking personality in the world of horticulture, and enjoyed a high reputation as a writer, lecturer, and judge, was the younger of three brothers, all of great ability, and all associated with horticultural pursuits. Mr. William and Mr. Richard Dean devoted their attention chiefly to flowers, mainly those beloved of the florist, but Mr. A. Dean gave more attention to vegetables and fruits. Especially was he interested in vegetables, and in the course of his long and active life he did an immense amount of useful work by his advocacy of an extension of the cultivation and exhibition of these useful products. When associated with his brother, the late Richard Dean, in the management of their seed grounds at Bedfont, he raised a considerable number of potatoes of great excellence, and probably the one that retained a position in trade lists for the longest period was the large purple-skinned round known as The Dean. He was long a prominent and useful member of the Royal Horticultural Society's Fruit and Vegetable Committee, and he took an active part in the movement which resulted in the Vegetable Conference and Exhibition held at Chiswick in 1903. In connection with this event Mr. Dean initiated a gardeners' dinner, which was acknowledged to be the most successful function of its kind ever held in this country. This dinner took place at the Holborn Restaurant on September 29, 1903, on the evening of the first day of the fruit and vegetable show at Chiswick, which was the last great gathering held in the Royal Horticultural Society's historic gardens. Mr. Dean acted as secretary of the dinner committee, and upwards of five hundred gardeners and garden lovers were present. For many years he was a lecturer and instructor of horticulture under the Surrey Council, and took a prominent part in the advancement of horticultural education, while as a judge of vegetables and fruit he had few equals. Of fearless, independent, and sturdy character, Mr. Dean was most emphatic in declaring his opinions on matters horticultural in the horticultural Press, to which he was a regular contributor until advancing years rendered some reduction in his activities necessary. This free expression of his opinions led to many a fierce fight, from which he usually emerged triumphant and never vanquished. Gardeners' associations and gardening charities found in Mr. Dean an earnest advocate. In 1904 the Council of the Royal Horticultural Society conferred the distinction of the Victoria Medal of Honour in Horticulture upon him, an honour that was well deserved. During his residence at Kingston-on-Thames Mr. Dean's advocacy of window and flower garden competitions led to a material improvement in the appearance of those parts of the town occupied by the industrial classes. Mr. Dean maintained his interest in horticulture in general, and vegetables in particular, until the last, and some three years since he took a leading part in the formation of the National Vegetable Society, which has already done much useful work. Mr. Dean was elected the first chairman of the committee of the society, a position he held until a short time since, when his failing health induced him to resign.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

SCIENTIFIC COMMITTEE.—August 13.

Mr. E. A. Bowles, M.A., F.L.S., in the chair.

CATERPILLARS ON HOPS.—Mr. Holmes reported that there was no doubt the caterpillars on hops were those of Vanessa Io.

BLACK CURRANTS SPORTING.—Messrs. J. R. Pearson and Sons wrote that their plants of black currants were similarly affected, but that the trouble was not due to pruning. A letter on the same subject was read from Mr. E. Ballard, who suggested that forcing by too much manure or too hard pruning was the cause of the "throw back" in black currants, and that the trouble is common amongst the Worcestershire growers.

HAZEL.—Mr. O'Brien showed hazel nuts with very large foliaceous bracts, a condition he had found fairly common in the neighbourhood of Haywards Heath.

PRIMULA PYCNOLOBA.—Messrs. H. Veitch and Sons showed a new Western China primula, P. pycnoloba, a species with small, dark purple flowers, very large sepals, and foliage resembling a megasea.

HEATHS DISEASED.—Some heaths with partial withering of the stems were sent. As the bark around the stem (at the collar) was partially decayed, it was thought the trouble was due to some irregularity in the water, probably lime or some such substance.

GLADIOLUS CORMS DISEASED.—Mr. Jenkins sent corms of gladiolus which had failed to grow; the substance of the corm was very woody, and the buds, which were still sound, had failed to push through, due probably to the effect of the dry heat of last season. Mr. Bowles remarked that he had occasionally noted this state of things in crocus corms.

OAK GALLS.—Mr. Odell remarked upon the widespread attack of the oyster gall (Neuroterus ostreus) on the Oaks, pointing out that the alternate gall, Spathegaster apallinus, was not so much in evidence during the early months of the year as the attack of Neuroterus last summer would indicate.

DINANTHE.—Mr. Bennett-Poë, V.M.H., showed some open flowers of the genus Dinanthe; the flowers are a deep blue, somewhat like Meconopsis Wallichi in form. Specimens of this new plant were shown at the International Show by Miss Willmott, V.M.H., and Mr. H. J. Elwes, V.M.H.

## The British Pteridological Society.

The annual meeting of this society was held this year at the Albion Hotel, Arnside, Westmorland, on August 5, when a good number of members were present, Mr. Alex. Cowan, of Penicuik, as president, taking the chair. Many of the members assembled on the Friday preceding the meeting in order to arrange some fern-hunting expeditions in the vicinity, but, owing to the distance which it was necessary to travel to reach good ground, and still more to the terribly cold and wet weather which prevailed during their stay, no "finds" of any special note can be recorded.

Subsequently, in view of the first drawback, it was resolved that Devon or Dorset should constitute the area for hunting on the occasion of the next meeting, since not only are the species there far more numerous than in the north, but ferns generally are far and away more abundant. At the meeting the hon. secretary, Mr. Chas. T. Druery, reported that the society was now represented by no less than 150 members, and that as a consequence the funds were in a very satisfactory position, fully justifying the establishment under his editorship of the "British Fern Gazette," the illustrated quarterly issued to members, the first volume of which, representing three years' issues, having just been completed. It was acknowledged on all hands that this "Gazette," which now represented the first permanent serial publication devoted entirely to our British ferns and their varieties and was contributed to by the Editor and many of the members, was a very practical, valuable, and up-to-date contribution to the standard literature of the cult.

A vote of thanks to the president and officers, who were re-elected en masse, was supplemented by a special one to the Editor, together with a testimonial in recognition of the services rendered by him to the society and to such fern lovers as contributed thereto. A large number of fronds of very beautiful ferns, some new finds, and some improved raised varieties, were exhibited, and displayed, in many cases, some most extraordinary advances in the development of those varietal charms, which in our native ferns far and away excel all exotics in diversity, and rival the best in beauty.

The hon. secretary, whose address is 11, Shaa Road, Acton, London, W., will be happy to send a sample copy of the "Gazette" to any one desirous of joining the society, the subscription to which is only 5s. per annum (August to August), and entitles not merely to fellowship with an ever-increasing number of fern experts and lovers, but also to four issues of the "Gazette," of which Volume II. will commence in September.

## Broughty Ferry Horticultural Association.

The annual excursion, held under the auspices of this association, took place on Saturday, 10th inst. Mount Melville, St. Andrew's, was the rendezvous. On arrival the party was met at the East Lodge by Mr. Wm. MacDonald, head gardener to J. Younger, Esq. Exploring the charming grounds was a delight to all. Something new was noted on all sides, while original ideas on the part of the landscape artist were in evidence, and commented upon by the visitors. It is not too much to assume that when the grounds are furnished with that luxuriant growth which must inevitably come in the strong soil, this will be amongst the most beautiful places in Scotland. Only ten years since the estate was acquired by Mr. Younger; he had much to do, and has done it thoroughly and picturesquely, without taking a single point of interest from a charming old-world country seat. There is beauty, charm, and substantiability in the beautiful and serviceable mansion, new from its foundations, to the Italian garden not yet complete. The rose garden, with the newest and best roses in carpets of Viola gracilis, were lovely, and ramblers, too, were in rich profusion, as hedges, and on the pergola. The formal flower garden was a mass of bold and telling colours, and the vegetable and fruit gardens contained supplies for all demands. The extensive glass ranges, all comparatively new, were a delight to all, and contained splendid crops of large peaches, well finished, and ripening grapes. Orchard house fruits were extra fine too, and carnations were splendid. Separate houses accommodate orchids, ferns, palms, melons, tomatoes, and stove plants in choice sorts. Such a garden is well worth visiting, and worthy to rank among the notable places of Scotland.

The party were further honoured in being the guests of Mrs. Younger, who entertained them to high tea. Mr. Grant conveyed the thanks of the company to Mr. and Mrs. Younger for their kindness.

## Poole (Dorset).

The fourth annual show of the Borough of Poole Allotments Association, Lim., was held in Poole Park on August 14, and proved a great success. In the various centres there are about seven hundred allotment holders, and at the show nearly 400 entries were made. In many classes there were more than twenty entries, and the produce throughout was very good indeed.

The Longfleet schoolboys, who have a garden of their own, had a nice collection of vegetables, which added considerably to the interest and attractiveness of the show. Cabbages, turnips, carrots, beet, parsnips, onions, potatoes, and marrows were staged in large numbers, and were of high quality.

Table decorations, sweet peas, roses, hardy cut flowers, including some very beautiful arrangements of them in baskets; and dahlias were also features of the show.

A complete arrangement of plants suitable for a window was a novel feature, and the various collections, tastefully arranged, were very attractive. Mr. W. Evans, gardener to G. J. Fenwick, Esq., was first in the class for a group of plants in semicircular form in the open division. Dr. Crallan and Mr. G. C. Richards were second and third respectively. Dr. Crallan was first, and Mr. Palmer (head gardener to the Poole Corporation) second, in the class for eight vases of sweet peas. Mr. Palmer had the best roses, followed by Mr. Evans and Dr. Crallan.

Non-competitive exhibits added much to the attractiveness of the show. Mr. T. K. Ingram, Parkstone, had a lovely circular group of miscellaneous greenhouse plants. Mr. H. W. M. Elford, Bournemouth, had seedling dahlias; Mr. R. Aireton, Longfleet, greenhouse flowering plants; Mr. C. W. Hill, sweet peas; and Mr. A. Piercy, Parkstone, plums.

## East Anglian Horticultural Club.

At the August meeting of this club, held at the Boar's Head Hotel, Norwich, Mr. W. Rush, the president, read an interesting paper upon "Stove and Greenhouse Foliage Plants." Mr. Rush has a varied collection of these under his charge, and is thoroughly versed in the subject, consequently he was able to give some very practical advice upon propagation and cultivation. The good discussion which followed showed that the members interested themselves in the subject. There was a fine exhibition of flowers, fruits, and vegetables. A special feature here was the well-conditioned apples of 1911 growth, which Mr. Frank Neave, Lingwood, staged side by side with those of 1912 growth. The collection of fruit from Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, was striking evidence of good cultural skill.

## United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall, Westminster, on Monday evening, August 12, Mr. Thomas Winter in the chair. Ninety-one new members were elected, making about 300 since July 8. Mr. W. Collins is resigning the secretaryship on September 9, and Mr. A. C. Hill, of 35, Alexandra Road, West Kensington, W., has been appointed secretary pro tem.

## GARDENING ENGAGEMENT.

Mr. Harry Foster, who succeeded the late Mr. Charles Foster as Director of the "Times" Experimental Station, Sutton Green, Guildford, has been appointed assistant to Mr. Walter P. Wright, Horticultural Superintendent and Instructor in practical gardening to the Kent Education Committee. Mr. Foster's many friends will wish him every success in the duties upon which he enters about the middle of September.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

STREPTOSOLEN JAMESONI.—W. B., Chappel: I have two fine specimens of Streptosolen Jamesoni, and am anxious to make use of them for summer bedding. Would you be good enough to tell me if the plant is suitable for this purpose, and also how to propagate so as to obtain good sturdy plants by June 1 next?—Streptosolen Jamesoni is a fine plant for summer bedding, and is largely used for this purpose in many of the notable parks and gardens of London and other large cities. It is usual to insert cuttings of new growth early in March, in a warm pit, and grow the plants freely in a moist atmosphere; in fact, the treatment usually accorded young fuchsias struck early in spring will suit Streptosolen Jamesoni. As quite small plants the streptosolen is not a success for summer bedding, as the flowers are seen to the best advantage when the plants are a yard or more high, and rise well above a lower subject in the bed. We have never tried raising plants from autumn-struck cuttings, but we should try the method if we wanted to produce the largest plants possible by bedding-out time next year. In such a case we should root the cuttings now in gentle heat, pot them early, and grow the plants steadily in a warm greenhouse until March, when further potting and more heat and moisture should induce free growth in ample time for proper hardening off before early June

MILDEW ON CRIMSON RAMBLER ROSE.—J. R. P., Holywood: I shall be much obliged if you can tell me what is the matter with the Crimson Rambler rose, specimen of which I have enclosed. It has been growing over an arch for at least fifteen years, and has always bloomed well. This year it has a fine promise of bloom, but the flowering growths became affected like those sent. Last year there was a slight attack only. The plant has produced some fine young canes from the base this year. Is there a remedy, or shall I take up and destroy the plant?—The rose is suffering chiefly from an attack of mildew, but greenfly is also very much in evidence. Unfortunately, Crimson Rambler is particularly liable to mildew attack. Thin out all unnecessary growth, and cut out a large number of the flowering growths as soon as the flowers fade, though this may be done at once if the infection is very bad all over the tree. Spray the tree with a liver of sulphur solution, made by dissolving 1oz. of liver of sulphur in a little hot water, and adding it to five gallons of soft water. The whites of two eggs or a tablespoonful of liquid glue will give a little adhesiveness to the mixture.

MEANING OF PLANT NAMES.—W. B., Chappell: Will you kindly let me know the title of a book which gives the meanings of the specific names of plants? A great many of the names convey their own meaning, such as aquatica, riparia, alba, socotiana, etc., but I am constantly coming upon names of which I do not know the meaning.—A book that you would find very helpful is "Nicholson's Dictionary of Gardening," where the meaning of every plant name is given in brackets immediately after the name; while in the fourth volume is a pronouncing dictionary and a list of Greek root words from which a large number of botanic names are derived, with meanings and examples of derivations. B. D. Jackson's "Glossary of Botanic Terms, with Derivation and Accent," should also be useful, and, as it is necessarily a smaller and cheaper work than Nicholson's, you should get it first. Of course, it does not contain horticultural information.

GLOXINIAS.—R. T., Stockton.—Kindly advise me concerning the "blind" gloxinia I enclose.—There is not the slightest evidence to show what has caused the "blindness"; the tuber, roots, and leaves all seem perfectly healthy, and so some local cause must have been at work. We have seen begonias go blind after being watered inadvertently with very cold, hard water, and liquid chemical manures not infrequently defeat the end in view when used over-strong. It is in these directions, and in connection with fumigation, that we think you must look for the cause of the trouble.

POTATO SCAB DISEASE.—T. J., Shaftesbury: Can you give me some information concerning potato scab disease, and what is the best means of curing and preventing it? In Somersetshire last week I found the pink-skinned potatoes had the disease badly, but the white-skinned ones seemed to be fairly free. —It is quite impossible for us to help you unless we know more definitely what particular form of scab the potatoes are suffering from. Scab may be due only to mechanical injury resulting from the harshness of the soil. On the other hand, it may be due to the attacks of Oospora scabies or Spongospora scabies. The worst of all scab diseases is the Black Scab or Wart Disease, to which we have referred in these columns on many occasions. Growers with crops suffering from this terrible and unpleasant disease must report to the Board of Agriculture under the Destructive Insects and Pests Order. The penalty for neglecting to report is £10. You may obtain a leaflet dealing with and describing the black scab disease from the Secretary, Board of Agriculture, 4, Whitehall Place, London. Letters of application need not be stamped.

PROPAGATING CLEMATIS.—E. W., Harrogate: A friend of mine has a particularly good clematis. We neither of us know its name, but it is so beautiful that the propagation of a few plants is very desirable. Would seeds sown now prove satisfactory, or would cuttings or layering prove the surest way of securing a little stock? Any help you can afford us in our difficulty we shall greatly appreciate.—You may propagate clematises from seeds, but the seedlings would not necessarily reproduce the seed parent exactly. Seeds are best sown in early spring, in gentle heat, giving the seedlings cooler conditions as they advance, and planting them out in the autumn. Another method is to sow the seeds in sandy soil in a cold frame, as soon as they are ripe. In your case, however, the better plan will be to layer several growths, pegging them down firmly in fairly light sandy soil; but great care must be taken to make sure the layers are well rooted before they are severed from the parent plant.

PULQUE.—C. J. R., Essex: I am told that from Agave atrovirens, of which you have recently given two excellent illustrations, the Mexicans prepare a fermented liquor, which is known as pulque, and is largely drunk. I have not been able to obtain much information with regard to pulque, and I should like to know how the supplies of the sap from which it is made are obtained.—There is a considerable amount of information relating to pulque and its preparation in various publications, but it is scattered about and not readily accessible. It is, therefore, a matter of some interest that Mr. A. Burgestein prepared an article with illustrations fully dealing with the subject, and this was published in the "Oesterreichische Gartenzeitung" (Vol. vi., pt. vii., p. 252-8). An excellent abstract of this article is given in the current issue of the "Journal" of the Royal Horticultural Society, and, as it contains all the information you are likely to require, we give it herewith: "Pulque, the national beverage of Mexico, is obtained from the agave, generally from A. atrovirens, but many other species are used. When the seedlings have attained a height of four inches they are taken up, their leaves cut off, all except the central shoot, and the roots cut hard back. They are left to lie for seven days in the sun, and then replanted in a well-manured bed. Next year when they have reached a height of ten inches they are taken up again, the roots cut back, and replanted after exposure to the sun for fourteen days. They now send up abundant shoots in the axils of the leaves, which may be planted. The operation of root pruning and sun baths is repeated once more. When the plants are six to ten years old the central bud is cut off. Six months later the heart of the agave is hollowed out, forming a vessel a foot and a-half deep, which in the course of a week fills with liquid. This is collected twice daily. In good ground an agave will yield from one to one and three-quarters of a gallon of aguamiel daily for eight months. The plant then dies. The liquid contains about 10 per cent. of sugar. Some of the liquid is drunk as it is drawn from the plant, but most of it is fermented and converted into pulque."

LIMNANTHES DOUGLASI.—Spero, Kingston: Will you kindly advise me on the following matter: For the past three years I have tried to grow Limnanthes Douglasi, but have failed each time. The plan I have followed is to sow the seeds early in September in boxes, and after duly thinning the seedlings plant them out in the open ground. The young plants have always appeared to be doing well until about February, when they gradually die, roots and all. If you can suggest anything to get over the trouble I shall be obliged, as it is annoying to fail after taking pains to get the plants to grow. —Limnanthes Douglasi, like D. alba and D. rosea, are hardy annuals, that should be sown where they are to bloom. In well-worked and fairly light garden soil a good sowing should be made in early September. Thin sowing and early thinning are essential, so that good sturdy plants are left to stand the winter, and to flower next spring. In March and May other sowings should be made to succeed the autumn sowing; in these cases, also, early thinning is essential.

## NAMES OF PLANTS.

P. D. J., Bunbury.—1, Gesnera cardinalis: 2, Begonia Haageana.

F. E., Torquay. A garden variety of the Pomegranate—Punica granatum.

H. M. C., Sidmouth.—1, Fuchsia corymbiflora; 2, Gaura Lindheimeri; 3, Phacelia campanularia.

S. L., Huntingdon.—1, Spiræa Douglasi; 2, Colutea arborea; 3, Rhus Typhinus; 4. Ceterach aureum.

W. D. A., Horley.—1, Leptosyne Stillmani; 2, Rudbeckia Goldstrahl; 3, Polygonum orientale; 4, Muehlenbeckia complexa.

W. C. F., Renfrew.—The flowering plant is Statice Suworowi; the ferns are—1, Lastrea felix-mas cristata; 2, Athyrium filix-fœmina capitatum; 3, Lastrea pseudo-mas cristata; 4, Athyrium filix-fœmina laxo-cristatum; 5, Athyrium f.-f. cristatum.

→ Syringes ←

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No.1 Four Oaks Undentable, $1\frac{1}{2} \times 20$in. 21/-; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, $1\frac{1}{8} \times 20$ in. 12/6 or with Angle Joint, 18/-

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

1 Year, **10/6** post free; 6 months, **5/6** post free; 3 months, **3/-** post free; to Foreign Countries, **14/-** per annum.

* * If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

**NEW DEPARTURE IN FERTILISERS.**

**"CRESCENDO" FERTILISER CABINET.**

**NEW FEATURE I.**—Artificial manures for different purposes, supplied in separate bags.

**NEW FEATURE II.**—Entirely soluble. A pinch in the watering-can daily. No trouble of mixing with the soil.

**NEW FEATURE III.**—Instantaneous action. Effects quickly visible. No waiting.

**NEW FEATURE IV.**—Opportunity for experiment with separate substances. (See directions.) Every garden, every greenhouse, may become an experimental station.

**NEW FEATURE V.**—The most highly-concentrated Fertilisers offered. Each 1s. 6d. cabinet makes 120 gallons of plant food. They **cannot be sold in mixture,** as they spoil one another. The Fertilisers are those employed by the greatest scientific horticulturists, and they are the prescription of a Fellow of the Chemical Society.

**NEW FEATURE VI.**—A substance is included for sweetening the soil, liable to be soured by artificial manures.

**NEW FEATURE VII.**—A Free Box to every customer who introduces five other new customers. (See Directions in the cabinet.)

The "Crescendo" Cabinet is supplied for 1s. 6d., post free, direct from the makers only.

Send P.O. for 1s. 6d. **now,** to

**"CABINET FERTILISERS,"**
**4, Hill Road, Wimbledon, S.W.**

**Full Instructions on Planting and Propagation of Hardy Plants and Flowers.**

**476 PAGES AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.**

**EASILY-GROWN HARDY PERENNIALS.**

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6.**

*SOME FEATURES OF THE WORK:*

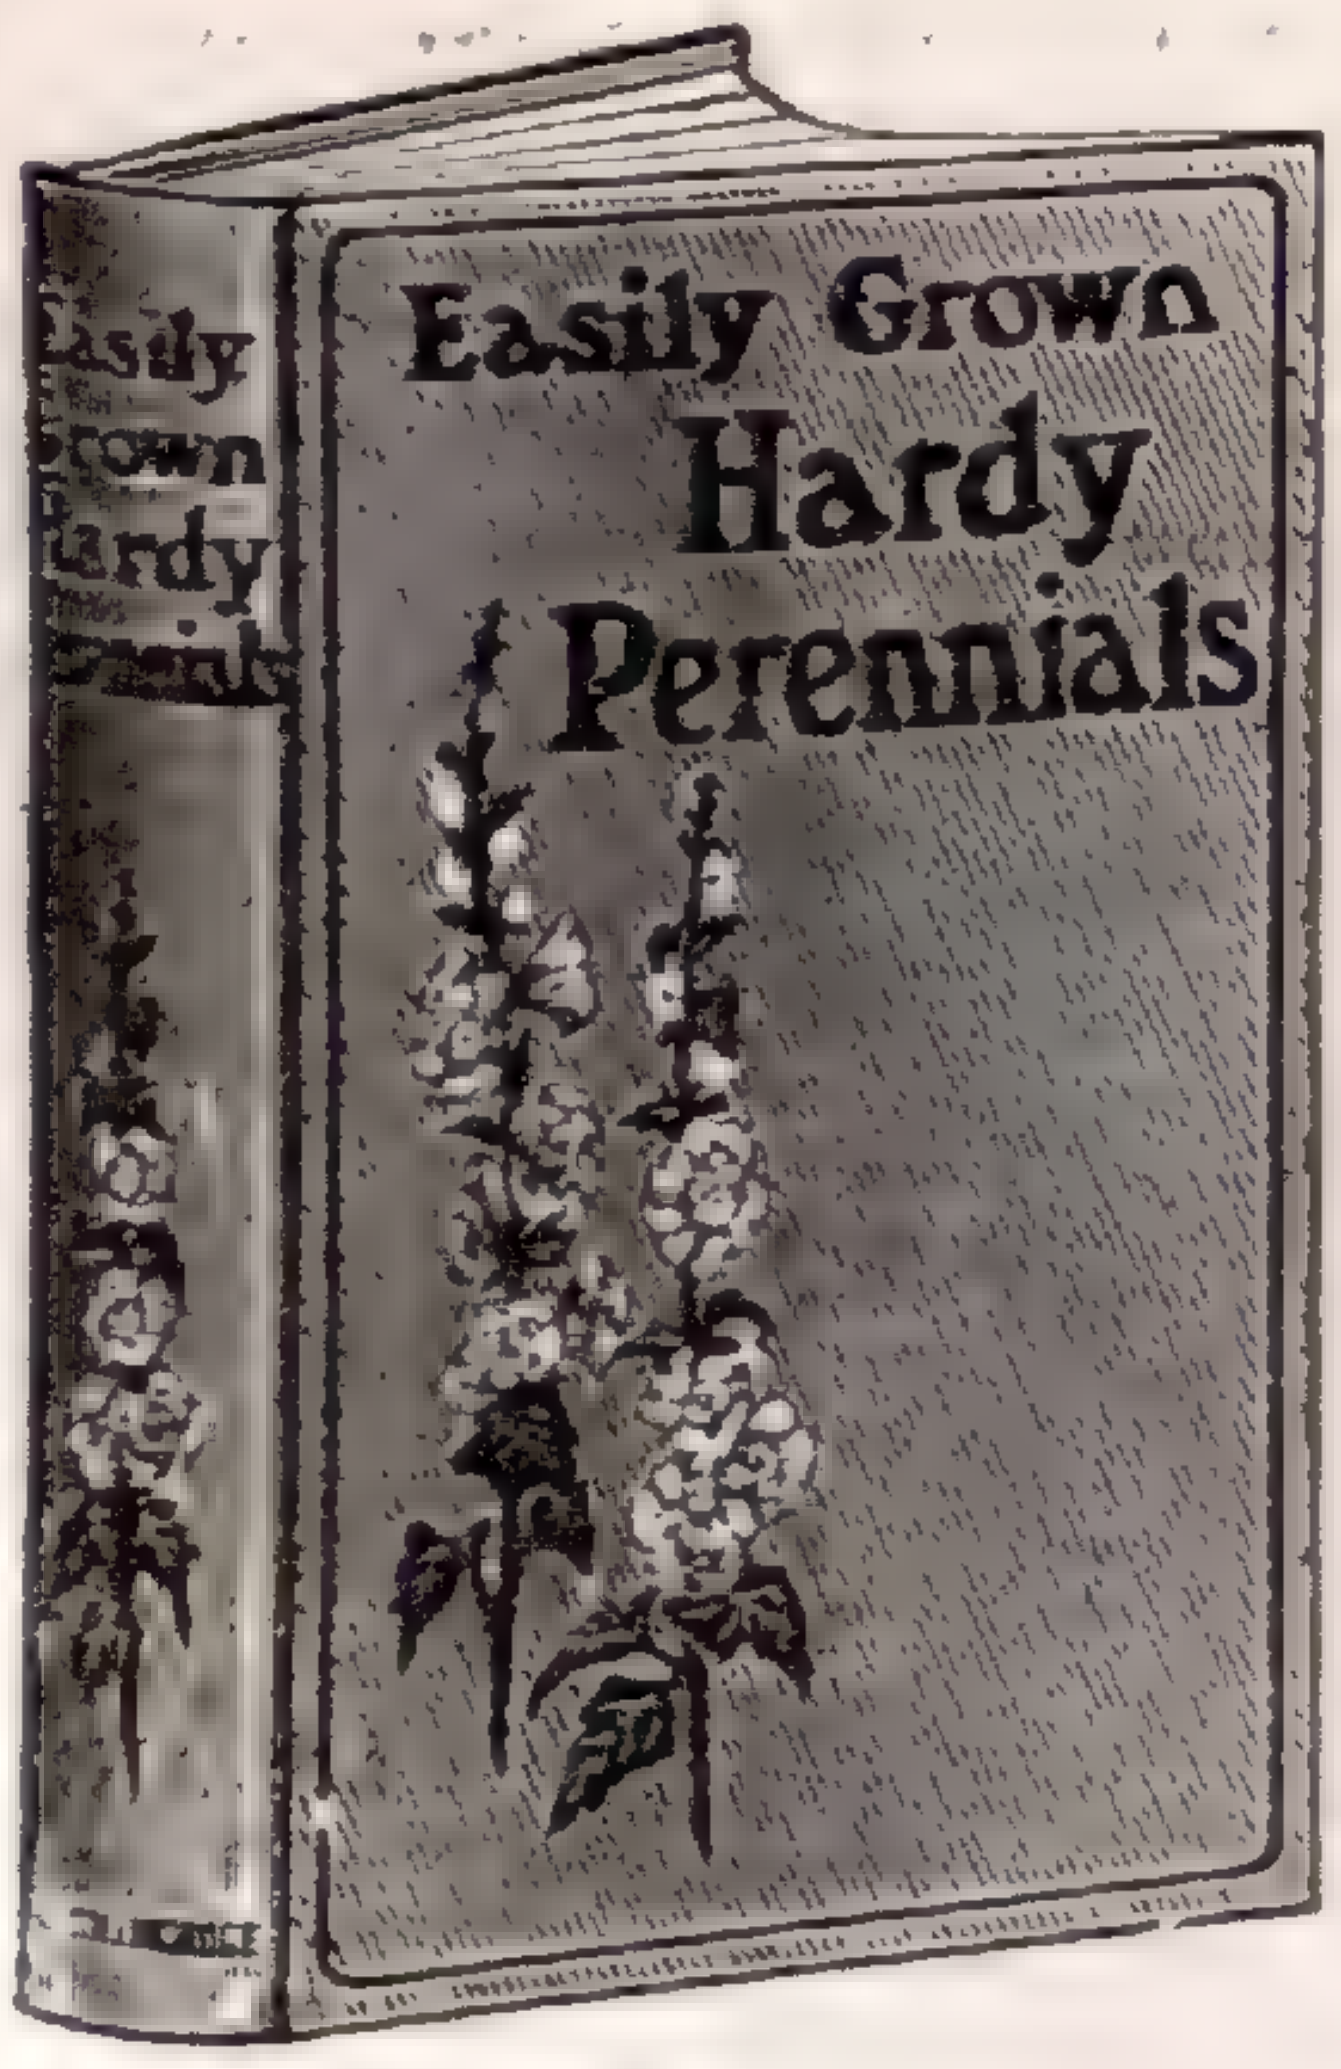
**Soil and Position.**—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

**Planting.**—The best time and method of planting are also clearly set forth.

**Pests.**—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

**Propagation.**—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

**Illustrations.**—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



**Botanical Name.**—Gives the botanical or generic name of each genus of plant described in the book.

**Common or Popular Names.**—Supplies the common or popular English names of all the plants described.

**Natural Order.**—The botanical family to which kind belongs.

**Habit and Uses.**—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

**Species and Varieties.**—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

**"The cultural details are very valuable."**—*Gardeners' Chronicle.*

## SUBSCRIBER'S ORDER FORM

Every Saturday THE GARDENERS' MAGAZINE. Twopence.

To W. H. and L. COLLINGRIDGE,
148 and 149, Aldersgate Street, London, E.C.

I request you to send me the GARDENERS' MAGAZINE by post every week until countermanded, and I enclose________ for________ months in advance.

Name____________________

Address____________________

Date____________

1 Year, **10/6** post free; 6 months, **5/6** post free; 3 months, **3/-** post free; to Foreign Countries, **14/-** per annum.

** If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

VOL. LV.—No. 3,070. SATURDAY, AUGUST 31, 1912.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Value of Spring-flowering Bulbous Plants.

Many are the changes that have within recent years been made in the methods of beautifying the garden and the ornamental structures that have a place therein; and one of the most important of these has been the fuller utilisation of bulbous plants that yield of their floral wealth during the earlier months of the year. Time was, and that not so far distant, when the greater proportion of the gardens of all classes were wholly destitute of flowers during the joyous season of spring, or contained so few as to bring into stronger relief their poverty in spring blossoms. Happily, this state of things has been changed, not wholly, perhaps, but sufficient to enable us to say that it is now the rule, rather than the exception, to find flower gardens, not alone of the wealthy, gay with colour, and it may be redolent with perfume, during the three months which constitute the spring season. Not only is the flower garden made brighter and more interesting at this period, but the attractions of the conservatory and greenhouse have been increased, and the floral adornment of the home carried out on a more liberal scale. The more general cultivation of trees and shrubs that are remarkable for the beauty of their flowers and bloom in spring, or can be so readily forced as to yield their flowers at that season, have contributed in some degree to the great change that has been wrought in the spring aspect of the flower garden and conservatory, but the dominating factor has been the fuller appreciation of the great value of the early-flowering bulbous plants of which there is so great an abundance at the command of cultivators. The commencement of the high degree of popularity which these bulbous plants now enjoy was unquestionably stimulated by the successful endeavours that were made some thirty years ago to obtain for the daffodils then available the prominence they so well merited. The number even then was considerable, and fortunately, they included varieties such as Emperor and Empress, in which were combined with flowers of great beauty a constitution so robust as to admit of their multiplication at a rapid rate. As these and other of the beautiful daffodils that were known thirty years ago became widely distributed as the result of the enterprise of those who were associated with the bulb trade, the public taste for spring flowers underwent a remarkable development. As the result of this stimulus attention was given to tulips that bloom in May, and many fine old varieties were rescued from oblivion, new forms were raised, and these, as they came before the flower-loving community, still further increased the widespread taste for spring flowers. It is interesting to observe that, as one result of the change in public taste, hyacinths have been restored to public favour, and now take the position they so fully deserve in the production of tasteful colour effects, both under glass and in the open. This further appreciation of spring flowers is a matter that must afford gratification to all who take an active interest in bulbous plants, showing, as it does, that their value is becoming generally recognised. A still further extension in their use in beautifying the flower garden is much to be desired, for their value is great, and there are many gardens in which they are as yet but sparingly planted. Large numbers of the varieties of daffodils, tulips, etc., are obtainable at so small a cost that the most beautiful displays may be produced for a very small sum. For this reason they have strong claims upon owners of town gardens who desire to maintain the surroundings of their house attractive with flowers over the largest possible period, for by utilising the varieties of daffodils and tulips that are at once cheap and beautiful, the cost of producing effects of great beauty is, comparatively speaking, so small that the question of destroying them at the end of the flowering season is not a matter for serious consideration. To the owner of a town garden the facility with which the stock can be annually replenished is a great advantage, for he has no space available for the completion of their growth. Moreover, nearly all classes of bulbs rapidly deteriorate, as do many fibrous-rooted plants, when grown under the conditions that obtain in gardens within the influence of the atmospheric conditions that obtain in towns. In country gardens the bulbous plants will, as far as circumstances permit, be grown on from year to year, but where, as in so many cases, the spring bulbs have to be removed before they have completed their growth to make way for summer flowers, it will not be possible to maintain them for an indefinite period in the best possible condition. For flower production for beautifying the home in spring, the more important of the classes of bulbous plants that bloom at that season are of immense value because of the simplification of their culture, which has been effected by the introduction of moss fibre to which a small quantity of charcoal and broken shell is added when used. It may not be possible to grow them to so high a degree of perfection

MR. E. F. HAZELTON.

in this material, as in a skilfully prepared compost, but those so grown may be placed in the various apartments without any risk of water draining from the receptacles as in the case of ordinary pots, and damaging carpets or furniture. In some of the larger gardens it would be an advantage to make a rather larger selection of kinds than is usually the case, and attention might well be directed to certain of the anemones, such as A. apennina and A. blanda, the chionodoxas, the scillas, spring snowflakes, bulbous iris, muscaris, and tritelias, the majority of which are of great value both for borders and for planting in the grass. Fully appreciating the great value of bulbous plants that bloom in spring, we advise our readers to plant them freely, and as early in the season as it can be conveniently done.

**Mr. E. F. Hazelton**, who early in the current year succeeded Mr. C. R. Fielder, V.M.H., in the charge of the beautiful gardens of North Mymms Park, the residence of Mrs. Burns, is a gardener of wide and varied experience, and shows in a marked manner, by the high position he occupies as a practical horticulturist, that he has taken full advantage of the opportunities he has had for the acquisition of knowledge relating to the gardening art. Commencing his gardening career in the nurseries of Messrs. Saltmarsh and Son, at Chelmsford, under the late Mr. M. H. Ranger, he passed through the gardens of Broomfield, Chelmsford, the residence of the late R. Warner, Esq., and then famous for orchids; Tring Park, the residence of Lord Rothschild; and The Dell, Egham, the residence of Baron Schroder, filling various positions of more or less responsibility. Subsequently Mr. Hazelton occupied the position of foreman in the gardens of Arle Court, Cheltenham, and Trentham, Stoke-on-Trent, then the residence of the Duke of Sutherland. His first appointment as head gardener was at Brocklesbury Park, the Earl of Yarborough's seat, thence he went as head gardener at Longford Castle, the Wiltshire seat of the Earl of Radnor, and subsequently he was appointed head gardener to the Earl of Derby at Knowsley. In the several positions of responsibility that Mr. Hazelton has occupied he has afforded ample evidence of his remarkable administrative ability and his thorough acquaintance with all that relates to the garden and its management. Mr. Hazelton does not specialise, as that term is usually understood, and therefore there is no occasion for us to enter into particulars of his accomplishments as a gardener, but we cannot refrain from mentioning that we have been much impressed by the success he has achieved in the cultivation of fruits and vegetables.

**Flower Culture in Great Britain.**—The extensive cultivation of flowers for market is one of the developments of modern farming of which as yet there has been no record, although in many parts of England its importance as a means of exploiting land which would be less profitably devoted to ordinary farm crops is well recognised. Information which was obtained by the Board of Agriculture in connection with the inquiry under the Census of Production Act, 1906, showed that the counties in which flower-growing is most widely practised are Lincoln, Cambridge, Middlesex, Norfolk, Devon, Somerset, Cornwall, Cheshire, Lancashire, West Riding, Sussex, Kent, Hampshire, and Surrey, but there are very few English counties in which the cultivation of flowers for market is not carried on, while in Wales and Scotland the industry has established itself in a few localities. Among the flowers most extensively cultivated are asters, chrysanthemums, daffodils, dahlias, lilies of the valley, narcissi, nasturtiums, pansies, roses, sweet peas, violas, violets, and wallflowers. The total area devoted to the cultivation of flowers and shrubs appears to be slightly more than 4,000 acres, and the gross value of the production is put at £121,000.

**Bulbous Plants for Indoor Culture.**—The cultivation of bulbous plants in moss fibre for beautifying indoor apartments in the earlier months of the year is becoming increasingly popular, and with a view to render further assistance to those of our readers who are specially interested in the indoor culture of plants, we arranged for an illustrated article on the subject to appear in this issue. The pressure on our space prevents our publishing the article in this issue with the whole of its illustrations, and we are therefore compelled to hold it over until our next issue.

**St. Petersburgh International Horticultural Exhibition.** The Russian Imperial Horticultural Society will hold a great exhibition next year on the occasion of the tercentenary of the Imperial House. The exhibition will open at the end of April, and include decorative and other plants, flowers, fresh and preserved fruits, scientific exhibits, products of school gardens, etc.

**Manchester Chrysanthemum Show.**—We are informed that an exhibition of chrysanthemums will be held by the Royal Botanical and Horticultural Society of Manchester in the second week of November next. The show will be held in the Manchester Town Hall, and about £160 will be offered in prizes.

**August Weather.** — Our readers will not need to be told that during the present month the rainfall has been largely in excess of the average, and that both temperature and sunshine are considerably below. These unfavourable climatic conditions are only too evident; but it may be of interest to compare the weather of this month with that experienced in the corresponding month of some previous years in which it was of an abnormal character. In the Augusts of 1885 and 1891 the weather was so cold and wet as to be the worst recorded for August in the memory of the present generation. At the time of writing it is not possible to do more than compare the official weather records for the first twenty-four days of the present month with those for the whole of August in 1885 and 1891, but these are sufficient to show that the weather in the current month will not be far from the worst, if it does not establish a record. The total rainfall for the first twenty-four days of this month was 3.20in., as compared with 0.93in. in August, 1885, and 4.55in. in August, 1891, and the number of rainy days in the same periods of the three years were 21, 10, and 22 respectively. The mean temperature for the first twenty-four days of this month was 58.5 deg., and for August, 1885, 59.1 deg., and August, 1891, 59.8 deg. The highest temperature recorded this month has so far been 70 deg., and for August, 1885 and 1891, 80 deg. and 76 respectively. The lowest temperature recorded in the respective periods was 46 deg., 41 deg., and 43 deg. No temperature exceeding 80 deg. was recorded in the three periods. From the commencement of this month until the 24th inst. 79 hours of bright sunshine were recorded or a daily average of 3.3 hours. In August, 1885, there were 116 hours of bright sunshine, or a daily average of 3.7 hours, and in August, 1891, there were 134 hours of bright sunshine, or a daily average of 4.3 hours. The following figures show how great is the difference between the rainfall, temperature, and sunshine of the first twenty-four days of this month, and that of August, 1911. In the last-named month the mean temperature was 68.8 deg.; highest temperature 96 deg.; lowest temperature, 51 deg.; there were 11 days on which the temperature exceeded 80 deg.; 243 hours of bright sunshine, or a daily average of 7.8 hours, and the total rainfall of 1.13in. These figures are taken from the records of observations made at Brixton and Westminster. During the past week the rainfall, if it has not established any records, has been sufficient to deluge the country and do enormous damage.

**Potato Breeding.**—At a recent conference at Cambridge, Dr. Salaman spoke on his researches on potato breeding. He has succeeded in establishing that the inheritance of many characters in the potato is governed by the Mendelian law. Practically all domestic varieties are hybrid in the Mendelian sense—that is, if the flowers are selfed and plants are raised from the true seed (as distinct from the tuber), a large number of types differing from the parent are produced. Dr. Salaman showed that in regard to shape of tuber (long or round), habit of growth (erect or procumbent), colour of tuber (red, purple, or white), the inheritance follows the Mendelian law of segregation. Interesting results have been obtained from a study of the wild species, Solanum etuberosum, which, though grown in this country for many years previously, set seed for the first time in 1906. The interest of this variety lies in the fact that it is believed to be immune to phytophthora disease, and there is consequently a possibility that by working on Mendelian lines it may be practicable to produce a variety of the domestic potato immune to this disease.

**Functions of Kew.**—In the new "Popular Official Guide to the Royal Botanic Gardens, Kew," attention is directed to the fact that, besides numerous other duties and functions of a minor character, these gardens have four leading national and Imperial functions to perform. These are: (1) The advancement of botany; (2) the introduction of new and valuable plants to the Colonies; (3) as a place of public resort; and (4) as a school of horticulture. As a national establishment, it stands in relation to botanical science much as Greenwich does to astronomy. The botanical survey of the Empire has been carried out with the aid of the herbarium, with its 2,000,000 specimens, and the library, which contains some 24,000 volumes. Floras of ten Colonies and dependencies have been published, and others are well advanced. At Kew, also, was compiled "Index Kewensis," an alphabetical list of every plant name published. In connection with the introduction of various new and valuable plants to the Colonies, one of the chief duties in 1841 was the introduction of plants of economic value to the Dependencies of England. These include fruits such as bananas and pine apples; foods like tea, coffee, and cocoa; medicines and drugs, such as quinine and coca; rubbers, dyes, timbers, and fibres. Two of the greatest successes in connection with the second of the functions of the Gardens were the introduction of quinine to India and the introduction of Para rubber to the Malay Peninsula. When, in 1866, the experiment of introducing the quinine plant (Cinchona) from South America to India was undertaken, the Government of Bengal alone was expending £40,000 annually on quinine. Now a dose of five grains can be bought at any post-office for a farthing.

## SNOWFLAKES.

In the many plants which constitute the family of the Amaryllids we have a number of our most popular and delightful flowers. Yet some of the members of the order are not so widely known as they deserve, and among these we may well include the snowflakes or leucojums. Of these there are three sections—those which flower in spring, the summer-flowering forms, and those which give their elegant flowers in the later months of the year. They are such beautiful and useful plants that it is not amiss to speak of them now, when the planting-time is with us, and when we are ordering our bulbs for the season.

### The Spring Snowflakes.

In leucojum or Erinosma vernum we have one of the most delightful of spring flowers, this spring snowflake successfully vieing with the snowdrop in grace and charm, having, indeed, a greater wealth of beauty, and producing in the grass, in the border, or on rockwork some of the most exquisite of all effects, with its handsome, bell-like flowers of purest white, save where a beautiful spot of colour adorns the tip of the perianth segments, and reveals more fully the perfect purity of the blossom as a whole. Growing from six inches to a foot in height, it is of surpassing beauty among the white flowers of spring. There are several forms of the spring snowflake, and each is beautiful enough to deserve our consideration at planting time. The typical Leucojum vernum is charming, with its perianth segments all of the same length, as pure as the snowdrop, but daintily tipped with a green spot. It is, as a rule, single-flowered, but occasionally in a clump a stray bulb or two may give two flowers on a stem.

It is difficult to say whether we most admire this typical spring snowflake, which has grace enough to compel admiration, or its varietal forms; yet there is beauty in the variety called carpathicum. This is a lovely snowflake, differing but little in general appearance from the other, save in the fact that the spot at the tip of the perianth segments is of a lovely golden-yellow instead of green. It is a charming variety, whose colouring appeals to many of us.

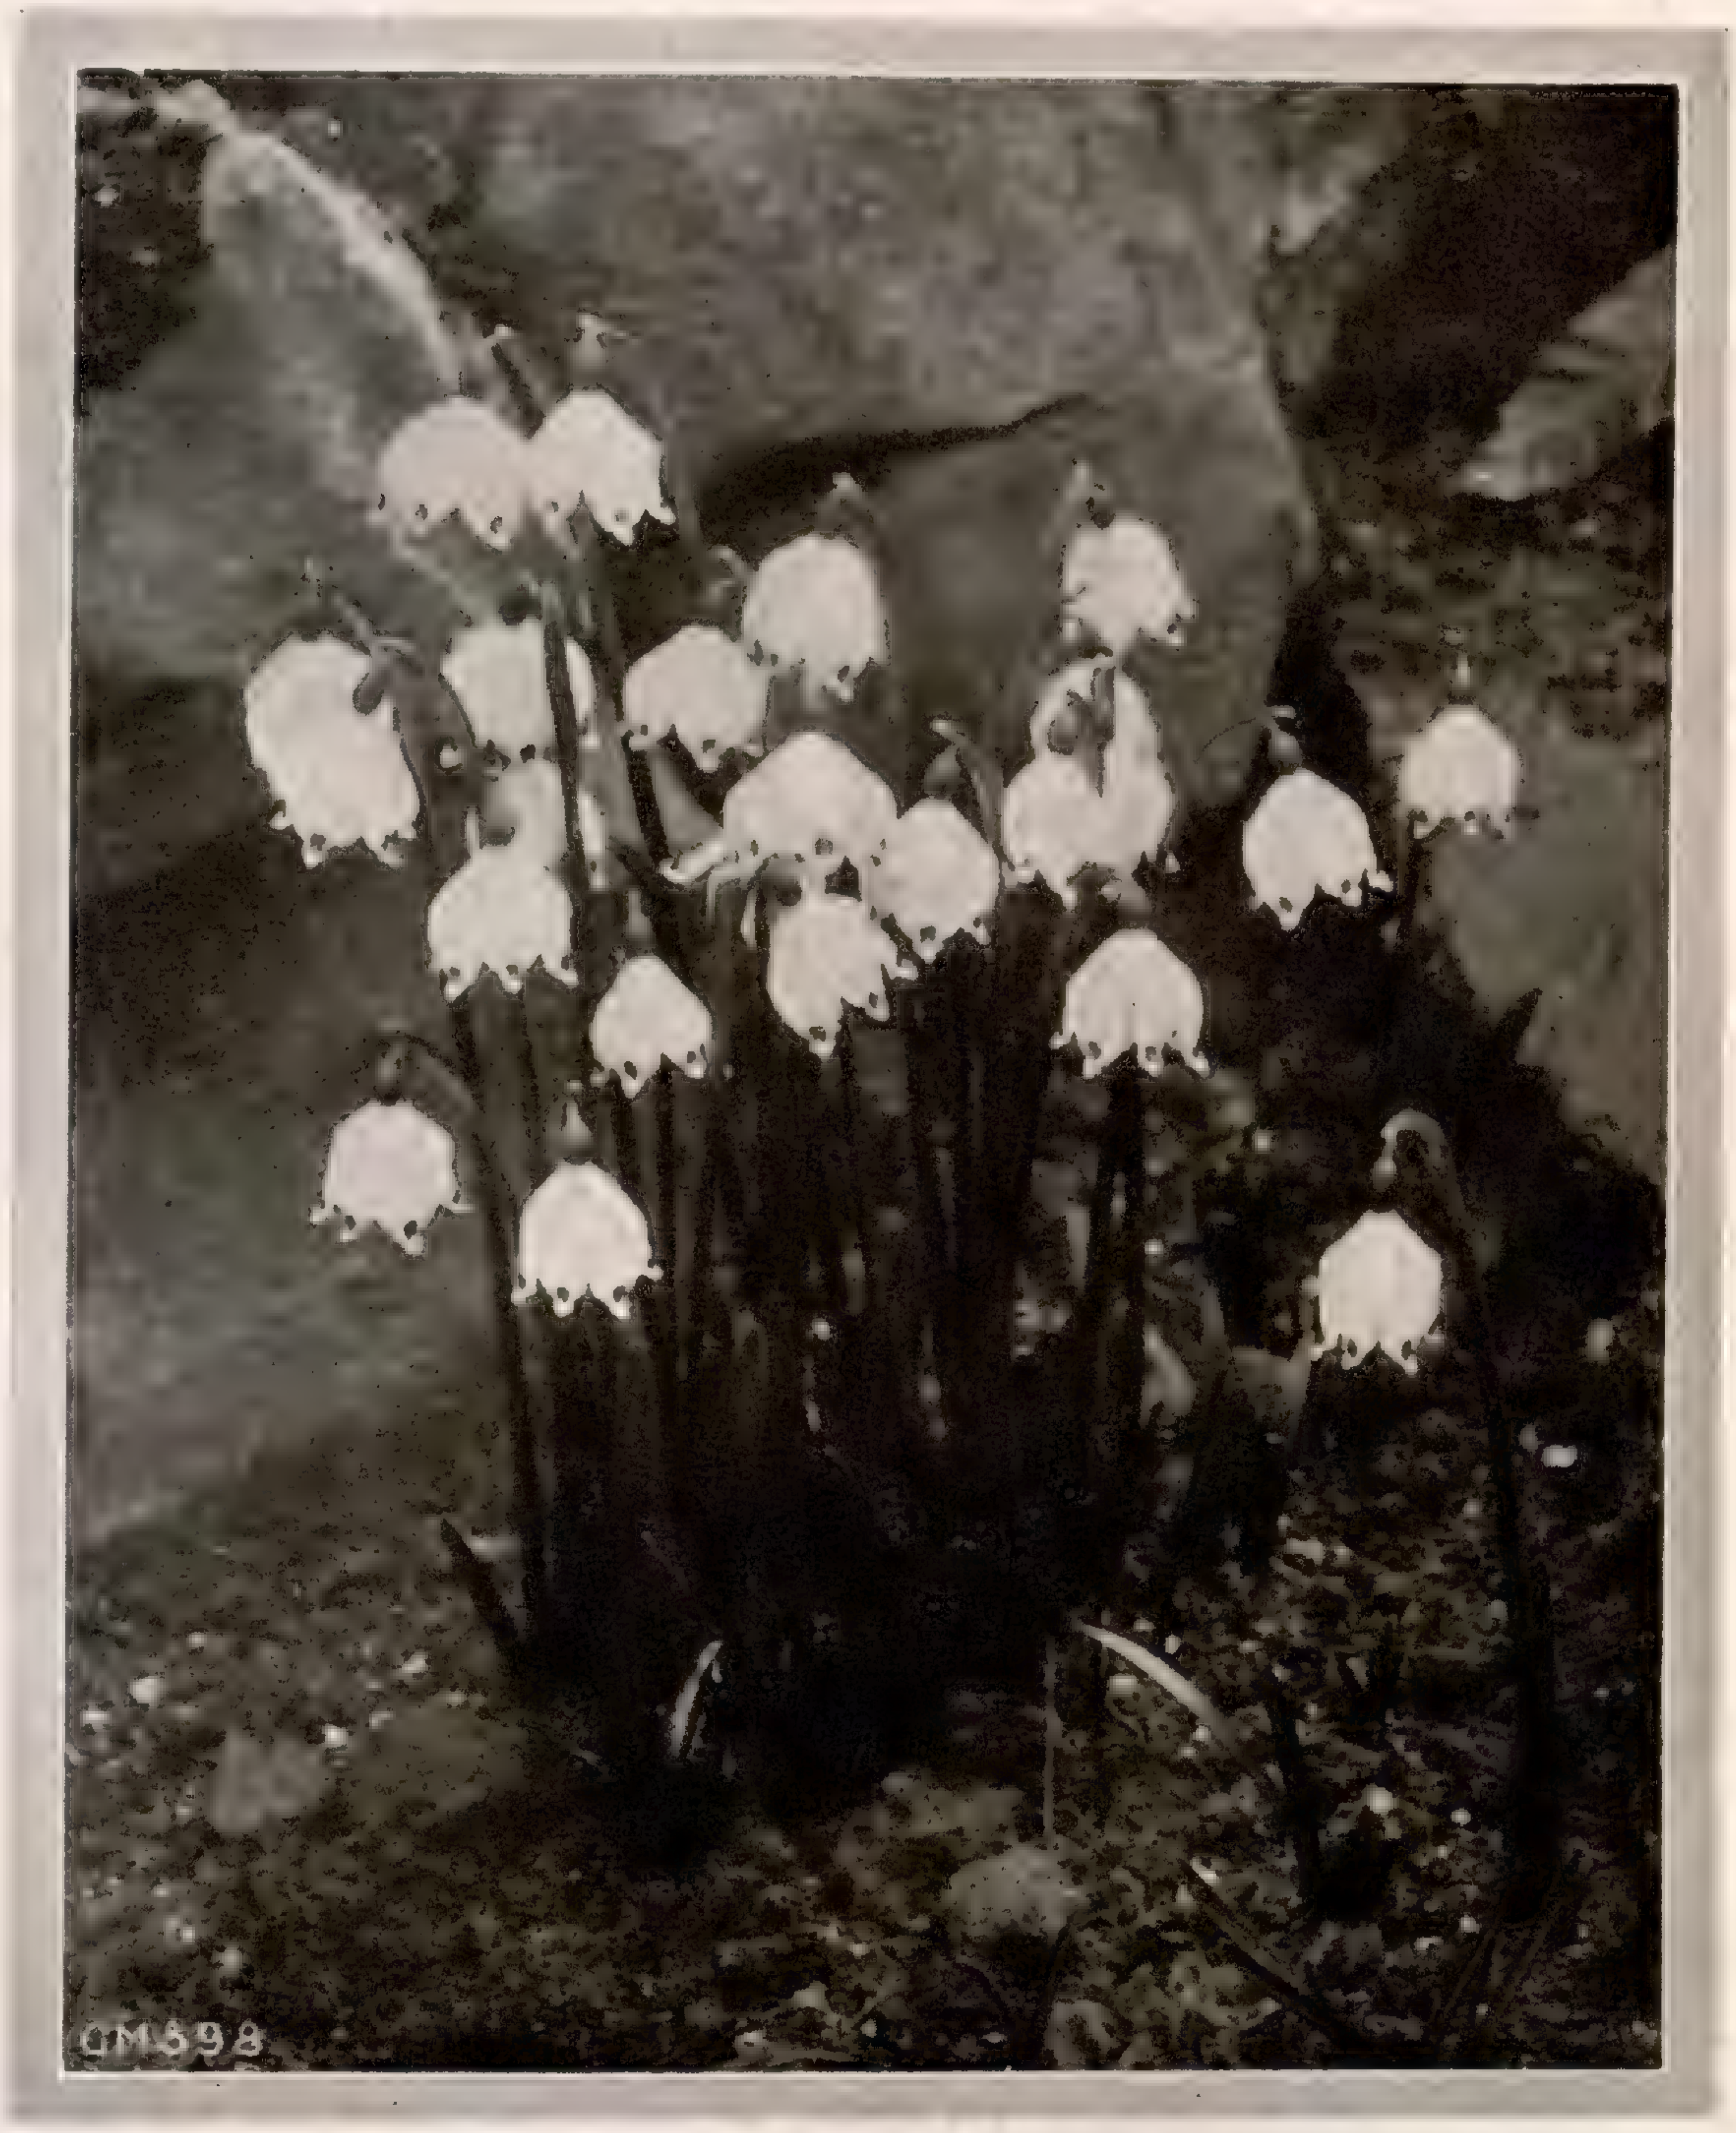
Perhaps the finest of all the spring-flowering leucojums is that called by Mr. J. G. Baker L. vernum Vagneri, which is the earliest and most robust of the set. It occasionally blooms in January, but usually in February, and has almost invariably two flowers on a scape, while the green spots are deeper in colour than those of the ordinary L. vernum. This is often grown as L. carpathicum, and it corresponds with the flower shown in the "Botanical Magazine," plate 1,993, save that it has green spots, while that of the plate referred to has spots of yellow.

There thus appears to be a considerable difference of nomenclature, and it is to be hoped that the names may be revised once more, as the writer has seen, and has in his possession, some varieties differing from the above, including a twin-flowered, yellow-spotted spring snowflake.

There is also a double spring snowflake, called Leucojum vernum multiplex, but this is scarce, and is also rather a disappointing flowerer, sometimes coming misshapen, and often failing to bloom. It is difficult to obtain, and it was only lately that the writer was able to replace it after being without it for years.

### The Summer Snowflakes.

Much less refined than its sister of spring, Leucojum æstivum has yet a role to fulfil in the garden. Its clusters of small, white flowers, tipped with green, are useful for bouquets and wreaths, and when arranged in a glass with foliage are by no means to be despised. The value of this summer snowflake is, however, lessened by the fact that its stem is too long for the size of the flowers when grown in the open in the ordinary way. It is more of a moisture-lover than its sister flowers, and this has suggested a means of reducing the apparent length of stem. This is to plant it as an aquatic, with about six inches of water above the base of the stem. In water it looks delightful. It may also be planted among low grass, or carpeted by some plant which will deprive it of some of its ungainly appearance. Its ally, L. pulchellum, sometimes called L. Hernandezi, has smaller flowers, and comes into bloom about fourteen days earlier. It appears to be a little more tender than the ordinary L. æstivum, which flowers in May.



THE CARPATHIAN SPRING SNOWFLAKE (LUCOJUM VERNUM CARPATHICUM).
Flowers white with yellow spots on the segments of the corolla.

### The Autumn Snowflakes.

The most reliable of the autumnal-flowering snowflakes is Leucojum autumnale, a graceful little plant, and a gem for the rockery or for pots. It grows about six inches or so high, and has narrow, grassy leaves, and a succession of little flowers of white, tinged with red, on chocolate-coloured stems. It is a very dainty snowflake, which to know is to admire.

L. roseum, a Corsican species, is both rare and tender. It is only from two to four inches high, and blooms in September and October. It should be grown in pure sand. Other snowflakes are L. trichophyllum, with its variety grandiflorum, which flowers in April; L. tingitanum, an April bloomer from Morocco; L. hyemale, another spring flowerer; and L. longifolium, from Corsica, flowering in April and May, but these do not appear to be in commerce.

### Cultivation.

The spring and summer snowflakes like a good soil, rather inclined to moisture, and should be planted rather deeply—six inches not being too much. The autumnal varieties prefer a rather dry soil, and are more tender than the others. Planting should be performed as soon as the bulbs can be procured. The best time to plant L. autumnale is in June or July, placing the bulbs, which are small, at a depth of about two inches.

S. Arnott.

---

**Ceanothus Indigo.**—While most of the ceanothuses have flowers of some shade of blue, this is the richest coloured of the numerous varieties that bloom during the latter part of the summer and early autumn. —W.

## LILIES FOR GENERAL CULTURE.

Though many lilies, owing to their somewhat exacting requirements, can scarcely be recommended for general culture, there still remains a wide choice of many beautiful kinds that can be grown under anything like favourable conditions.

### Lilies in Pots.

Apart from their value as outdoor flowers, some kinds of lilies are extensively grown under glass for the decoration of the conservatory and dwelling-house for grouping purposes, or for the supply of cut flowers. While many can be grown in this way, the choice is, as a rule, limited to very few, and those few are of easy cultivation.

Lilium longiflorum.—Perhaps the most popular of all lilies for the supply of cut flowers is Lilium longiflorum, whose silvery-white trumpets are admired by everyone. Under the name of Lilium Harrisi a form of this lily may be obtained as dormant bulbs in the month of August, and if potted at once they can, of course, be had in bloom much earlier than those which reach here from Japan in November and December. Closely running Lilium longiflorum in popularity as a favourite lily for growing in pots comes

L. speciosum, represented by both white and coloured forms. This blooms naturally towards the end of the summer and in early autumn, but by keeping it in a warm structure flowers may be had earlier if desired. It is a lily rarely troubled by insect pests, whereas Lilium longiflorum is often attacked by green-fly. Though a decidedly erratic lily, the

Golden-rayed Lily of Japan (Lilium auratum) must on no account be passed over as a pot plant, as when it does its best the blossoms are so magnificent as to gain the admiration of everyone. Of late years these three lilies above-mentioned may be often seen in flower more or less throughout the entire year. This is effected by retarding the bulbs in refrigerators till their season of growth is past, and bulbs so treated will commence to grow as soon as they are placed under favourable conditions. There is now quite an extensive trade in these retarded bulbs. Beside these many other easily-grown lilies are amenable to cultivation in pots, but they are not much grown in this way. Of them especial mention may be made of Lilium Browni, croceum, davuricum, elegans, Hansoni, testaceum, and tigrinum.

### Lilies in the Open.

It is in the open ground that many lilies can be seen at their very best, be the garden that of prince or peasant; indeed, the Madonna lily, so much admired by everyone, is often seen flourishing in cottage gardens, whereas in more pretentious establishments it frequently fails. The following lilies can all be recommended for outdoor culture where no exceptional conditions prevail.

L. auratum.—As above-stated, this is erratic, but too grand a lily to be omitted. It is seen at its best when associated with rhododendrons that are not too old or too closely planted. A moderate amount of peat suits it well, and it is greatly benefitted by a good sprinkling of clean silver sand around the bulb when planting.

L. Browni.—No better example of the high decorative value of this lily and its adaptability for outdoor culture can be mentioned than the illustration of the bed of the species at Kew, which appeared in the Gardeners' Magazine for August 17. It will be observed that the bed is carpeted with low-growing heaths, which serves to show that a soil with at least a fair proportion of peat suits it well.

L. candidum.—The Madonna lily often falls a prey to disease, to check which various suggestions have been made, but a complete cure has yet to be found. The most favourable conditions appear to be planting in a clean loamy soil, without peat, leaf-mould, or manure, taking care not to put the bulbs too deep, and if transplanting is necessary, to remove them in August, but when once established do not shift them unless compelled to do so.

L. chalcedonicum.—Given a good, deep, loamy soil, and a season or two to establish itself after planting, this, the scarlet Turk's cap, will prove an object of beauty about the end of July. The blooms, from the thick wax-like nature of the segments, remain fresh and bright longer than do the flowers of most lilies.

L. croceum.—This, the old orange lily, has long been grown in British gardens. It is a loam lover, and will thrive in the ordinary herbaceous border, where, about the end of June, the rich orange-red, upright flowers are borne in great profusion. A short time since I saw a large bed in which clumps of this lily were alternated with blue delphiniums, and the effect when the two were in bloom was very striking.

L. davuricum.—Another border lily of much merit, especially when those forms known generally as Lilium umbellatum are included with it. All bear upright heads of showy flowers, most of them being of some shade of red or terra-cotta. Among the best are erectum and fulgidum. Both can be obtained at a cheap rate when dormant.

L. elegans (also known as L. Thunbergianum).—This is remarkable in most varieties for its lowly stature, and for the wide range of colour to be found in the different forms. In alutaceum the flowers are of a buff tint, and in Van Houttei deep crimson. A sandy loam suits this lily best.

L. Hansoni.—This species is noteworthy among the members of the Martagon group from the fact that it flowers well the first season after planting. It starts into growth very early, hence it is necessary to protect it by neighbouring shrubs. Dwarf rhododendrons or azaleas are very suitable as the soil conditions just meet the requirements of this lily.

L. Henryi.—A tall-growing Chinese lily that has proved to be of a very accommodating nature in this country. It is somewhat weak in growth, and is best associated with rather tall-growing shrubs.

L. longiflorum.—Grown under similar conditions to L. Browni, this lily does well, and it may be associated with bright-coloured flowers, from which the spotless trumpets of this lily stand out in a very conspicuous manner.

L. martagon.—This species, in its several varieties, is a loam lover, and seldom gives satisfactory results the first season after planting, but then it improves yearly.

L. pardalinum.—This, the panther lily, pushes up its six to eight-feet stems among rhododendrons, the conditions there suiting it well. The scarlet and yellow flowers are very showy.

L. pyrenaicum.—A Turk's cap, with dull yellowish flowers. It will grow in the herbaceous border, and is the first lily to flower in the open ground.

L. speciosum.—Equally as useful out of doors as when grown in pots this lily, given fine weather towards the end of August and in September, forms a striking feature.

L. testaceum.—The nankeen lily, as this is commonly called, is in its peculiar buff or nankeen tint quite distinct from all other lilies. It is withal a very beautiful and stately lily, and does well in the open border.

L. tigrinum.—The tiger lily is well known as a good garden lily, and is often to be seen in cottage gardens. Besides the common kind there is a variety—splendens—with brighter-coloured flowers and larger blotches, and Fortunei, that blooms very late.

Though the lilies enumerated above form but a small percentage of those in cultivation, they will produce a succession of bloom from the flowering of pyrenaicum till speciosum and tigrinum Fortunei feel the effects of the cold nights in autumn.

W. T.

## THE POTATO CROP IN SCOTLAND.

A trip through the principal potato-producing districts of Ayrshire, in the closing days of July, revealed the fact that the bulk of the earlier sorts of the valuable tuber were then raised, and for the most part disposed of. These are grown chiefly in the warm, sandy soil lying along the western sea-board of the county, and the culture entailed provides employment for a large number of persons, who are brought from far distant places to assist in the work, more particularly that of raising the crop.

The early spring, owing to its dryness and the consequent friability of the soil, was extremely favourable to the planting of the tubers; while after-growth, when it appeared above the surface, was but little affected by frosts or other very adverse weather conditions, so that, in many instances the crops were ready for market quite a fortnight earlier than usual. Not much credence can, as a rule, be taken of the stated weight per acre and market value of these very early crops, as accounts of such that from time to time appear seem rather sensational, though, in all probability, correct. Later or second-early crops of fully-matured tubers are, however, more easily estimated, and such during the past week or two have been put at an average of fifteen tons per acre, which must constitute a record, even in this much-favoured district. In private gardens, and upon rich, deeply-cultivated soils, all kinds of early and successional varieties of potatoes have given exceptionally good returns, the tubers being very numerous, large, and uniform in size, and so far free from disease; while, in regard to quality, this could hardly be excelled.

Late kinds and field crops in general have until now, August 12, maintained a very promising appearance, the haulm being extra vigorous and tall, reminding one of the Champion in its most palmy days. The effect the recent wet weather and cloudy skies may have upon crops is impossible to foretell, but among growers of long experience much apprehension exists lest, should a change to drier and warmer atmospheric conditions not soon come, disease in virulent form may set in.

Garlieston. James Day.

**Populus lasiocarpa.**—A comparatively new species from China, which stands out from all other members of the genus by reason of its huge ovate cordate leaves, measuring in some instances nearly a foot in width. In colour they are bright green, while the leaf-stalk, midrib, and principal veins are red.—W.

# HYACINTHS IN THE FLOWER GARDEN.

Hyacinths are subjects of great possibilities in the flower garden, and yet, when wrongly used, they are not only uninteresting, but productive of effects the reverse of pleasing. Some object to them because of their stiffness of growth and artificiality of appearance, and there is something to be said for their point of view. When, however, all has been said which can be said in support of it, the fact remains that, in some respects, the hyacinth is one of the hardiest and most easily-grown of our spring flowers, and, next to tulips, perhaps the most attractive, so that it is not likely to be supplanted in popular favour. The question for us to consider is the best way to use it in the flower garden, so as to obtain the most beautiful and effective results.

A CHARMING COMBINATION OF PINK HYACINTHS AND WHITE ARABIS

In the Gardens of Hampton Court in April last.

First, and perhaps mainly, we will deal with the use of

## Hyacinths in Beds,

which will include any border or plot in which they are the main feature. One most commonly sees hyacinths growing in rows in bare earth, and it is then that they are uninteresting and artificial, the soldier-like rows and the bare ground being alike unnatural. Another wrong method is the indiscriminate mixture of colours, for some of the pink and red shades are very crude, the latter especially, and cannot be put in juxtaposition with the dark blues and purples. If there is a good proportion of white and yellow varieties in the mixture the clash of colours is minimised, but beds of blue and red varieties only, as one often sees in public parks and gardens, are almost offensive to anyone with a good colour sense. The variety of shades is so numerous that anyone who professes to be a colourist can find full scope for the display of his taste in planning harmonies and contrasts. It is well to bear in mind Ruskin's dictum that "the character of everything is best manifested by contrast," for the full beauty of some of the delicate shades of starch blue, for instance, can only be realised when they are shown up by others of a pale yellow colour as a foil.

Another matter that needs scarcely less consideration than the arranging of the colours of the hyacinths is the selection of carpeting plants, or those of low growth, for planting amongst them. In a state of Nature one never sees bulbs flowering in a setting of bare earth unless in thick woods, where only spring-growing plants can survive. The surfacing plants on hyacinth beds should be beautiful in themselves and enhance the beauty of the bulbs by their setting, while from October to March they should transform what would otherwise be bare earth into neatly-planted beds. To give the plants a fair chance in the spring the bulbs should be planted rather further apart than is usually done when they are the only occupants of the beds. The double white arabis is always good for this purpose—and so is the single, as it flowers earlier—no matter what the colour of the principal subject, and when the brighter reds are used it is perhaps the best surfacing plant that can be grown, as it helps to tone them down. A pretty little annual that answers very well for the same purpose is Limnanthes Douglasi, or its variety grandiflora, the yellow and white flowers being very effective amongst the pinks and reds, and also the blues, when good strong plants are obtained in the autumn. Other good surfacing plants for certain colours of bulbs are Silene compacta, Myosotis dissitiflora, red and white daisies, primroses, aubrietias, some of the earlier-flowering violas, and small bulbs, such as grape hyacinths, Scilla sibirica, and chionodoxa. These last-named bulbs make capital edgings for hyacinth beds of suitable colours, and are not only very effective in themselves, but serve to lessen the abrupt transition between the turf and the comparatively tall growth of the hyacinths. When other bulbs are planted amongst the latter different surfacing subjects should be used with them as well, in order to relieve the bareness of the beds in the winter.

A method of growing hyacinths in beds, which appeals to some on account of its apparent greater nearness to Nature, is to combine them with other things, so that instead of being hyacinth beds primarily other plants, etc., are of equal importance in the scheme. Those who object to the stiffness in the appearance of a bed of hyacinths alone, even when it is well surfaced, may relieve it, e.g., by mixing narcissi or tulips with them. Here again is an opportunity for study in colour, a bed of starch blue and chamois or salmon hyacinths, mixed with yellow tulips or narcissus, producing a feast of colour of which the eyes do not tire, but it needs care in the selection of the varieties to have them in flower at the same time, for if the hyacinths are beginning to fade, even after the tulips have been out a week, the duration of the prime effect is lessened by at least half. A mixture of hyacinths and wallflowers—a pretty good range of colour here also—has the advantage that the growth of the latter as flowering proceeds gradually overspreads the former, and so conceals the untidiness after flowering, which is one of the drawbacks to hyacinths. A similar effect is produced by the use of the Leopard's bane known as Harpur Crewe, though, as this plant is only effective in clumps, the hyacinths must be planted in clumps also. A variative of this plan, which is suitable for large beds or borders, is the planting of small shrubs, either singly or in groups, with clumps or patches of hyacinths amongst them.

### Hyacinths in Mixed Borders.

As regards the use of hyacinths in mixed borders, this, to the Nature-lover, is the best method of growing them, and it has the merit of being inexpensive, for, while new bulbs must be bought every year for bedding, if the best results are to be obtained, those which have done a year's service in beds may be used for the general decoration of the less formal parts of the garden, if they are given a fair chance to ripen off either before or after being lifted from the beds. In soils of a heavy character, where hyacinths soon die out in an ordinary way, they will last for years, and even increase, if planted amongst perennials, in shrubbery borders, by woodland walks, etc., where the soil is kept open round the bulbs by the roots of plants and trees, so that they are kept dry in the summer, and free from excessive wet in the winter. Bulbs should be planted in such situations in groups of three or four, when they will soon make clumps carrying a dozen heads, which, though small compared with those from good new bulbs, will yet be very effective in the mass, and possess a beauty of form and grace of habit quite unlike that of the massive flower spikes usually seen in beds. The perennials amongst which they are planted will soon begin to hide their foliage in May, and thus lessen their untidy appearance.

One of the best attempts at semi-wild gardening I ever remember seeing was a nut walk where hyacinths took part in the struggle for existence with daffodils, tulips, primroses, foxgloves, and the like, showing that, in favourable circumstances, hyacinths may be almost naturalised. They grew in this position for years without being touched, except as far as was necessary to keep down the worst of the weeds, and formed large clumps. By reason of their longer and more slender stems they helped to supply the demand for cut flowers for the house. When one takes up more bulbs out of the spring bed than one knows what to do with, it is not a bad plan to put clumps or patches amongst the gooseberry and currant trees, where they will probably do well for the reason stated above, and produce telling patches of colour in the spring. Digging is not, or should not be, done in such positions, and if the hoe is not used from late November till March they will not be disturbed.

ALGER PETTS.

---

**Nerines.**—These beautiful bulbous subjects are now commencing to show their flower-spikes. Water should not be given until the spikes are four inches high. They should then be moved from their resting quarters and placed in the conservatory and given water. The leaves will be seen to be advancing on some of the bulbs, and such bulbs are not likely to bloom. When the leaves are three inches high, and no flower-spikes can be seen advancing, the plants should be given water and treated as though they had flowered.—L. S.

---

## BULBS FOR THE ROCK GARDEN.

It has been my practice to utilise bulbs in combination with rock plants in order to maintain as much beauty and as many pleasing blends of colour as it is possible to get, and to achieve these results means a study of the decorative values of rock plants and bulbs. Many gardens, singularly rich in rock plants, are weak in bulbous plants, and thereby miss much of the colouring of spring. Also, in many cases, bulbs may be grown amid a carpeting of plants, so that they break through a groundwork of greenery, and give the benefit of their beauty before their associates are showing the promise of bloom.

The list of bulbs available would entail much space if I were to detail varietal forms, but I will confine myself, as far as possible to the varied groups. These include snowdrops, crocuses, scillas, chionodoxas, brodiæas, camassias, ixiolirions, muscari, fritillarias, calochorti, iris of many types, puschkinias, narcissi, hyacinthus, tulip species, erythroniums, and many others.

I may briefly allude to a few successful forms and groupings. A mass of the dark-crimsoned foliage of Thymus coccineus throws into charming relief the golden, black-veined blossoms of Crocus Susianus. Crocus Imperati, blue and silver, comes through a silvery carpet of Antennaria tomentosa. With Crocus biflorus is massed the close-growing Aubrietia A1, which follows later in blossom. A roving mass of Sedum album will cover the bulbs of Narcissus moschatus and Muscari Heavenly Blue. The effect of the rich green and bronze-veined foliage of the sedums, as an undergrowth to these exquisite bulbs in blossom is a picture of delight. One can also combine the two forms noted, or replace N. moschatus with N. Queen of Spain, grouping them fairly closely, and the effect will be wonderfully pleasing. It is well that the majority of late-flowering sedums and other plants of like nature should have early-flowering bulbs amongst them. One should always include Muscari azureum, as its delightful touches of blue are charming, especially if near the early golden saxifragas, of which S. apiculata, S. sancta, and S. pseudo-sonata are so conspicuous. The quaint Muscari monstrosum, with its mauve plumes of blossoms, is best against a mass of white.

Another good combination is the dainty yellow Waldsteinia trifoliata, with a drift of the soft blue Puschkinia libanotica running through it. In another instance, the scented Tulip sylvestris, with its showy yellow blossoms, rises from a cool bed of Tiarella cordifolia. In low drifts by the pathways Fritillaria meleagris and its forms may be massed in quantity. Few spring flowers hold more charm than the nodding, chequered bells of F. meleagris, and few are more dainty than the best forms of alba, its white variety. The reader would do well to note the fine varietal forms known as Cassandra, Pomona, Orion, Emperor, Triton, etc.; these are large in blossom and very dainty and distinct in colouring. Camassias, of course, require moisture, and any low rock bed where Primula rosea and P. cortusoides, or the dodocatheons flourish, there also will Camassia esculenta, C. Cusicki, and C. Leichtlini find a home.

The sun-loving Californians, the brodiæas and dwarf calochorti, I usually give a well-drained, warm position, where cold and damp does not affect them to any great degree. The exquisite grace of the calochorti, and the wide range of colouring of the brodiæas, should commend them to all lovers of floral beauty. Hyacinthus amethystinus should always be included in plantings, and may be grouped with Phlox subulata, the pink-flowered aubrietias, or the yellow of Alyssum montanum or A. rostratum. The white form of the foregoing is also of much value, while the white, pink, and blue scillas are worthy of note where a goodly range of subjects are required.

A very pleasing drift of blue may be obtained by using Anemone blanda, A. Robinsoni, and A. apennina, which rise prettily among low-growing veronicas, sedums, and similar subjects. The white of A. apennina alba and A. nemorosa alba plena are also of great service, and, with the preceding blues, are valuable for streaming through a colony of small ferns. Bulbous irises may be grown with many subjects, though a favourite plan is to associate them with dwarf flag irises. Of the latter I do not favour the pumila forms as greatly as the vastly improved intermediate varieties, which last season gave me two displays of blossom. Of these intermediates I may note Diamond, Dauphin, Dorothea, Ivorine, Odin, Freya, Bride, and Bosniamac. Throughout the groups of intermediates I would advise running drifts of such bulbous irises as I. alata, I. tuberosa, I. filifolia, I. Danfordiæ, I. pavonia major, I. reticulata, I. Heldreichi, etc. Such sterling dwarfs as I. orchioides, I. Bucharica, I. Tubergeniana, etc., should always be kept to the forefront of the rock garden in a warm, well-drained position.

One might go further and note the value of dwarf liliums for the larger rock gardens and pretty groups of erythroniums near to the footways. Alliums, such as A. Ostrowskyanum and A. azureum, the glorious blues of such chionodoxas as C. gigantea, C. sardensis, and C. Luciliæ, the snowy heads of the ornithogalums, the starry tritelias, the varied ranunculus, especially the scarlet of R. asiaticus, the many fine galanthus (snowdrops), and the bright blue of Ixiolirion Pallasi, all assist to swell the beauty of the rock garden, while, if space can be found for Sternbergia lutea, the colchicums, and the autumn-flowering species of crocus, a supply of late bulbous blossom is readily assured. These bulbs may be carpeted with mossy saxifrages, gaining thereby spring blossom and a perennial surfacing of delicate greenery. From the foregoing notes the reader will perceive the wealth of bulbous material at hand, and there remains but one thing more, namely, to use it, and in the best possible manner.

P.

---

**Veronica longifolia** and its varieties form a group of hardy perennials, whose value during July is not readily overestimated. This species is of more than ordinary interest, in that it produces four distinct varieties, differing only in the colour of the flowers; in other respects, the good qualities of the type are faithfully reproduced in each. In the type the flowers are a rich, deep shade of blue, and are borne in upright branching spikes on stems some 24 to 30in. high; another form yields flowers of a much paler shade, probably best described as lavender, while there is also a pure white form, and the variety incarnatus produces flowers of a most desirable shade of pink; the last-named variety is less vigorous than the others, and averages in height some 18 to 24in. Veronica longifolia and its forms are hardy perennials, succeeding in any ordinary garden soil, and show to conspicuous advantage when planted in rather broad masses of a variety. The stiff, erect stems call for little or no artificial support.—THOMAS SMITH.

## INEXPENSIVE DAFFODILS FOR EXHIBITION.

The rapid extension of the exhibition side of daffodil culture has given rise to much enquiry with regard to the relative merits of varieties that produce flowers which will render good service in a close competition, and can be purchased at a moderate price. The question of price is a very important one to amateurs of moderate means because, to enable the cultivator to exhibit flowers of any particular variety on a given date, at least half a dozen bulbs will be necessary, but those who plant not less than one dozen of each will be in a much stronger position. It has been suggested by several successful exhibitors that a selection comprising three or four dozen varieties, of which bulbs are obtainable at a price not exceeding seven shillings and sixpence each, would be most useful to the many lovers of daffodils who are commencing their culture for exhibition purposes. The following selection has been made in accordance with these suggestions, and as many of the varieties as possible that can be obtained at prices ranging from half a crown to three shillings and sixpence per bulb, have been included. This selection will also be found useful to those who may desire to grow a representative set of varieties of a much higher standard than those so generally used for massing in beds and borders.

### Trumpet Varieties.

Duke of Bedford.—A handsome bicolor, the flowers large, refined, and of good proportions, the perianth pure white, and the trumpet bright yellow.

Florence.—A beautiful bicolor, remarkable for its elegant pale yellow trumpet.

Glory of Noordwijk.—A noble flower similar in colour to Empress, but of much larger size and finer form.

Hamlet. — A remarkably handsome variety, somewhat resembling Emperor, but the flowers are of larger size and more highly finished. The broad, flat perianth is primrose-yellow, and the trumpet rich yellow.

Lady Audrey.—A large, finely-formed flower with white perianth and long primrose-coloured trumpet.

King Alfred.—A large-flowered variety of much merit; form and substance are alike good, and the colour golden-yellow.

Lord Roberts.—A robust and handsome variety, the flowers of large size and superb form, and the colour rich yellow.

Madame de Graaff.—A white trumpet of great merit, and cheap enough to be planted in quantities for garden decoration. The flowers are of large size, fine form, and good substance, opening pale primrose, passing as they attain full development to cream-white.

Monarch.—A distinct and handsome variety with flowers of large size and superb form, and of the richest yellow.

Mrs. H. J. Veitch.—A large, superbly-formed flower remarkable for its fine finish; the perianth primrose-yellow, and the trumpet rich yellow.

Sir Francis Drake.—A bold and handsome flower of the Emperor type, but more refined and the colour of both perianth and trumpet deeper.

Weardale Perfection.—A grand bicolor that has long occupied a leading place in its class; the flowers are of large size and superb form; the perianth cream-white, and the trumpet soft primrose colour.

### Incomparabilis Varieties.

Chancellor.—A remarkably fine variety, the flowers large with broad, ivory-white perianth segments, and an open, bright yellow crown.

Gloria Mundi.—A medium-sized flower of much merit, the perianth segments rich yellow, and the large spreading cup bright orange-red.

Homespun. — A superb variety; the flowers rather large and of exquisite form; perianth and crown rich yellow.

WEARDALE PERFECTION.

One of the most handsome of the Trumpet daffodils, perianth creamy-white and the trumpet pale yellow.

Lady Margaret Boscawen.—One of the finest varieties in its class. The flowers are of large size and grand form; the perianth segments white, and the large expanded cup rich yellow.

Marigold.—A beautiful variety. The flowers are of large size and finely formed; the perianth segments rich yellow and the large cup deep red.

Solfaterre.—A distinct and handsome flower of large size and remarkable for its refinement; perianth and cup lemon coloured.

Wagtail.—A finely-formed flower above medium size; perianth segments white, and the long cup bright yellow.

### Barri Varieties.

Aftermath.—A beautiful variety. The flowers of rather large size and distinguished by their refinement; the perianth segments ivory white, and the cup yellow with red margin.

Alton Locke.—A large and handsome flower, with broad, overlapping white perianth segments, and citron-coloured cup margined with orange-red.

Armorel.—An early-flowering variety of much merit. The flowers are of large size and the perianth segments are white and the cup apricot-coloured.

Circlet.—One of the finest in its class. The flowers large and of superb form; the perianth segments pure white, and the large cup pale yellow with brilliant scarlet margin.

Genial.—A distinct and highly attractive variety; the flowers are of moderate size, stout, and with fine outline; the perianth segments white and the cup lemon-yellow with red margin.

Incognita.—A handsome variety with large flowers of good form; the perianth segments white, and the shallow cup rich orange.

Southern Gem.—A large and pleasing flower; the perianth segments white, and the large frilled cup lemon-colour.

### Leedsi Varieties.

Dewdrop.—An exquisitely beautiful variety, the flowers of large size and fine form, the perianth segments white and the cup suffused apricot with orange margin.

Evangeline.—A beautiful variety, flowers large for its class, of superb shape, and pure white.

White Lady.—A charming variety with medium-sized flowers of fine outline, the perianth segments pure white, and the frilled cup pale yellow.

GM.316

NARCISSUS ARMOREL.

A beautiful variety belonging to the Barri section, with white perianth and orange-coloured cup.

White Queen.—A superb variety; the flowers of relatively large size, with broad, smooth perianth segments, and large cup, frilled at the edge, the former white and the latter citron-tinted, passing with age to white.

White Slave.—In the way of White Lady, but a great improvement on that variety, and well deserving the attention of those to whom cost is a secondary matter. The bulbs of White Lady may be obtained for four or five shillings per dozen, while those of White Slave cost seven shillings and sixpence each.

G.

## PLANTING CHOICE DAFFODILS.

It might be said, with some degree of force, that whether daffodils are so plentiful as to be obtainable at a price not exceeding a few shillings per hundred, or so rare that the cost of single bulbs has to be reckoned in guineas, they should be grown under the conditions favourable to their attaining the highest degree of development. Such a view as this is quite sound, but in practice it is not possible to do all that one could wish in cultivating plants, and some compromise has, in many cases, to be made. In the case of daffodils, it is found necessary, in the majority of gardens, to grow the cheap daffodils that are planted in large numbers for the production of colour effects in the flower garden under the most satisfactory conditions that are practicable, and to devote special attention to the cultural requirements of those which are scarce and expensive.

Varieties that are not sufficiently plentiful to be planted in quantities for the embellishment of the flower garden, or are intended for the production of flowers for exhibition, should have a position where they can be grown in beds so arranged as to readily admit of their being attended to at any time, and where they will receive some shelter from easterly winds in the spring, and also enjoy slight shade, artificially or otherwise. I have for some years past grown my choice daffodils in convenient positions in the kitchen garden, and the practice has much to recommend it. The bulbs can be given a change of soil from time to time, and the plants can be readily sheltered from cold winds when making their new growth, and the flowers be screened from bright sunlight when in process of development.

Daffodils require for their full development a deeply stirred and moderately rich soil. The soil should not be enriched immediately before planting with such manures as those obtained from the stable and farmyard, the contact of the young roots with comparatively fresh animal manures not being conducive to their welfare. To avoid this, and at the same time have the soil liberally stored with plant food, it is my practice to make such arrangements as will enable me to form the new beds in one of the quarters from which a crop of early potatoes has been taken. When the ground is liberally manured and trenched in the course of the previous winter, and a crop of early potatoes taken off during the summer, the bulbs can be planted in August or September without any considerable amount of preparatory work being necessary. All that is done in my case is to spread evenly over the surface bonemeal at the rate of about 2oz. to the square yard, and give a light dressing of newly-slaked lime. Just sufficient to well whiten the surface may be regarded as a light dressing of lime.

Should it not be convenient to take a crop of early potatoes off the ground in the year in which the beds are to be formed it will be necessary to prepare it by applying dressings of bonemeal and lime and double digging. The lime is used in the same quantity as before, but the bonemeal is increased to 4oz. to the square yard. In all cases the ground should be prepared sufficiently early to enable the soil to settle down before the bulbs are planted. Beds 3½ feet wide are the most convenient, especially when the daffodils are grown for the production of blooms for exhibition, and when several beds are arranged parallel with each other a two-feet alley should be allowed between them.

From the middle of August to the middle of September is an excellent period in which to plant choice daffodils, and it is a safe rule to complete the planting operations before September is far advanced. The bulbs should be arranged in rows across the bed, and with ten-inch spaces between them. Sometimes the rows are formed lengthwise of the bed, but this is not a good arrangement, inasmuch as the surface of the spaces between the rows should be stirred at intervals for the purpose of keeping down weeds and aerating the soil. With the rows lengthwise those who use the hoe have to walk between the rows, whereas with the rows across the beds, the hoe can be readily used from the alleys between them. From four to six inches is a good depth at which to plant the bulbs in ordinary garden soil, the depth being determined by the size of the bulbs of the respective varieties, the larger the bulb the greater the depth required. On light soils the depth may be increased about one inch. From four to six inches is also a good distance at which to arrange the bulbs apart in the rows, the stronger growers requiring the greater space.

W. G.

## SOME NEW DAFFODILS.

"Of the making of books there is no end," said Solomon, some hundreds of years B.C. The same remark applies to the making of daffodils in these days. Each year scores of beautiful new seedlings make their appearance at the spring shows, and these are only the "select" of thousands which are not quite as good. And yet the possibilities of further development seem to be greater than ever.

In the matter of size we seem to be only in the first stages, to judge by the huge Ajax forms which were exhibited by the Rev. G. H. Engleheart this year. Some of his blooms were nearly 5in. across, and had stems of 24in. in length.

This is a development that I am sorry, personally, to see. One of the great charms of the daffodil is its grace, but these ungainly giants, though very wonderful, are anything but graceful. I hope the day is very far off when we shall buy daffodils by the square inch!

A more remarkable development, however, may be expected in the colouring of daffodils. One was almost startled to see in some exquisite little white seedlings, shown by Mr. Engleheart at Birmingham, distinct traces of indigo blue in the centre of the eye. They were only traces, it is true, but even a blue shadow is something quite new in a daffodil, and we may yet live to see the Blue Daffodil, of a recent novel, an accomplished fact; though, I fear, that we shall take some time to get used to it if it ever comes.

Yes, indeed, there is no end—to the quantity—of new daffodils but there are only a few—I was going to say increasingly few—that will "stay." The number of really great flowers is very limited, and only time will prove which these are.

It is much to be hoped that seedling raisers will turn their attention to improving the constitution of their new varieties. Many of the delicately-formed and coloured varieties are, alas! delicate in constitution also, and we do not want the daffodil, which is essentially a hardy outdoor plant, to become a tender greenhouse subject.

The season of 1912 was one of the most trying on record. The continued drought and heat of last summer, and the repetition, in most parts of the country, of similar conditions during the flowering season, had their effect, and the new daffodils of this year made their appearance under great disadvantages. This makes it difficult to review them justly, and I am sure that there are many that are not mentioned in these notes that are well worth notice, but which were not seen at their best.

Mr. A. M. Wilson exhibited some of the finest of the new varieties. Avalon is one of these; a most striking white incomparabilis of his own raising, with a poeticus-white perianth 3½in. across, and flat cup ⅞in. in diameter, soft canary-yellow with a sharply-defined broad band of brilliant red colouring round the edge.

Crœsus, which obtained a F.C.C., is another, and a really great daffodil. It is a giant incomparabilis with a quite circular perianth of great substance, a delightful shade of palest primrose; the cup, very large and expanded, is of rich deep red; a strikingly handsome variety, raised by Mr. J. C. Williams.

A flower of another type which gained an A.M. is Pedestal, raised by Mr. Ernest Crosfield, and shown by Mr. Wilson. This is a huge incomparabilis with pure white perianth segments, very solid, and having a long, straight cup of rich clear yellow; a flower of fine build and balance.

Neptune, raised by Mr. Copeland, and shown by Messrs. Cartwright and Goodwin on the same occasion, is a flower of much the same type, which ran Pedestal very close.

On the same date Mr. Wilson again secured an A.M. for Killicrankie, a noble pale bicolor of refined character and of improved Weardale Perfection colouring and form. This again just beat a very fine flower of rather the same type—Onslaught—shown by Messrs. Cartwright and Goodwin.

Robespierre—a daffodil to remember—also gained an A.M. It was raised by Mr. P. D. Williams, and is a brilliant flower, measuring 4in. across the ivory-coloured perianth, with a fiery-crimson crown well over an inch in diameter.

I believe that Rubellite, shown by Mr. Wilson, is the first of the new brilliantly-coloured Poetaz varieties to be honoured with an Award of Merit. It is a strikingly beautiful flower, bearing several good-sized blooms on a stem, the white perianth throwing up the rich all-red eye in vivid contrast. Another fine Poetaz variety is Scarlet Gem.

Red Macaw and Sealing Wax are two telling exhibition flowers. The first has a shapely white perianth with flat eye of pale yellow, heavily margined with brilliant

NARCISSUS HELIOS.
An exceptionally beautiful Incomparabilis variety. The perianth segments rich yellow, and the finely frilled cup is deep orange. Introduced by Mr. C. Bourne, who received an A.M. for it at the R.H.S. Meeting, April 19, 1912.

red. The second is aptly named, having a large, solid bright red flat eye, and very white perianth—the earliest of its section to flower.

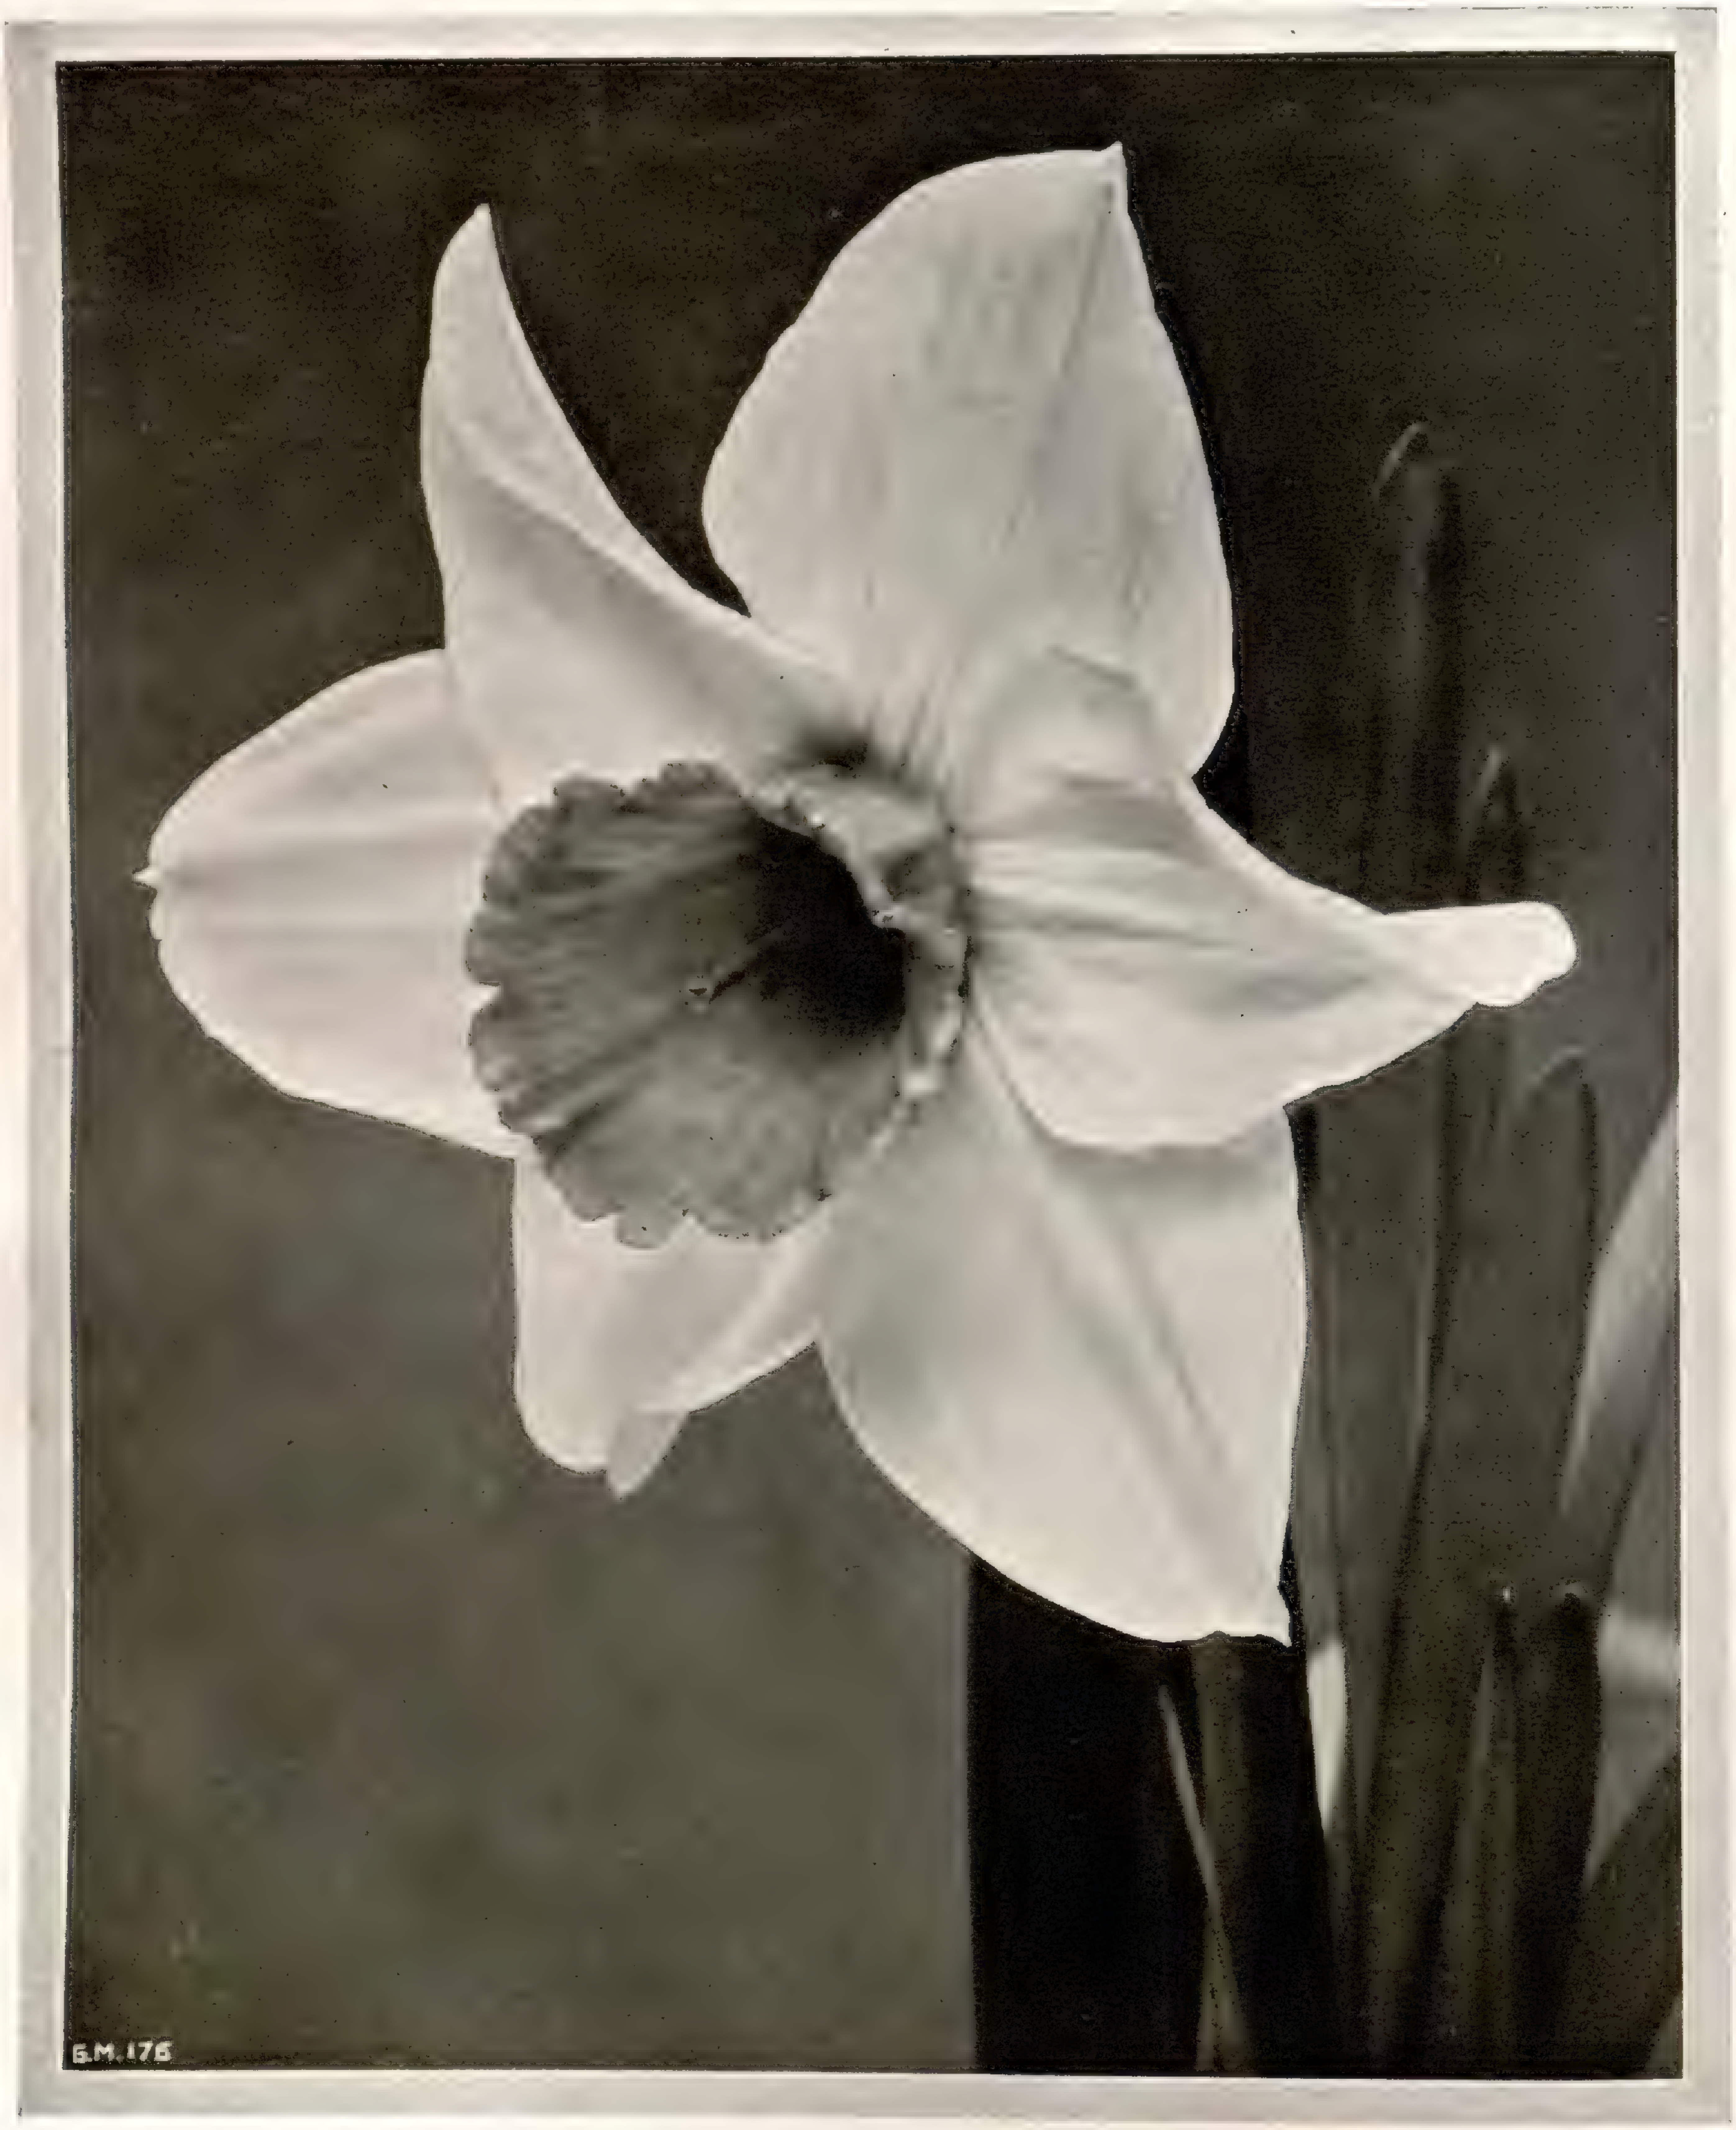
Another striking example of the giant red-cupped flowers that always attract so much attention is Seville. This flower, shown by Mr. Phillips, also gained an A.M. It has a large, firm, over-lapping perianth and huge, disc-like eye of bright orange-red; it should make a fine garden plant when the price is low enough.

Perhaps the most notable incomparabilis of this year is Helios. I have some hesitation in saying this, as I had the pleasure of showing it for the first time. However, I have parted with the stock to Mr. Walter T. Ware, and I am only repeating the opinion of the experts who saw it at the shows, where it gained an A.M., and in my grounds. It was raised by Mr. Engleheart, and is a very noble giant incomparabilis with smooth perianth segments of fine form, great substance, and of rich butter-yellow colouring. The large expanded cup—perhaps better described as short, wide trumpet — is beautifully frilled and of rich, translucent orange-copper, tinged with flame colour. Though the whole flower is large, it is perfectly proportioned, and has no trace of coarseness. It flowered with me at Simpson fully three days after Henry Irving.

It is refreshing to turn from these gorgeous fiery flowers to those of a "cooler" type. Madonna, for instance, is perhaps the finest of the pure white triandrus hybrids raised by Mr. Engleheart. The whole flower is of intense whiteness, and of exquisite grace. I believe it was bought by Mr. Chapman, who raised another of the flowers which gained an A.M.—Silver Spangle. This is a lovely and refined flower of medium size with very broad snow-white perianth segments, and large, pleated flat cup of clear lemon-yellow; the colouring is delightfully refreshing.

Among the many lovely seedlings shown by Messrs. Barr and Sons, Athene is, to my mind, one of the most beautiful and interesting flowers shown this year. It is of Ajax form, but has a triandrus for one of its parents, and is unique in being the first self-yellow triandrus trumpet yet shown, the colour being a soft sulphur-yellow throughout; a flower of very refined character. King Arthur, also shown by Messrs. Barr and Sons, is a beautiful smooth-petalled yellow trumpet of fine form and large size.

Another very distinct yellow trumpet is St. David, which I had the pleasure of introducing. This is a huge flower with



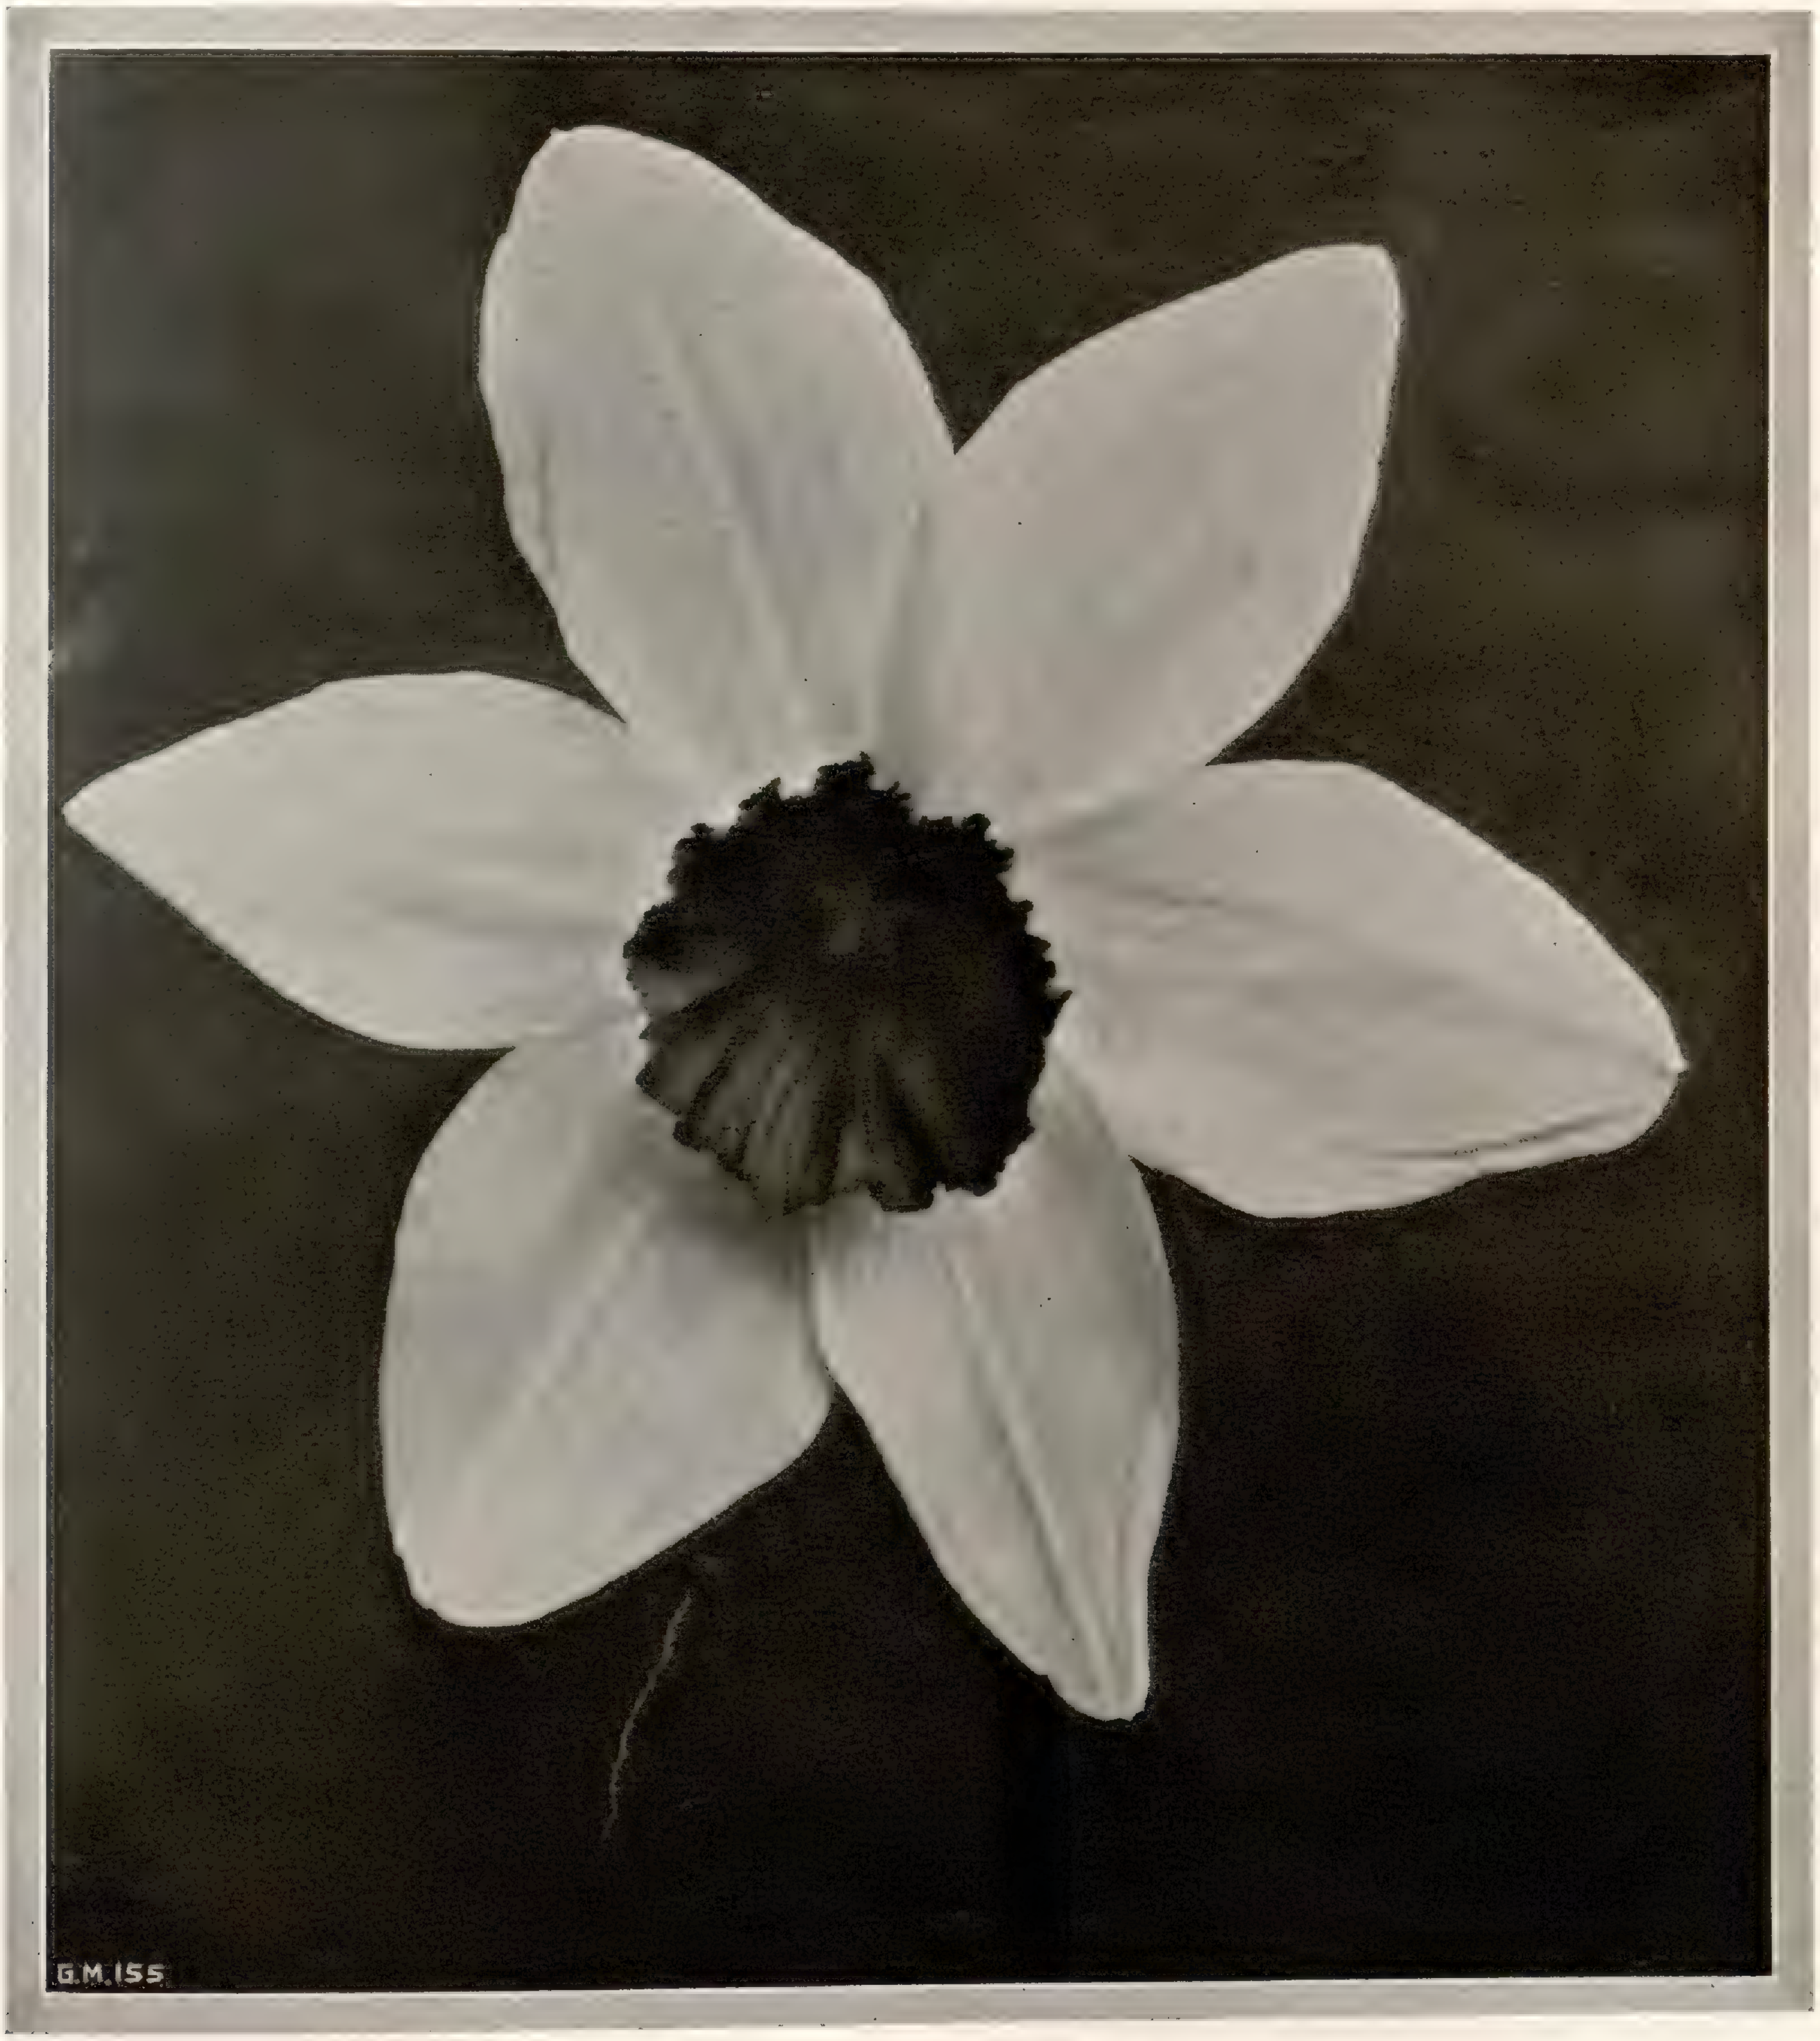
NARCISSUS BRUNHILDE.

A very fine trumpet daffodil introduced by Messrs. Barr and Sons. The perianth segments creamy-white and the trumpet soft yellow.

well-formed and smooth perianth segments, and very expanded trumpet, deeply frilled at the brim, and of a distinct soft pale yellow throughout, not seen in any other trumpet variety. It flowered two days before Henry Irving.

A remarkable advance in the white Ajax section is seen in Mrs. Ernst Krelage, a noble flower named after the raiser's wife. This magnificent and refined flower comes from Holland, and gained a well-deserved A.M. The bloom is large and of good substance, and carried on a good stem; the colour is creamy white, and the form is that of an improved Madame de Graaff without the rolled-back mouth of the trumpet; a flower with a great future.

To those who, like myself, have a love for the delicately-coloured, smaller flowers, Little Joan, with its snow-white perianth and open cup of old ivory daintily tinged with shell-pink round the edge, will appeal.



NARCISSUS ROBESPIERRE.

A distinct and handsome Incomparabilis variety raised by Mr. P. D. Williams. The perianth segments are creamy-white, and the cup brilliant orange. A.M., R.H.S., April 19, 1912.

Alpine Snow is another perfectly white flower, which attracted a good deal of attention at Birmingham this year. It is an exquisite example of Mr. Engleheart's raising, beautifully proportioned with rounded perianth and globular cup of intense glistening white. Black Prince, also of Mr. Engleheart's raising, is a remarkable "break" in the Poeticus section; a flower of medium size, it has an eye of very dark crimson throughout (the colour of the perpetual carnation Black Chief); it marks the beginning of a new race of Poeticus, and should be invaluable to hybridists.

There are others which I should like to mention, but if I described them all the Gardeners' Magazine would have to be enlarged. I hope I have not omitted any of the "upper ten." Some wonderful varieties were shown under numbers, but until these are named it is impossible to review them. Many of them will doubtless be described next year—if they are not all drowned by the incessant rains we are having during the planting season.

Christopher Bourne.

**Vallota purpurea.**—Within the last ten years or so immense numbers of this South African bulb have been sent to this country from their native home, and occasionally a rather distinct form crops up among them. Indeed, there have been rumours of a white-flowered variety, but I have not yet had the pleasure of seeing it. I do not think that these quantities of imported bulbs have led to any improvement in the vallotas as grown in this country, for very few of them are the equal of the good old-fashioned type. These South African bulbs are by no means easy to establish, while they are, as a rule, taller and weaker in growth, and with more starry flowers than the vallotas one occasionally meets with in old gardens.—T.

## BULBS FOR MASSING.

In dealing with varieties of spring-flowering bulbs that are specially adapted for massing and are capable of producing splendid colour effects in the garden, we are reminded of the fact that even in these days many gardeners are apt to distribute a large quantity of bulbs over a big area by arranging them in puny groups or thin planting. It is, of course, quite permissible to arrange small colonies in the rock garden, herbaceous border, and by the water-side, and few, indeed, are the varieties in any family of spring-flowering bulbous plants that fail to produce a charming effect so placed.

In dealing with the narcissi it matters not whether the furnishing of large beds, big stretches of border, or great breadths in the grass be considered, the following kinds will be found unsurpassed for our purpose. Of vigorous constitution, the flowers are supported by fairly tall and stout stems, and the price is by no means prohibitive. The merits of Emperor, Empress, and Sir Watkin are recognised and acted upon, but I cannot understand why Princeps, an early-flowering bicolor, is not more extensively employed for massing. Bulbs of first-rate quality can be had for 10s. per 1,000, and, as will be readily seen, a glorious colony or series of colonies can be formed for a couple of pounds. No more reliable or effective variety can be found than Horsfieldi, and how well it associates with almost any spring-flowering plant or bulb. Of great merit, too, are Telamonius plenus (Van Sion), Frank Miles, Golden Spur, Incomparabilis Stella superba, Maximus, Henry Irving, Katherine Spurrell, Beauty, Victoria, Autocrat, Madame Plemp, Grandis, Figaro, Ard Righ, Barri conspicuus, poeticus ornatus, rugilobus, Duchess of Westminster, and varieties of Phœnix.

In speaking of tulips, those which are usually termed standard varieties are eminently adapted for our purpose, and great is the pity that the more uncommon kinds are not planted upon a more extensive scale.

The early-flowering tulips with single flowers are of immense value for massing, as they produce rich displays of colour early in the spring, when bright colouring is much appreciated, and the early period at which they bloom admits of their being removed well in advance of the time for the preparation of beds and borders for their summer occupants. Scarlet varieties that are specially useful comprise Artus, Couleur Cardinal, Crimson King, and Vermilion Brilliant. Rich orange-red varieties that should have attention include Prince of Austria and Thomas Moore. Yellow varieties that can be strongly recommended are Golden Queen, Montresor, and Ophir d'Or. Wouverman may be mentioned as one of the best of the rich purple varieties, and Snowflake and White Swan are two of the finest of the white early tulips.

It is difficult to understand why the ordinary double tulips are not more extensively planted en masse. I am alive to the fact that many varieties present a flat and uninteresting appearance when brought together in large numbers, but it cannot be said to apply to such varieties as Titian, Gloria Solis, and Murillo. Vuurbaak, too, cannot be beaten for extreme brilliance, and forms a fitting companion to Rose Blanche (of snowy whiteness). Yellow Tournesol, Yellow Rose, Blue Céleste, Duc van Haarlem, and El Toreador are each and all superb.

The value of the various Darwins when massed has been clearly demonstrated at Kew in recent years, where we have seen them arranged in the formal beds close to the palm-house, each bed holding a distinct variety; also in mixture, the sole occupants of a border extending over 200 feet in length. In each case it may be said that nothing attracted so much attention in their season. Wonderfully handsome and effective varieties are found in Donders, rich crimson, with violet and white base. Clara Butt, in soft rose, is well known; and the same applies to Europe, which boasts glowing salmon and scarlet colouring; Antony Roozen, rosy-blush; Madame Krelage, rose margined blush white; Philip de Comminet, glossy-brown maroon, a great beauty; Erguste, heliotrope with silvery shading; and White Queen, a large, globular flower in creamy-white.

Then we have the varieties known as Cottage or May-flowering tulips, and it is gratifying to know that they have become very popular for garden decoration. Notwithstanding the fact that they bloom late in spring, a good deal of space is devoted to them in the bedding arrangements, and the effect created when massed is exceedingly beautiful and artistic. T. elegans and its variety alba, with reflexed and rose-edged petals, are altogether first-rate, whilst the Inglescombe varieties in scarlet, pink, and white, must be written down as very desirable. At Battersea Park last season I noted a bed containing Picotee, and was much impressed with its elegance and refined beauty, and it was very clear that it found many admirers. The same applies to a glorious display at Kew a couple of years ago. Perhaps the best for massing, in addition to those mentioned above, are named Caledonia, a fine red kind; Fulgens, a tall, crimson sort with reflexed petals; Snowdon, the flowers creamy-white; White Swan and Didieri alba, which speak for themselves. # J. R. PEARSON AND SONS
## THE NURSERIES : LOWDHAM : NOTTS

spathulata major is a superb thing in dazzling scarlet with blue-black base. Ranging from pale primrose to deep yellow are Mrs. Keighley, lutea, Bouton d'Or, Mrs. Moon, Illuminator, and retroflexa.

Considerable diversity is also noted as to the decorative value of hyacinths, and this is very pronounced when arranged in masses in large numbers. Amongst dark blue kinds we have nothing to equal King of the Blues and Marie, whilst the most effective amongst those in light shades are Regulus, Czar Peter, Leonidas, Pieneman, Electra, Blondin, and Enchantress. Scarlet and dark shades are finely represented by La Victoria, Linnæus, Roi des Belges, Stanley, and Robert Steiger; and I hardly think that alba maxima, Blancheur à Merveille, l'Innocence, and Snowball have any superior amongst white kinds. I have nothing but praise for Yellow Hammer, Bird of Paradise, City of Haarlem, and Obelisque for this work, not forgetting Gigantea, Pink Beauty, Rose à Merveille, and rosea maxima in shades of rose and pink.

It is quite superfluous to dwell upon the merits of crocuses, snowdrops, scillas, and other of the smaller bulbous plants for massing; and, pretty as small colonies undoubtedly are, we should aim at a Kew standard, more especially with regard to the Siberian squill, whose wondrous beauty is the delight of visitors in spring.

Walter H. Aggett.

## BULBOUS IRISES.

The bulbous section of the beautiful family of iris provide us with some of the most welcome and useful flowers of early spring. Even during the winter months the lovely Scorpion Iris (I. alata) may be had in bloom in sheltered positions, with a covering of glass to protect it from the weather. On a sunny border in the months of February and March there is a no more welcome and charming sight than little groups of these early-flowering species like I. stenophylla, with its beautiful blue and white flowers, or the dainty little I. Danfordiæ, with its yellow blooms. For cultivation in pots or pans the smaller ones are indispensable for the cold greenhouse, brightening up the house with their beautiful shades of colour. In the rock garden, too, these little bulbous plants may be used with great advantage planted in groups in sheltered corners, or between low carpeting plants, which will form a background for them when in flower.

Most of the early-flowering kinds come from Asia Minor, the country from which so many bulbs like the Glory of the Snow (Chionodoxa) and scillas come, to give us such sheets of blue in the grass and border in early spring. Others, like I. orchioides and the closely-allied I. bucharica, with I. Warleyensis, come from farther east in Turkestan. The later-flowering I. tingitana and I. juncea come from Northern Africa, while the indispensable English and Spanish iris are natives of Southern Europe.

Apart from the English and Spanish irises, which flourish in any good garden soil, and are not particular as to position, most of the other kinds are best suited in a warm position in the rock garden, or slightly raised sunny border. They like a root run of light, well-drained, sandy soil, with which has been mixed plenty of broken bricks or sandstone. All irises of the persica or Juno group (well characterised by their two ranked leaves) produce thick, fleshy, permanent roots, which serve as storehouses of food. These penetrate deeply, hence the need of an open, well-drained soil to carry away surplus water quickly during the resting period. The following are some of the more showy and easily-grown kinds.

I. alata.—The Algerian iris is a charming winter-flowering member of the Juno group, and in mild seasons is often in bloom in mid-winter. These beautiful irises, however, need protection against the weather, which destroys their beauty at that time of the year. A handglass, or even a piece of glass, is sufficient to throw off the heavy rain. The flowers are large and vary much in colour from a deep blue to pure white. It grows well in light soil in a warm border, but the chief difficulty is to get the bulbs ripened sufficiently to produce flowers the following season. They must either be taken up, or kept dry by a covering during their resting period.

I. Danfordiæ.—On account of its earliness this is one of the most charming little plants of the family, with its bright yellow flowers. It is quite hardy, and does well on sunny borders, but it is worth growing in pans for the alpine house. The bulbs should be potted up early in the autumn in light, rich soil, and then may be plunged in ashes in a cold frame, or even outside. As soon as the bulbs show signs of growth they may then be taken into the house. After flowering the pots should be re-plunged in a sunny place to ripen off the bulbs, using the larger bulbs for potting up, and planting out the smaller ones.

I. juncea can be grown in any warm border. The bulbs are small, and produce slender stems with long leaves, while the flowers are about four inches across, and golden-yellow in colour, the falls being very broad and long, marked with carmine on the keel. It is an Algerian plant, and looks better when growing amongst some low-growing plants to form a background for it. There is also a pure white variety of this species in cultivation.

I. orchioides is a valuable hardy plant, and one of the best of its section. It grows freely, and increases when planted in good, loamy soil, with plenty of broken brick and mortar rubbish mixed with it. The bright yellow flowers are produced freely in March and April. A closely-allied and beautiful species is I. bucharica, with similar habit, growing about a foot high. It has flowers which are pure white in the upper portion, with golden-yellow falls and crest. Both are good plants for growing in pans.

I. persica.—A native of Asia Minor, that has the distinction of being t. 1 in the "Botanical Magazine." It is less hardy than many of the others, but may be grown with a little protection in winter. On account of its exquisite colouring it is well worth a little trouble.

I. reticulata.—This favourite plant is so well known that it needs no description. There are several forms of it, of which the variety major has the largest flowers. I. r. histrioides, which comes from Syria, is an early-flowering form of great beauty, varying much in colouring and size of flowers. It is one of the hardiest for the border, as well as being of great value for use in pans. The flowers, which are produced in March, have their falls mottled with white and rich lilac spots. There is also a pale blue variety known as var. cyanea. I. r. var. Krelagei is an early-flowering form, with somewhat dull-coloured flowers. All are valuable for use in the cold greenhouse.

I. Sieheana, from Asia Minor, also known as I. Haussknechta, is a charming little bulb with flowers of a curious mixture of silver-grey and purple.

I. sindjarensis is one of the taller-growing kinds, with arching leaves and somewhat yellowish-white flowers. It is very hardy, and does well in the border.

I. stenophylla (I. Heldreichi).—A very distinct species of the persica group, with very large flowers on stems about three inches high. The standards are of a soft blue shade, the falls intense blue, bordered with white.

I. Tauri is a closely allied plant, also from Asia Minor, with deeper violet-purple flowers of various shades, tinted in various parts with gold or bronze.

I. tingitana.—Except in the more southern counties the Tangiers iris does not flower so freely as one could wish. It is very beautiful, with the habit of the English iris, and large flowers of a pale blue merging into pale purple, with a keel of golden-yellow. To succeed with it the bulbs must be well ripened off, either by lifting and storing, or by covering them up from wet. It should be planted in rich, well-drained soil on a warm south border.

I. Vartani is a winter-flowering kind from Palestine, with pale blue flowers.

I. Warleyensis is a member of the orchioides group from Eastern Bokhara, very free flowering, and one of the easiest to grow. The flowers vary from pale to deep violet, with deeper-coloured falls, which, again, are margined with white. Another closely allied kind is I Willmottiana, from Eastern Turkestan ,with lavender-coloured flowers, having blotches of white on the fall.

I. xiphioides.—The English iris is much larger than the Spanish iris, and comes into flower about a fortnight later. It prefers a somewhat heavy and moist soil, and may be naturalised in fern borders or similar places where the necessary conditions of moisture obtain. The garden forms of this iris are numerous, and many are of great beauty.

I. xiphium (Spanish iris).—This well-known iris embraces many beautiful forms, which are of great value in the garden. They are of easy cultivation, and do well in somewhat dry soils. From the numerous varieties of all shades of colour that are offered in catalogues it is easy to make a good selection.

W. I.

## THE ASTURIAN CROCUS.

The crocuses of autumn are very welcome, and are generally very beautiful as well. They come with the shortened days, and give us a foretaste of what we may expect when spring comes round, and the almost flowerless days of winter give place to those of the gladsome spring.

There are many valuable and beautiful autumn-flowering crocus species, but none is more easily grown than the Asturian crocus (Crocus asturicus), a showy and pretty one from the Asturias mountains. It has the merit—for those with slender purses, at any rate—of being comparatively cheap; while as some dealers sell it in distinct shades, groups of different tints can be formed for the garden. The range of colours is not large, but it is sufficient to give a change, although even a group of mixed Crocus asturicus is beautiful in its way. What is known as the typical C. asturicus has flowers of a kind of purple-lilac, striped with darker marks towards the base.

Then there is a pretty blue variety, called C. azureus, which makes a pleasing group in the rock garden, on grass, or in the border. In atro-purpureus we have a fine variety of a distinct and handsome deep purple, and one of the most effective of the group. A pleasing crocus, with nice, soft, lilac flowers, is called lilacinus, and variety is given by a mauve one named pallidus. All these crocuses should be planted, as early as they can be procured, at a depth of an inch or two.

D.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

ODONTOGLOSSUMS.—The spring and early summer-flowering members of this genus are the most popular of all the cool-growing orchids. The remarkable degree of popularity to which the members of this most beautiful family have attained is sufficient proof of their great value. The species O. crispum, O. Pescatorei, O. Halli, O. Harryanum, O. triumphans, O. luteo purpureum, O. cirrhosum, and their very numerous hybrids and varieties, are all extensively cultivated, and they can be successfully grown together n a cool, well-ventilated structure. Odontoglossums require a constant and regular circulation of air. Owing to the great humidity of the outside atmosphere, and the small amount of sunshine experienced during the present season, no great difficulty has been experienced in maintaining a suitable cool and moist atmosphere.

REPOTTING is an important detail, for upon it largely depends the success achieved. The early autumn is generally regarded as the most favourable season for this operation, the cool nights and moist atmospheric conditions which prevail at this season being favourable to their becoming re-established before winter sets in. No time should be lost, therefore, in proceeding with these operations. When the young growths are seen to be pushing roots from their base, which will soon enter the new compost, the plants receive the slightest check possible.

SPECIMENS that have been left undisturbed for some years, and are showing signs of exhaustion, should be given attention. Shake away the old potting material from the roots, and remove old and useless pseudo-bulbs. Use pots just large enough to accommodate the roots for one season only. Those growing vigorously and in need of more root space may be shifted without disturbing the ball beyond picking out the loose and decayed material. Return them again to receptacles large enough for their proper development for two seasons' growth.

WATERING.—Supply water to plants that have been newly potted with care, and regulate atmospheric conditions by the judicious damping of the floors and the bare surfaces about the plants. Shading will be needed on bright days, and the plants may be slightly sprayed overhead twice daily on favourable occasions.

PROPAGATION.—Odontoglossums may be increased by means of the pseudo-bulbs, which have been removed in repotting. Select the bulbs, label them, and place them together on a bed of sphagnum moss, in a box close up to the roof glass in a cool house. If in good condition the bulbs may also be put in small pots and placed on a shelf, and kept on the dry side, when many will soon make breaks and useful plants. Another method is to sever the rhizomes between the pseudo-bulbs whilst growing in the pots. If these divided portions have bulbs with leaves they soon make breaks and root readily.—J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

IMPATIENS SULTANI. — This bright-flowering exotic balsam is of easy cultivation, and by inserting cuttings at intervals an almost perpetual display of flowers may be had. Cuttings root readily at any season, and the present is a good time to insert a batch for raising plants for winter flowering. We usually sacrifice a few of the largest plants about this time, cutting them down to the ground level and selecting the strongest shoots for propagating purposes. These we put singly in 2½in. pots. When rooted they are transferred to either large 60's or 48's, in which size they are flowered. Over-potting should be avoided, as when this happens the plants grow vigorously and produce but few flowers. It is far better to restrict the roots of winter-flowering plants generally, and feed them well as may be found necessary. Given good culture these make fine specimens by the early part of the winter, and are of great value for house decoration. During summer they thrive in the conservatory, but I know of no plant more susceptible to cold, sunless weather, or draughty rooms, than this.

ACALYPHA SANDERIANA.—The plants will now be developing their crimson inflorescences, and should be placed where they will have rather less atmospheric moisture than was advised previously. Watch closely for the dreaded red spider, and when it makes its appearance sponge the leaves carefully with soapy water. It is indeed a good practice to do this occasionally as a preventive measure. Shade only during the hottest part of the day, and continue to give periodical applications of liquid manure alternated with a little artificial manure until the majority of the tassels are developed, when only clear water should be given.

WATERING AND SHADING.—The cold, sunless weather experienced for the last few weeks has necessitated very careful watering of all pot plants. During such abnormal weather great care should be exercised, it being far better to err on the dry side. See that the water used is of about the same temperature as the structure in which the plants are grown. Fortunately it seldom happens that such a note of warning is necessary at this time of year, but it will be seen that this is a matter of great importance. Careful regulation of the shading is of equal importance; in many instances it can be dispensed with altogether, merely having it at hand should we have a return of brighter weather. The material should be light and open, and only put on for 2 or 3 hours in the middle of sunny days.—H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

MELONS.—The dull, sunless weather, and the continuation of rain for the past few weeks, has not been favourable to late crops of melons, and it has been necessary—and will be more so from now onwards—to maintain a steady bottom heat, ranging from 70 to 75 deg., with a temperature in the house of about the same. Admit an abundance of air, night and day, when the weather is favourable, and stop all sub-laterals at the first leaf. Keep the roof glass absolutely clean, so that the foliage may be exposed to all the sun and light possible. Without this, it is impossible to grow good-flavoured fruits at this season of the year. Water and stimulating manures should be administered to the roots with great care, for if the soil becomes too wet, the plants will probably collapse some weeks after the fruits have set. At the same time, moisture at the roots must be supplied at all times as required, or otherwise red-spider wil be sure to make its appearance, and much labour and patience will be required to eradicate it. The supply of water can, however, be diminished at this season of the year, when the fruits are ripening, exercising care that this is not withheld in such a manner as to check the full development of later fruits. Spray the plants with clean water on fine days, after closing the house in the afternoon. Any fruits that are ripe should be immediately cut and placed in the fruit room, where they will keep in good condition for a few days, if not required for immediate use.

EARLY VINES.—The soil in the borders of the house or houses required for very early forcing should be allowed to become fairly dry to induce an early rest. The current season's side growths should be cut back to within five or six leaves, and all the side shoots cut clean away with a sharp knife; this will materially assist the back buds to break, and also the vines will receive a complete rest sooner than would otherwise be obtained. It is very essential to attend to these small details, where the vines are required to be started early in November.

PEACHES AND NECTARINES.—All the fruits having been gathered from the permanently planted trees under glass, give plenty of air night and day, and dispense with fire-heat. Give copious supplies of clean water to the roots. Where any trees are making too much wood at the expense of fruitfulness, the work of root pruning and careful lifting should be done any time from the beginning of September. We find that it is advantageous to the trees next season where this operation can be taken in hand at the latter part of this month or the early part of next. Much depends upon the weather. If the sun is bright and powerful the glass should receive a light shade, and the foliage kept well syringed for a week or ten days. After this work has been accomplished the roots should receive a good soaking with rain water, and the young growths be untied from the wire trellis.—Henry R. Farmer, Cardiff Castle Gardens.

# CHRYSANTHEMUMS.

## Treatment of Late-flowering Varieties.

Owing to the weather having during the past few weeks been so cold and rainy, and the lack of sunshine, late-flowering chrysanthemums will need extra care during the period between the present time and the commencement of the shows. The wood of these cannot be too well ripened, and if any of the varieties were a week or more in showing their flower-buds in the early part of August, the plants should be placed in a very exposed position by themselves, and given twice as much room as is necessary in an ordinary season. Of course, some protection from very strong winds is essential.

Some cultivators put their late-flowering plants under glass very early in order to make up for lost time. It is certainly necessary to place them in the houses in good time, but it is essential to success that the wood be properly matured first. A long sojourn under glass is conducive to a rather sappy growth when the buds are quite small at the time of housing. Stems bearing buds well advanced are not affected much by early housing.

### Injudicious Feeding.

The application of strong stimulants at the time of housing in the case of late varieties bearing small buds on immature wood is not beneficial but harmful. Nitrate of soda and sulphate of ammonia cause a too free growth, and valuable time is passing, so that such forced growth will not bear the deep blooms at the desired time—during the first half of November. It is much better to allow the wood to ripen slowly at first, and then assist the full development of the flowers with nitrate of soda judiciously applied twice or thrice after the flowers are half open. Less stimulating foods may be given before this stage. Nitrate of soda has a bad effect on the cuttings which are relied upon for the next year's stock of plants if given very freely. At first the suckers grow very luxuriantly, and then seem to fail suddenly, and if subjected to even a slight frost, the edges of the leaves will turn brown.

### Specimen Plants.

These, too, must be given more than the usual space at this season, so that all the shoots will be well ripened. Some cultivators partly plunge the pots in the ground to steady them and prevent winds from blowing them over. Where any plants are so plunged they must be at once placed on boards or ashes. Geo. Garner.

## MAY-FLOWERING TULIPS.

The striking popularity of May-flowering tulips at the present day provides a full testimony to their wonderful value for garden decoration. One should include in the group of tulips known as "May-flowering" the Cottage tulips, the old-world favourites of English, Scotch, and French cottage gardens; the many fine late-flowering tulip species; the wonderful breeder tulips, of which the Darwin and Rembrandt groups; and the English exhibition tulips, known to us best in their sectional divisions of byblœmens, bizarres, and roses. One will observe that the May-flowering tulips comprise a veritable host of varieties, and that they cannot all have justice done them in one article; therefore, no reference will now be made to the breeds, exhibition varieties, or species.

Of their utility for garden decoration there is no question, for, in form, height, and colouring these tulip groups are of splendid value. They are grand in the beds and the May borders, especally if one arranges them to come through a carpet of lowlier plants, which should provide a contrast to the glow of the tulips, in addition to covering the bareness of the soil. One can use for this purpose saxifrages (preferably white, mossy varieties), myosotis, alyssums, violas, or other suitable subjects. For informal groupings in the wild garden, or in the grass, or on sloping ground above the waterways, these tulips are capable of fine effects, while for decorative purposes when cut they are first-rate, whether used in variety, or whether simple colours are contrasted one with another.

To those whose taste tends to decorative work, let me commend a study of the colour values of the mauve, silver, maroon, and pink-hued Darwins, and the whites, yellows, and rosy colours to be found amongst the Cottage tulips, some pleasing contrasts and delightful effects can be achieved with a little trouble.

Intending planters of the May-flowering tulips should, if possible, do their planting in October, or, failing this, the early part of November. "Earlier" or "later" one is placed at a disadvantage. A good loamy soil suits the tulips well, and for the sake of the extra strength and substance of the flowers I would prefer it inclining to heaviness, rather than too light. A good planting depth is four inches on heavy land, to six or seven on light.

If manure is necessary it should be worked into the soil several weeks previous to planting the bulbs, for, in my opinion, fresh manure is often detrimental to the vigorous growth of the young rootlets. Plantings should always be arranged for effect, and one should be able to obtain close proximity of the blossoms by means of well-placed paths or footways.

The tall, bold-flowering Darwins deserve first place in our notes, being grand at all points. In height they average twenty-five or more inches, and, the stems being strong and stiff, no supports are necessary.

A selection of varieties is a tax upon the suggestive powers of any one, for who can discriminate where all are so good? A few splendid garden forms would be Clara Butt, a lovely soft pink; Dream, a silvery-heliotrope; Antony Roozen, a soft rose; Madame Krelage, a nice shade of rose; Duchess of Westminster, darker than Clara Butt; Claude Gillot, a brilliant vermilion-red; Europe, a first-rate scarlet; Farncombe Sanders, a study in dark crimson; Fra Angelico, a grand maroon-black; Henner, a shapely crimson-maroon; King Harold, a fine ruby-crimson; La Candeur, creamy-white; La Tulipe Noire, the famous Black Tulip; Loveliness, rosy-pink and white; and Margaret, rose, with a blue base.

I would commend also the crimson-maroon, Millet; Phyllis, a lovely rosy-lilac; Pride of Haarlem, a tall scarlet-crimson; Rev. H. Ewbank, one of the best heliotropes; Sultan, a good dark variety; Van Poortvliet, rosy-salmon; Viola, a splendid violet-crimson shade; and the bronzy-gold Yellow Perfection.

May I ask the reader to note the following Cottage tulips? They are pre-eminent for beauty and garden decoration: The golden-yellow Afterglow should be secured; Flame, for a touch of orange-scarlet; Eurasian is a tall, dainty strawberry-pink; Feu Ardent, a fiery-scarlet, will attract greatly; the Inglescombes, for effect and a poor soil, Pink, Scarlet, and Yellow, are all good; Kathleen and Mrs. Moon are two grand yellows; Marksman, a good new orange-scarlet; Orange King is a fine tall orange; Red Standard, a magnificent crimson; The Fawn is a charming fawn and apricot-hued variety; Walter T. Ware, a splendid orange-yellow; Scarlet Emperor, a glowing scarlet of merit; while the coral-shaded La Merveille, the fine varieties of Gesneriana, together with Primrose Beauty and Amber Crown, are worthy of note. Novelties like Norman Knight, orange-scarlet; Great Dane, a pale orange; Beau Brummel, scarlet; and Coralie, near to La Merveille in colour, are, with others, deserving of attention.

The Rembrandt tulips, to give them just a brief reference, are Darwin tulips which, instead of retaining the self colours of the group, have broken into a series of marked and flamed varieties, and retain these markings perfectly fixed under cultivation. They have not the fine finish of the English flamed and feathered tulips, being marked more unevenly, but their rich colours, fine stems, and general good character, warrants them due notice at the hands of English growers. One will hear more of them, but unless tulip fashions change they can hardly expect the same meed of public favour as the self-coloured Darwins.

P. S. Hayward.

---

**Erica cerinthoides.**—While we have a great number of greenhouse heaths that flower in the spring, there are comparatively few that bloom towards the end of the summer. One of them is Erica cerinthoides, which forms an upright plant, whose shoots are thickly furnished with deep green leaves. The flowers are borne in a terminal head or cluster, and are tubular, about an inch long, and of a bright crimson-scarlet colour. It forms a very pretty feature in the greenhouse.—K.

**Stenoglottis longifolia.**—Terrestial orchids are at the present day thought much less of than the epiphytal ones, though some of them well merit more attention than they now receive. Among them may well be included this stenoglottis, which, early in the autumn, flowers freely in the cool house. From a foliage point of view alone it is very pretty, as it forms a rosette of narrow, deep green leaves, about six inches long, and prettily undulated on the margins. The slender flower spikes reach a height of about eighteen inches. They are quite erect, and bear on the upper half a large number of pleasing rosy-purple blossoms, dotted more or less with a deeper tint. This stenoglottis grows well in a mixture of loam, leaf-mould, sphagnum moss, and sand, and must at no time of the year be kept quite dry; while during the growing season it needs a liberal amount of water. It is a native of Natal. —S. W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

## EXHIBITIONS AND MEETINGS.

◆

### Royal Horticultural Society.

AUGUST 27.

The exhibition held by the Royal Horticultural Society on Tuesday was extensive, and remarkable for the high order of excellence that was characteristic of the greater proportion of the various contributions. Visitors were reminded of the fact that we are now near the close of summer by the liberal contributions of dahlias and the remarkable fine collections of fruit trees and gathered fruit.

#### FLORAL COMMITTEE.

A splendid bank of cut flowers of Buddleias came from the Hon. Vicary Gibbs, Aldenham House, Elstree (gardener, Mr. E. Beckett, V.M.H.). The finely-developed flower spikes were arranged in huge vases, and attracted much attention. The varieties were B. variabilis Heliotrope, B. v. Distinction, a glorious spike; B. v. Delight, very pale lavender; B. v. gigantea, and B. v. Lovely; also the orange-flowered species known as B. globosa.

Messrs. Dobbie and Co., Edinburgh, exhibited dahlias of the collarette type in large variety, arranged in vases and stands. The most conspicuous varieties were Henri Furman, Diadem, Balmoral, Prince de Venosa, Princess Louise, Comtesse Icy Hardegg, and Antwerpia.

From Messrs. W. Fells and Son, Hitchin, came a natural rock garden and a collection of violas. The latter were well coloured, but exhibited signs of the unfavouable weather of late. A collection of saxifragas, sedums, etc., added interest to this exhibit.

Messrs. James Veitch and Sons, Lim., Chelsea, had an exhibit of a miscellaneous character, which included tall standard fuchsias, comprising good examples of Thalia, Richmond Lass, Charming, and Mrs. Rundle. Cannas were included, and were remarkably well grown, the most striking being J. B. van der Schoot Meteore, W. Saunders, Ottawa, and Frau D. Hultzsch; while the streptocarpuses in clear, well-defined colours, were much admired.

From Mr. Amos Perry, Hardy Plant Farm, Enfield, came a fine bank of delphiniums backed with some well-coloured acers. The most attractive delphiniums were King of Delphiniums, Persimmon, Amos Perry, Perfection, Mrs. Creighton, and Lizzie.

Messrs. W. Wells and Co., Lim., Merstham, exhibited hardy flowers in quantity, among others being delphiniums and some fine phloxes, the best of the latter being Le Mahdi, Rose Queen, Arthur Raane, and Selma; while Viola cornuta purpurea and its white form were in excellent condition; while from Messrs. G. Bunyard and Co., Lim., Maidstone, also came a collection of herbaceous flowers. The best among other good features were those formed by delphiniums, autumn-flowering anemones in variety, phloxes, and tritomas.

Messrs. J. Piper and Sons, Bishop's Road, Bayswater, had a fine display of liliums of the speciosum type interspersed with Gypsophila paniculata fl. pl., the whole being backed with palms, chiefly kentias and cocos.

Mr. James Box, Lindfield, Sussex, occupied a corner of the hall, with a large and attractive arrangement of hardy flowers comprising phloxes of high quality. These were arranged in tall columns, and were most effective, especially the varieties Le Mahdi, Selma, Mrs. J. Harkness, Gloire du Marc, and Iris. A clump of Gladiolus America was most pleasing, with the blue variety Blue Jay. Other notable subjects were liliums, pentstemons, tritomas, and gaillardias.

. From Messrs. W. Cutbush and Son, Highgate, came an attractive group of hardy flowers arranged on the floor of the hall.

Messrs. H. Cannell and Sons, Swanley, exhibited single begonias in a good variety of colours, also giant single dahlias and some collarette varieties. From Messrs. James Stredwick and Sons, St. Leonards-on-Sea, came a number of new cactus dahlias the most attractive being Pegasus, Royal, Wild Rose, and Nantwich.

Mr. A. Ll. Gwillim, Canbud Nursery, Sidcup, contributed some very fine double begonias, remarkable alike for their size and brilliant colours. Mrs. A. P. Brandt, Lady Cromer, Margaret Gwillim, and Pride of Eltham being the best.

The Rev. L. C. Chalmers Hunt, Willian Rectory, Hitchin, contributed a display of asters, roses, and early-flowering garden chrysanthemums. The asters were large, but had been treated badly by rain and wind.

Mr. Cobb, gardener to R. R. Cory, Esq., Duffryn, Cardiff, exhibited a collection of dahlias chiefly of a decorative character. They embraced collarettes, pæony-flowered, pompous, and singles. The whole would have produced a better effect with a little more finish, nevertheless the flowers were well grown.

Messrs. H. B. May and Sons, Upper Edmonton, staged an effective exhibit of ferns, dracænas, and ixoras. Among the ferns were noted Nephrolepis Marshalli compacta, an elegant form; N. exaltata superba, and Adiantum Farleyense gloriosum. The ixoras included well-flowered plants of I. Fraseri, I. Prince of Orange, I. Westi, and I. Williamsi.

Messrs. H. Cannell and Sons, Swanley, had a large and attractive display of dahlias comprising cactus, collarette, decorative, and giant single varieties. The finest examples of cactus were Mrs. Douglas Flemming, H. L. Brousson, New York, and Coral, and the most striking collarettes were Negro, Albert Maumene, and Vicomtesse de Monts. The same firm also had some fine double begonias.

On the steps of the northern annexe were fine bowls of nymphæas from Mr. L. de Rothschild, C.V.O., Gunnersbury House, Acton (gardener, Mr. James Hudson, V.M.H.). These included N. stellata, Berlin var., N. pulcherrima, a very fine stellate form, and N. gigantea var. Hudsoniana.

Mr. Ernest Dixon, Putney, exhibited delphiniums, pentstemons, phloxes, and violas with a smart edging of Viola cornuta purpurea.

Messrs. J. Cheal and Sons Crawley, contributed an exhibit of dahlias in which all sections were represented. The pæony-flowered varieties were especially bright, while the single varieties were also very good. Such varieties as Betty, Brilliant, Fugi San, and Kitty standing out well, while the collarette section was well represented.

## ORCHID COMMITTEE.

Messrs. Sander and Son, St. Albans, exhibited a small group of orchids, in which were to be seen numerous examples of Cattleya Atalanta, C. Lord Rothschild, C. nobilis, a finely-flowered example of C. Portia, with Cypripediums Rossetti and Franconia, also charming pots of Burlingtonia fragrans, each carrying numerous spikes, and the quaint Bulbophyllum virescens. Mr. H. T. Pitt, Rosslyn, Stamford Hill, N., had a small and interesting group, in which were some choice cypripediums, Cattleya Dowiana, Odontioda Charlesworthi, Catasetum fimbriatum, and Miltonia. From Messrs. A. J. Keeling and Sons, Westgate Hill, Bradford, came a few choice specimens, such as Cypripedium Ultor and Penelope, Vanda cærulea in varying shades of colour, and the quaint Eria Rhyncostyloides. Messrs. J. and A. McBean, Cooksbridge, contributed a few choice examples, in which the outstanding features were Vanda Sanderiana with two fine spikes, Cattleya Dowiana, and several odontoglossums.

A charming group was that staged by Mr. E. H. Davidson, Borlases, Twyford. It was largely composed of odontoglossums, cattleyas, and cypripediums, O. Helene and O. Nathaniel being most conspicuous, and presented a fine appearance, being lightly arranged. From Messrs. Charlesworth and Co., Haywards Heath, came a small but choice exhibit, especially good being Ærides Lawrenceæ, var. Sanderiana, Cœlia macrostachya, Cattleya Gaskelliana alba, and Pescatorea Rœzli superba.

Messrs. Stuart Low and Co., Bush Hill Park, also had a choice exhibit of orchids, the backgrounds being formed with oncidiums, while a central plant of Lælia crispa was a source of much attraction. Læliocattleya Callistoglossa, C. Vulcan superba, and C. Hardyana were also highly meritorious.

## FRUIT AND VEGETABLE COMMITTEE.

On this occasion Messrs. Geo. Bunyard and Co., Lim., Maidstone, made one of their most successful efforts, and they had a magnificent collection of fruit trees in pots, all loaded with fruit of the highest quality. They also staged large finely-finished apples and pears in baskets, with a collection of filberts and crabs on dishes. The trees in pots included well-coloured, developed fruits of apples Wealthy, St. Martin, Emperor Alexander, Peasgood's Nonsuch, Baumann's Red, Winter Reinette, Gascoyne's Scarlet, Allington Pippin, and Jeanne Hardy. The plums were really remarkable, especially Monarch, President, Coe's Golden Drop, and Late Orange. The pears were beautifully clean and well developed; while the fruits in baskets attracted general admiration, as did also the remarkable collection of nuts.

Messrs. H. Cannell and Sons, Swanley, exhibited a nice collection of apples, pears, and plums. The apples were clean and bright, while the plums included such varieties as Japanese Burbank, Goliath, River's Late Orange, Cox's Emperor, Washington, Kirke's Blue, Monarch, and Jefferson's. Mr. J. Gray, Sandy, staged a collection of carrots which were well developed and of good type. The roots were fine examples of cultural skill and true to type.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, occupied a large space with fruit trees in pots, which were very fine, not only in the crop, but in the colour and development of the individual fruits. Apples, pears, and plums were all represented. The apples included fine examples of Christmas Pearmain, Col. Vaughan, Tyler's Kernel, Wealthy, Worcester Pearmain, and Lady Sudeley. The pears were well represented by Conference, Souv. du Congrès, Charles Ernest, and Marguerite Marillat. Messrs. Stuart Low and Co., Bush Hill Park, contributed a good collection of fruit trees in pots. The figs were a feature here, including figs in a high state of development.

A meritorious collection of plums in boxes were shown by the Hon. Mrs. Merry, Danesbury Park, Welwyn (gardener, Mr. G. Kelf); all were well grown, but the best examples were those of Late Orange, Jefferson's, Prince Englebert, Angelina Burdett, Green Gage, Monarch, and Belgian Purple. Mary Countess of Ilchester, Holland House (gardener, Mr. C. Dixon), sent a collection of ornamental crabs, which attracted much attention, and certainly called attention to this class of fruit for ornamental purposes. A collection of beans and peas came from the Rev. L. C. Chalmers Hunt, Hitchin. The examples of runner beans, Prizewinner, Best of All, White Giant, and Scarlet Emperor being excellent, while fine dishes of peas, as Duke of Albany, Centenary, and Gladstone were to be seen.

Mr. G. W. Miller, Clarkson's Nurseries, Wisbech, had a fine exhibit of his Red Victoria apple. The fruits were very regular and grand in colour; while examples of the growth loaded with fruits stamp it as a very free-cropping variety.

## MEDALS AND AWARDS.

Gold Medal.—To Messrs. G. Bunyard and Co., for fruit trees in pots, and collection of fruits.

Gold Hogg Memorial Medal.—To Messrs. Jas. Veitch and Sons, Lim., Chelsea, for fruit trees in pots.

Silver-gilt Flora Medal.—To Mr. E. H. Davidson, Twyford, for group of orchids.

Silver-gilt Banksian Medal.—To Mr. Jas. Box, Lindfield, for phloxes.

Silver Flora Medal.—To Messrs. H. Cannell and Sons, for dahlias; to Messrs. W. Cutbush and Sons, for hardy plants; to Mr. L. de Rothschild, for nymphæas.

Silver Knightian Medal.—To Messrs. S. Low and Co., Bush Hill Park, for fruit trees in pots.

Silver Flora Medal.—To Messrs. Sander and Sons, St. Albans, for orchids.

Silver Banksian Medal. — To Mr. Pitt, Rosslyn, Stamford Hill, for orchids; to Messrs. S. Low and Co., Bush Hill Park, for orchids; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. H. Cannell and Sons, Swanley, for collection of fruit; to the Hon. Mrs. Merry, Welwyn, for collection of plums; to Messrs. G. Bunyard and Co., Lim., for herbaceous plants; to Messrs. J. Cheal and Sons, Crawley, for dahlias; to Messrs. Pipers, Bayswater, for liliums; to Messrs. Jas. Veitch and Sons, Lim., Chelsea, for miscellaneous flowering plants; to Messrs. H. B. May and Sons, Upper Edmonton, for miscellaneous plants; to the Hon. Vicary Gibbs, for buddleias.

Bronze Banksian Medal.—To the Rev. A. L. Chalmers Hunt, Hitchin, for collection of peas and beans; to Mr. R. R. Cory, Cardiff, for collection of dahlias; to Mr. A. Ll. Gwillim, Eltham, for begonias.

First-class Certificate.—For Melon John Massey, from Messrs. W. Rowlands and Co., Liverpool, and for Cotoneaster divaricata, from the Hon. Vicary Gibbs, Elstree,

Award of Merit.—For Odontioda Enterprise, Davidson's var.; for Odontoglossum Helene; for Lælio-cattleya Amabilis Borlases var., all from Mr. E. H. Davidson, Twyford; for Angræcum O'Brienianum, from Mr. J. S. Bergham, Hampstead; for Læliocattleya Golden Fleece, from Sir Geo. Holford; for collarette dahlia Princess Louise, from Messrs. Dobbie and Co., Edinburgh; for Cactus Dahlia, Edith Carter, from Mr. H. Shoesmith, Woking; for single dahlia Leopold, from Messrs. J. Cheal and Sons, Crawley; for single dahlia, Marion and for pompon dahlia Irene, from the same exhibitors; for cactus dahlia Pegasus, from Messrs. Jas. Stredwick and Sons, for collarette dahlia Antwerpia, from J. B. Riding, Chingford.

A Cultural Commendation was granted to Sir G. Holford for a plant of Cattleya Euphrasia, and to Mr. Roger Leigh for Brown Turkey figs.

---

## General Bulb Growers' Society of Haarlem (Holland).

The following awards were made to gladioli at the recent meetings of the Gladiolus Committee of this society:

First Class Certificate. — Glory of Noordwijk, flowers soft yellow, pure; Red Emperor, syn. Meteor, flowers scarlet-red, shaded brownish-red; Panama, flowers of an exceedingly fine form, colour pink, shaded lilac, imported; Sieger, flowers orange-vermilion, the lower petals lilac with white.

Awards of Merit.—Darling, flowers violet, spotted white; Eldorado, flowers clear yellow, spotted reddish-brown; Loveliness, flowers creamy-white, shaded rose and pink; Pfitzer, flowers orange-scarlet, spotted velvety red; Apollo, flowers dark crimson-rose, shaded carmine; Badenia, flowers clear lilac-blue, striped, the spot is dark blue; Johanna, flowers dark brown-red; Martha, flowers purplish-violet; L'Immaculée, flowers white, the lip yellow; Princepine, flowers bright scarlet-red, with a large white spot, from America; Sulphur King, flowers clear yellow, imported from America; Carmen, flowers dark violet, imported; Dr. Dotter, flowers clear sulphur-yellow; Scheybeek, flowers orange-red, spotted white and carmine.

The following awards were made by the Floral Committee at the same meetings:

First Class Certificate.—Cactus Dahlia Richard Box, flowers soft creamy-yellow, very large.

Awards of Merit.—Cactus Dahlia Florid, flowers bright scarlet; Cactus Dahlia Flossi Wells, flowers violet-red; Cactus Dahlia Stability, flowers lilac-rose; Pæony-flowered Dahlia White Lady, flowers white, in the centre creamy-yellow; Montbretia Fire King, flowers bright scarlet, shaded orange, raised by E. H. Krelage and Son, of Haarlem.

## Shrewsbury Floral Fete.

(Continued from page 656.)

### NON-COMPETITIVE.

The trade displays alone would have provided an exhibition far above the ordinary, both in extent, variety, and quality; consequently they formed a fine setting for the competitive contributions, and added materially to the size and interest of the fete.

Messrs. Dicksons, Chester, displayed splendid sheaves of Gladiolus America, G. Lafayette, Lilium auratum rubro-vittatum, Romneya Coulteri, montbretias, roses, early chrysanthemums, phloxes, and other useful flowers. A large exhibit of ferns from Mr. H. N. Ellison, West Bromwich, contained a fine collection of nephrolepsises, Adiantum Glory of Moordrecht, and the new Pteris Parkeri. Mr. Ellison also contributed a very interesting collection of cacti for Mr. F. Adolphe Haage, of Erfurt.

Messrs. Bakers, Wolverhampton, filled a large space in the large fruit tent with phloxes, delphiniums, Lilium tigrinum, pæony dahlias, gladioli, and early chrysanthemums, set out in bold masses. Messrs. Caldwell and Son, Knutsford, displayed a rather crowded lot of phloxes and other useful hardy border flowers. Messrs. John Forbes, Hawick, made up a capital display with choice phloxes, a fine selection of carnations and picotees, and a specially fine set of beautiful pentstemons, among which Mrs. Michie and Sir Dighton Probyn were of great merit.

Picked fruit and fruit trees in pots, splendidly grown and cropped, were finely set up by the King's Acre Nursery Co., Worcester. Glou Morceau, Le Lectier, pears; Black Hamburgh, Alnwick Seedling, and Black Alicante grapes; Mère de Ménage, Emperor Alexander, Cellini, Cox's Orange Pippin, Peasgood's Nonsuch, and The Queen apples, were the pick of a grand lot. The same firm also contributed roses and hardy flowers. In the display of hardy flowers from Messrs. G. Gibson and Co., Leeming Bar, the varieties of Chrysanthemum maximum named Princess of Wales, Wynyard, and Mrs. F. Daniel stood out prominently among many good things. A little collection of alpine plants was tacked on to a very large and bright exhibit of select border flowers set up by Messrs. Isaac House and Son, Westbury, Bristol; the over boxes from this firm were particularly good.

A very effective exhibit came from Messrs. E. Webb and Sons, Wordsley, Stourbridge. Liliums, astilbes, and early chrysanthemums formed a fine background for fine specimens of the firm's specialities in melons, tomatoes, peas, potatoes, beans, onions, etc., and the whole was decorated with arches of sweet peas and carnations. A very interesting collection of cacti was submitted by Messrs. S. S. Thompson, Alfred Road, Handsworth, the mamillarias being particularly good. Mr. Edwin Murrell, Shrewsbury, put up a very interesting and clean lot of roses, and staged many of the latest novelties.

Messrs. Dobbie and Co., Edinburgh, exhibited sweet peas, roses, and collarette dahlias; the former were quite fine for the season, and such dahlias as Queen Anne, Antwerpia, Balmoral, Queen Mary, and Princess Louise stood out conspicuously. The Cosmos and African marigolds were equally fine. Floral designs of great beauty and distinction were displayed by Messrs. Jones and Sons, Shrewsbury; the baskets of roses, liliums, and carnations were very attractive. Choice nephrolepsises and a selection of carnations and violas came from the same firm.

The Royal Horticultural Society's exhibit of forty-two bunches of grapes from the Wisley Gardens was a great attraction to the fruit specialists, as the varieties staged included many not in general use, but of great excellence, as well as some of great attractiveness but little table merit. The varieties were Duke of Buccleuch, Buckland's Sweetwater, Lady Hutt, Mrs. Pearson, Directeur Tisserand, Prince of Wales, Muscat Champion, Black Prince, White Tokay, Lady Hastings, Trebbiano, Golden Champion, Chasselas Napoleon, Madresfield, Appley Towers, Syrian, Foster's Seedling, Gros Maroc, Black Hamburgh, Alnwick Seedling, Duchess of Buccleuch, Bowood Muscat, Muscat Hamburgh, Grizzley Frontignan, and White Frontignan. The whole formed a most creditable and interesting collection.

Messrs. Sutton and Sons, Reading, put up a first-rate exhibit of flowers, fruits, and vegetables. The background was composed of asters, antirrhinums, liliums, and begonias, and formed a capital setting for splendid melons and tomatoes, fine onions, potatoes, carrots, cucumbers, beet, aubergines, marrows, peas, endives, cauliflowers, etc., the whole forming a most attractive exhibit. Messrs. Hobbies, Lim., Dereham, filled a crescent-shaped space with a very large collection of roses, and collarette cactus and pæony-flowered dahlias. The roses were very fresh, and represented the best varieties for garden decoration, and they were used here to flank the high stands of brilliant dahlias.

Messrs. Gunn and Sons, Olton, displayed phloxes in their usual splendid fashion, and set up glorious heads of bloom in great sheaf-like stands, presenting the finest varieties in fine style. Messrs. R. Wallace and Co., Colchester, presented their striking novelty Montbretia Star of the East, together with choice gladioli, kniphofias, etc

Messrs. Dickson and Robinson, Manchester, put up a beautiful lot of Lilium longiflorum, L. auratum, L. speciosum, fine sheaves of perpetual carnations, and a capital set of finely grown vegetables, their peas being perfect. Messrs. Aldersey and Marsden Jones, Tilston, Malpas, staged sweet peas; and Mr. Robert Bolton, Warton, Carnforth, showed sweet largely and grandly, his R. F. Felton, Chas. Foster, Mrs. C. W. Breadmore, Thos. Stevenson, etc., being particularly good. Messrs. Young and Co., Hatherley, Cheltenham, displayed perpetual carnations in capital style, showing large vases of Mrs. Greswolde Williams, Lady Neeld, Cheltonian, Mikado, Britannia, Enchantress, and other good varieties.

Messrs. Fred Smith and Co., Woodbridge, set up a particularly fresh and attractive contribution of hardy flowers, their gladioli, scabious, phloxes, gaillardias, and montbretias being especially good. Messrs. Rich and Co., Bath, also contributed hardy flowers, and made up a fine show with Gladiolus America. Messrs. Jarman and Co., Chard, submitted good vegetables, dahlias in abundance and in great variety, roses, zonal pelargoniums, and their charming sweet sultans. Messrs. Barr and Sons, Covent Garden, put up a first-rate selection of well-grown vegetables, and staged their produce in a most attractive manner.

Lyon Rose, George Dickson, Lady Ursula, Mrs. Fred Straker, and Irish Fireflame, were conspicuously good new roses in an exhibit from Messrs. A. Dickson and Sons, Newtownards. Mr. W. Ferguson, Dunfermline, put up large stands of Lyon, Frau Karl Druschki, and other good roses. Messrs. Hewitt and Co., Solihull, sent hardy flowers in season; and Mr. W. A. Manda, St. Albans, exhibited the beautiful Polypodium Mandaianum, and a very elegant and light asparagus named A. elongatius. Messrs. Felton and Sons, Hanover Square, W., demonstrated the decorative value of imported blooms and leaves of Nelumbium speciosum.

The gladioli from Messrs. Hogg and Robertson, Dublin, were in first-rate condition, and Messrs. Webb and Brand's stately hollyhocks, from Saffron Walden, made a brave show. Messrs. S. Bide and Sons, Farnham, had a fragrant and effective exhibit of the finer varieties of sweet peas, and Mr. R. Prichard, Wimborne, and Mr. J. H. Marsden, each contributed groups of hardy flowers. Very bright and gay were the showy gaillardias set up in goodly numbers by Messrs. Harkness and Son, Bedale. Messrs. Hugh Dickson, Lim., Belfast, were large exhibitors of beautiful roses, their stands of George Dickson and the Lyon showing up finely. Mr. Vincent Slade sent brilliant cut pelargoniums from Taunton, and Mr. A. W. Thorpe, Lichfield, made a fine display with large bunches of first-rate early-flowering chrysanthemums.

Mr. E. Beckett, V.M.H., Aldenham House Gardens, Elstree, put up one of his surprisingly fine exhibits of splendidly-grown vegetables, the quality, variety, and fine staging of the large numbers of kinds and varieties leaving nothing to be desired. Messrs. Clibrans, Altrincham, had a large and meritorious contribution of well-grown vegetables set out in most skilful and attractive manner; if one subject could be selected as of outstanding excellence it would be the celery.

Fruits, picked, and growing on pot trees, from Sawbridgeworth, thoroughly sustained the reputation of Messrs. T. Rivers and Sons; their Cox's Orange Pippin, Rival, and Peasgood's Nonsuch apples were marvels of fine culture, and the pears, chiefly of their own raising, with oranges, plums, peaches, and nectarines, combined to make a striking exhibit of great educational interest. Mr. Albert Myers, Sutton Lane, Shrewsbury, brought forward the best of new and old zonal pelargoniums, and set up plants and cut flowers in splendid style. Mr. Patterson showed violas in his usual good style; and Robert Sydenham Limited, Birmingham, made a good show with floral decorations in rustic stands.

Messrs. H. B. May and Sons, Edmonton, brought up a first-rate contribution of ferns, and put up their group in fine style. Large davallias, adiantums, and platyceriums formed a fine background for Adiantum Glory of Moordrecht, gold and silver gymnogrammas, Nephrolepis todeaoides, N. Marshalli, and other beautiful plumose forms. Of special interest was the display of twenty fronds, showing the varieties that have been evolved during recent years. Two plants of the rare Platycerium Wallichi were included in this exhibit. A brilliant exhibit from Mr. L. Russell, Richmond, consisted of several hundred beautifully-grown plants of Celosia plumosa; scarlet and yellow were the colours chiefly displayed, but there were a few purplish-rose ones also. A few baskets of hardy fuchsias added further interest to this display.

Mr. Amos Perry, Enfield, was a large exhibitor, and he occupied a large half-circle in the large group and plant tent. In the centre of his space was a raised water lily pool of rectangular shape, the front and sides being planted up with choice hardy ferns, while along the back, just beyond the water, Lilium auratum, L. Browni, and L. speciosum rose among bamboos, reeds, and other elegant moisture-loving plants. The circumference of the display was filled in as a broad flower border, with six great masses of blue, lavender, violet, and purple delphiniums, with masses of Artemesia lactiflora, astilbes, phloxes, hollyhocks, heleniums, etc., in between. The whole formed a very bold and striking exhibit that attracted a great deal of attention.

In reporting on the exhibits of dahlias we were only able to give the names of the winners of the first and third prizes in the class for collections, owing to the entries being somewhat scattered. We are now in a position to say that the second award was made in favour of Mr. J. Walker, Thame.

## Royal Horticultural Society of Aberdeen.

AUGUST 22-24.

Favoured with three of the best days experienced in August, this society held its annual show in the Duthie Public Park, Aberdeen. Than this beautiful park no more ideal situation for such an exhibition could be found in Scotland. As may be supposed, the spell of bad weather experienced this season has had a very serious effect on flowers and plants. Everything is in a very backward state, and the effect was to a great extent reflected here. Notwithstanding these untoward circumstances, however, there was a great floral display.

The entries amounted to over 1,600, and the exhibits were displayed in three large marquees, which were, as usual, laid out in a very tasteful manner. Lady Cowdray of Dun-Echt, Aberdeenshire, gracefully performed the opening ceremony, and the worthy secretary, Mr. J. B. Rennett, assisted by a large committee, capably carried out all the arrangements.

### PLANTS.

There was an exceedingly fine display of plants, the fuchsias, begonias, gloxinias, pelargoniums, and early-flowering chrysanthemums being of great excellence. It was very pleasing to observe here that the majority of the exhibitors found some place in the prize list Mr. William Dick, gardener to Alexander Ledingham, Esq., S.S.C., Queen's Road, Aberdeen, had a very meritorious win for the four best plants in flower. Mr. A. Brebner, gardener to Colonel W. S. Gill, Dalhebity, Aberdeenshire, took first and second places for best specimen plant in flower with well-grown examples of Disa grandiflora. The foliage plants proved a very attractive feature. Mr. A. Brebner, Dalhebity, had a capital win for ferns, his Adiantum cuneatum and A. gracillinum and Nephrolepis Whitmani being greatly admired. Dracænas and asparagus were well shown. Here Mr. Elder, gardener to Professor Baillie, of Norwood, Aberdeen, had a capital win. For the best specimen foliage plant, Mr. J. W. Brechin, Ardo, Belhelvie, Aberdeenshire, deservedly gained first place. Hardy ferns were well shown, and Mr. A. Duncan, gardener to Lord Provost Maitland, had some capital specimens. Zonal pelargoniums formed a very attractive class, and here the honours were deservedly awarded to Mr. Brechin, Ardo, Belhelvie, Aberdeenshire. Mr. W. Dick, gardener to Mr. Ledingham, Queen's Road, Aberdeen, led finely for pelargoniums and begonias (single and double), and Mr. James Burnett, gardener at Summerfield Hospital, Aberdeenshire, had premier honours for fuchsias and petunias, all well-grown specimens. For best six plants for dinner-table decoration Mr. John Petrie, gardener to Sir Thomas Burnett, Bart., Crathes Castle, Aberdeenshire, took first and second places in fine style; Mr. Douglas, Kepplestone, being third.

### CUT FLOWERS.

It was in this department where the chief effect of the adverse weather was most noticeable. Yet some capital collections were shown, especially in the professional classes. The silver challenge cup presented by Messrs. James Cocker and Sons, Springhill Nurseries, Aberdeen, for best eighteen roses, distinct, was finely won by Mr. A. Brebner, Dalhebity. Mr. John Petrie, Crathes Castle, and Mr. Lockhart, Craigiebuckler Cottage, Aberdeen, divided the honours in the other rose classes with Mr. James Burnett, Summerfield Hospital. For a long period one of the outstanding features of this show has been the fine display of sweet peas. Mr. Petrie, Crathes Castle, had a very fine collection, the colouring of the blooms being remarkably good. Very fine were his flowers of Scarlet Empress, Dobbie's Cream, Rosabelle, Thomas Stevenson, Edrom Beauty, R. F. Felton, and Hercules. Mr. J. A. Grigor, gardener to Mrs. Dunbar Dunbar, of Seapark, Forres, N.B., made a good second, and R. A. Grigor, gardener to Mr. T. Ranken, Dalswinton, Dumfries, was third. For the best six bunches, however, the last-named was first, Mr. McKinnon, gardener to Lord Aberdeen, Haddo House, being second. Mr. A. Cumming, Rubislaw, Aberdeen, had also some choice entries, his honours being well deserved. Mr. J. W. Brechin, Ardo; Mr. J. M. Dunn, Aberdeen; and Mr. W. Lockhart, Craigiebuckler, had leading honours for dahlias, which were much admired. The first-named gardener also led for asters and gladioli with flowers of high quality. Marigolds were a good class. For twenty varieties of cut flowers and fine foliage bedding plants Mr. W. Dick, Queen's Road, Aberdeen, worthily gained first place with a very meritorious collection. Carnations were well shown Mr. Lockhart, Craigiebuckler Cottage, leading; while for begonias, Mr. J. McCombie Brown, Park House, Aberdeenshire, obtained the premier award. Phloxes, stocks, pansies (show and fancy), violas, and chrysanthemums were well shown, leading places being taken by Mr. Brechin and Mr. John Garden, Inverurie.

### FRUIT.

Mr. W. Harper, Tulliebelton, Perthshire, was first for a collection of hardy fruits. Mr. John Grigor, gardener, Seapark, Forres, proved a very good second. Neither apples nor pears were numerous, and here the leading places were taken by Mr. Harper, Tulliebelton, and Mr. H. B. Smith, Burdshaugh, Forres. Grapes were better shown than for some time, and Mr. R. A. Grigor, Dalswinton, Dumfries; Mr. Petrie, Crathes Castle; and Mr. McKinnon, gardener to Lord Aberdeen, divided the honours.

### VEGETABLES.

This section was one of the outstanding features of the show, the excessive moisture conducing not a little towards this end. For the best collection, Mr. R. A. Grigor, gardener to Mr. T. Ranken, Dalswinton, led the way. For salads, Mr. Scorgie, Springhill, was unquestionably first. Mr. Harper, Tulliebelton, Perthshire, was very successful, his cauliflower and carrots being much admired. Onions were very fine, and peas and leeks were specially good. The leaders here were Mr. W. Harper and Mr. R. A. Grigor. The great feature in this section was, as usual, formed by the potatoes. They were of great excellence, and, where all were so good, it would be invidious to particularise; but it must be remembered that such well-known growers as Mr. Brebner, Dalhebity; Mr. James Ferguson, Linton Gardens, Cluny; Mr. J. McCombie Brown, Mr. J. W. Brechin, and Mr. John Yule were among the prize-takers.

### NURSERYMEN'S CLASSES.

The contributions to these were of much merit, and proved a great source of attraction to the many visitors. For the fourth time in succession, Messrs. James Cocker and Sons, Springhill Nurseries, Aberdeen, carried off the silver cup for the best thirty-six rose blooms. Messrs. Adam and Craigmile, Fernielea Nurseries, Aberdeen, were second. For wreaths, the last-named firm won grandly with a most artistic production. For bouquets—hand, spray, and shower—floral designs, and ladies' sprays, Mr. Alex. Burns, jun., New Market, Aberdeen, and his eldest daughter, Miss Burns, Victoria Road, Torry, had matters entirely their own way.

### AMATEURS.

Here there was a remarkably creditable display in all departments. In the section for pot plants, Mr. John Davidson, Hardgate, Aberdeen; Mr. Alex. Gillespie, Northfield Place, Aberdeen; and Mr. Alex. Kemp, Stoneywood, near Aberdeen, divided the principal honours with capital entries. For cut flowers the competition was very keen, and some fine entries were shown, chief among which were those sent in by Mr. George Harper, Huntly, Aberdeenshire; Mr. G. Maclennan, Forres, N.B.; Mr. W. Farquharson, Cults, Aberdeen; Mr. John Davidson and Mr. John M. Dunn, Aberdeen; Mr. J. McLaren, ditto; and Mr. R. Marnock, Kintore, Aberdeenshire.

Needless to say, the exceedingly fine weather which prevailed throughout the whole three days, and the fine band of the Gordon Highlanders, lent not a little to the marked success which the show attained financially, as well as horticulturally.

### NON-COMPETITIVE.

There were some very fine displays made by local nurserymen and seedsmen, and these were distributed throughout the various marquees Undoubtedly the finest in the show was that made by Messrs. James Cocker and Sons, Springhill Nurseries, Aberdeen. This firm had an exceedingly fine collection of herbaceous and hardy perennials, roses, etc. One of the most interesting and attractive exhibits in the show was that of Messrs. Benjamin Reid and Co., Pinewood Park Nurseries, Aberdeen, which included a number of new and rare plants. Messrs. W. Smith and Son, of Burnside and Silverhillock Nurseries, Aberdeen, had a very brilliant display, their prominent exhibits consisting of perpetual-flowering carnations, roses, gladioli, sweet peas, and herbaceous flowers. Mr. M. H. Sinclair, seedsman, Aberdeen, had a very fine collection of cut flowers. Mr. James Robertson, seedsman, Aberdeen, staged a capital collection of flowers of herbaceous plants, and also well-grown plants of various kinds. Messrs. Leslie and Macdonald, West End Nurseries, Aberdeen, had a large exhibit of very useful decorative plants. Mr. P. McHardy, Green, Aberdeen, had on exhibition a very attractive display of plants, etc.

## National Hardy Plant Society.

SECOND ANNUAL CONFERENCE.

The second annual conference of the above society was held at the George Hotel, Shrewsbury, on Thursday, August 22. Mr. W. H. Paine presided over a large attendance. A letter was read from the chairman, Mr. A. J. Macself, regretting his inability to be present.

Mr. T. W. Sanders, F.L.S., gave a most interesting paper on "Are Flower Shows Advancing Hardy Plant Culture as they might and ought to do?" in which he came to the conclusion that horticultural societies and flower shows were not doing justice to hardy plants, and that substantial prizes should be offered to the trade, professional, and amateur growers. When the prize money given for bouquets, sprays, table decorations, and other side classes was considered with the amounts now offered for hardy flowers, the point was quite clear. Shows were apparently fond of following the beaten track, and he should like to see more initiative in new classes, and in this direction the National Hardy Plant Society had been already of some assistance with their model schedule, and no doubt might help further in the future. He should like to see, in these days of herbaceous borders in colour schemes, a prize for a collection of hardy flowers, staged in various colours, say, six of each colour, but, of course, details could be worked out if a start was only made. Such a class would be of more use to people who went to shows for the purpose of seeing plants to add to their borders than all the present classes. Then, again, there were plenty of groups of inside plants, very similar to what one saw ten years ago. Why not work out a class for a group of hardy plants? Classes for rock plants, grown in cool houses, would show the amateur what a wide field of beautiful subjects lay to hand for a trifling cost, and without any expense for heating.

The lecturer also dealt fully with the present methods of showing and judging, and pointed out many improvements which might be made.

In the course of the discussion, Mr. John Collingridge agreed with the suggestion that hardy plants were very much neglected in schedules to-day. Large prizes were often given for plants which were grown by a few people only. The principle was wrong, and he thoroughly endorsed the lecturer's remarks. Mr. G. Gibson, whilst agreeing with most of the suggestions thought that with regard to the colour scheme, there would be a difficulty in carrying it out, owing to the limited number of colours available in one month at one time. Mr. J. Harkness thought that the difficulty as to a colour scheme could be surmounted. There was never more interest than now in hardy plant flowers. The schedules should be absolutely definite, and in the big classes he thought the money should be pooled, and allotted to all the exhibitors by points. Culture should be first, decorations second.

Mr. Edginton thought that the large classes of hardy plants were badly defined, and, as framed, it was impossible to stage on 300ft. for natural effect. He criticised that wording and the judging of several classes at recent shows, and instanced as examples of natural effect Gladiolus America in May, and Lilium umbellatum cut down to six inches in height. He thought that rock gardens would be more natural with 600ft. and two facings, with the same number of plants at present crowded into 300ft. Background of bamboos should be discarded. Mr. T. R. Hayes agreed with the lecturer, and also endorsed Mr. Edginton's remarks, and thought that the society should communicate with the Shrewsbury Committee as to more clearly defining their group class, whilst recognising the start that had been made.

Mr. Bouskell agreed with Mr. Sanders, and thought, from the exhibits at Shrewsbury that day, that any large grower could have had arranged a colour-scheme class with the material he had at the show. He pointed out that the model schedule had already borne fruit, and he read particulars of Class I. at Messrs. Robinson's Birmingham Show, on August 28, which was a great advance on any previous class that he had noticed. He urged individual members of the society to endeavour to influence shows in their district, which the society as a whole could not get in touch with at once. Mr. Quick thought that it would be a step in the right direction if non-competitive exhibits were judged on their merits, the same as competitive.

The Chairman said that the best argument that hardy flowers were popular was that nurserymen found them pay. There was a more artistic arrangement to-day. It was no good beating about the bush, and they should demand proper treatment for hardy flowers. Gladiolus America exhibited in May was not advancing hardy plant culture who would regard the group as typical of plants in bloom at the period. He should like to see a class for delphiniums, twelve spikes of each staged for natural effect. With regard to the framing of a class, he thought it would be better to have given a number of sorts with a given number of spikes of each; and if a prize were offered for judges of hardy plants, it might have a stimulating effect.

On the proposition of Mr. Bouskell, seconded by Mr. Gibson, a hearty vote of thanks was accorded to the lecturer for coming up from Aberystwith to give his paper. Mr. Sanders, in reply, said that the discussion had justified his title. He should like to see a class for hardy orchids at the Temple Show and classes for veronicas, primulas, etc., at other shows.

There was a discussion on the herbaceous species of the genus veronica, about fifty species and varieties being exhibited. The confusion in the nomenclature was pointed out by Messrs. Bouskell and Paine, who had made a list of every species exhibited at the show, many of which appeared under several names. It was resolved that Messrs. Sanders, Paine, and Irving, with the hon. secretary, be appointed a committee to correspond and report at a future meeting. The Hon. Secretary (Mr. Frank Bouskell), Market Bosworth, Nuneaton, will be glad to receive specimens of any species or varieties or, preferably, a small plant to bring before the committee.

### AWARDS.

Awards of Merit.—To Erica cinerea atrococcinea, from Messrs. Hayes, Keswick; to Bidens dahlioides, a fine form, with pink flowers, quite hardy at Sheffield, from Messrs. Artindale and Son; to Gaillardia Mrs. Mackellar, very fine habit, large yellow blooms with carmine centre, from Messrs. Harkness and Co., Bedale; to Primula japonica autumnale, a new local race from Japan, flowering in the autumn, robust habit, and fine flower trusses; to Lobelia Glory of St. Anns and Lobelia Glow, from the Tully Nursery, Kildare; and Thalictrum dipterocarpum, from Messrs. J. Veitch and Sons.

Lobelia W. H. Paine was exhibited, and considered the finest recent introduction. As only one spike was exhibited the Council asked for it to be staged again. Messrs. Kelway exhibited some fine spikes of delphiniums second bloom, which the Council desired to see again.

## PROPOSED CITY ROSE SOCIETY.

A short time ago correspondence appeared in the Gardeners' Magazine suggesting the formation of a rose society exclusively for the City of London people. Coming as it did from that ardent horticulturist and rosarian, Mr. A. E. Protheroe, the suggestion is well worthy of consideration, the only possible objection to the idea being that horticultural societies are so very numerous that an undue increase in their numbers must be discouraged, and the addition of even a single new society should not be countenanced until it is conclusively proved that its formation will be the means of advancing some phase of plant culture or of doing really good work that is not already being done by existing societies.

Mr. Protheroe convincingly shows that the National Rose Society and the Royal Horticultural Society do not meet the exact requirements of the many enthusiastic rosarians to be found among men engaged in the City of London, whose business ties prevent them devoting a day to exhibiting at or visiting a rose show. Nor can the London dweller compete with provincial growers, although a set-off to the latter objection is the fact that the N.R.S. schedule contains classes restricted to London growers. The expenditure of time and money is undoubtedly the great consideration, and yet no society or show can be carried on without this expenditure.

It may not have occurred to those who suggest the new society that there exists, with headquarters in the City, a society called The National Amateur Gardeners' Association, in connection with which regular meetings and small evening shows are held almost in the heart of the City as well as a larger annual show on a Saturday afternoon in the height of the summer season.

Would it not be possible for our rose-loving City friends to throw in their lot with this established society, joining hands with it on the clear understanding that both at the evening shows and the annual exhibition they, as City rosarians, should have classes to meet their needs and approval? It seems to me this would in many ways be preferable to starting another new society. The N.A.G.A. could well do with increased support, and the rosarians would find it possible, by having small classes at each evening show throughout the summer and autumn, to pursue their particular pleasure, and enjoy several opportunities for exhibiting or inspecting roses at a comparatively small cost.

A. J. M.

**Pilea muscosa.**—Plants of a dwarf mossy character that may be easily grown in small pots are in many gardens in considerable demand, especially such as can be readily renewed when, after being employed for various decorative purposes, they become shabby. Such a plant is this member of the nettle family, a native of the West Indies. In a warm house it strikes root, and grows without any trouble. Popularly it is termed the Artillery Plant, from the fact that, when moistened, the flower buds expand forcibly, and discharge their pollen like tiny puffs of smoke.—K.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

ORCHIDS.—A. J., Bristol: I am much interested in orchids, and I am very pleased to say that I find the Gardeners' Magazine most helpful to me in their cultivation. I am now writing to ask whether you will kindly answer the following questions? What is the meaning of the term insigne as applied to cypripediums and other orchids, and from which species, varieties, or hybrids did Cypripedium Clinkaberryanum originate? —The term insigne is the Latin for remarkable, and as applied to orchids it is intended to indicate that the plants are remarkable for their beauty. The parents of Cypripedium Clinkaberryanum were C. Curtisi and C. philipinense.

CERTIFICATE FOR EFFICIENCY IN PRACTICAL GARDENING. — Would you kindly tell me how I can obtain a certificate of efficiency in practical gardening? At the present time I have an excellent situation as gardener to a gentleman, and he helps me very much by lending me books on gardening and botany. I have studied these subjects for five or six years, and practical gardening since my school days. Apart from my master's books, I have been a subscriber to the Gardeners' Magazine for a long time, and have found it of immense value in my endeavour to become thoroughly proficient, both in the practice and science of horticulture.—We regret our inability to give our correspondent, whose reference to the Gardeners' Magazine we much appreciate, the information he seeks. So far as we are aware, there is no society or other body that undertakes examinations in the practice of gardening. The annual examination in horticulture held by the Royal Horticultural Society includes a number of questions relating to the practical work of the gardener,

→ Spraying. ←

One of England's leading Fruit Growers says: "I consider the 'Four Oaks' Spraying Machine, 'Battle' Pattern, to be the only practical machine on the market."

18 Gallons £13 15 0
25 Gallons £18 15 0
Four Oaks "BATTLE" PATTERN Very Powerful Pump.
Solid Oak Container. Very narrow over all.

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:-THE FOUR OAKS SPRAYING MACHINE CO., No. 3G, Sutton Coldfield.

and you would probably find the preparation for that examination, and also sitting for it both interesting and useful. You will be able to obtain particulars from the secretary of the Royal Horticultural Society, Vincent Square, and for a small sum you can procure a copy of the papers set for several examinations.

FITTING AND PLANTING CONSERVATORY.—A Twenty Years' Reader: Will you please advise me on the following points relating to the fitting-up and planting of a conservatory? My employer is having a conservatory erected, adjoining the dwelling-house. It is to be iron, 24ft. long, 12ft. wide, and about 16ft. to top of lantern. We are situated in a very exposed position, open to the east and south-westerly winds. It will be slightly heated from the north, and is to be heated by an extension of pipes from the radiators (or house service), which are heated by an efficient boiler. Do you think that a 4in. flow and return pipe carried all round the house would be sufficient? Sometimes I am in a mind to recommend a fountain, about 5ft. in diameter, for the centre. How could it be constructed, and what would it be likely to cost? I intend making a rockwork underneath the staging for ferns, and use a few creepers mixed with them. I also intend growing a pair of lapagerias, tacksonia, plumbago, and stephanotis against the back wall and angles. Will you please give your opinion of the above at your earliest convenience?—Your views with regard to the arrangement of the conservatory are very good; but the floor space is not sufficient for a fountain 5ft. in diameter. If you have a fountain, the basin should be smaller than you suggest, and it should have as a centre-piece a marble figure, suitable for a glass structure contiguous to the house. A flow and return 4in. pipe round the house would enable you to keep the inmates safe from frost, but, as the pipes will have to be placed below the level of the floor, it will be preferable to have two flows and one return to enable you to maintain the desired temperature in severe weather without difficulty. There will hardly be sufficient warmth for the stephanotis, but a bougainvillea would succeed and prove very attractive.

ROSE NOT BLOOMING.—J. F., Kettering: We hope to be able to reply to your question in our next issue.

FLOWER SHOW CONDITIONS.—Chas. S. Prideaux, Dorchester: Will you kindly answer the following question? "A prize is offered for a collection of fruit and vegetables to be competed for as follows: Eight distinct varieties of vegetables (one dish of potatoes only); eight varieties of fruit (pines and bananas excluded). In the rules there is one which reads as follows: In collections of fruit, black and white grapes count as distinct varieties. Would this rule be broken by a competitor staging a collection comprising the following: Three dishes of grapes (one black, and two white), two dishes of peaches, two dishes of nectarines, and one melon?"—A competitor who stages a collection in which the fruits shown are as you suggest would incur no risk of breaking the rule you quote. It is open for him to exhibit eight varieties of grapes if he chooses, but, whether it would be wise for him to do so is another matter. The rule has no bearing whatever upon the competition for the prizes for the collection referred to, and we fail to understand the purpose it is intended to serve. No rule is necessary to allow black and white grapes to count as distinct varieties. They always have been distinct, and are always recognised as distinct. Evidently the compilers of the schedule had kinds in their minds, but failed to differentiate between kinds and varieties when engaged in the work of compilation. Grapes, peaches, nectarines, and melons are, for example, distinct kinds, and it is customary to state in the conditions governing the competition in the classes for collections of fruit of so many kinds that black and white grapes will, for the purpose of the competition, be regarded as distinct kinds. As varieties are alone mentioned, the rule does not apply to the competition, and it really has no meaning.

PRIMULA OBCONICA POISONING.—F. H. B., Merton Park: Having from time to time heard and read of cases of poisoning caused by Primula obconica, these occurrences appear to be frequent. The sufferings of a neighbour induce me to enquire whether any readers of the GARDENERS' MAGAZINE can give, through your columns, the means of combating this poison. Primula obconica is a choice plant, and many people are unaffected by its poisonous nature; but where it is grown, susceptible persons are liable to suffer. Hence, the need for a widespread knowledge of any known preventive or cure.—We shall be pleased to give publicity to the particulars of any means by which those who are liable to being poisoned when the leaves of Primula obconica come into contact with their skin can be rendered immune, or of some preparation by which the effects of the poison may be quickly repressed. The effect of the poisoning varies considerably in the case of those who suffer from handling plants of this primula. In some cases it is light, and in others it is so serious as to endanger the life of the person poisoned. The most recent case that has come under our notice was so serious that, although the patient was under two or three medical men of the highest eminence, his illness was very acute, extending over several weeks, and his recovery was very slow. Hence the importance of a really efficient preventive, if known, having the greatest possible publicity given to it.

## OBITUARY.

### Mr. E. M. Eversfield.

With much regret we record the death of Mr. E. M. Eversfield, of Denne Park, Horsham, which occurred somewhat suddenly at Killiecrankie, Scotland, a few days since. Mr. Eversfield, who was in his seventieth year, has long been one of the leading amateur rosarians in the South of England, and many are the prizes that he has won at the exhibitions of the National Rose Society and elsewhere. His greatest triumph as an exhibitor of roses was the winning of the Amateurs' Champion Trophy at the metropolitan exhibition of the National Rose Society in July last.

## FORTHCOMING ENGAGEMENTS.

TUESDAY, September 3.—Scottish Horticultural Association.

WEDNESDAY, September 4.—Carlisle Horticultural Society; two days.

Northern Counties Fruit Show and Congress at Carlisle; two days.

Glasgow Centenary Show; three days.

British Association Meeting at Dundee.

THURSDAY, September 5.—Dundee Horticultural Society; three days.

SATURDAY, September 7.—French Horticultural Society of London.

Waterhouse Flower Show.

MONDAY, September 9.—National Chrysanthemum Society; Floral Committee at three o'clock.

United Horticultural Benefit and provident Society.

TUESDAY, September 10.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m., on "Cape Pelargoniums," by Miss Troyte Bullock; Scientific Committee at 4 o'clock.

A book of timely interest is Sanders' "Bulbs and their Cultivation" (2s. 10d. post free from the Publisher, 148, Aldersgate Street, London). Written by an expert whose advice is always practical, it is a volume in which gardeners will find all they want to know about the culture of bulbs. The book is admirably illustrated.

WEST'S PATENT GARDEN SUNDRIES have been invented during 30 years of practical experience. By better cultivation, and pleasure by which gardens are kept in order, their expense is doubly repaid. Samples and Illustrated Catalogue free. C. E. WEST, Higham Hill, London, N.E.

**IT IS WORTH WHILE TO PLANT A** PERENNIAL GARDEN.

It will be a saving in pocket and a Perennial Delight, as one season succeeds the other.

It is a garden of which you can make a *hobby*, which can hardly be said of the bedding system. Plant it with Kelway Artistic Colour Borders. Now is the time to plan them. Kelway's will save you all the trouble connected with them if you will send particulars as to area, position, soil, etc., to

KELWAY and SON, The Royal Horticulturists,
LANGPORT.

"I am sending you two photos, one of my border. As regards the border, planted about the middle of April, a friend of mine, who is a great amateur gardener, saw it in August, and said that he would not have believed that it had only been planted four months. He thought that at least the plants had been there three years. I myself have never seen better plants sent out by any other firm."

---

**"ROSES AND THEIR CULTIVATION."** A new edition of this Standard Book is now ready, and every Rose Grower should secure a copy. Cloth, many illustrations, 2s. 10d., post free, from Publisher, 149, Aldersgate Street, London, E.C.

---

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Epiphytes and Parasites.

In the great struggle for existence which, in the course of incalculable æons of time, has led to the evolution of innumerable forms of plant and of animal life, the result, in the former, has been the production of many plants which live upon others, both as simple attachments or epiphytal ones, or as deriving their nourishment from their involuntary hosts, thus constituting true parasites. To the former class an enormous number of orchids, ferns, mosses, and other genera belong, their existence being fostered by congenial conditions of warmth and moisture, particularly the latter, which enables their seeds to germinate and develop without the presence of that soil which the great majority of plants require. The roots commence by penetrating crevices in the bark, and, as the plant develops, it often does so in such a manner that leafy debris accumulates around it, so that in time it derives sufficient nourishment in this way to form, in tropical humid regions and in forestal shade, huge and flourishing specimens, as are exemplified by many of our finest orchids. Most of these, in their native habitats, are found on trees in association with ferns and other epiphytes. Among the ferns of the epiphytal class, the most prominent are platyceriums, or stagshorn ferns, which bear two kinds of fronds, viz., large shield-like, barren ones, which grow perpendicularly, and are admirably adapted for the lodgment behind them of leafy debris, while the fertile ones are bluntly forked, and springing from the central axis of growth hang pendulously downwards, the better to scatter the spores with which the backs of these terminals are literally coated. Other kinds of ferns, such as davallias, cover the tree trunks with their creeping rhizomes, and, in particularly humid habitats, many species of filmy ferns do the same, not only on trees proper, but also on trunk-forming ferns as well. As is always the case in Nature however, there are grades and grades of evolution, and the epiphytal character varies accordingly in degree. Thus, in our own familiar ivy, we see adventitous roots developed, which assist it to cling to its support, though mainly dependent upon the soil for its nourishment, while an immense number of climbing plants use the robuster vegetation to aid their ascent, and produce no such roots, but only tendrils or clinging foliage, or by mere spiral twisting maintain their hold without being epiphytes at all in the accepted sense, which implies an entire independence of soil support. Epiphytes therefore indicate by their very nature the need for moist aerial conditions, and successful culture is, consequently, largely dependent upon such provision. Parasitic plants, on the other hand, demand no such environment, since their roots, or root equivalents, penetrate the substance of the host plants, and derive their nourishment, either partly or entirely, from the sap contained therein. The mistletoe, for instance, belongs to the former category, since it produces foliage containing chlorophyll, which enables the plant to contribute something to its own growth, though mainly dependent upon the host. The dodder, on the other hand, produces only rudimentary leaves, associated with an abundance of flowers, and derives its sustenance entirely from the unhappy plant which it invades. Other parasitic plants thrive upon the roots of the host plants, as does the orobanche, or broom rape, the lathræa or toothwort, and others. The most extraordinary example of this type is Rafflesia Arnoldj, a tropical parasite, which grows on tree roots, and produces no leaves at all, but only immense brown flowers, very fleshy, and as much as a yard in diameter. This is one of the most curious plants known, since it has a strong carrion-like odour, which induces deluded flies to lay their eggs in it, the resulting grubs being doomed to starvation by the absence of proper food, a double instance of plant tergiversation. A vast number of plants, mainly fungi, support themselves parasitically, in the form of diseases, the potato disease, for instance, being due to the attack upon, and permeation of, the tissues by a fungoid plant, Peronospora infestans, while another fungal host derives sustenance from dead plant material. These, however, belong to neither epiphytes nor parasites, but to the tribe of saprophytes to which living plants pay no toll, though it is suspected that some of these are not over-particular, and sometimes contribute to their larder by invading living tissues as well. Nature, in fact, never draws hard and fast lines between kindred organisms, and although man may classify her creations, there are always forms on the border lines he endeavours to define, which are not exactly either the one thing or the other, and baffle his ingenuity.

---

MR. J. DUNCAN PEARSON.

**Mr. J. Duncan Pearson,** whose portrait we have the pleasure of giving herewith, is a member of the firm of Messrs. J. R. Pearson and Sons, whose activities at Lowdham are well known, not only in the United Kingdom, but far beyond its boundaries. As in the case of his two brothers, he combines a keen interest in horticulture with business aptitude of a high order, but while Mr. A. H. Pearson and Mr. C. E. Pearson have concentrated their energies on fruit trees, roses, and other classes of nursery stock of a similar character, Mr. Duncan Pearson has devoted his attention to bulbous flowers, and obtained for himself a prominent position among the leading authorities on this valuable class of plants. He has been specially identified with the development of the daffodil during the past twenty-five or more years, and during that period has done excellent work. Mr. Duncan Pearson began the raising of new daffodils early in the 80's of the last century, and has continued this interesting work until the present time. His first seedling of merit won a silver medal at Birmingham, but it failed to realise its early promise, and consequently was not introduced to cultivation. Alert, which is still a very good flower of the Tenby type, was one of his earliest efforts. The greatest success Mr. Duncan Pearson has achieved has been in the great Leedsi section, a cross effected between Minnie Hume and Madame de Graaff producing a remarkable break in this class of flower; Lowdham Beauty Capella, Norah Pearson, Mrs. Franklin, and Vega being some of the best. There were hundreds of other really good seedlings that were not named or distributed. Later on a cross between Minnie Hume and Weardale Perfection produced some more giant Leedsi of large size and good form, and of these Elfrida Pearson and Mavourneen are the best. Another variety of special merit is Florence Pearson, a large white trumpet daffodil, which is now well known to exhibitors. This was raised from a cross between Emperor and Madame de Graaff. Only five plants resulted from the cross, and this was one of them. Mr. Duncan Pearson has not entered into the raising of daffodils from seed on a large scale, but has made a few crosses between varieties which it was thought likely to give good results, and has achieved a remarkable success, having regard to the number of seedlings raised.

**Purchase of Palm Seeds.**—The Agent-General for New South Wales has received a telegram from the State Government advising him that the Department of Agriculture in Sydney desires to advise possible purchasers of seeds of Kentia palms in England, on the Continent, and in the United States of America, that the second Royal Commission has been appointed to inquire further into the control of the trade and prices, and that it is undesirable to book binding orders for any length of time with any persons until the result of the Commission is known.

**Plant Propagation.**—During the past month Professor Bayley Balfour, V.M.H., gave a course of Saturday evening lectures to the working classes of Edinburgh. The lectures were given in the lecture hall of the Royal Botanic Gardens, and among the several subjects dealt with was that of plant propagation. In this lecture Professor Bayley Balfour dealt with the propagation of flowering plants from the side that is of most interest to the gardener. At the outset the difference in result from propagation by seed, involving the inheritance of mixed characters from two parents, was contrasted with that from vegetative propagation, by which pure transmission from one parent is secured. Vegetative propagation alone was, he said, to be trusted for the perpetuation of definite races. All plants could be propagated vegetatively, although statements in a contrary sense were often made. The gardener must learn from Nature the essentials for his artificial propagation of plants, and the two dominant factors in the process were adequate water supply and adequate food supply. Nature's method of propagation by layering, as in the strawberry, and by separable buds and shoots, as in bulbous plants and plants like the potato, was shown to be the prototype of ordinary gardening operations. The formation of callus, primarily as a healing tissue consequent on wound stimulus, but with the capacity to produce roots and shoots, was the foundation of the whole practice of propagation by cuttings. The problem the gardener prepared for himself when making a shoot cutting was to preserve the vitality of a part which he separated from its source of water supply until such time as callus formation on the cut surface provides an absorptive mechanism of new roots. The effect of the wound stimulus in promoting callus formation was often excessive, and exuberant callus might mean no rooting of the cutting. This might be corrected by further application of the wound stimulus by paring the callus, which induced root formation. Some plants rooted as cuttings readily if the cutting was made at the node of the shoot; others must be cut through the internode. The ease with which soft-wooded plants could be propagated by cuttings, as compared with hard-wooded plants, was a consequence of the greater water content of the former. The lecture was freely illustrated by lantern slides, and proved of much interest.

**Shrewsbury Floral Fete.**—Considering the uncertainty as regards the weather during the week in which the flower show at Shrewsbury was held, it is gratifying to record the fact that during the two days the sum of £2,548 13s. was taken at the gates. Of this sum £931 18s. 1d. were taken on the first day, and £1,616 14s. 11d. on the second day. The total considerably exceeds that of last year, when the takings were seriously affected by the railway strike then in progress, but it is less than the total of 1910, when the takings at the gate amounted on the first day to £1,070 16s., and on the second to £2,034 19s. 1d., making a total of £3,105 15s. 1d. These amounts are exclusive of the receipts from the sale of tickets at a cheap rate.

**Bulb Culture in Moss Fibre.**—Several classes for bulbs grown in moss fibre will, as usual, be provided in the schedule of the bulb show that will be held, under the auspices of the Royal Horticultural Society, at the Horticultural Hall, in March next. The classes will be for six single hyacinths, grown in separate vases, six vases of tulips, and six vases of narcissi. The dates of the bulb show are March 4 and 5.

**The Magnificent Collection of Butterflies** which was formed by the late Mr. H. J. Adams, of Enfield, has been removed to the Natural History Museum, and is regarded as one of the most valuable gifts of its kind that has yet been received. Mr. H. J. Adams, who died in April last, left his collection of butterflies and moths upon trust, with the consent of the residuary legatees, for the use of the nation. It is believed that Mr. Adams spent upwards of £40,000 in the acquisition of the collection, which consists of about 150,000 specimens, arranged in 68 handsome mahogany cabinets, and includes specimens of about 200 species described by Mr. Adams. It need hardly be said that the collection contains many rare species, but it should be mentioned that the colours of the more attractive species are very bright.

**Exclusion of Plant Diseases from America.**—The Secretary for Agriculture in the United States has intimated his intention of prohibiting the importation, from the 16th inst., of four species of pine from Great Britain and other of the leading countries in Europe. The object is to prevent the introduction of the white pine blister mite into the United States. He has also announced that the importation of potatoes from Great Britain, Australia, and several other countries will be prohibited as from the 20th inst., with a view to prevent the introduction of the wart disease into America.

**Forestry in Wales.**—With a view to the improvement of forestry in Wales a scheme has been issued by the Board of Agriculture under which the North Wales University College will undertake advisory work in forestry for the whole of the Principality. The appointment has been sanctioned by the Board of Professor Fraser Storey, of the University College, Bangor, to the position of Advisory Officer under the scheme. Professor Storey will retain his professorship at Bangor, and Mr. T. Thomson, B.Sc., has been appointed assistant lecturer under him.

**National Rose Society.** — This society will hold its autumn show in the Horticultural Hall, Vincent Square, Westminster, on Thursday next, the 12th inst. With reference to the prospects of the exhibition, Mr. E. Mawley, V.M.H., writes under date of August 30: "Should fine weather set in before the show, there ought to be at the exhibition a magnificent display of autumn-flowering roses; and, after all, these are by far the best and most satisfactory roses to grow, and those that have made the greatest advances in recent years."

**British Gardeners' Association.**—A meeting of this association will be held at the Goold Hall, St. Andrew Square, Edinburgh, on Wednesday next, September 11. The chair will be taken at seven p.m., and the speakers will include Mr. James Harris, of Liberton; Mr. W. B. Little, of Carlisle; and Mr. Cyril Harding, secretary of the association.

**A Novel Use for a Vegetable Marrow.**—St. John's Hospital, Twickenham, adopted this summer a new method of adding to its fund. A large vegetable marrow was displayed in the window of a shop in Twickenham, and passers-by were invited to pay a penny and to guess its weight. In the result the marrow went to the most successful guesser, and the money to the hospital.

**Tobacco Culture in England.**—The experimental culture of tobacco for commercial purposes is being carried on, with the permission of the Government, in Norfolk and Hampshire. The largest of the farms on which the tobacco plant is grown is at Church Crookham, Hampshire, and is situated on the estate of Mr. J. A. Brandon. Some fifteen acres are under tobacco, and, notwithstanding the unfavourable weather conditions, the crop presents a promising appearance. Mr. Brandon considers that part of Hampshire in which the farm is situated as suitable for the cultivation of tobacco on commercial lines, and also that where hops will grow tobacco will thrive. The principal part of the crop consists of Virginian tobacco, but Mr. Brandon is cultivating some thirty other varieties at the request of a member of the Development Commission. With reference to the commercial side of tobacco culture, Mr. Brandon is of the opinion that a yield of between 1,500 and 1,600 lbs. per acre would pay well. Last year he obtained 800 lbs. per acre, and sold the crop to a firm of tobacco manufacturers, who have offered to purchase the whole of the crop produced this year.

**Horticulture in Manchester.**—We are pleased to learn from the "Manchester Courier" that a movement is on foot for the purpose of bringing about a revival in horticulture in the district of which Manchester is the centre, and to make the Royal Botanical and Horticultural Society of Manchester even more famous than it was in its palmiest days. Time was when the city of Manchester was one of the chief centres of horticultural activities, and its exhibitions such as to command the attention and evoke the admiration of all who were interested in competitive gatherings. Many years have elapsed since the Whitsun exhibitions of the society were anticipated with not less interest than are those annually held in the gardens of the Inner Temple, and for a considerable period but little has been done at Old Trafford of direct horticultural interest. Now we are told "The society is about to place the district where it should be in the matter of holding a great horticultural show with others for the season, and with the wide co-operation and the enlistment of many interests, is about to take a desirable lead in that direction, and assume its proper position." We trust this promise may be fulfilled in the interests both of the city and the society, for it appears to us little short of lamentable that a great and wealthy centre of industrial activity such as Manchester unquestionably is should be doing nothing beyond its public parks to encourage a taste for flowers among those who reside within its boundaries. According to our contemporary, "There are few areas more capable alone of supporting a vast display of fruits, plants, flowers, and produce, few with demesnes richer in glasshouses, few with more skilled cultivators of the best of all things. With such a nucleus to attract, the kingdom would come and compete on a level." There is no occasion for questioning these statements, but we do not attach much importance to the fact that the society has expended £100,000 in the encouragement of horticulture. If the society is once more to take a leading position among the horticultural organisations of the country and place the district "where it should be" in matters horticultural, but little reliance must be placed upon the traditions of the past. What will be found necessary to ensure success is a scheme of work, not based upon what was done during the second half of the last century, but so prepared as to fully meet present-day requirements. Procedure on the old lines is not likely to result in so high a degree of success as could be desired; but such change in the constitution as would enable it to become a two-county society (i.e., for Lancashire and Cheshire), and thus extend its operations over a wide area, could hardly fail to obtain the support necessary for carrying out useful work on a large scale. Among other work that may be undertaken with advantage is the provision of a Central Horticultural Hall for the two counties and a good library of works on gardening. It may not be possible to provide a hall and library at once, but these are objects that should be aimed at from the first.

## SHREWSBURY SHOW ON THE SECOND DAY.

### A Few Things Seen and Heard.

The International Show in London, of course, stands out as the leading horticultural event of the year, but we only have Internationals at rare intervals, and Shrewsbury comes every year, a grand show, immense crowds, and enthusiasm that is unequalled in the country. You may tell the annual visitor to Shrewsbury Show, who goes as regularly as he spends his holiday week at Blackpool, that Shrewsbury is the best show out of London, but he doesn't believe you, for he asserts, in face of all and any argument, that London is not in it, and Shrewsbury Show is the best in the country. In some respects I am inclined to agree with him.

On the first day Shrewsbury is not unlike a metropolitan exhibition. There are judges who are familiar at London shows—and I think Shrewsbury might change its judges a bit more frequently without casting any reflection on their ability, because changes of this kind are always good—there are the reporters, the exhibitors in force, the officials, and all the big-wigs connected with this wonderful society who attend on the first day. All these good folk predominate on the opening day, but on the second they seem to have vanished from the scene, and the show becomes the property of the cheap tripper.

By a means of its own, the Shrewsbury Committee has persuaded railway companies to run the cheapest of excursions from all parts of the country, and early on Thursday morning the people come in, a happy, rollicking crowd, some of whom have travelled a hundred miles or more with fourteen in the carriage, and they protest that they have enjoyed the experience. The Shrewsbury crowd seems to come from everywhere. They are mostly working folk out for the day, and if you listen you hear the broad dialects of the North and Midland shires, and rub shoulders with the cotton spinner from Lancashire, the cutler from Sheffield, the potter from Hanley, the farm labourer from Salop, and the collier from Wales, and ten to one most of them have been to Shrewsbury many times before.

They haven't all the same object in view, and one man in the carriage in which I travelled informed me that he was going to hear the music, and if anybody wanted to find him during the day, he would not be far from the bandstand. It was true, and several times I noticed him, oblivious to everything except the music of the band of the Coldstream Guards, and it was the same with hundreds of others who sat for hours near to the bandstand sublimely happy. It struck one that this love for good music is a fine trait in the character of British human nature, and Shrewsbury Show without its music would be destitute of one of its great attractions.

It doesn't seem to matter which of the many attractions the crowd likes best, every unit of it seems to make a rule of going through the tents. In fact, the Shrewsbury crowd is one that intends to have its shillingsworth, so it does the show tents in a business-like manner; thousand after thousand they press through, good-humoured, and laughing if they get stuck at a tight corner, and seeing as much as they can of the fruit and flowers as they are carried along. I have been more than once in an aristocratic crush at a Temple Show, but for real good humour on the part of those who are crushed, give me the second-day crowd at Shrewsbury.

I rather admired the attendants at the trade stands, who were there, of course, to do business. They smiled quite patiently as the crowd cracked jokes at their expense, and I paused in front of a big rose exhibit at a moment when the crush was not so great. The attendant was in conversation with a man, addressing him with "Yes, sir," and "No, sir," just as he would a real live lord at a Temple Show, pointing out to him the merits of this rose and that, and taking down an order in his book. "Thank you, sir, where shall we send them to?" when the transaction was finished, and as I listened it transpired that the man ordering the roses—and quite a good order, too—was a coal miner from the Forest of Dean. He would have looked a bit out of place at a Temple Show, but then Shrewsbury on the shilling day is a cosmopolitan gathering, and it contains florists as keen as any who paid their two guineas to see the International.

I noticed one lady from Yorkshire—you can tell where most of the people hail from if you listen to their talk—helped herself very freely to the literature on the different trade stands, and by the time she had finished she had got quite an armful. "What has ta got theer, Mary?" said another lady, apparently an acquaintance whom she met at the exit of the tent. "They wor givin' 'em away," said the former, as she held up for inspection a dainty little order booklet with a small pencil attached by a silken cord. "I thought they'd be so nice for th' children; they'll be mighty pleased wi' 'em, and you must tak' 'em summat back wen yer go out for t' day." Such is one of the uses to which the literature distributed by nurserymen at shows is put.

I think I only saw one man who looked as if he had received a shock of disappointment. He stood before Messrs. Blackmore and Langdon's splendid exhibit of tuberous begonias, and his face was blank with astonishment. He had evidently never been to a big show before, and after he had recovered himself, he turned round to his companion, and said, "Bill, I'm done; I thought I could grow begonias, but I think I'll throw my whole lot away wen I gets whoam. Bill, aren't they grand?" Away in a little, probably home-built, greenhouse, not far from a Lancashire cotton mill, that man grows begonias, and is a local champion. He had come to Shrewsbury to find that someone else could grow them better, and the shock was great to him. "Come your ways on," said the man addressed as Bill, as he tugged at the arm of his companion. "You won't be so cocky about yer begonia growin' after this, th' baloon ull be goin' up in a minit, and I doan't want ter miss it."

"Call them dahlias!" said another horny-handed son of Sheffield or somewhere in that locality. "Whatever are things comin' to?" The man was looking at a big display of the modern Collarette dahlias, but, instead of admiring, a look of the most intense disgust spread over his face. He was evidently a dahlia grower, and perhaps an exhibitor of the old school, and to see what his favourite flower had been brought to troubled him. He moved on, and the next time I saw him he was standing before a stand of show dahlias exhibited, I think, by Mr. J. Walker, of Thame, as happy as a sand-boy, looking, after all, as if the world was not lost, and it was a real study to watch him critically examining first one flower and then another, before he drew from his waistcoat pocket a bit of pencil about half an inch long, with which he proceeded to write down a few names on the margin of the programme of events that he carried in his hand.

It is to the credit of the Shrewsbury Committee that, while its show has grown to such gigantic proportions, it still encourages the cottagers, and one tent was devoted to their exhibits, but I think the society might do something more to educate its cottagers in methods of exhibiting. When inside the marquee I might have been hundreds of miles away from the famous Shrewsbury Show in some little village that was holding its first exhibition. Not but what the produce was good, but there were all the things that are so painfully and regretfully characteristic of cottagers' shows, such as asters exhibited in paper collars, Phlox Drummondi adorned in the same absurd way, twelve pansies occupying positions of stately solitude on a board big enough for a dozen Japanese chrysanthemums, and big, ungainly bundles of garden flowers which the card underneath described as "nosegays." Surely one expected better things than this at Shrewsbury, even in the cottagers' tent, and one wonders how many years the judges in this department have officiated, and whether they have ever made a report to the committee suggesting improvements in the methods of exhibiting.

It is interesting to note how the personality of a man follows him. I have said that Wednesday at Shrewsbury is the day for the notabilities of the gardening world, and so it is in a general way, but on Thursday afternoon I espied one well-known figure, none other than the genial Mr. S. T. Wright, of Wisley, and evidently some people had the idea that, as he is generally managing shows, he must have been managing Shrewsbury, for one exhibitor approached him and asked him a question as to the arrangements that had been made for removing the exhibits. As for Mr. Wright, he answered just as genially as he did after the day and night work at the International, but, poor fellow, he doesn't manage every show he goes to, and one thought that they might have left him alone at Shrewsbury.

The closing of the tents is an exciting time on the second day at Shrewsbury. The balloons have gone up, the bands have finished, the acrobats are packing up their traps, the boxing kangaroo has doffed his gloves, the horse-jumping is over, and there is nothing left but the fireworks. The trips are due out, at least some of them, and a few odd thousands of people suddenly remember that they must take something back with them. So they crowd to the tents again just when the police are trying to clear them, and the exhibitors have not the least difficulty in getting rid of flowers, or, in fact, anything else for which they have no further use. You see them later wending stationwards, dozens of them with the spoils of the show in the shape of bunches of flowers, etc., the same rollicking crowd that arrived in the morning, and the quaint old Shrewsbury streets are like a fair. They climb back into the carriages, perhaps a dozen in one the same as they came, they shout farewell to those left behind, and sit down to discuss the adventures of the day. They have been to Shrewsbury Show once more, and will come again next year if they are alive and well. This is how the great event maintains its popularity. H.

# HORTICULTURAL EDUCATION IN FRANCE.

(Continued from page 621.)

## Superior Primary Schools.

It is not only for an elementary primary school that the school-garden is extolled, and rightly, for its agricultural and horticultural instruction, but also, and much more so, for the superior primary school.

The instruction has been carefully set out by the Ministerial decree of August 18, 1893, which states precisely, in a very clear manner, in which way and with what developments it is most convenient to carry them out, and also what amount of time ought to be devoted to agriculture and horticulture respectively during the three years' training.

By the terms of Article III. of this decree, the programme and time-table of the professional sections (amongst which agriculture figures) ought to be fixed for each establishment by the academy inspector upon the suggestions of the manager or manageress, after first consulting with the masters and mistresses, taking into account to a very large extent the local needs.

Just as the general directions say, the instruction in manual work in a superior primary school ought to have, like the elementary primary school, an educative character. In the superior primary school it would at all times assure for the pupils, by more varied lessons and by more extensive application, all the necessary knowledge for practice in life.

Here again the school-garden allows of demonstrations, applications, and lessons, which together form a sound horticultural training.

Normal Schools for Masters and Mistresses.—It is mostly at the normal school—that is to say, in the nursery—where elementary masters and mistresses are trained in what is important to assure for them the necessary instruction and agricultural education. The better the master, as a pupil who is to become a teacher, is prepared for his task upon the subject of agriculture, the better he will appreciate the beauty and utility of it, and the more successful and productive of good results will be his efforts once he enters upon the field of teaching.

The theoretical course of agriculture is entrusted to departmental professors who are responsible for it in all parts of France. (Note.—In each department of France there is a normal school for masters and also one for mistresses.)

Horticulture forms an integral part of this important course. In some normal schools (such as those of Clermont-Ferrand, Dijon, and Melun) a special professor and ex-pupil of the National School of Horticulture at Versailles is always engaged for the horticultural section.

One can understand how useful this latter organisation is in diffusing the science of garden culture. Thus instructed, however zealous the professor of agriculture may be, he cannot displace a specialist in the teaching of such a special branch as horticulture represents, and which, to be successfully taught, requires special knowledge.

For this reason it is to be hoped that there will be an increase in the appointments of special professors of horticulture.

This point is not the only one upon which there is ground to persist in connection with agricultural and horticultural training in normal schools.

A recent revision of the syllabus of studies for these schools fixes the examination for the "brevet supérieur" (or higher grade certificate) for the end of the second year; as a consequence of this alteration the courses of agriculture and horticulture are carried forward into the third year (which is called the "year of application") and shortened somewhat. So that the study of these matters, in spite of their great importance, remains at the present time without any certification, which is very regrettable.

The manner in which practical instruction is given in the garden of the normal school lays itself open also to some criticism. More often than not it consists rather more in purely manual work, with the object of rendering immediate help to the steward, than in judicious applications, well thought out, and really worthy of the name. It is, however, very necessary that future masters should be initiated and trained practically in the various horticultural operations of primary importance, such as planting seed-beds and plantations, cutting out suckers, layering, taking cuttings, and pruning trees, shrubs, etc., etc.

It should be necessary, moreover, in order to complete it, that the practical instruction should be certified to by a special and thorough examination immediately before leaving.

## Horticultural Instruction for Young Girls.

What has just been said about primary schools of every kind—i.e., primary elementary schools, primary higher grade schools, and normal schools—applies to those for young girls as well as to those for boys—that is, so far as relates to the official syllabus. The persons who drew these up appear to have considered that instruction in gardening is at least more important for the former than for the latter.

In all country gardens, in fact, and more particularly in the modest allotments, which are much the more numerous, and, one may say, also the more worthy of interest, it is the mistress of the house, as housekeeper, who assumes the care of the garden. Hence the necessity for giving instruction in horticulture to young girls.

Gardening figures as a subject for professional tuition in the syllabus of January 18, 1887, for higher-grade primary schools for girls in the "Physical Education" section, under the headings of "Manual Work," "Work in the Garden," "The Fruit Garden," "The Kitchen Garden," "Notes on the Cultivation of Flowers."

The same subjects are prescribed for the primary normal schools for mistresses.

Gardening has figured for the first time amongst the subjects for tuition in these schools in the syllabus of August 4, 1905 (for two hours per week, usually on Thursdays in the third year).

This includes the cultivation of the principal vegetables, the pruning and treatment of fruit trees, making seed-beds, removal of suckers, etc., etc.

## Schools of Housekeeping.

If tuition in gardening is to have any place at all, it should be included in the syllabus of schools of housekeeping, and more particularly in those schools which are situate in agricultural districts.

One cannot too much insist upon this point, since it is so singularly important for the future mistress of a household to know how to manage her garden, which is so closely connected with rural life and household management.

Also does horticulture hold a sufficiently important place in the science of household management? Though only recently organised in France, in the neighbouring countries like Switzerland, Belgium, etc., the teaching of agricultural household management has been mostly given in ambulatory schools, to which at present, in France, an almost exclusive preference seems to be given, yet these ambulatory schools only very imperfectly answer their intended object—that is, to give to a young girl an education with professional instruction sufficient to put her in a position to fulfil the important rôle which devolves upon her on a farm.

Then near us there exist already at least twenty movable schools of housekeeping, whereas one finds only three or four stationary schools of this kind, and these are all devoted to the teaching of dairy work.

In the movable schools, where the full course lasts only three months, tuition in gardening can only be theoretical, and this is precisely one of the points where these schools, which are excellent from all other points of view, fail.

# GROWING BULBS IN FIBRE FOR HOUSE DECORATION.

The growing of hyacinths in water used to be, and still is, very popular with a large number of amateurs who have no other facility for cultivating them successfully. Growing bulbs in fibre is only a modified form of the water cultivation. Under both methods successful flowering is due entirely to the nourishment the bulbs receive from the water. I have never been able to see much beauty in a hyacinth flowering with its roots visibly dangling in a glass of water, and, in my estimation, the fibre method of cultivation is in every way to be preferred. If ordinary care is exercised from the time the bulbs are placed in the receptacles, there need be no fear of failure. It is surprising how many varieties of bulbs will flourish in fibre—narcissi, tulips, crocuses, liliums, fritillarias (the latter, perhaps, make the prettiest bowls of all), iris, lily of the valley, spiræas, etc., all do exceedingly well. I have occasionally had a bowl of freesias do very well, but, on the whole, culture in soil is to be preferred for these flowers.

One or two well-defined rules may be laid down, which should be observed rigidly.

1. Pot at the right time.
2. The bulbs must all be good large specimens of the variety (except hyacinths, see below).
3. The bowls must be of the requisite depth to suit each section of bulbs.
4. Always keep the fibre sufficiently moist.

I make it a rule to pot up Roman hyacinths about August 20, and these bulbs may be flowered any time from early in November to Christmas. If freesias are to be grown in fibre, it is imperative that they be potted not after, say, August 15, for if potted later, the flower scapes almost inevitably go blind. There is one other point about freesias which should not be overlooked—never cover the bowls with any material, as is generally done with most other bulbs; if covered, it is surprising how quickly the bulb breaks and throws up a weak top growth, which frequently leads to the flower scapes being more or less imperfectly developed.

At any time from September 1 to 15, I pot up a batch of narcissus, hyacinths, crocus, and fritillarias. These bulbs all suffer more or less from exposure to the atmosphere, and it is advisable to pot them not later than the date named. I may say here that I prefer what are known as Miniature or Dutch Roman hyacinths to the larger bulbs for growing in bowls. Six to nine bulbs of Miniatures in a bowl will throw medium-sized spikes of flowers which are decidedly more graceful and decorative than three to four heavy, massive spikes of large flowers. The Miniatures, for some reason, are also much more certain in flowering, and if one variety only is grown in each bowl instead of a mixture of colours, the effect is decidedly more pleasing.

About October 1 to 15, experience has proved to be the best time for potting tulips. These bulbs do not start into root growth nearly so early as the foregoing kinds, and if potted too early in fibre, are liable to an attack of a green fungoid growth which reduces the vitality of the bulbs, and frequently destroys them altogether. Tulips should therefore only be potted in fibre just before root action will commence.

The choice of fibre for potting is entirely a matter of cost. I prefer cocoanut-fibre to moss fibre, if obtainable at the same price, as cocoanut-fibre takes and retains the moisture more evenly and remains perfectly sweet at all times. Whether it is necessary to put shell with the fibre is very doubtful, although I have not actually put it to the test.

The method of procedure in potting is as follows: Shoot the fibre on the floor, or, if only a small quantity, put it in a box, and gradually moisten with water as it is being turned over. The fibre should be just moist enough to cling together a little when squeezed in the hand without water actually dropping from it. Have broken charcoal at hand, and place a few pieces in the bottom of each bowl, then fill the bowls with fibre to within about one to one and a-half inches of the rim, according to the size of the bulb being potted, but, in any case, let the bowls be quite full and fairly firm when finished. I have noticed bowls that have had the fibre and bulbs too far below the rim, and scarcely any fibre covering the bulbs; that is quite a mistake. It is better for the crown of the bulbs to be rather above the rim of the bowl than below it, and the bulbs should be well covered with fibre. I frequently round up the fibre quite an inch above the rim of the bowl; it affords extra root-run, and it is quite a common thing for the roots to come out all round the edges of the bowls, the roots being so strong and healthy. I have also found from experience that tulips require a deeper bowl than do narcissus or other bulbs; a bowl of less than four and a-half to five inches in depth is too shallow for tulips, six inches is a much better depth. If put in shallow bowls they frequently go "blind," or if they do bloom, the flowers are invariably very small.

TULIP WHITE POTTEBAKKER.
As grown in fibre.

I mention the latter point because there is a tendency amongst manufacturers and dealers to offer for sale quite shallow bowls that look pretty, but are of little use for bulb culture. As soon as the bulbs are potted they should be put in a cool, dark place; I usually put them in a cold frame and cover with fibre to a depth of four inches, and let them stay there usually until the end of December, until they are placed in a warmer temperature to bring them into flower. The bowls containing crocuses should not be covered after potting, neither should they be forced at all. They do much better if allowed to grow naturally. A cool cellar is a good place in which to put them, and they need not be covered if it is fairly dark. Never put them in a close, warm cupboard, as that will make the growth weak and spindly.

Attention should be paid to watering from the beginning. As soon as the bulbs begin to make root, the fibre should be kept regularly moist, too much water will do very little harm, but if allowed to become dry, the roots shrivel, and, with shrivelled roots, failure must ensue.

It seems almost unnecessary to say that when top growth commences the bowls should be placed where there is plenty of light and fresh air. A friend of mine said last spring, "Why don't my hyacinths succeed? They seem to make no progress." They were in a room thirteen feet from a window, where they had very little air, and yet were expected to grow like mine, which were not more than a foot from the glass and had an abundance of air. Light and air are essential to success. The following is a list of my favourite varieties of the several kinds for growing in bowls, those which have proved to be always a success over a period of years.

Narcissus. — Aspasia, Autocrat, Campanelle odorus, Elvira, Emperor, Empress, Golden Spur, Lulworth, Mont Cenis, Ornatus, Princeps, Rugulosus, Sir Watkin, Vesuvius, Victoria.

Tulips. Couleur Cardinal, Duchesse de Parma, Fabiola, Keizerskroon, King of Yellows, La Grandesse, La Reine, Prince of Austria, Rose Gris de Lin, Rose Luisante, Thos. Moore, Van der Neer, Vermilion Brilliant, White Pottebakker. Darwin varieties.—Bartigon, Clara Butt, Dream, Europe, Isis, King Harold, Maiden's Blush, Mr. Farncombe Sanders, Pride of Haarlem, White Queen, William Copeland.

Crocus.—King of the Whites, Dorothea, Purpurea grandiflora, Yellow, Sir Walter Scott.

Miscellaneous Kinds.—Chionodoxas, muscari, Fritillaria meleagris, Spanish iris in great variety, Iris reticulata, and spiræas.

W. G. L.

HYACINTH QUEEN OF THE BLUES.
A beautiful pale blue variety that ranks high for fibre culture.

## RAMBLING NOTES ON ROSES.

Being an ardent lover of flowers in general, and roses in particular, my greatest pleasure is to walk among, and, I might almost say, commune with, the varied forms of garden roses. An early-morning stroll is simply delightful, and it has been my pleasure to enjoy this more than usual during the present rose season.

The glorious colourings of such varieties as Mrs. Arthur Waddell, Mrs. Aaron Ward, Theresa, Rayon d'Or, Madame Ravary, Souvenir de Stella Gray, Jacques Vincent, Margaret Molyneux, Senateur Mascurand, James Coey, A. R. Goodwin, and Marquise de Sinety are almost indescribable. Then we have Lady Hillingdon, Duchess of Wellington, and Lady Pirrie, that seem to be even surpassing themselves just now.

I had intended a brief description of most of these varieties, but it is difficult to select any without omitting those of almost, if not quite, equal merit.

Theresa is simply glorious as seen growing in small beds upon well-kept turf. The deep, clear orange-apricot flowers, beautifully splashed with carmine and madder-pink, carried in great profusion upon a bronzy-red foliage, produce an effect that is unique, but when backed by green turf the effect is heightened. I cannot imagine anything more showy and charming than this rose well cultivated under such conditions. It is only semi-double, but very free and lasting, while its perfume is very noticeable as one approaches, and though similar to Madame Ravary, Madame Abel Chatenay, and Madame Pol Varin-Bernier, I can distinguish the presence of Theresa from its perfume without the plants being visible.

Theresa is a new rose, sent out from Newtownards in 1909, and this is the second season I have seen it in quantity out of doors. It is a hybrid tea, and must not be confused with Theresa Bevan, another rose with beautifully shaded coppery-yellow and carmine flowers. This last is a tea-scented variety, large, double, and very free flowering, altogether distinct from Messrs. Dickson's Theresa, and I mention it because of its similarity of name having caused confusion in more than one instance known to me. Both are excellent and indispensable in the garden.

The depth of colour in Messrs. Pernet-Ducher's roses is truly remarkable, and that found in Mrs. Arthur R. Waddell (1908) catches the eye immediately. In the bud stage it is a glowing rosy-scarlet, opening into reddish-salmon, with more scarlet upon the reverse of its petals. The buds are very long, and the blooms only a little more than semi-double, but they stand much longer than most of this class, and they are wonderfully helped by the deepest of green foliage and copper-red thorns. We have a sport from this that is almost as deep a yellow as Rayon d'Or, and I am pleased to find it good again this year—the third year of its existence.

Rayon d'Or is in its happiest mood just now, and very intense in its colouring, being the deepest yellow we have. The distinct shade of carmine found in its earliest bud stage is charming; but what I most value it for is the persistent shade of yellow, never fading but rather intensified by age. In this useful characteristic I must also include Miss Alice de Rothschild, which has a decidedly deeper yellow as the flowers develop, whereas the majority of the yellow roses are apt to fade into almost creamy-white with age.

Senateur Mascurand is another deep golden-yellow, that produces exhibition

GOLDEN PRINCEPS NARCISSUS, very fine large bulbs, ready for boxes or pots for Christmas flowering, price 10s. per 1,000, 3,000 for 28s.; carriage paid for cash; 50,000 to sell. J. HANDSCOMBE, F.R.H.S., The Nurseries, Feltham, Middlesex.

RARE ALPINES CHEAP, profits devoted to patriotic objects. Apply for list. LADY C., The Abbey, Much Wenlock, Shropshire, and please enclose fully addressed and stamped envelope.

flowers in great quantity, and borne well above the foliage. This and James Coey are exceptionally clear yellows, as seen this season. Indeed, it is difficult to pass on to others, much as the vivid distinctness of Lieutenant Chaure's velvety crimson-red draws one. In this we have a really beautiful red hybrid tea, and one that retains the peculiarly satisfying perfume of our dark hybrid perpetuals. Referring to dark roses, Chateau de Clos Vougeot is almost black in the intensity of its velvety-crimson. This does not burn in the same objectionable way as do so many of our darkest during bright sunshine. Edward Mawley and Commandant Felix Faure are others that escape injury from brilliant sunshine. Chateau de Clos Vougeot is a good but very erratic grower, throwing out so many unevenly-balanced side shoots after the manner of Madame Abel Chatenay, and although this is not so noticeable in a large mass, it has a somewhat bad effect in small beds.

Dorothy Ratcliffe (McGredy and Son, 1911) is a more ideal bedder than Lyon Rose, which it greatly resembles in its younger stages. Although not quite so deep as Lyon Rose it is equal to it, because of its better habit and more hardy constitution. Jacques Vincent (1908) has been perfect with me under glass since I possessed it three years ago. This rose has Souvenir de Catherine Guillot for one of its seed parents, and possesses much of the delicate art shades found in that rose. It is a much stronger grower, carrying large, well-formed flowers of deep coral-red, with salmon and yellow-shadings. A very hardy, spreading, and free-flowering rose.

We have a real advance among the rose-coloured flowers that are rather too numerous in André Gamon, a beautiful deep rose shaded with cochineal and carmine. The flowers are very deep and high centred, after the form of Pharisaer, altogether one of the clearest flowers of its particular shadings, and exceptionally free in both bloom and growth.

Messrs. Soupert et Notting have given us a fine rose in Madame George Serrurier, raised from a cross between G. Nabonnand and Mrs. W. J. Grant. It favours both parents about equally, and I need say little more than that it is as free and constant as either parent, with exceptionally long buds, and almost all of the substance found in a well-finished Mrs. W. J. Grant. It well deserves a place in every garden. Fortunately it does not appear to have inherited the rather tender constitution of Mrs. W. J. Grant.

George Reimers, a reputed seedling from Richmond, crossed with Etoile de France, will prove a grand, fiery-red bedder; it is large, well-formed, and very free. It is a decided advance upon both of its parents, and I have every confidence of it coming to the front among bedders of its colour. A promising seedling from Marie Van Houtte and Caroline Testout, named Madame Léon Simon, at once attracts attention. It has very long and pointed flowers, and is evidently free blooming, and of ideal growth. The colour is a dark rose, with a distinct yellow centre, and crimson on the reverse side of the petals. Margaret Molyneux still advances in favour. A changeable rose, being saffron-yellow with apricot and peach when young, and passing to almost a canary-yellow when fully opened. The blooms are carried in large, spreading trusses, and, although only a little more than semi-double, stand well, and are exceptionally showy up to the time of falling.

In complete contrast to these art colours is the deep maroon-scarlet of Sarah Bernhardt, which I admire more and more. It should be made a note of by all who do not possess it, more particularly where a dark semi-climber or pillar rose is wanted. A rose well worth growing, if only for its usefulness as a coat flower, and its exquisite perfume, is Madame Pol Varin-Bernier. The flowers are deep yellow when young, opening to a pale straw-yellow. Although this variety pales much with age, it is so clear as to actually heighten the effects of its younger blooms, which are produced in upright trusses. The exceptional beauties of Jessie, Orleans Rose, White Pet, Mrs. W. H. Cutbush, Katherine Zeimet, Eugene Resal, and the aptly-named Canarienvogel, with its trusses of clear canary-yellow, should receive a full share of attention.

I must not forget Mrs. Arthur Munt, one of the most reliable hybrid teas, and a truly delightful rose for any purpose. The raisers' description of "suffused peach on deep cream, becoming creamy-ivory as the flower develops," is very good. Large flowers, with a perfectly-formed high centre. A. P.

---

**Antholyza paniculata.**—This is very pretty in flower out of doors, and attracts attention from its distinct character. In general appearance somewhat like a tall-growing montbretia, it has branching panicles of red and yellow flowers.—T.

NARCISSUS PRINCEPS.

A well-known, rich yellow trumpet daffodil of much value for indoor culture in fibre.

## FERN VARIATION.

Although throughout the plant world we find innumerable instances of marked departures from the normal type—that is, the particular and prevalent form which botanists have determined upon as representing the species—there would certainly appear to be a greater tendency to such aberration in ferns than in flowering plants. In this comparison we can, of course, only consider the foliage, and not the inflorescence, since as regards the latter it is a remarkable fact that throughout all the genera and species of ferns, numerous as they are, and diversified in habit, size, and make, the same type of microscopic inflorescence practically prevails throughout, while in flowering plants, as we know, the diversity is infinite. We can therefore only compare the leaf and the frond, and when we do so, we find that though the forms of foliage proper, i.e., the true leaves of flowering plants, are wonderfully diverse, those of the fern frond, including varietal sports, are not only equally so, but in some respects far more curious.

Thus, for instance, leaves vary in size and shape and arrangement according to their species, and vary wonderfully in the way of sports, so that at Kew we may see scores of oaks of precisely the same species, but with leaves aping those of other and different trees altogether, and playing furthermore a sort of fantasia on the oak leaf theme as well in the matter of size and shape. In the acacia we may see the simple leaf merging into a pinnate one, and so on; and in the cacti and euphorbias the foliage consists of mere rudiments, or the antipodean briar may present it in the guise of prickles only. Amid all these diversities, however, we never find one particular type of variation into which all species of ferns seem capable of sporting, namely, that of forming tassels at the tips of the fronds and their subdivisions. This faculty would appear to be correlated with the fact that the frond and its subdivisions develop apically, that is, the cellular growth is engendered at the extreme tip.

AN ATTRACTIVE BOWL OF CROCUSES.
The bulbs grown in fibre.

If we examine the incipient bud of a tree we shall find it to consist of a compact bundle of young leaves, which when the bud bursts, emerge and grow, so to speak, all over, expanding in all directions, so that the outline alters but little except as regards expansion. A fern frond at the same stage is a small, fleshy knot, devoid of any indication of foliar structure; it is, in fact, only a rudimentary stalk, tipped with a mass of gummy cells. By means of these cells the stalk lengthens, and an incurved top is formed, within which a process of division and redivision goes on to the extent determined by the form of the frond, simple or decompound, until, if decompound, all the parts of the frond in a small and delicate form may be found to exist in the still curled-up terminal at the top of the now long stalk. After this it grows all over, leaf fashion, and, as it does so, the coil unrolls, the parts straighten themselves, and ere long we see the broad, flat frond full size and mature. Obviously this mode of development is more compatible with tasselling at the tips than that of the leaf, since all that is necessary is that the rest of the formative cell work in the coils being completed, the terminal cells split up and finish off with more points than the normal one.

All the same, however, we must rank this occurrence with the many other natural marvels, when we consider that in the more highly-developed crested or cristate forms in which the smallest subdivisions are tasselled, as well as the largest, this means that many hundreds, or even thousands, of formative cells, which normally would, as it were, fix the last brick on the pinnacle, unanimously take it into their heads, so to speak, to pile up a few more on the top as a sort of radiating finial. This eccentricity is the more remarkable as no specie shows it as a normal character, thought it must be assumed to occur sporadically on most species, seeing that out of about 44 native species of ferns only about a dozen have so far failed to yield examples of crested forms to the varietal fern hunter. In many instances the tendency to split up is developed erratically in the form of irregularly branched and tasselled fronds; while in some cases it so predominates over the normal tendency to produce a flat frond, that the whole fern is a bunch of tassels so closely set as to resemble a ball of moss or selaginella.

Here, then, is a whole range of frond forms which have no counterpart at all in leaf forms. The extra foliose or plumose type of fern variation, embracing the fringed and frilled section of the Hartstongues cannot be so clearly distinguished from some of the abnormal leaf types in flowering plants, such as we see in some cyclamen sports, where the fringed or butterfly type of flower is associated with a frilled and fringed edge to the very large leaves. Many of the more beautiful examples of fern variation, however, belong to this section, which superficially may be said to be represented by Todea superba, though since ferns have been subjected to cultural selection, even that gem of emerald vegetation has been excelled by the divisilobe plumosums of Polystichum angulare, and more recently by those marvels of dissection, Nephrolepis exaltata Whatmani and Marshalli compacta. To these extremely dissected and exuberant types we have no parallels in true leaves, although, curiously enough, they have been derived from merely pinnate or bipinnate specific forms, which some leaves could easily surpass.

The most extraordinary example of the twisted type is a form of the Common Bracken, known as Pteris aquiline glomerata, in which all the leafy subdivisions and terminals curl up so tightly as to twist the stalks into knots and form balls, the fronds presenting thus a most weird and unnatural appearance. In the revolute forms the fronds form tubes instead of being flat, and the side divisions are convex, and, together with the frond tip, are spirally twisted owing to the fact that the rolling up of the frond tends to bring the under surface upward instead of the upper; and as the latter is better adapted to receive the light, a compromise, as it were, results in the twist in question. It is curious that a natural sport of this description should really be in conflict with the law that a leaf or its equivalent is so arranged as to catch directly as much light as the environment permits. In that very peculiar tree, Liriodendron tulipiferum, or the Tulip Tree, the broad leaves are peculiar in terminating squarely, the midrib slightly projecting as a thorn, and it is a very curious fact that while this, we believe, has no parallel in flowering plants, at any rate, as being a constant specific character, several of our native fern species present precisely the same feature in wild varietal forms—viz., the Hartstongue, Lady Fern, Lastrea filix-mas, L. montana—and we have also received the same type of variation from the United States in Polypodium hexagonopterum truncatum. In all these the unrolling frond or fern division suddenly ceases to develop the leafy portion on each side of the midrib, though that continues for a short distance as a bristle or thorn-like point.

Chas. T. Druery, V.M.H., F.L.S.

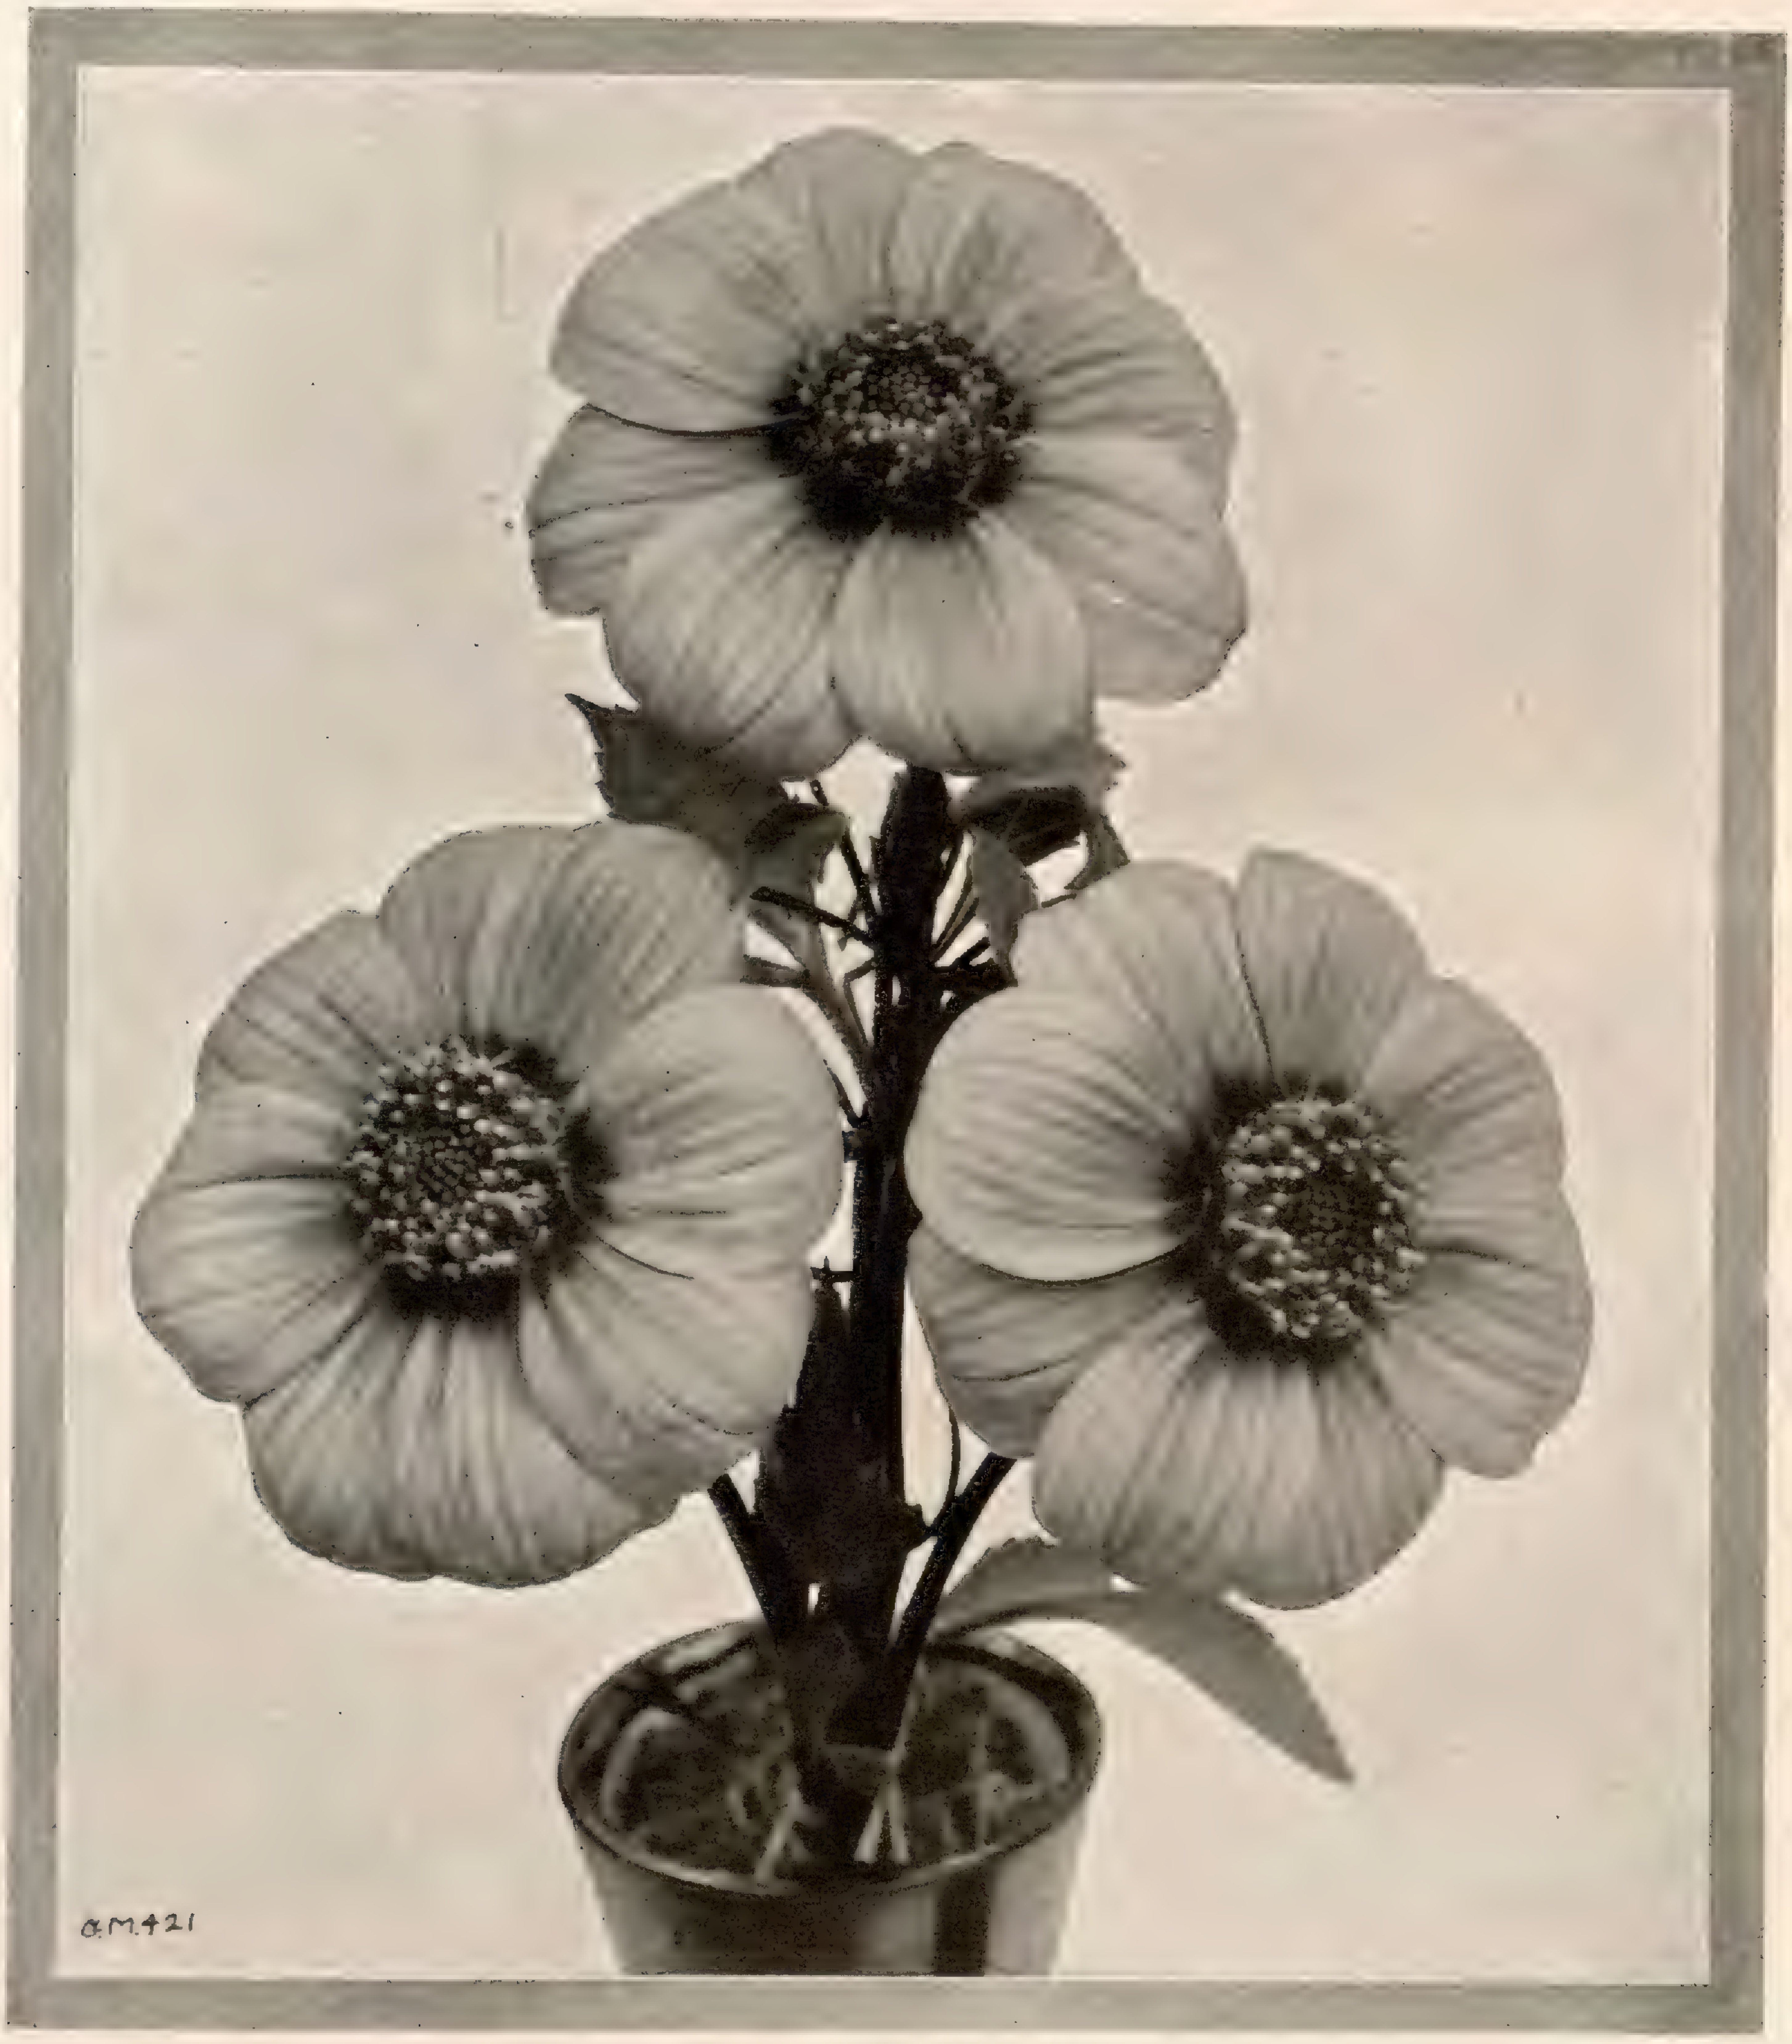
---

**Lantanas.** These have of late years been used for bedding purposes to a much greater extent than was formerly the case. Last year they did remarkably well during the almost tropical weather we then experienced, while this season, with its cloudy skies and heavy rainfall, they are still bright and cheerful.—W. T.

## NEW PLANTS, ETC.

### ANGRÆCUM O'BRIENIANUM.

A distinct species that is at once attractive and interesting. It is vigorous in growth and free in flowering, the plant shown bearing six racemes. These latter are of medium length, and the flowers are pure white, the spurs tinted with reddish-brown. A native of Western Uganda. A.M., R.H.S., August 27. J. S. Bergheim, Esq., Belsize Court, Hampstead (gardener Mr. H. A. Page).



NEW SINGLE DAHLIA MARION.

Buff, suffused rose, with deep rose-coloured zone. A.M., R.H.S., F.C.C., N.D.S., August 27. Messrs. J. Cheal and Sons, Crawley.

### ODONTIODA ENTERPE DAVIDSON'S VARIETY.

A free-flowering and attractive hybrid obtained from a cross effected between Odontoglossum Uro-Skinneri and Cochlioda Noezliana. The flowers are of average size, the sepals and petals deep red, and the lip bright red, with a light zone on the apical lobe. A.M., R.H.S., August 27. E. H. Davidson, Esq., Borlases, Twyford.

### LÆLIO-CATTLEYA AMABILE, BORLASES VARIETY.

A beautiful form of a fine hybrid obtained by the inter-crossing of Cattleya Luddemanniana and Lælio-cattleya Fascinator. The flowers are of large size and fine form; the broad sepals and petals are pearl-white, and the well-expanded lip rich purple. A.M., R.H.S., August 27. E. H. Davidson, Esq.

### LÆLIO-CATTLEYA GOLDEN FLEECE.

A distinct and beautiful hybrid derived from L.c. Golden Gem and Cattleya Dowiana. The flowers are of medium size, and of a rich yellow hue, with markings of deep red on the lip. A.M., R.H.S. Lieut-colonel Sir George Holford (grower, Mr. H. G. Alexander).

### ODONTOGLOSSUM HELENE.

A remarkably beautiful form of the O. Lambeauanum type. The flowers are of large size, and the sepals and petals nearly covered with large claret-coloured blotches on a white ground, the front lobe of the lip white. A.M., R.H.S., August 27. E. H. Davidson, Esq.

### COTONEASTER DIVARICATA.

A handsome evergreen shrub from China, of dwarf, spreading growth, with rather small, deep green foliage, and bearing with great freedom comparatively large, oval, brilliant crimson fruits. These latter are erect, and, standing well above the foliage, are very effective. F.C.C., R.H.S., August 27. Hon. Vicary Gibbs, Aldenham House, Elstree (gardener, Mr. E. Beckett, V.M.H.).

### DAHLIAS.

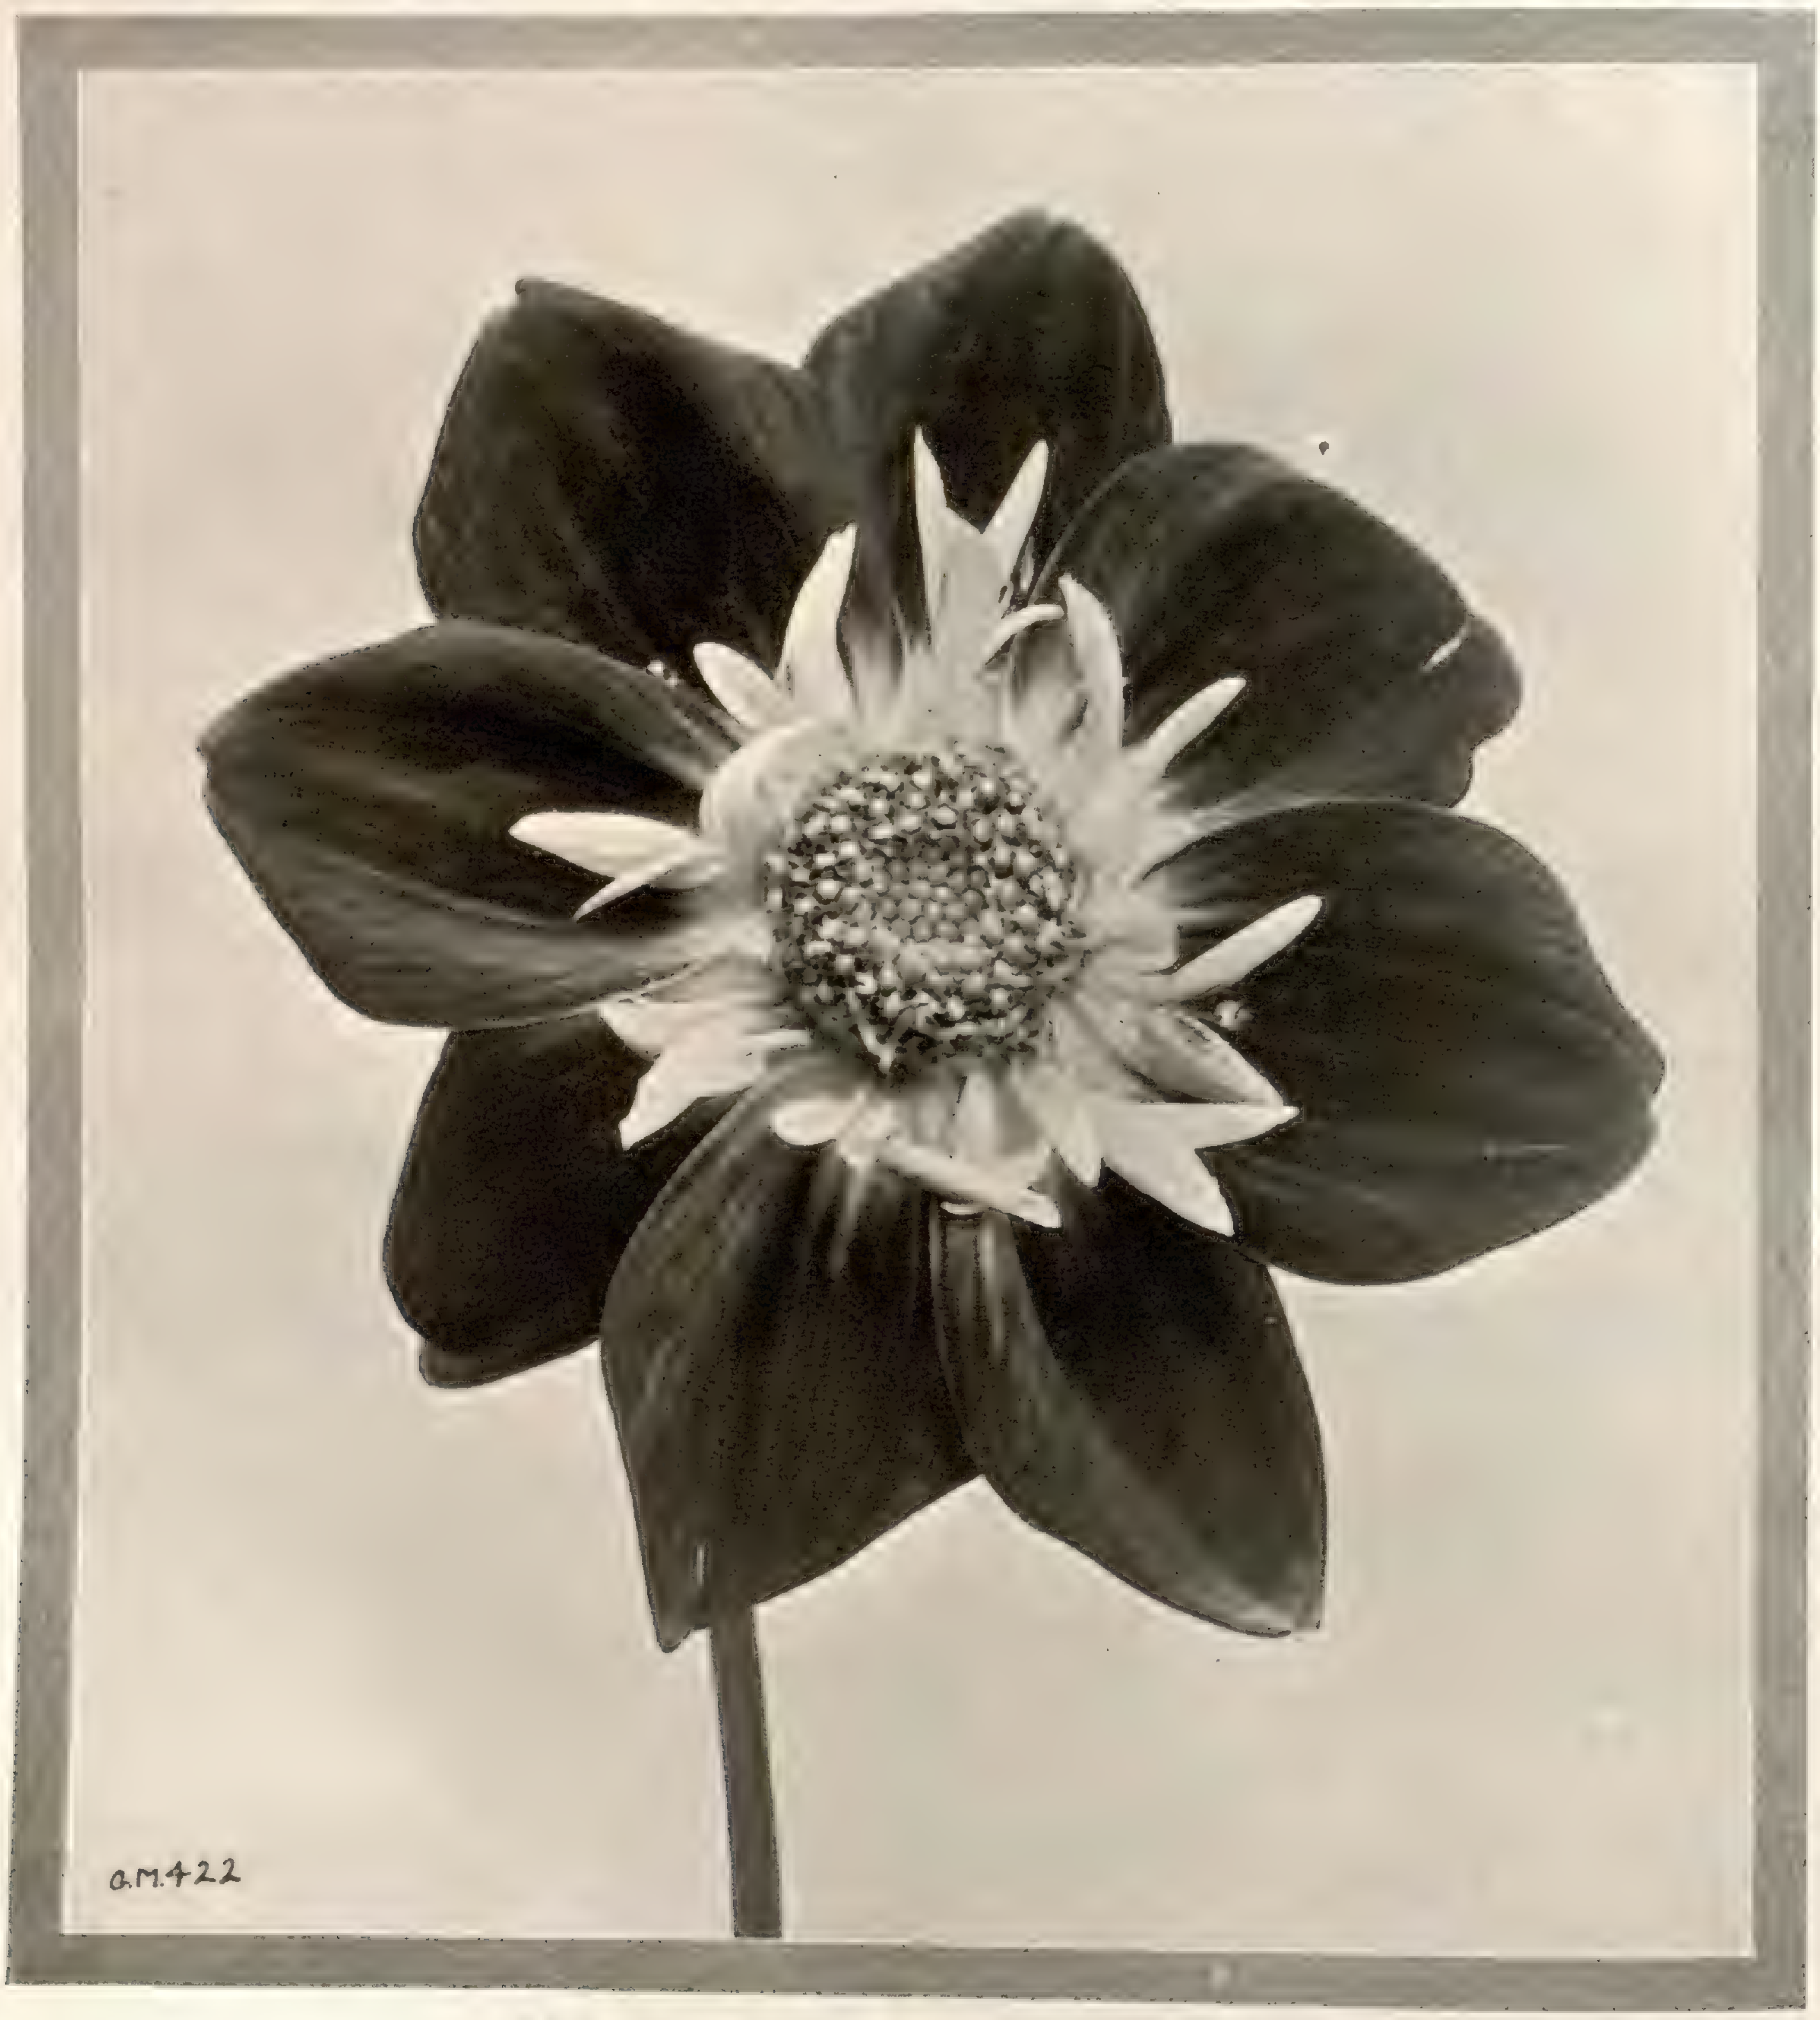
Marion.—A beautiful single variety, the blooms of medium size, fine substance, and perfect in form; the colour pale buff suffused rose, with deep rose-coloured zone. A.M., R.H.S., F.C.C., N.D.S., August 27. Messrs. J. Cheal and Sons.

Edith Carter.—An attractive cactus dahlia, with elegantly arranged florets, which are rich yellow at the base, passing to bright rose-red on the upper half. A.M., R.H.S., F.C.C., N.D.S., August 27. Mr. H. Shoesmith, Woking.

Pegasus.—A distinct and attractive cactus variety of high quality, the florets are slender and elegantly curved, and are bright rose marked with spots and stripes of crimson. A.M., R.H.S., F.C.C., National Dahlia Society, August 27. Messrs. J. Stredwick and Sons, St. Leonard's-on-Sea.

Antwerpia.—A distinct and attractive variety; the blooms are of fine form, and the colour is bright red crimson, with yellow collar. A.M., R.H.S., F.C.C., N.D.S., August 27. Mr. J. B. Riding, Chingford.

Princess Louise.—A remarkably handsome collarette variety the blooms large and of high finish, the florets deep crimson, and the collar light primrose. A.M., R.H.S., F.C.C., N.D.S., August 27. Messrs. Dobbie and Co.



NEW COLLARETTE DAHLIA ANTWERPIA

Red-crimson with yellow collar. A.M., R.H.S.; F.C.C., N.D.S., August 27. Mr. J. B. Riding, Chingford.

Leopold.—An effective single variety with blooms of medium size, fine substance, and colour rich crimson. A.M., R.H.S., F.C.C., N.D.S. Messrs. J. Cheal and Sons, Crawley.

Irene.—A distinct pompon, with medium-sized blooms of exquisite form, the colour rose-mauve. A.M., R.H.S.; F.C.C., N.D.S., August 27. Messrs. J. Cheal and Sons.

### ALOE STEUDNERI.

A handsome species, which was first described by Dr. Schweinfurth in 1894, and subsequently introduced to cultivation by Professor Penzig, of Genoa. A native of Abysinnia, this aloe is rather bold in habit, and produces its bright and yellow flowers on erect spikes, which rise to a height of about three feet. It is rather shy in flowering, but worthy of a place in a select collection of succulents. "Bot. Mag.," t. 8,448.

### HYDRANGEA SARGENTIANA.

A Chinese species discovered by Mr. E. H. Wilson at Hsing-Shan-Hsien, Western Hupeh, in 1907, when collecting for the Arnold Arboretum. It is of strong growth, has large leaves, and bears dense-flowered corymbs, the fertile flowers pale violet and the relatively few sterile flowers white, lightly tinted violet. The hardiness of this species has not, as yet, been satisfactorily determined at Kew. Several young plants succumbed there to the winter conditions of 1909-10, and since then the remaining plants have received protection in severe weather. "Bot. Mag.," t. 8,447.

### MUEHLENBECKIA COMPLEXA.

An interesting New Zealand plant, which was introduced to cultivation by the Rev. W. Colenso, who, about seventy years ago, sent plants to the Royal Gardens, Kew. It is a dwarf-growing climber or trailer, and has small, orbicular leaves, and bears clusters of greenish-white flowers. It is only suitable for gardens in the more favoured parts of England, as elsewhere it is liable to injury from frost. "Bot. Mag.," t. 8,449.

### AGAVE DISCEPTATA.

An interesting species, with rather long lanceolate leaves, and bearing pale green flowers, rose-purple at the margin, arranged in a loose spike, which rises to a height of between five and six feet. "Bot. Mag.," t. 8,451.

### MELON JOHN MASSEY.

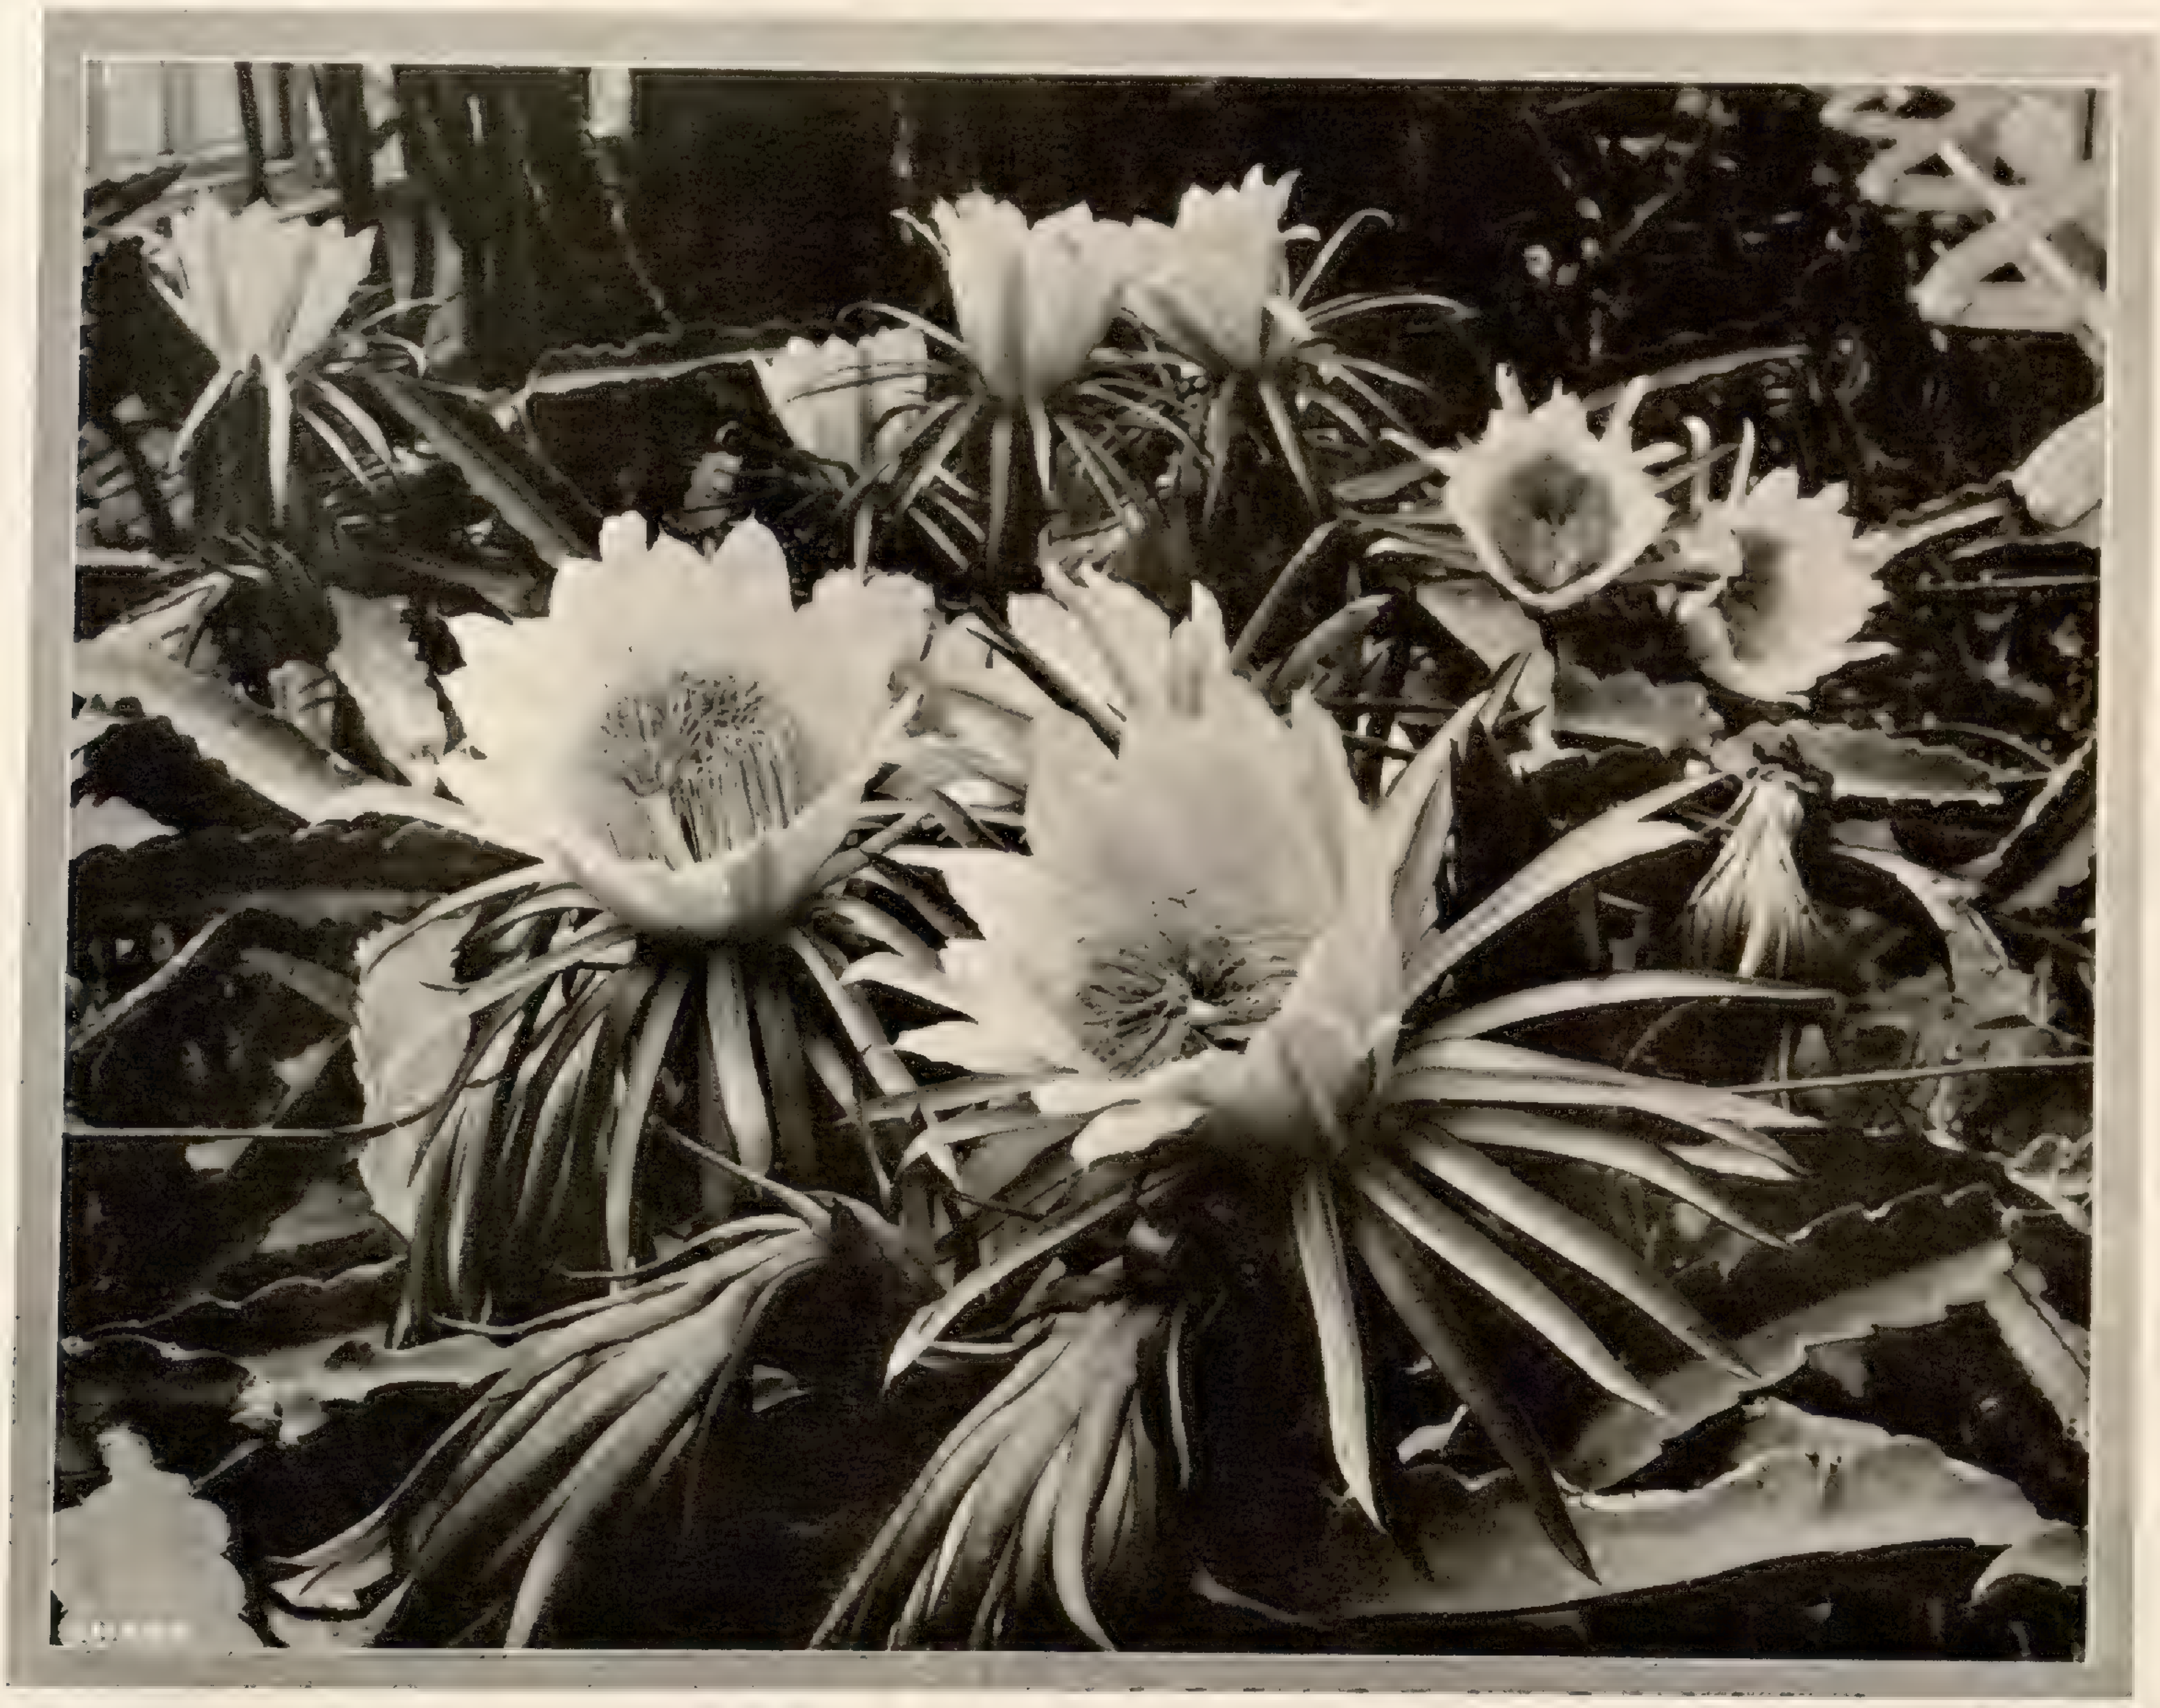
A scarlet-fleshed fruit, remarkable for its distinctness, handsome appearance, and rich flavour. It has been grown for trial at Wisley, and the fruits are of rather large size, oval in shape, and have a finely-netted, greyish-green skin; the flesh rich and melting and bright in colour. F.C.C., R.H.S., Messrs. W. Rowlands and Co., Liverpool.

### APPLE, PADNALL SEEDLING.

A culinary variety of much merit; the tree has a vigorous habit, and is a heavy cropper. A.M., R.H.S., August 27. Mr. R. Roberts, Chadwell Heath.

## THE NIGHT-FLOWERING CACTUS AT KEW.

For many years past one of the features of the large Succulent House at Kew has been the fine healthy specimen of Cereus triangularis trained on wires near the roof, which, during the summer months, produces large numbers of its extremely handsome flowers. During bright weather these open in the evening and close again as soon as the sun reaches them, usually between 7 and 8 a.m. Should dull weather intervene the blooms will remain expanded up till eleven o'clock. This has occurred frequently of late, and on several occasions as many as thirty flowers have been open together. The Kew specimen has produced over 200 flowers this season up to the present.



[Photo by C. P. Raffill.

THE NIGHT-FLOWERING CACTUS (CEREUS TRIANGULARIS) AT KEW.

The flowers are about ten inches in diameter when fully expanded, and are rather sweetly scented. The tube is some six inches long, and an inch to an inch and a-half in diameter. The inner petals are pure white, and an inch in diameter, the outer ones, gradually changing to yellowish-brown sepals, and becoming shorter and narrower, until those at the base of the tube are pale green and only an inch or so long. The stamens which fill the whole of the centre of the flower are supported on long slender, creamy-white filaments. The whole flower is chaste and beautiful, but unfortunately only opens once and then closes and fades.

The whole plant covers an area of six by eight yards, and is planted out in a narrow strip of open soil placed on the stage. The stems are triangular, rich dark green in colour, are freely armed with short spines, and send off at intervals clusters of aerial roots. This cactus is of very easy culture, thriving under quite diverse conditions. I am informed that it thrives equally as well under the moist, tropical conditions on the coast in the West Indies as it does under the cooler conditions of the Succulent House at Kew. This species has been in cultivation in this country for well over 200 years, having been recorded as being grown at Hampton Court in 1690.

There are several other species of night-blooming cacti in cultivation, all of which bear white, or creamy-white flowers, of large size, and are of slender climbing habit. The commonest of these are C. grandiflorus, C. Macdonaldiæ, C. nycticalus, and C. rostratus. They do not thrive or flower so freely as the species herewith illustrated.

C. P. Raffill.

---

**Passiflora cærulea.**—Despite the fact that this passion flower is a native of Brazil, it is much hardier than many consider it to be, and in different parts of the country it is justly valued as an outdoor climber. Not the least desirable feature possessed by it is the length of time over which the season of blooming extends, while the blossoms are totally distinct from anything else in our gardens. The white-flowered variety, Constance Elliot, is also equally hardy with the type. In the more favoured parts the egg-shaped fruits, which are suspended on long stalks, and become yellow when ripe, form another attractive feature. From these fruits seedling plants may be raised, while it can also be very readily raised from cuttings.—W. T.

## HIBISCUS SYRIACUS.

This shrubby member of the mallow family is in many places flowering with great freedom; perhaps the exceptional heat of last year had something to do with it. Complaints are sometimes made that in the northern parts of the country this cannot be depended upon, but in the southern portion at least it is a valuable late summer and early autumn-flowering shrub. It succeeds best in a deep, well-drained soil, and a sunny spot. There is quite a long list of varieties, but though tastes differ, I prefer those with single rather than double flowers. Of the single-flowered varieties a particularly good pure white form was, under the name of Snowflake, given an award of merit last year by the Royal Horticultural Society. The rich violet-blue variety Cœleste is another beautiful single flower: while Painted Lady, whose petals are white, or nearly so, with a crimson blotch at the base of each, is also very effective. In the double kinds there is a wide range of colour, and these are admired by many. These varieties are grown in a wholesale manner in some of the Continental nurseries, being grafted or budded on to seedling stocks of the typical kind. They are in this way disposed of at a very cheap rate.

S. W.

---

**Cyrtostachys renda.**—This is an uncommon palm, and one more particular in its cultural requirements than many of the others. It is a native of the Malay Archipelago, and needs a moist stove for its successful culture. The foliage is handsome, but the most prominent feature is the bright red leaf stalks, from which circumstance it has been referred to as the rhubarb palm.—K.

# WORK FOR THE WEEK.

## CONSERVATORY AND GREEN-HOUSE.

WINTER-FLOWERING CARNATIONS.—The time has now arrived when the plants growing in frames should be removed to the houses. They will not need any heat at present, and must have abundance of air. Especially should those growing in pots have attention. The growths should not be stopped after this date, but be looped up with raffia to the centre stake. Give the houses a thorough scrubbing and cleaning throughout, and the walls should receive a good coating of lime-wash. The pots in which the plants are growing ought also to be washed. Plants that have grown well, and have their pots full of roots will be benefited by a little help from stimulants. There are many good fertilisers on the market, and the one that has proved the most beneficial should be used. Sheeps' droppings also make an excellent liquid manure for carnations. They should be collected and put in a sack, and the latter placed in a tub of water and allowed to soak for a fortnight. The liquid can then be used once a week to commence with. Soot water is also a good fertiliser, and if the soot is placed in a sack in the same way as the sheeps' droppings, and the liquid used alternately once a week, it greatly improves the colour of the foliage. Those growers who prefer the bench or planting-out system must now clear out the old plants that have done service for the past year. After a thorough cleaning make up new beds with fresh compost, and set the plants out a foot apart, and press the soil firm about them.

PRIMULAS AND CINERARIAS.—These will now be growing freely, and should be shaded during bright sunshine. If the lights are pulled off in the evening and replaced in the morning the plants will be greatly assisted by the heavy dews we shall now experience. The lights must be kept on, however, if heavy rains set in, or the soil will soon become sour and water-logged.

BOUVARDIAS AND SOLANUMS that are growing in the open should now be lifted, potted, and placed in a frame, where they can be kept close for a time.

GENERAL REMARKS.—Should the sunless days and cold, wet nights continue, fires will have to be started, or many of the flowers in the conservatory and greenhouse will quickly damp. Very little artificial heat by day will be required for some time, but a little warmth in the pipes in the evenings and continued during the nights will be most beneficial to the plants in bloom.—Lewis Smith, Norwich.

## THE ORCHID HOUSES.

TEMPERATURES.—In the warm departments it will, owing to the dull, sunless weather, be advisable to maintain the summer temperatures during this month, as an inducement to the plants to complete their growths as quickly as possible. With the additional amount of fire-heat necessary to maintain the temperatures, it will be possible to admit more air. Light and air are the essential elements in the ripening or maturing of all plants and orchids. The cool house must, during the present month, be kept as cool as possible, both night and day. The moist night air will, if admitted to the structure, do an enormous amount of good.

SHADING must only be used during the hottest part of the day, and then no longer than is absolutely necessary to prevent burning or scalding of the foliage. The same remarks apply also to the cool house.

ATMOSPHERIC MOISTURE may be maintained at about the same level as previously recommended, as, with the additional ventilation, evaporation will be more rapid, and the houses will, therefore, dry more quickly. The two things to avoid are a hot and dry, and a low, temperature, both being highly injurious.

PREPARING FOR WINTER.—We have now passed through the greater part of the growing season of this year, and we must begin to make preparations for placing the different kinds in their winter quarters. The plants, houses, and, indeed, everything appertaining to them should be made scrupulously clean, and those fastidious kinds which succeed only in particular positions be placed where, by experience, they have been found to grow most satisfactorily. A careful examination of the heating apparatus should be made, and any defects made good. It is also advisable to examine the roofs of the houses for damaged squares of glass, which, although not a source of trouble at the present time, may become so later on, by causing drip, which may occasion the loss of a valuable plant.

WATERING will from now onwards require more judgment than when growth is vigorous. The watering of orchids cannot be treated collectively, or by any rule of thumb methods. Each plant should have its requirements satisfied, and no more. The wants of the different species, and the condition of their growth, have to be considered individually, and the treatment varied accordingly. The pseudo-bulbs of many will have finished their growth; others will be fast completing their bulbous stems. To these sufficient water should be given to avoid weakening the older bulbs, even when the new ones have completed their growths. All terrestrial kinds, with strong, persistent roots that are growing freely, will require ample supplies of water.—J. T. Barker, The West Hill Gardens.

## THE KITCHEN GARDEN.

CABBAGE.—The plants intended for late spring and early summer use should be put out without delay, or should the onion crop not be quite cleared off, defer the operation for a few days. Here we find the onion bed an ideal site for the maincrop cabbages. It is just forked over to a moderate depth, and a dressing of burnt garden refuse, strewn over its surface. The plants are given various distances, and the strong growers, as Sutton's Flower of Spring, are allowed a space of two feet between the rows, and twenty inches from plant to plant. The smaller kinds, as Harbinger, Ellam's Early, and Sutton's April, are given eighteen inches each way. Should slugs be troublesome, place a ring of cinder ashes around each plant to save needless worry and extra time in filling up gaps at a later date.

MUSHROOMS.—Beds should be made up as early as possible, as I fear very little dependence must be placed on the September meadow crop. The ground will not contain the warmth necessary for outdoor mushrooms. Place the required amount of horse droppings with the small particles of straw, into a heap in a covered shed. Turn the heap over every other day so as to prevent it drying. When the heat has receded to 80 deg., form the beds, making them fifteen inches in depth, and fill in evenly and firmly. When it is found that the temperature is still falling, insert pieces of spawn two inches deep, and ten inches apart, and finally cover the bed with fine soil and make it firm.

CAULIFLOWERS. — The preparation of the crop for a spring supply must now be taken in hand. Make a sowing at once, and a second one about the 20th of the present month. The first sowing can be made on an outside border that has been well worked for a previous crop. Give a dressing of wood ashes, and sow the seeds thinly and evenly, rake over and net at once to keep the seeds safe from birds. The later sowings should be made in an unheated frame, the soil being about three inches deep, and resting on a hard ash bottom. It will be found that when raised on a bed thus prepared the plants will be hard and dwarf. The lights should be only placed over the seeds during very wet weather, or till frosts appear. The seedlings from the outside sowings, when large enough will need pricking off into frames, and treated exactly as advised for the seedlings from the second sowing. With an occasional dusting of soot, and the picking off of decayed leaves, very little attention will be needed for some time to come. The following varieties are excellent for these sowings: Early London, Magnum Bonum, White Queen, and Walcheren.

POTATOES.—The lifting of the main crop should be proceeded with during favourable weather. Disease will be rife amongst them, particularly on heavy soils, therefore care should be taken of the tubers. Scatter a good dressing of lime over them at storing time, as this will help to preserve them, besides improving their flavour. — George Ellwood, Swanmore Park Gardens.

## HARDY FRUITS.

PLANTING BUSH FRUITS.—Where new plots are to be formed the ground should be prepared as soon as possible. It will need to be deeply stirred and liberally manured, particularly where the soil is of a poor character. Gooseberries, currants, and raspberries require conditions different to those under which apples and pears thrive, these being much better without manure in close contact with the roots. The site should be dug two spits deep, adding plenty of well-rotted manure with each layer of soil. Dig a trench one yard wide and one spit deep at one end of the plot, and wheel the soil to the other end for filling in when the trenching is completed. In the bottom of the trench spread a good layer of manure, and proceed to dig this in, well mixing the manure with the soil. Then mark off another strip of ground one yard wide, and, after manuring the surface, turn the top spit with the manure on the freshly dug soil in trench No. 1, and so on throughout the plot. If the second spit of soil is deemed good enough to bring to the surface, the first trench should be taken out two spits deep at the outset; in this case it is a good plan to break up the bottom spit, using a digging fork for the purpose. This amounts to trenching three spits deep. It is not desirable to make the third spit too rich with manure, but the addition of a good layer of old rubbish heap material that has been laid by for a couple of years, will improve the soil, and with retentive soils assist free passage of water and air.

PEACH AND NECTARINE TREES that are now cleared of their crops should, if infested with red spider or other insect pests, be thoroughly cleansed by means of a suitable insecticide; every effort should be made to keep the foliage clean and healthy right up to the time of ripening. Old fruiting wood which can be spared should be removed to allow a better opportunity for the ripening up of the young shoots. Continue to give attention to the training of young trees, and see that the fast-swelling growths are not suffering from too tight ligatures. Fruits approaching the ripening period should be daily examined, and carefully gathered when ready. If intended for packing the fruits must be firm and not over-ripe; for home use two or three days in the fruit-room will improve the flavour of the fruits.

GATHERING FRUIT.—Figs ripening on open walls should be looked over daily, gathering those that are ripe and storing them in a cool fruit-room until required. Birds and wasps are particularly fond of figs, and it may be necessary to net the trees to keep off the birds. The ripening fruits of apples and pears should be gathered as they become fit. Careful handling is especially required in dealing with these, as the flesh is, in most cases, softer than the later varieties. Most early varieties are soon past their best, and great care is necessary in selecting fruits for the table that they are in just the right condition, neither under nor over-ripe.—W. Messenger, Woolverstone Park Gardens, Ipswich.

NATIONAL CHRYSANTHEMUM SOCIETY.

THE EXHIBITION OF
EARLY CHRYSANTHEMUMS
will be held at the CRYSTAL PALACE on
OCTOBER 2nd and 3rd, 1912.
Write for Schedule and particulars, post free, to the Secretary, RICHARD A. WITTY,
72, Savernake Road, Gospel Oak, London, N.W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

### SCIENTIFIC COMMITTEE, AUGUST 27.

Present: A. E. Bowles, Esq., M.A., F.L.S. (in the chair).

SWEET PEAS FROM MR. DIPNALL.—The specimens submitted to the committee were damaged by the "Streak" disease Thielavia basicola. Many of the leaves and parts of the stem had also patches of Botrytus cinerea growing on them. The roots were poorly developed, and showed signs of some check earlier in the season, probably overwatering in the early summer. It is suggested as a method of preventing the attack, deep and early-autumn cultivation of the ground intended for next season's crop of sweet peas, a very moderate use of organic manure, thin seeding, and frequent use of the Dutch hoe in place of watering during early droughts.

EPIDENDRUM LATERALE. — Mr. O'Brien showed for Mr. Neal, Penarth, a plant of Epidendrum laterale (Central America), and remarked that the infloresence is produced on a rudimentary pseudo-bulb, as in E. Stamfordianum (probably the only similar case), a peculiarity that seems to show that the normal mode of flowering is from the base of the mature pseudo-bulb. A Botanical Certificate was awarded to this plant on the proposition of Mr. O'Brien.

MUMMY PEA.—Mr. A. Sutton showed a series of photographs illustrating several crosses with the so-called Mummy pea, Pisum umbellatum.

LILY FASCIATED. — Mr. Bowles showed a remarkable photograph of Lilium candidum showing a fasciated double form, a condition figured in Dr. Masters' "Teratology."

ARMENA ABNORMAL.—Mr. Van der Wyre sent specimens of thrift with abnormal pollen and petals. Referred to Mr. Hill for report.

VARIATION.—Rev. Geo. Henslow wrote with reference to non-scented musk, a condition due to the cold and wet weather. Mr. Henslow also drew attention to the tendency to variegation in aspidistra when removed from a partly-shaded position to the full light of a conservatory.

PEAR WITH AXIAL GROWTH. — Mr. Ockenden sent a pear with elongated axis, showing the formation of three fruits, as a result of the elongation. Messrs. Bunyard sent a drawing of a pear fruit showing a similar elongation, resulting, however, in a tuft of leaves beyond the fruit.

## Messrs. Robinson Bros.' Horticultural Show at Edgbaston.

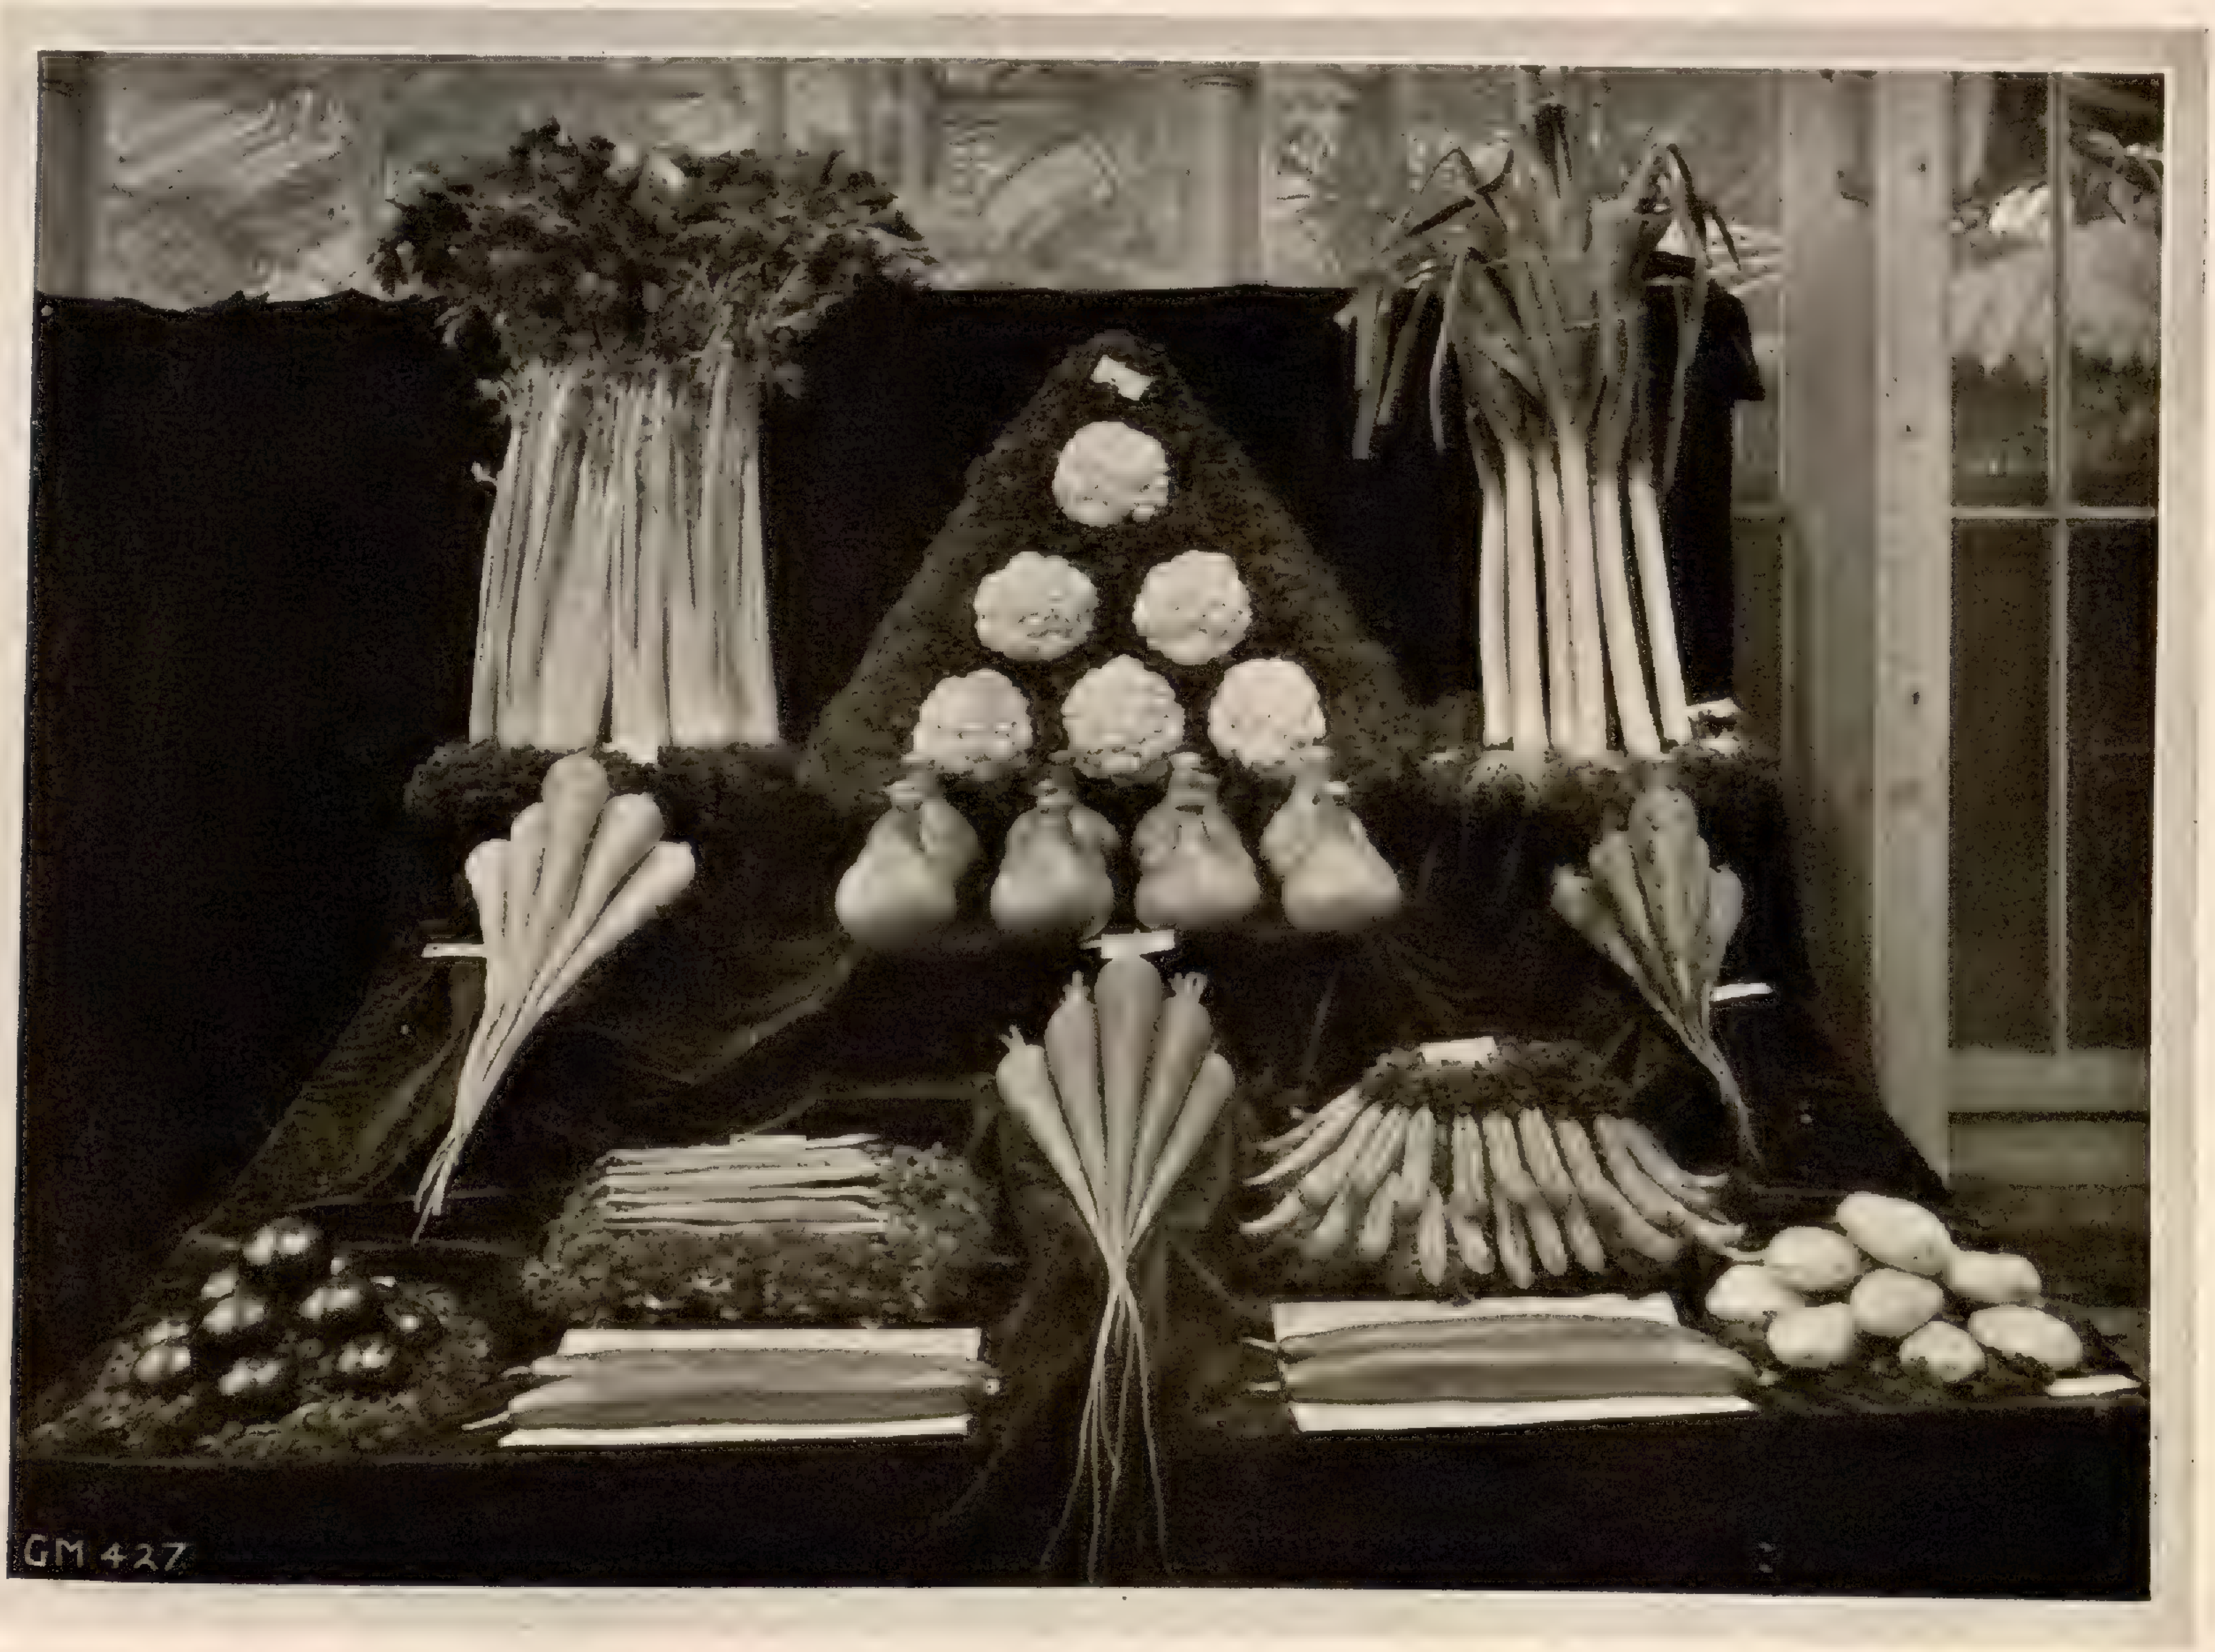
Considerable interest, not unmixed with curiosity, has for some time past been evinced in the prospect of a horticultural show on a large scale being held for commercial reasons by a firm of horticultural sundriesmen. The enterprising firm who undertook by means of an exhibition to show the public the excellence of the produce that can be grown by the aid of their various specialities are Messrs. Robinson Bros., Lim., Ryders Green, West Bromwich, who engaged the Botanic Gardens, Edgbaston, Birmingham, and held the show on August 28 and 29.

From all points of view the show was a brilliant success. With a schedule of considerable extent, and cash prizes of unusual value, exhibitors were drawn from all parts of the country, and quite a number of the giants among exhibitors came down in force and competed in the big classes for flowers, fruits, and vegetables, the result being a display of which any horticultural society might well be proud.

The vegetables formed, undoubtedly, as fine a display as could be produced at any August show, and in the flower section the border exhibits of hardy flowers were a pattern to those who frame schedules, and pointed the way to the most effective arrangement possible of the lovely flowers that adorn herbaceous borders. The tables of fruit, the roses, and the large tentful of decorated dinner tables were all of a very high order of merit, and even in the cottagers' classes there were vegetables of really good quality. Everybody was in great good humour, and at the excellent luncheon provided for judges and exhibitors many compliments were paid to the firm of Messrs. Robinson Bros., to their manager (Mr. A. W. Evans), and his able helpers (Messrs. Fleming and Hadden).

### OPEN SECTION CUT FLOWERS.

The leading class in this section was for a collection of border flowers arranged on a space of 20ft. by 8ft., to represent as nearly as possible, a growing border. It was certainly a fine class, and the general comment was that this style of exhibiting was a great improvement on the orthodox arrangement on tables. The winning exhibit contributed by Mr. Frank Bouskell, Market Bosworth, was a delightful arrangement of choice, well-grown flowers. Among many good things in the foreground were Potentilla Gibson's Scarlet, varieties of Veronica elegans, Achillea alpina, and several other dwarf plants of merit, whilst the central portion was tastefully filled with phloxes, helianthuses, double



FIRST PRIZE COLLECTION OF VEGETABLES SHOWN BY MR. J. GIBSON AT MESSRS. ROBINSON BROTHERS' EXHIBITION.

gypsophila, some good spikes of Astilbe Davidi, and Montbretia rosea. A hybrid echinops and several choice verbascums also played their part in a capital exhibit.

Messrs. G. Gibson and Co., Bedale, who were second, had a number of choice phloxes and gladioli, and there were also a few uncommon plants, such as Echinops Tournefortiana, Lobelia Milleri, new hybrid verbascums, etc. Third prize went to Mr. J. H. Marsden, Malvern Link, who lost points through cutting his flowers with short stems, which gave a dwarf, flat appearance.

The winners of the first prize for forty-eight roses, distinct, were Messrs. Perkins and Sons, Coventry, whose best flowers were Mildred Grant, Madame Eugène Verdier, Earl of Warwick, Frau Karl Druschki,and The Lyon. Mr John Mattock, New Headington, Oxford, was a good second, showing nice fresh flowers. Mr. W. H. Frettingham, Beeston, Notts, was third. Mr. Mattock led for six bunches of roses, showing, among others, Lady Hillingdon, Mdme. A. Chatenay, and Hugh Dickson. Messrs. Perkins and Sons followed, Mr. Frettingham again coming third. For a bowl of roses Messrs. Perkins and Sons scored with a very tasteful arrangement in shades of yellow and buff. Mr. J. Mattock was a close second with Lady Pirrie and Irish Elegance. Mr. W. T. Mattock, Barton End, Oxford, third.

Sweet peas were not as fine as they have been at earlier shows, but for the season must be called good. The winning exhibit in the class for twelve vases was staged by Mr. G. Bowness, Riverside Nurseries, Busby, near Glasgow, and they were excellent flowers of up-to-date varieties on long, strong stems, well set up, and a credit to the grower. Mr. J. Dorell, Uphill, Warwick Road, Acocks Green, was second; Mr. W. J. Godwin, Hill Nursery, Four Oaks, Sutton Coldfield, third.

Mr. J. Mattock was awarded first for twelve gladioli, and Messrs. Keynes, Williams, and Co., Salisbury, led for eight varieties of cactus dahlias, followed by Mr. H. Woolman, Shirley, and Mr. G. Bowness, Busby, in the order named. Early-flowering chrysanthemums were well shown by some half-dozen exhibitors, who staged twelve bunches, distinct varieties. The highest honours were taken by Mr. H. Woolman, Shirley, Birmingham, whose flowers were really excellent; Mr. W. A. Ballard, Abbey Lane, Leicester, and Mr. Bowness, Busby, were second and third respectively.

### FRUIT.

The tables of fruit decorated with flowers and foliage occupied one end of the large hall, and were a centre of attraction. Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, is to be congratulated on winning first prize in a closely-contested class. His dishes were Muscat of Alexandria and Prince of Wales grapes, Triomphe de Vienne pears, Washington apples, Ringleader melon, Brown Turkey figs, Crimson Galande peaches, and Pineapple nectarines. The decorations were carried out with liliums, carnations, and francoa. Mr. A. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, was a close second, his grapes being simply superb, and his other fruit all of good quality, but the floral decorations lacked the finish of those of the winning table. Mr. Hilliar, Mount Pleasant, Darlington, was third.

Mr. Gibson was also first for eight bunches of grapes, showing good Madresfield Court, Mrs. Prince, and Buckland Sweetwater in excellent form. Again for two bunches of black, Mr. Gibson was the leader with a pair of bunches of Madresfield Court. Mr. A. Jenkins, gardener to J. Horton, Esq., Fern Hill, Moseley, was a good second with Black Alicante, Mr. Hilliar coming third. For apples and pears the chief awards were secured by Mr. J. Gibson, Messrs. Plowman and Son, Market Harboro', coming second in each class. Messrs. Whateley and Son, Kenilworth, being third for apples, and Mr. W. A. Sarsons, 92, Trafalgar Road, Moseley, for pears.

### VEGETABLES.

The outstanding feature in the schedule was the class for a collection of twelve dishes of vegetables, in which the first prize was £20. Mr. J. Gibson, Welbeck, was the fortunate winner, and it may be said that his vegetables were models of perfection. The cauliflowers, leeks, and celery made a grand background to beet, onions, carrots, cucumbers, parsnips, peas, potatoes, runner beans, and tomatoes of the highest excellence. Mr. J. Hudson, Mostyn Street, Leicester, followed closely for second place with a collection that was only about two points behind that staged by Mr. Gibson. The other prizes in the class were awarded to Mr. D. Gibson, The Gardens, Ford Manor, Lingfield, and Mr. A R. Searle, Castle Ashby, Northampton.

A strong class was that for twelve onions, Mr. H. Wheeler, The Gardens, Wenvoe Castle, near Cardiff, scoring with beautiful specimens of good weight, even size, and clear, nicely finished skin. Mr. D. Gibson, Lingfield, was second, and Mr. J. Hudson, Leicester, third. The competitors whose names have already been mentioned were highly successful in the classes for potatoes, tomatoes, leeks, celery, and cucumbers, other successful exhibitors in various classes being Mr. T. Avery, Loudwater, Rickmansworth; Mr. Bannister, Marston Green; and Mr. J. Hilliar, Mount Pleasant, Darlington.

In a special section set apart for market growers, Messrs. A. and G. North, Meadow Nursery, Northfield, won first prize for a basket of tomatoes, the fruits being even, smooth, and of fine condition. He was followed by Messrs. H. J. and A. Hughes, Grange Nursery, Water Orton, Mr. Hudson, Leicester, being third. Messrs. Plowman and Son, Market Harboro', had the best brace of cucumbers, Mr. Hudson coming second, and Mr. J. Carlsson, North Lancs Vineries, Poulton-le-Fylde, third. Both black and white grapes in this section were won by Mr. Hilliar.

### TABLE DECORATIONS.

The table decorations were not only numerous but were of more than ordinary merit, every table being treated in a truly artistic manner. The premier award was taken by Mr. W. Harper, 104, Warwick Street, Leamington, the dominant feature being oncidium flowers lightly disposed in rustic receptacles. Gloriosa superba was skilfully intermixed, with just sufficient asparagus and selaginella to provide a setting without heaviness. Mrs. Greaves, The Cottage, Warmington, near Broadway, Worcestershire, was second.

### AMATEURS' SECTION.

In the amateurs' class for twelve bunches of herbaceous flowers there were six entries, Mr. F. Bouskell being the leading exhibitor. His stand contained a fine bunch of Montbretia rosea, and also good bunches of Sanguisorbia canadensis, Lilium tigrinum splendens, Lupinus polyphyllus roseus, and the true type of Veronica spicata. Mr. A. J. Bastock was second, the strongest bunches in his stand being Liatris spicata, Chelone barbata and Phlox Sheriff Ivory; the third-prize exhibit, from Mr. John Bland, Welland Bank, Market Harboro', was also remarkably good. Mr. F. Dennison, Cranford, Leamington, led for eighteen roses, being very closely followed by Mr. Gulliver Speight, Market Harboro'.

The amateur's class for six dishes of vegetables was a strong class, with seven entries. The winner was Mr. T. Jones, Penylan, Ruabon, who is as strong a competitor with his vegetables as with his sweet peas. He had Sutton's Queen cauliflower, Pink Perfection celery, Sensation potato, Webb's Ailsa Craig onion, Perfection carrots, and Quite Content peas. Mr. E. Deakin, Hay Hall, Birmingham, was an excellent second, and Mr. D. W. Bedford, The Braes, Berkhamsted, third.

Non-competitive exhibits included a remarkably fine collection of perpetual carnations from Messrs. Young and Co., Hatherley, Cheltenham. The collection was tastefully arranged, and included the finest of both old and new varieties in a high state of development.

A very elaborate and attractive stand was occupied by Messrs. Robinson Bros., Lim., West Bromwich, for the purpose of displaying their "Guaranteed Gardenalities." These, as most of our readers will have learned from the advertisement pages, consist of Carmona fertilisers, Clift's manurial insecticides, Velvas lawn sand, and other chemical preparations, as well as the well-known Alpha spraying machines and Pine Spray syringes which have often been mentioned in our show reports.

## Chester Flower Show.

AUGUST 28.

This flower show, held in conjunction with the Cheshire Agricultural Society's exhibition on the Roodee, was fully equal to the average, excepting the cut flowers which showed evident signs of the heavy and continuous rainfall during August.

### PLANTS.

In the class for the group of miscellaneous plants, twelve feet by nine feet, and arranged for effect, Mr. C. H. Creasey, Oxton, Birkenhead, led with a very pleasing arrangement of well-grown plants. Mr. T. Gilbert, gardener to T. G. Frost, Esq., Mollington Hall, was a close second, followed by Mr. B. Cromwell, Hunts Cross, Liverpool, and Mr. J. Breen, Tattenhall, for third and fourth places. The premier award in the class for six stove or greenhouse plants was made in favour of Mr. B. Cromwell, who had fresh, medium-sized specimens; Mr. A. Ellams, gardener to A. Tyrer, Esq., Chester, and Mr. C. H. Creasey shared the remaining awards. Four ferns: Mr. H. Randles, gardener to A. E. Hall, Esq., Abbotsfield, Chester, won with good examples, followed by Mr. E. Palin, gardener to Mrs. Butt, Chester. Mr. A. Ellams' four pelargoniums won with large specimens, well flowered. In competition for the prizes for a single specimen, Mr. A. Ellams won with a good Goniophlebium subauriculatum, Mr. Cromwell followed closely for second place, and Mr. M. Brennan, gardener to Sir Foster Cunliffe, Bart., Wrexham, was third.

### CUT FLOWERS.

In competition for the prizes for twelve cactus dahlias, Mr. P. Miller, Hartford, was the winner with good blooms, and for six Mr. S. Salisbury, Wallasey, obtained premier honours. Mr. A. D. Pitcairn Campbell, Bangor-on-Dee, had the best twelve asters, and for twelve roses Mr. Bernard J. Sanby, Sandiway, led in a strong competition. Annuals were well shown by Mr. L. N. Brooke, Heswall, and Mr. J. L. Maddock, gardener to G. W. Gossage, Esq., Great Saughall, had the best bouquet of wild flowers.

In the class for twelve bunches of hardy herbaceous cut flowers, Mr. John Dean, gardener to G. R. Darsee, Esq., Newton House, occupied the first place, and Mr. A. D. Pitcairn Campbell had the best six bunches. Sweet peas were poorly represented, but Mr. John Wynne, Rowton, who had the leading twelve vases, and Miss Roberts, Wrexford, who staged the best six, had flowers of good quality. Mr. Thomas Saunders, gardener to Captain Townsend Currie, Christleton, won Messrs. Webb and Sons' special prize for six vases; and Mr. J. Bapscott, Heswall, Messrs. McHattie's special for six vases.

### FRUIT.

This section was well filled with fruit of good quality. For two bunches of black grapes Mr. W. Pilgrim, gardener to Sir G. Merrick, Bart., Anglesey, won with well-coloured Madresfield Court; and Mr. W. H. Faulkner, Caldy, second. In the corresponding classes for white grapes, Mr. R. Jones, gardener to J. Amphlett, Esq., Colwyn Bay, was successful in obtaining the premier award with fine bunches of Muscat of Alexandria; Mr. Joseph Stoney, gardener to Lieut.-Colonel Jas. Gaskell, Woolton, was an excellent second in this class. The winner of the first prize for six peaches was Mr. H. Young, gardener to P. H. Ashworth, Esq., Gresford, with Exquisite, highly-coloured; for six nectarines, Mr. W. Pilgrim was first Humboldt.

## Glasgow Centenary Flower Show.

The Centenary Flower Show of the Glasgow and West of Scotland Horticultural Society was held in the West End Roller Skating Rink at Bunhouse, on September 4, 5, and 6. Though under the entries at the show held in the Scottish National Exhibition Grounds at Kelvingrove last year, they were in excess of the records for the St. Andrew's Hall shows by about 200. Notwithstanding the very dismal, sunless weather which has prevailed during the season, the quality of the exhibits was excellent, and, although some of the grapes showed a lack of finish, and some of the other fruits showed some signs of the want of sun, these were exceptions. Both cut flowers and vegetables made a fine display, and the traders' exhibits generally were very fine, and most of the leading firms throughout the kingdom were represented. A deputation of five members of the Royal Horticultural Society were present, and awarded a number of cups and medals to the exhibits.

### POT PLANTS.

For the group of miscellaneous plants, arranged on the ground, in a space 15ft. by 10ft., variety, quality, and effective arrangement to be considered (gardeners and amateurs), there were five entrants, and the first prize of £7, and a special prize of £5 and memorial medal, presented by the trustees of the "Veitch" Memorial Fund, was awarded to Mr. Adam Knight, gardener to Sir Wilfrid Lawson, Bart., Brayton Hall, Carlisle. Crotons were the main foliage plants in the group, and orchids and Lilium lancifolium the principal flowering subjects. The foliage plants were splendidly-grown specimens, and the arrangement of the group, tied down as it was to a hard and fast oblong, was excellent. The second prize of £5 fell to Mr. John E. Davis, gardener to Colonel Stewart Richardson, of Ballathie, Perth, whose arrangement was almost as good as Mr. Knight's, but the quality of the plants was not quite so high. Crotons and elegant bamboos were the chief foliage subjects, and there was a considerable variety of flowering plants in the group. Mr. John Hood, gardener to T. G. Bishop, Esq., Dalmore, Helensburgh, was placed third, and Mr. Andrew Kelly, gardener to W. Beattie, Esq., Dineiddwg, Milngavie, was placed fourth.

For the group of stove or greenhouse plants, arranged on the ground in a circle, 8ft. in diameter, variety, quality, and effective arrangement to be considered (gardeners and amateurs), there were three entrants, and Mr. Knight was again placed first, gaining the prize of £5. Mr. Davis, to whom the second prize of £3 was awarded, was again a close runner-up. Mr. Wm. Ferguson, gardener to Colonel Gray Buchanan, Eastfield House, Cambuslang, was placed third. In Mr. Knight's arrangement crotons and liliums again figured prominently.

Mr. Jas. Templeton, gardener to Mrs. Alex. Rose, Richmond House, Glasgow, was placed first for one specimen palm (open); Mr. Alex. McMillan, gardener to the Right Hon. the Earl of Home, Douglas Castle, Lanarkshire, second; and Mr. J. E. Davis third. Mr. Templeton was also placed first for three palms (gardeners and amateurs), and Mr. McMillan and Mr. John Davidson, gardener to John Reid, Esq., Ardincraig, Rothesay, were placed second and third respectively.

For three stove or greenhouse plants, distinct varieties, at least two in bloom (gardeners and amateurs), Mr. McMillan was the only entrant, and was awarded the first prize. His plants were Statice brassicæfolia, petunia Mrs. Ellis, and Begonia Wiltonensis.

For two greenhouse plants (amateurs), Mr. James Swan, Railway Buildings, Lennoxtown, was awarded first prize, and he also carried off first honours for two ornamental foliage plants. For four ornamental foliage plants (gardeners and amateurs), Mr. McMillan was placed first, and Mr. Templeton second: Mr. John Sutherland, Victoria Nursery, Largie, was the only entrant for two gleichenias (open), and was awarded first prize. Mr. D. Halliday, gardener to W. Mackay, Esq., Ascog, Rothesay, was placed first for one orchid (gardeners and amateurs), and also for three orchids (gardeners and amaturs).

For twelve plants for table decoration, distinct varieties (open), Messrs. Malcolm Camp-Bell, Lim., Glasgow, were placed first; Mr. Knight second, and Mr. Alex. L. Davidson, gardener to A. H. Pettigrew, Esq., Lanark, third. For six plants of the same class (gardeners and amateurs), Mr. Jas. Thomson, Broomfield, Giffnock, was first, Mr. Knight second, and Mr. Davidson third. Mr. Thomson was also first for three plants of this sort confined to amateurs. Mr. Templeton was placed first for three dracænas, distinct varieties, in pots not exceeding 9in. (gardeners and amateurs), Mr. John Davidson second, and Mr. A. L. Davidson third.

Mr. Charles Pattison ("The Village Blacksmith"), Linwood, Paisley, took first place for six dwarf British ferns in pots, not exceeding 6in. (gardeners and amateurs); Mr. Thos. Nelson, Muirbank House, Rutherglen, was second; and Mr. James Swan third. Some of the varieties in Mr. Pattison's lot could scarcely, however, be considered truly dwarf. For three exotic ferns, distinct varieties (gardeners and amateurs) there were only two entrants, and Mr. McMillan was placed first; Mr. Archibald D. Hughes, gardener to J. R. Cochrane, Esq., Calder Glen, Blantyre, being second. Mrs. Chas. Pattison was placed first for three British ferns, distinct varieties (gardeners and amateurs), for which there were only two entrants; and Mr. Thos. Nelson second. Mr. James Wilson, Duntilbae, Kirkintilloch, took first place for one exotic fern, Messrs. Nelson and Alex. Bryson, Edinburgh, being second and third respectively. For two British ferns, distinct varieties (amateurs), Mr. Pattison was first; Mr. J. Mason, Pollokshaws, second; and Mr. T. Nelson third. In the class for ferns for table decoration, six distinct varieties, in pots not exceeding 6in. (gardeners and amateurs), Mr. McMillan took first place, and Messrs. Nelson and Swan were placed second and third respectively.

Mr. McMillan also took first place for three stove or greenhouse plants, distinct varieties, exclusive of specified varieties for which prizes were offered (gardeners and amateurs), with three splendid plants, consisting of Maranta zeberina, Alocasia metallica, and Phyllotinium Lindeni. Second honours fell to Mr. Knight, whose plants were Maranta insignis, Dieffenbachia Bausei, and Anthurium leuconeurum. Messrs. Nelson, Walter M. Robb, and Swan were awarded first, second, and third prizes respectively for one zonal geranium (amateurs).

### CUT FLOWERS.

For twenty-four spikes gladioli (open) there were two entries, and the first prize fell to Messrs. Geo. Mair and Sons, Prestwick, for a magnificent lot. The spikes were simply superb, some of them having about a dozen perfect flowers opened out. This was also awarded a Silver Banksian Medal of the Royal Horticultural Society. The only other entrant was Messrs. Alex. E. Campbell and Son, Gourock, who were a good second. In the class for six spikes in at least three varieties (gardeners and amateurs), Mr. James Stewart, gardener, Alloa, took first place with a very fine lot, and Mr. R. S. Aitkenhead, Gourock, was second.

For the collection of roses, in a space 8ft. by 5ft. (open), Mr. W. Ferguson, Dunfermline, Messrs. J. Cocker and Sons, Aberdeen, and the Killermont Nursery Company, Bearsden, entered, and the first place was awarded to Mr. Ferguson, who was also awarded a Silver Banksian by the R.H.S. for a very fine collection. Messrs. Cocker were placed second, and the Killermont Nursery Company third.

In the classes for decorative roses in vases, Mr. Ferguson was first for eight vases (open), Messrs. D. Robertson and Co., Helensburgh, being second. For six vases (gardeners and amateurs), Mr. John Finnie, Summerhill, Shandon, was the only entrant, and was awarded first prize. For six vases roses, six varieties, five blooms of each (open), Mr. Ferguson was first, Messrs. Cocker second, and Messrs. D. Robertson and Co. third. Mr. P. Kenyon, gardener to J. M. Clark, Esq., Troon, was first for three vases roses (gardeners and amateurs), and Mr. John Russell, Newton Mearns, second. In the single vase classes for gardeners and amateurs, Mr. Russell was first for any pink, for any other colour than white, red, or pink, and for vase artistically arranged with any foliage. For amateurs, Mr. James Ker, Stewarton, was first for the single vase with six blooms. Messrs. Jas. Cocker and Sons were first for thirty-six blooms, distinct (open), Mr. Ferguson was second, and the Killermont Nursery Company third. In the twenty-four bloom class (gardeners and amateurs), Mr. Wm. Virtue, gardener to Hugh Renwick, Esq., Castle Park, Lanark, was first, Mr. Joseph Barclay, gardener to Chas. C. Mann, Esq., Gourock, was second, and Mr. P. Kenyon third. Mr. Robt. Borrowman, Bargeddie, was first in the class for twelve blooms (amateurs), Mr. Aitkenhead second, and Mr. James Kerr, Stewarton, third.

For the collection of dahlias, in a space 9ft. by 5ft. (open) Messrs. M. Campbell and Son, High Blantyre, were placed first, and they were also awarded a Silver Flora Medal by the R.H.S. The collection, which was largely cactus, was a very fine one. Mr. Geo. Bowness, Busby, was second. Mr. D. Barbour, Lochwinnoch, was first for twelve blooms, show or fancy dahlias (gardeners and amateurs), Mr. Wm. Jenkins was second, and Mr. Alex. Welsh, Castlecary, third. For the twenty-four blooms of cactus dahlias (open) Mr. Geo. Bowness was first, Mr. R. Sutherland, Kirkintilloch, second, and Messrs. Alex. Lister and Son, Rothesay, third. In the vase classes Mr. J. Findlay, Cambuslang, was first for one vase collarettes.

For the collection of border carnations in a space 8ft. by 5ft. (open), Messrs. M. Campbell and Son were first, Mr. James Nicol, gardener to Allan Kirkwood, Esq., Darnley, Nitshill, was second, and the Killermont Nursery Company third. Messrs. M. Campbell and Son were first for twelve vases border carnations (open), Killermont Nursery Company second, and Mr. J. Nicoll third. Mr. Nicoll was also third for three vases (gardeners and amateurs).

Mr. John Fletcher, Auchenheath, Lanarkshire, carried off the first prize for a collection of sweet peas in a space 9ft. by 5ft. (open) with a very fine lot of blooms, for which he was also awarded a Silver Flora Medal by the R.H.S. and a silver cup presented by a private donor. Second place was taken by Mr. J. H. Crosley, Comrie, and Mr. John Smellie was third.

Mr. Geo. Bowness was first for eighteen vases sweet peas (open), Messrs. Guthrie Brothers, Ladybank, Fife, second, and Mr. Wm. McLaughlan, Kirn, third. For twelve vases (gardeners and amateurs) Mr. John Fletcher was first, Mr. James Paul second, and Mr. Geo. A. Turnbull, Garelochhead, third. Mr. Fletcher was also first for six vases, Mr. Paul being second, and Mr. P. Skellon, Eaglesham, third. Mr. John G. Williamson was first for three vases, Mr. Fletcher for one vase scarlet (Red Star), one vase lavender (Mrs. Heslington), and one vase pink (Elfrida Pearson), and Mr. J. Paul for one vase flaked (May Campbell).

Early-flowering chrysanthemums made a fine show. First honours for the twelve vases, distinct (open), went to Mr. Thomas Robertson, Thornliebank, and Mr. R. Sutherland being second. Mr. John Smellie was first for twelve vases (gardeners and amateurs).

In the classes for single-flowered chrysanthemums (open), Mr. Smellie was first for twelve vases, and Mr. A. McMillan second. For six vases Mr. R. Sutherland was first, and Mr. Jenkins second.

Mr. Charles Pattison carried off the first prize for the collection of flowers, cut from the open border, and arranged in a space 8ft. by 5ft. (gardeners and amateurs), and he was also awarded a Silver Banksian Medal for the exhibit, which was a very fine one, from the R.H.S., and also the Gold Medal presented by Mr. Whitton for the most meritorious display in the cut flower section. Mr. Robt. McLelland, gardener to Alex. Murray, Esq., Duncryne, Alexandria, was second with a very meritorious lot also.

Messrs. Gemmell Bros., Kilwinning, were first for twelve pentstemons (open), and Mr. John Richardson, Manor, Peebles, for six spikes. Mr. A. Laird, Johnstone, was first for twelve spikes of antirrhinums (gardeners and amateurs), and also for six spikes (amateurs). Mr. J. S. Ritchie, Denny, was first for six spikes phloxes (gardeners and amateurs); and in the following single vase classes open to gardeners and amateurs. Mr. Fletcher was first for French marigolds. Mr. Paul for Scotch and African marigolds, Mr. D. Galbraith for quilled asters, Mr. Ballantyne, Biggar, for Comet asters, and Mr. J. McIntyre for Victoria asters. Mr. A. McMillan was first for twelve vases annuals (gardeners and amateurs), and Mr. J. Fletcher for six vases annuals (amateurs). Mr. R. Watson, Kilsyth, was first for twelve begonia blooms (gardeners and amateurs). There was a fine show of pansies, especially the fancy section. For forty-eight blooms, fancy, distinct (open), Mr. C. Kay, Gargurmock, carried off the first prize, Mr. J. McKillop, Uphall, being second, and Messrs. A. Lister and Sons third. Mr. Kay was also first for twenty-four blooms (gardeners and amateurs) and twelve blooms (amateurs). Mr. Paul was first for twenty-four blooms show pansies (open), closely followed by Mr. Kay; and the latter was first for twelve blooms (gardeners and amateurs). Mr. John Macgrory, jun., Campbeltown, was first for forty-eight blooms violas, distinct (open), Mr. Kay being second. Mr. Paul was first for twenty-four blooms (gardeners and amateurs), Mr. Jas. McKillop second, and Mr. R. Hunter third. For twelve blooms violas (amateurs) Mr. A. Molloy, Campbeltown, was first, Mr. McKillop second, and Mr. Jas. Paul third.

## FRUIT.

For the table of dessert fruit, 10ft. by 4ft. 6in., decorated with plants in pots or cut flowers or foliage, or any combination of these, not more than sixteen dishes (gardeners and amateurs), the first prize of £6 for fruit was awarded to Mr. J. Gibson, gardener to the Duke of Portland, Welbeck, and this exhibit was also awarded the Veitch Memorial Medal. His fruit consisted of grapes, one bunch Madresfield Court, one bunch Black Hamburgh, one bunch Muscat of Alex. andria, and one bunch Buckland Sweetwater; peaches Sea Eagle and Barrington, nectarines Spencer and Pine Apple, pears Marfuerite Marillat and Souv. du Congrès, apples Washington and Cox's Orange, figs Negro Largo and Brown Turkey, and two seedling melons. Mr. Gibson was awarded the second prize for decoration. Mr. James Small, gardener to John Graeme Thomson, Esq., Norwood, Alloa, was second for fruit and third for decoration; and Mr. D. Kidd, gardener to Lord Elphinstone, Carbury Tower, Musselburgh, was third for fruit and first for decoration, which consisted of roses and francoa with selaginella. Mr. Gibson was first for the collection of twelve dishes of fruit, distinct varieties (gardeners and amateurs); Mr. J. Brown, gardener to A. A. Hagart Spiers, Esq., Houston, Renfrew, was second; and Mr. Small third. Mr. John Finnie, Summerhill, was first for the collection of six dishes (gardeners and amateurs); Mr. H. MacSkimming, gardener to W. T. Maclellan, Esq., Auchenault, second; and Mr. Gibson third.

In the principal grape class for eight bunches, decorated, not more than two of any variety (gardeners and amateurs), Mr. Jas. Dixon, gardener to Lord Rowallan, Rowallan, Kilmarnock, was first. His bunches were Madresfield Court (two), Muscat of Alexandria (two), Black Hamburgh (two), Muscat Hamburgh (two), and he was awarded 63½ points out of a possible 74. Mr. Dixon was also awarded the silver centenary cup bunches were very fine, and well finished. Mr. Robt. Glen, gardener to R. W. Donaldson, Esq., Blairvaddoch, Row, was a good second, with 59 points out of a possible 72. The third prize well to Mr. D. Halliday, Ascog, and the fourth to Mr. J. Middleton, Callendar Park, Falkirk. For four bunches of grapes, two white and two black, Mr. MacSkimming was first, and Mr. J. Finnie second. Mr. MacSkimming and Mr. Finnie were also first and second for two bunches Black Hamburgh grapes. Mr. J. Middleton was first for two bunches black grapes (other than Black Hamburgh), and Mr. D. Halliday second. Mr. MacSkimming was first for two bunches White Muscat grapes, and Mr. Finnie second. For two bunches white grapes other than Muscats, Mr. J. Dixon was first, and Mr. J. Brown second. For a bunch of grapes with finest bloom Mr. John Middleton first, and Mr. D. Halliday second. Mr. Halliday also secured first prize for the heaviest bunch of grapes, and Mr. Middleton was second.

For the collection of apples, twelve varieties, four of each (gardeners and amateurs), Mr. R. Greenlaw, gardener to H. J. Younger, Esq., Benmore, was first; Mr. A. T. Harrison was second, and Mr. J. Small third. For the collection of pears, six varieties, four of each, Mr. A. Harvey, gardener to Miss Hamilton, Rozelle, Ayr, was first Mr. Gibson second and Mr. R. Greenlaw third. For the collection of plums, six varieties, nine of each, Mr. D. Campbell, gardener to H. A. S. Gladstone, Esq., Copenoch, Dumfries, was first, Mr. Harrison was second, and Mr. Harvey third. For twelve plums, two varieties, six of each, Mr. J. Russell, Prospect House, Newton Mearns, was the only entrant, and was awarded first prize. For two melons, one green or white and one scarlet, Mr. Greenlaw was first, and Mr. Jowett was second.

For twelve pears, two varieties, six of each, Mr. T. A. Dunlop was first, and Mr. Russell second. For twelve peaches, two varieties, six of each, Mr. J. Ferrier was first, Mr. Finnie second, and Mr. Campbell third. For twelve nectarines, two varieties, six of each, Mr. Greenlaw was first, Mr. Harrison second, and Mr. Small third. For twelve figs, Mr. D. Halliday was first, Mr. A. McMillan second, and Mr. J. Brown third. For twelve apples, three varieties, four of each, Mr. W. Campbell, Alexandra, was first, and Mr. Russell second. For twelve dessert apples, three varieties, four of each, Mr. J. Gibson was first and Mr. D. Nicoll, gardener to J. H. Bell, Esq., Rossie, was second. Mr. Gibson also obtained the silver medal presented by the Highland and Agricultural Society of Scotland, along with the first prize. For twelve cooking apples, three varieties, four of each, Mr. D. Macgregor was first.

## VEGETABLES.

For collection of vegetables, in thirteen varieties (gardeners and amateurs), prizes presented by Messrs. Sutton and Sons, Mr. Gibson was first, Mr. C. Shaw, Kippen Station, was second, and Mr. H. Jowett was third. Mr. Gibson was also awarded a Silver Knightian Medal by the R.H.S. For collection of vegetables in nine varieties (gardeners and amateurs), prizes presented by Messrs. Webb and Sons, Mr. Shaw was first, Mr. J. Devey, Stranraer, was second, and Mr. J. Grey, Uddingston, was third. For collection of vegetables in thirteen varieties, confined to Scotland (gardeners and amateurs), first prize, with Hunter Memorial Medal, presented by Messrs. Austin and M'Aslan, was won by Mr. C. Shaw, Mr. H. Jowett being second, and Mr. W. P. Bell, Bothwell Castle, third. For collection of vegetables in nine varieties (amateurs), the first prize, presented by three of the directors of the society, was awarded to Mr. J. Devey, Mr. G. Watson, Kippen, being second, and Mr. J. Gray third. For the collection of salads, for which the Highland and Agricultural Society presented a silver medal, to be awarded along with presented by the Glasgow Seed Trade. The first prize, Mr. C. Shaw was first, Mr. R. Glen second, and Mr. Harrison third.

## BASKETS, BOUQUETS, ETC.

Mr. John Hood, Dalmore, whose chief decorative subject was Irish Elegance rose, was first for the floral decoration for a dinner table, 8ft. by 4ft. (gardeners and amateurs); Mr. J. Donaldson, Myrtle Bank, Kirn, second; Mr. A. Knight third; and Mrs. R. Drummond, Sanquhar, fourth. Mr. Hugh MacSkimming was first for a hand basket of cut flowers and foliage (gardeners and amateurs), and for a vase of early-flowering chrysanthemums. Mr. Hood was first for hand basket of early chrysanthemums (gardeners and amateurs), and for hand basket of carnations (gardeners and amateurs). Mr. J. Davidson, Ardencraig, was first for a vase of liliums (gardeners and amateurs). Mr. Donaldson was first for an epergne of sweet peas (gardeners and amateurs); and Mrs. Grace Bryan was first for a similar epergne (confined to ladies), and also for a hand basket of cut flowers and foliage, and for ladies' sprays and coat bouquets. Messrs. Arthur S. Ritchie and Co., Belfast, were placed first for two shower bouquets (bride and bridesmaid's) (open), and Mr. MacSkimming was a good second. For one shower bouquet (gardeners and amateurs), Mr. MacSkimming was first, and Mr. Knight second. Mr. MacSkimming was also first for the shower bouquet of roses (gardeners and amateurs).

## NON-COMPETITIVE GOLD MEDALLISTS.

The following were awarded Gold Medals in the non-competitive section: Messrs. Austin and M'Aslan (flowers, fruit, and vegetables); Messrs. Sutton and Sons, Reading (flowers, fruits, and vegetables); Messrs. Blackmore and Langdon, Bath (begonias); Messrs. Jas. Veitch and Sons, Chelsea (stove and greenhouse plants); Messrs. E. Webb and Sons, Stourbridge (flowers, fruits, and vegetables); Messrs. Dobbie and Co., Edinburgh (cut flowers); Messrs. Malcolm Campbell, Lim. (table plants); Messrs. Clibrans, Manchester (cut flowers).

## ROYAL HORTICULTURAL SOCIETY'S AWARDS.

The following were the awards by the Royal Horticultural Society:

Gold Medals.—Messrs. J. Veitch and Sons, for stove, etc., plants; Messrs. Sutton and Sons, Reading.

Cups.—Messrs. Malcolm Campbell, Lim., for table of fruit; Messrs. Dobbie and Co., for roses, peas, dahlias, etc.; Messrs. May and Sons, for ferns; Messrs. Blackmore and Langdon, for begonias.

Silver Hogg Medal.—Lord Rowallan (gardener, Mr. J. Dixon), for grapes.

Silver-gilt Knightian Medal.—Messrs. Clibrans, for vegetables.

Silver-gilt Flora.—Messrs. Austin and M'Aslan, for stove plants.

Silver-gilt Banksian Medal. — Messrs. Webb, Wordsley, for sweet peas, fruits, etc.; Mr. D. G. Purdie, for stove plants; Messrs. Hugh Dickson, Lim., for roses.

Silver Flora.—Colonel Stewart Richardson (gardener, Mr. J. E. Davies), for group of plants; Messrs. Cutbush, for carnations; Messrs. M. Campbell and Son, for dahlias; Mr. John Fletcher, for sweet peas; Mr. J. Smellie, for dahlias and chrysanthemums.

Silver Banksian Medal.—Messrs. Webb, for cut flowers; Messrs. Cunningham and Fraser, for cut flowers; S. A. Jones, for gladioli; Messrs. Young and Co., for carnations; Messrs. G. Main and Son, for gladioli; Mr. C. Pattison, for collection of flowers; Messrs. Austin and M'Aslan, for vegetables; Mr. W. Ferguson, for roses.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention correspondents are requested to distinctly mark the paragraph.

PLANTING BORDER CARNATIONS.—M. J. B., Hants: Towards the end of July I layered a considerable number of border carnations, and I am pleased to find that the layers are rooting most satisfactorily. As I only commenced the cultivation of these beautiful flowers less than a year ago, I am not well acquainted with the details of their cultivation, and am rather perplexed with regard to the most suitable time for planting the rooted layers in the beds in which they are to bloom. Some of my friends tell me they should be planted in the autumn, while others assure me that the most satisfactory results are obtained from spring planting. —The "best time" for planting border carnations is determined by the character of the soil in which they are to be grown. If the soil ranges between that which is light and a well-drained substantial loam, the most satisfactory results will be obtained from layers that are taken off and planted during the present month. When the planting is done in September or early in October, the roots push freely in the new soil, and, as they do not suffer during the winter, the plants become so well established as to make a vigorous growth as soon as there is a revival of activity in the spring. On the other hand, should the soil be naturally tenacious in texture and cold, there is a risk of the roots being more or less injured by the unfavourable conditions to which they are exposed during the winter, and of some perishing. Therefore, in heavy soil, the best course is to put the layers in pots during the current month, winter them in an unheated pit or frame, and plant them out early in March. In our next issue we shall publish a comprehensive article on the cultivation of border carnations, written by one of the most eminent amateur cultivators of the present day, and we advise you to take advantage of the information it contains.

SEMPERVIVUM DONCKELAARI. — C. W. Garner, Bedford: We are much obliged by the photograph of the fine specimen of Sempervivum Donckelaari that you have recently flowered, and we regret the photograph is not suitable for reproduction.

WINTERING CALADIUMS. — S. M., Kent: As my employers greatly admire the richly-coloured leaves of these handsome plants, I grow them largely, and it may be added most satisfactorily. There is no difficulty in growing them, but keeping the corms during the winter is a constant source of perplexity. I follow the practice of the gardener under whom I served as foreman immediately before being appointed to my position as head gardener. He was, and indeed still is, considered to be a good plantsman, a reputation he well deserves. A similar difficulty was then experienced to that with which I have now to contend. My practice is to turn the soil out of the pots a short time after the leaves have died down, take out the corms, and put them in flower pots with dry silver sand shaken down among them, a piece of cardboard being put in the bottom to prevent the sand filtering out through the hole provided for the escape of water. The pots, as they are filled with corms and sand, are placed on a shelf in the plant stove, where they remain throughout the winter, without, of course, their receiving any water. When the time arrives in the spring for repotting the corms, a considerable proportion are found to be in a state of decay and worthless. I am anxious to avoid this, and shall be obliged by your advice.—Your experience is that of many other cultivators, who adopt the mistaken practice of storing the corms in sand. The proper course of procedure is to leave the corms undisturbed in the pots in which they were grown until it is desired to start them into growth, and to lay the pots on their sides in a convenient part of the plant stove, but not near the hot-water pipes because of the excessive drying of the soil that follows their occupancy of such position. Stored in this manner, the corms will be found sound and plump when shaken out of the soil, and wholly free from the dry rot that does so much damage when storage in dry sand is resorted to. The pots must be kept in the stove, for in a lower temperature than is usually maintained therein many corms will decay.

WART DISEASE OF POTATOES.—An Anxious Reader: I am sending you some potato tubers that are affected with a disease that has not previously come under my notice. I should like to know what it is, and the best means of combating it.—The potatoes that you have sent us are infected with Black Scab or Wart Disease (Synchibrinum endobioticum) which appears to be slowly but steadily spreading in some parts of England. This is one of the notifiable plant diseases, and we advise you to at once give notice to the Board of Agriculture, as you will incur the risk of a fine not exceeding £10 for withholding such information. In digging the crop be careful to gather up the whole of the tubers, and to destroy all that show signs of infection by burning them. If they are thrown on the rubbish heap the decaying matter will become contaminated with the spores, and when used may be the means of infecting quarters that are at present quite free from the disease. You should not crop the infected ground with potatoes for two or three years.

STORAGE OF FILBERTS AND COB NUTS.—R. M. H., Sussex: We have this year very heavy crops of both filberts and cob nuts, and I should like to obtain trustworthy information with regard to the best way of keeping them in good condition for the table over a considerable period.—We have tried various methods of keeping nuts during the winter, and the most successful results have been obtained by packing them in large, wide-mouthed jars, and placing the latter in a cellar. When gathered the nuts should be spread out on the shelves of the fruit-room or some other suitable place for the husks to become dry. If you have no cellar at your command the jars may be placed on the floor of the fruit room, but we do not consider such position equal to a cellar.

STERILISATION OF SOIL.—F. B., Yorkshire: There has been a considerable discussion about the sterilisation of soil in relation to the cultivation of ornamental plants and useful crops, and I should like to know from an authoritative source whether it is good practice. Will you kindly state your opinion with regard to the matter.—There can be no doubt as to the advantages of soil sterilisation, but as yet the matter is in an experimental stage. It has been determined both in the laboratory and the garden that the sterilisation of the soil is distinctly beneficial, but the methods by which it can be the most satisfactorily carried out by the general body of cultivators require further investigation. To show the manner in which sterilisation is useful as an aid in cultivation, it is necessary to state that there are two classes of bacteria, one which is beneficial by the work it accomplishes, as for example, the fixation of atmospheric nitrogen, and the other which is harmful by keeping in check the useful kinds. The object of sterilisation is to bring the bacteria under control, and the researches of Dr. Russell and Dr. Hutchinson at Rothamsted have proved that some degree of control is possible. By subjecting the soil to the various processes of partial sterilisation, such as heating or treatment with antiseptics, like chloroform or toluene, the bacteria which interfere with the activities of those doing useful work by breaking down the nitrogen compounds to the state of ammonia, are kept in check. Heating the soil to the temperature of boiling water for two hours has had the effect of doubling its productivity, and such a process has been found profitable in the cultivation of various crops under glass. Market growers of cucumbers and tomatoes prepare very rich composts for the plants, but such rich soils, while very rich on analysis, become in a few years incapable of growing satisfactory crops. Partial sterilisation, by eliminating the injurious organisms, restores the fertility of the soil, and renders profitable culture again practicable.

R.H.S. RULES FOR JUDGING.—A. B., Cosheston, Pembroke: Kindly favour me with the address of the publisher of the Royal Horticultural Society's Rules for Judging flowers, with the price, inclusive of postage. Is there a similar publication for vegetables ?—The price, post free, of the R.H.S. Rules for Judging is 1s. 6d., and, if you send a postal note for that amount to the Secretary, R.H.S., Vincent Square, Westminster, S.W., the publication will be supplied to you through the post. The judging of vegetables is fully dealt with in the rules.

GREEN SWEET PEA.—C. S. P., Croydon: I shall be extremely obliged if you will kindly let me know whether there is such a plant as a green sweet pea, and, if so, will you give me the name of the pea.—We are not aware of there being a sweet pea with green flowers.

HYDRANGEAS.—W. H., Hampshire: Retiring from an active business life, I have taken a house with a large garden in a pleasant part of Hampshire, and not far distant from the sea. For a long period the hydrangeas have been favourites of mine, but in my garden, some distance north of London, I was not able to grow them satisfactorily in the open. I am therefore desirous of knowing whether they can be planted in the open in my new garden in Hampshire, with the assurance of their growing into large bushes and blooming freely.—The distinct and handsome Hydrangea paniculata grandiflora may certainly be planted, for it is quite hardy in this country, and the beautiful H. Hortensia, to which we assume you allude, may also be planted with the assurance of growing vigorously and blooming profusely. Generally speaking, it is wise in the outdoor culture of the latter to select a warm, sheltered position, because of its liability to

->Spraying<-
And Limewashing Machines

In every garden and on every estate one of these 'Four Oaks' machines are indispensable.

Will spray the Fruit Trees, Limewash the Stables, Kennels, Outbuildings, &c., in a fraction of the time taken by brushes.

Complete Catalogues of Spraying and Limewashing Machines & Syringes free on application to Sole Manfactrs. : The

'Four Oaks' Limewashing Machine, "Royal Pattern" £3 18s. 6d.

FOUR OAKS SPRAYING MACHINE CO.,
No. 3C, Sutton Coldfield, Birmingham.

injury from severe frosts, and, as a rule, it should be planted along the front of a shrubbery facing south or near a wall. In the southern counties of England it may be planted in bold groups on the lawn with the most satisfactory results. The stations should be well drained, and the soil be moderately light and rich. Very little pruning will be required, and usually the removal of a few of the most weakly shoots and taking the tops off the stronger ones will alone be necessary. The robust H. paniculata grandiflora, which produces huge pyramidal flower heads, can be successfully grown in the open on both heavy and light soils. You will find it singularly effective both in large masses on the lawn and in bold groups in the shrubbery border. When grown in groups the shoots produced in the previous season should be cut back to within a few inches of the soil.

### NAMES OF PLANTS.

M. C., Corbridge-on-Tyne.—Your plant is Calceolaria chelidoaifolia.

S. M.—The crested form of the Royal Fern, Osmunda regalis cristata.

T. S.—1, Sanchezia nobilis variegata; 2, Athyrium filix-fœmina Craigi; 3, Tillandsia tesselata; 4, Sericographis Ghiesbreghtiana.

S. K., Brighton.—1 Berberis stenophylla; 2, Clerodendron trichotomum; 3, the fruit of Pyrus baccata; 4, Cotoneaster horizontalis.

F.—1, Casuarina sumatrana; 2, Aotus gracillima; 3, Coronilla glauca variegata; 4, please send when in bloom; 5, Lotus peliorchynchus.

W. B., Yorkshire.—We are unable to undertake the naming of florists' flowers; the blooms of perpetual carnations you send are so out of character that it would not be possible to recognise them.

AMATEUR.—The shrub which you saw growing on the west side of the rock garden at Kew and bearing a heavy crop of brilliant orange-red berries is Cratægus Lelandi, and is one of the best of the berry-bearing shrubs for culture in small gardens.

### NAMES OF FRUIT.

L. F.—1, Dartmouth Crab; 2, Transcendent Crab.

W. R. H.—1, Farleigh Prolific damson; 2, Shepherd's Bullace.

YOUNG GARDENER.—1, Washington; 2, Kirk's Blue; 3, Reine Claude de Bavay; 4, Pond's Seedling; 5, President.

F. W. S. G.—1, White Transparent; 2, Warner's King; 3, Ribston Pippin; 4, Newton Wonder; 5, Royal Jubilee; 6, Old Winter Nonpariel.

J. W.—1, Lord Grosvenor; 2, Lane's Prince Albert; 3, Ecklinville; 4, Beurre d'Avalon, also known as the Glastonbury pear; 5, Bergamotte d'Esperen.

## CATALOGUES RECEIVED.

MESSRS. SUTTON AND SONS, READING.—As usual the bulb catalogue issued from Reading is remarkable for its comprehensive character and attractive style. Interspersed with the carefully-prepared lists of the various kinds are numerous illustrations showing the use of bulbs in the garden, and in addition there is a finely-executed coloured plate illustrating the charming effect produced by the combination of blue and yellow hyacinths.

MESSRS. E. WEBB AND SONS, WORDSLEY, STOURBRIDGE.—The attractively-illustrated catalogue of bulbs that we have received from Messrs. E. Webb and Sons will be found of a high degree of utility in the preparation of lists of the most noteworthy varieties of the several kinds of bulbous plants, whether required for beautifying the conservatory or flower garden, or for obtaining honours at the exhibitions. All the finest varieties are enumerated and briefly described, and not a few illustrated.

MESSRS. BARR AND SONS, 11-13, KING STREET, COVENT GARDEN, LONDON, AND TAPLOW NURSERIES, BUCKS.—The two catalogues issued by this firm are of special interest to those who appreciate the importance of bulbous plants as aids in beautifying the flower garden and plant houses. In the catalogue of daffodils all the finest of the new varieties, and the best of the old varieties, and they are many, are described, and in such manner that their distinctive characteristics are readily understood. Not less remarkable is the comprehensive catalogue of bulbs other than daffodils.

COACHING BY CORRESPONDENCE CLASS for the R.H.S. Exam. Gardeners should write for prospectus, with past successes. MEDALLIST, Pightle, Letheringsett, Norfolk.

ADVERTISER, wishful to lay out quaint old English Garden in Harrogate, about three-quarters acre square and flat, asks for designs. Ten Guineas given for accepted design.

SPOFFORTH,
Wath-on-Dearne, Yorks.

# Employment THE GARDENERS' MAGAZINE Register.

**The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.**

**A list of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.**

## Situations Wanted.

C. PAXTON, Branches Park Gardens, Newmarket, highly recommends YOUNG MAN as Rose Grower and Assist in Pleasure Grounds in a large establishment; smart, civil, and obliging; 7½ years' experience here; desires a change; age 31.

E. DEAN, Esq., highly recommends GARDENER (Head or Single-handed); 5½ years with him; 29 years' experience Inside and Out; age 43. Apply WELSTEAD, Woodvale, Woodvale Avenue, South Norwood.

G. BATES, Head Gardener to A. D. ACLAND, Esq., Digswell House, Welwyn, Herts, can thoroughly recommend strong LAD, age 17, as IMPROVER (Inside); two years' experience; Bothy preferred.

GARDENER (Head Working, or good single-handed); life experience; last five years Head; excellent references; age 32; married, one child. TYLER, Dalton House Gardens, Watford.

GARDENER (Head), age 32, married, one child, aged 4½; seventeen years' practical experience in carnations, chrysanthemums, fruit, stoves, house and table decorations, etc., seeks SITUATION where five or more are kept; six years as head. Apply, G. MOWBRAY, The Gardens, Tansor Court, Oundle, Northants.

GARDENER (Head Working). — Mrs. MACLEAN recommends H. MITCHELL as above; life experience; age 30; married, one child. Cottlewell Cottage, Otford, Kent.

GENTLEMAN strongly recommends GARDENER (Head Working); thorough practical man; life's experience in all branches of up-to-date gardening; 28 years' good references; Land and Stock; no family. FOOTE, Adsdean, Chichester, Sussex.

GARDENER (Working, with or without help), thoroughly understands his business in all its branches; Flowers, Fruit, and Vegetables, Vines, Peaches, Orchids, Ferns, Tennis, Herbaceous Plants and Shrubs; a good grower of Chrysanthemums. J. M., Box 2,594, Office of this Paper.

GARDENER (Head).—Advertiser offers his services to any Lady or Gentleman requiring a thoroughly practical man; life experience in first-class establishments, including Leonardslee; present situation four years as Head; disengaged September 7; age 35. G. W. WYATT, Stonehurst Gardens, Ardingly.

GARDENER (Head Working), age 32, seeks SITUATION( where two or three are kept; thoroughly experienced in Fruit, Flowers, and Vegetables, Roses, and Herbaceous Plants; 8½ years' excellent reference from present situation. T. H. ORAM, Grangehyrst Lodge, Grange Hill, South Norwood, S.E.

GARDENER (Head) seeks SITUATION, where one or two are kept, 14 years' experience in all branches, Inside and Out, in large establishments; excellent ref.; highly recommended. H. PAYNE, 59 Thorpe End, Melton Mowbray.

GARDENER (Single-handed, or with help); experience inside and out; vines and poultry; good references; married, one child (boy, 8½); age 39. C. H. SMITH, 44, Ravenbourne Road, Catford. (No circulars.)

GARDENER seeks SITUATION (Single-handed); experienced (Inside and Out), or good Kitchen Gardener; good references; married; age 32. E. REYNOLDS, 93, London Road, Maidstone, Kent.

**Read what our Advertisers write re "Gardeners' Magazine."**

"Glad to say that H. S. has got a situation in Norfolk, and I beg to thank you, and on behalf of S."

Yours, etc.,
J. A.

"I beg to say the youth has found an engagement through your paper. Thanking you for your assistance," Yours, etc.,
W. T.

**The "GARDENERS' MAGAZINE" is the gardener's friend. Read it and recommend it to your friends.**

GARDENER (Head Working, or good Single-handed); highly recommended by late employer; good experience with Fruit, Flowers, and Vegetables; married, no family; excellent references; disengaged. SAUNDERS, 41, Sussex Road, Tonbridge. (No circulars.)

GARDENER (Head Working, where several are kept); life experience in all branches of the profession, both Inside and Out; especially well up in Hardy and Herbaceous Plants, Bog and Water Gardens; excellent references; married, no family. A. T., 70, Peel Road, North Wembley, Middlesex.

GARDENER (Head Working); thorough and practical in all branches of up-to-date gardening; 28 years' good references; Land and Stock if required; no family. FOOTE, Adsdean, Chichester, Sussex.

GARDENER (Head); life practical experience in all branches; disengaged when suited; six years' good reference from present employer. KETTLE, Violet Cottage, Whitstone Road, Pen-y-lan, Christchurch, Newport, Mon.

GARDENER, age 27, seeks SITUATION (Inside and Out, or Kitchen Garden); 14 years' experience; disengaged; good references; married. A. SHONE, High Street, Oxted, Surrey.

GARDENER (Head Working).—Mr. COLLETT, Kirtlington Park, highly recommends H. STEDMAN where three or more are kept; life experience Inside and Out; Vines, Fruit, Flowers, Kitchen Garden; age 35; married, two children; life abstainer; good references. STEDMAN, Bicester Lodge, Kirtlington Park, Oxon.

GENTLEMAN recommends LAD (17½) as Improver; understands Kitchen and Flower Garden; anxious to learn greenhouse work; good reference; Bothy preferred. Apply, 2,842, Office of this Journal.

H. DE LA RUE, Esq., Six Mile Bottom, wishes to recommend W. SCOTT, Gardener (Head Working, where two or more are kept); experienced Inside and Out; married, no family; middle age; disengaged. Apply, SCOTT, Bulwick, Wansford.

TWO YOUNG MEN seek SITUATION; ages 20 and 25; 2½ and 5 years' experience, Inside and Out; Kitchen Garden and Pleasure Ground preferred; good references. A. H. FORSEY, Winsham, Chard, Somerset.

THE FLORAL DEPOT are pleased to recommend a very good Gardener (Single-handed or otherwise). Inquiries will be answered at the above, 47, Baker Street, W.

WANTED, an opening for a YOUTH of 17 to learn Intensive Gardening. SECRETARY, 91, Parliament Chambers, Great Smith Street, S.W.

WANTED, a Situation as UNDER GARDENER; 4 years' experience; Inside and Out; good references; age 20. Apply to A. CHAPMAN, No. 6, New Street, Stockbridge, Hants.

YOUNG MAN seeks SITUATION as GARDENER, Inside and Out; had experience since school days in gardening; good references. G. W. BENTON, 161, Duke Street, St. Helen's, Lancs.

YOUNG MAN (23) seeks SITUATION in or near Surrey, as CHAUFFEUR-GARDENER, or Groom-Gardener; can ride and drive well, single or pair. Apply BOATWRIGHT, The Gardener's Lodge, Alton Lodge, Roehampton, S.W.

# "A GRAND FERTILIZER."

"The value of CLAY'S FERTILIZER needs but little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur growers are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."—NURSERYMAN AND SEEDSMAN, July 20, 1912.

CLAY'S LONDON FERTILIZER
TRADE MARK

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Spontaneous Generation.

Professor Schäfer's opening address to the British Association must, we imagine, have struck many of his audience, and eventually many of his scientific readers, as representing a great retrograde step in evolutionary teaching. In the last century the doctrine of spontaneous generation, i.e., the development of life from inorganic material without a previous egg or germ, was practically demolished by innumerable experiments undertaken by Professor Tindall and other eminent scientists, who conclusively proved that, however fitted for nutrition a material might be, unless access were given to it, after thorough sterilisation, of living germs, such material developed no organisms. It was simultaneously proved also that the air we breathe was so laden with germs that the minutest quantity of it, if admitted to the material, was capable of conveying germs of life, which then profited by the opportunity, and multiplied exceedingly. In the old days, when the theory of creation involved the idea of the creation of even highly organised beings, including even man himself, from mere clay, spontaneous generation was naturally widely accepted, and the appearance of grubs in decaying flesh and innumerable other unexplained developments of life, were naturally imputed to a simple transformation of the nutriment direct into organisms fitted to devour it. Many scientific observers, however, declined to accept this theory, and by experiment demonstrated in all cases that if the all-essential egg or spore, already derived from a living organism, were excluded, no life appeared, and "omne vivum ex vivi" became the established motto. Despite all this, however, we are now informed that, in all probability, ultra-microscopic development of primary life germs, i.e., germs invisible even with the highest powers of the microscope, may be, even under the present conditions of the world, evolving themselves directly from inorganic material. A theory which is that of spontaneous generation pure and simple, since the production of such germs or primary forms of life, must result, if it means anything at all, in an evolution which would eventually bring their progeny within the realm of visibility, as evolution clearly shows us must have been the case in the primary germs or cells which started the life cycle of the world as we are now enabled to study it in the shape of fossils and existing organisms, simple and complex. Such study forces us to conclude that, however the primary cell was engendered, it must have had within it the power of not merely reproducing its own primary form, but of changing that form in response to its environment, and thus become more and more complex to fit more complex conditions until, as a result, we see the wonderful world around us filled with a practical infinity of organic adaptations and endowed with a faculty of progression on wider and wider lines. A primary cell, i.e., one produced by mere chemical combination of nutritious elements, if not so endowed would be useless as an evolutionary factor, and how can we impute such an endowment to merely chemical action? We know, as regards plants, that, although they are only provided with a few elements for their nutrition and growth, they are capable of associating and recombining these into such an infinity of different substances, that members of one and the same genus may yield products of the most opposite character, boons or banes, as the case may be. We also know that all this work is done by means of cells, which research has shown to be of an inconceivably complex character, despite their apparent simplicity. Professor Schäfer, however, unless we sadly miscontrue his words, considers that if our chemists could absolutely determine the constituents of the cell formation, they could synthetically construct a living cell, i.e., induce spontaneous generation. Here, however, the all-important point is overlooked, viz., that the cell is not merely a sac containing a glutinous liquid, which the chemist might, and indeed can, imitate very closely, but there is also the wonderfully endowed nucleus, the "creative" centre, in which, though but a microscopic bundle of fibres, lies all the potencies of the race it sprang from, plus, probably, future ones. What sort of nucleus would the chemical elements contrive? There are no potencies to inherit, and therefore none to transmit when the chemical molecules start on the difficult and non-chemical course of reproduction by means of a dividing wall, itself a mystery of cell formation, which can only be formed by the directive impulse of the "nucleus" itself. We are indeed confronted in this connection with a metaphysical difficulty. Accepting the nebular hypothesis, that our earth was originally a glowing mass, which slowly cooled down and formed a crust divided by oceans on or in which life then appeared, the materialist argues that such life must have had a spontaneous commencement as a subtle combination of inorganic matter in which a vital spark was engendered under the conditions then existent. This, of course, is beyond proof, as indeed, is any other theory regarding the origin of life. The non-materialist argues, on the

MR. ROBERT MORTON.

other hand, that the evidence of plan and design, and the wondrous adaptations among which we live, and of which we form part, indicate some creative guidance, and that of a benevolent, omniscient, and omnipotent character. This doctrine, though it involves conceptions far and away beyond human capacity, is certainly the more comforting of the two, and appeals more deeply than one which argues that all the world's beauty, charm, and more especially the intellectual enjoyment it provides, is the mere outcome of blind laws minus a Law-giver.

**Mr. Robert Morton,** who has for some years occupied a leading position among the large body of amateurs who devote some portion of their leisure to the cult of the border carnations, evinced a strong affection for these delightfully fragrant flowers quite early in life, and before he was out of his teens he entered on their cultivation. He, however, considers that it was not until 1897 that he began to grow them seriously. Since that year he has devoted much time and attention to his favourite flowers, and, as the result of unremitting attention and a keen appreciation of their cultural requirements, has from the first achieved much success. His success induced him, some eight years since, to exhibit at the exhibitions of the National Carnation and Picotee Society. In 1908 Mr. Morton was successful in winning the Divisional Cup in the second division, and this achievement he repeated at the exhibition held by the society in July last. In 1910 Mr. Morton competed for the Martin Smith (or Amateurs') Cup, and was placed second. His failure to obtain the coveted award evidently stimulated him to further endeavour, for in 1911 and the present year he was successful in winning this trophy. Evidently, Mr. Morton has a decided preference for border carnations that are shown more or less naturally, for he confines himself to the classes for undressed flowers, and has not at any time competed for the prizes for dressed flowers shown on cards. Mr. Morton attributes much of his success to the many kindnesses and hints on the cultivation of the plants that he received from the late Mr. James Douglas, who, as so well known, was ever ready to encourage amateurs in the cultivation of these and other flowers, and to assist them in any difficulties with which they had to contend, owing to their not being conversant with some of the details essential to success. Mr. Morton evidently fully utilised the advice he received, and in the interest of border carnations we trust he may long continue to take an active interest in the work and the exhibitions of the National Carnation and Picotee Society, for his success as a cultivator and exhibitor can hardly fail to have a stimulative effect upon those entering on the cult of his favourite flowers. We have been fortunate in inducing Mr. Morton to describe his method of procedure in the cultivation of border carnations for exhibition, and we commend his contribution, which appears in another part of this issue, to those of our readers who are interested in these flowers.

**The Mendelian Method.**—In the presidential address given by Professor Keeble at the opening meeting of the Botanical Section of the British Association special reference was made to the great value of the Mendelian method in biological research. If, as he believed was the case, the greatest gift which an experimental science could receive was a new, serviceable general method, then to no man were biologists more indebted than to Mendel, for such a method he gave to their science. The supreme importance of Mendel's contribution to science consisted in this, that instead of mixing anything with anything, he had taught them the value of the method of genetical analysis of individual characters. Thus the first part of the Mendelian restatement of the old problem of heredity read, "Investigate one by one the modes of inheritance of the several characters of an individual. Choose for this purpose organisms which are as far as possible alike in all respects except for the character under investigation. Carry the experiment to its conclusion, even to the third or fourth generation. If uncertain results are obtained, ascertain before discarding the method whether the uncertainty may not be due to the interference of other characters not to be suspected a priori of exercising an influence upon the expression of the character under investigation." Who, for example, would suspect a morphological character like thickness of stem of exercising an influence on the time of flowering of a plant? Yet such was the case with the pea (Pisum sativum), and there was evidence that when this disturbing influence was removed, inheritance of time of flowering followed Mendelian rules.

**Foreign Horticultural Exhibitions.**—An international horticultural exhibition will, as already announced in these pages, be held at St. Petersburgh in April, 1913, and a great chrysanthemum and fruit show at Nantes, November 12-17 of the present year. The President and Council of the Royal Horticultural Society have been asked to suggest some names of gentlemen willing to act on the jury of one or other of these exhibitions. They will consequently be glad to hear from any British horticulturists intending to attend either of them. They should, of course, write to the Rev. W. Wilks, Vincent Square, Westminster, S.W.

**The Wisley Viola Trial.**—The trial of violas has this year been so successful, particularly in the late spring and early summer, that it has been suggested (and the council have accepted the suggestion) that the trial should be continued in 1913 for the purpose of determining the date of the flowering of the various varieties. Growers, amateurs as well as trade, are therefore requested to send three rooted cuttings of each variety (old as well as new) so that they may be planted before the third week in October. Address by post, The Superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey.

**R.H.S. Daffodil Show,** 1913. — The Royal Horticultural Society's daffodil show will next year be held on Tuesday and Wednesday April 15 and 16. The schedule of prizes may be now obtained from the Secretary, Royal Horticultural Society, Vincent Square, Westminster, London, S.W.

**Northern Fruit Congress.**—The conference on fruit culture that was held at Carlisle on the 3rd and 4th inst., under the auspices of the North of England Horticultural Society in conjunction with the exhibition of the Carlisle Horticultural Society, was attended with a fair amount of success. At the afternoon meeting on the first day Mr. Chisholm gave a demonstration of the most approved method of fruit bottling. This was followed by an address by Mr. G. P. Berry on "Soils in Relation to Fruit Growing." Professor F. V. Theobald was to have given at the evening meeting on the first day a lecture on "The Spraying of Fruit Trees," but was unable to attend, and his place was taken by Mr. Somers Rivers. The programme of the meetings held on the second day included a fruit bottling demonstration by Mr. W. B. Little, a lecture on "Canker and Other Bark Diseases," by Mr. F. J. Chittenden, and a demonstration of pruning fruit trees and bushes.

**The British Potato Crop,** which was very promising over a wide area in Great Britain until about the middle of July, has suffered so severely from the wretched weather that has been experienced since then, as to suggest one of the least satisfactory of the yields of late years. The disease is rife over the whole of Great Britain, and, in many instances, it has done much damage. In some instances large areas of potatoes have been under water, and the soil is in a saturated condition. According to the official returns which have recently been issued, the area under potatoes in England and Wales amounts to 463,007 acres, or an increase of 33,835 acres, as compared with last year's crop.

**Mr. E. A. White's Visits to Ottawa and Stockholm.**—An interesting sequel to the Royal International Horticultural Exhibition held in May last has been afforded by the recent visits of the honorary managing director, Mr. Edward White, to Ottawa and Stockholm. At the former city he was called upon by the Dominion Government to advise upon the laying out of the ground adjoining the Parliament Buildings acquired for the purpose of the erection of extensive new departmental buildings. At Stockholm Mr. White was commissioned to give advice concerning the arrangement of the gardens at the Royal Palaces at Stockholm and Wrottningholm. The latter is the Windsor Castle of Sweden, and it is hoped to be able to restore, to a certain extent, the magnificent gardens which were planned when the Palace was designed more than two hundred years ago by the famous Swedish architects—father and son—Tessin.

**Endowment of the South London Botanical Institute.**—Mr. Allan O. Hume, C.B., formerly of the Bengal Civil Service, and a well-known botanist and ornithologist, who died at the end of July last in his 83rd year, left his collection of heads and horns of Asiatic animals to the trustees of the British Museum. He also confirmed a settlement, dated January 10, 1907, of £10,000 2½ per cent. stock for the endowment of the South London Botanical Institute, and also the provision of an indenture by which he gave his premises, 323, Norwood Road, S.E., for the purposes of the Institute. He left all his books on botany and ornithology and dictionaries upon trust for the Institute to encourage the study of botany and (especially British botany) in the County of London south of the Thames, and also the part of his herbarium not already transferred to the Institute.

**North of England Horticultural Society.**—The next meeting of the N. E. H. S. will be held on the 18th inst. in the Queen's (Midland) Hotel at half-past six p.m., when Mr. W. Dyke, of Cranbourne Nursery, Ware, Herts, who is a recognised expert on commercial manuring, will lecture on "Commercial and General Manures." It is hoped there will be a good attendance of market growers. The show fixed for the 18th inst. is postponed for many causes over which the executive have no control. The reports of gardeners and others are in favour of concentrating on the two-days show, October 17 and 18, when a very fine exhibition of fruits, orchids, etc., is anticipated.

# EDINBURGH FRUIT AND FLOWER SHOW.

An extensive exhibition, and one of very varied interest, was held by the Royal Caledonian Horticultural Society in the Waverley Market, Edinburgh, on September 11 and 12. The general quality of the display was good, but some allowances have to be made for a season that has been lacking in brightness and sun-heat. Grapes were very fine again, and so were vegetables and roses; gladioli and early chrysanthemums were also of fine quality. Dahlias were fewer than usual, and so were pansies and violas.

GM431
FIRST PRIZE

FIRST-PRIZE TWELVE SPIKES OF GLADIOLI.
Exhibited at Edinburgh by Mr. J. Stewart, jun., Woodend Cottage, Whins, Alloa.

Apart from the chief grape class there was little of outstanding interest, or anything that could be described as of superlative merit; on the other hand, there were very few exhibits of poor quality, competition being fairly close throughout.

The Waverley Market is a fine place in which to hold an exhibition, but it is not a place in which an exhibition can be made a spectacular success because of the dead level of all the massive girders that carry the roof and its roof garden. The solid floor, however, permits heavy carts and vans to draw in right up to the sites of the exhibits during the eve of the show, and this is a matter of great convenience in such a large place. How large a place the Waverley Market is, is only fully appreciated when one has paced up and down it a score of times and gone quite round it a few times. We always feel that the fine exhibitions of the Royal Caledonian Horticultural Society are never seen to the fullest advantage; a loftier roof and different staging would make a world of difference, but, then, probably, if these advantages could be secured, some of the present advantages would be lost. Mr. Donald Mackenzie and his committee make the best of circumstances, and their efforts are greatly appreciated.

Trade exhibits bulked largely on this occasion, and they were of varied character, and, on the whole, good.

Fine weather prevailed throughout the opening day, and there appeared to be an excellent attendance. It may be of passing interest to mention that, though the entries were a few below the number reached in 1911 (when apples were so largely shown), they were more than on the occasion of the Centenary Show, when they were 1,492, as compared with the 1,500 of the present year.

## DESSERT TABLE CLASS.

Here, as at Shrewsbury, there were three competitors in the class for a table of dessert fruit. A table 10ft. by 4ft. 6in. is provided, and exhibitors have to stage not more than sixteen dishes of fruit, selecting their kinds from a list scheduled. The prizes were offered by the Corporation of the City of Edinburgh, and the chief award fell to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, with a fine lot of fruit and decoration of Lilium speciosum, Francoa ramosa, and white larkspurs. The dishes were of Cox's Orange Pippin and Washington apples, 6, 5½; Negro Largo and Brown Turkey figs, 5, 4½; Madresfield Court, Black Hamburgh, and Gros Colmar grapes, 7, 7, and 6½; Muscat of Alexandria grape, 7½; Golden Eagle and Princess of Wales peaches, 6, 6½; Pineapple nectarines, 6½; Marguerite Marrillat and Triomphe de Vienne pears, 7, 7½; Jefferson plum, 4½; Scarlet Seedling and Countess melons, 7, 6½; beauty of flowers and foliage, 5; harmonious blending of colours, 5; general arrangement for effect, 4; total, 114½ points out of a possible 143. Mr. W. Galloway, gardener to the Earl of Wemyss, Gosford, secured second place with a total of 105½ points, his best dishes being Black Hamburgh and Muscat of Alexandria grapes, Humboldt nectarines, Moor Park apricots, and Marguerite Marrillat pears, the latter beautifully coloured and of good size. Mr. G. Mackinlay, gardener to the American

Ambassador, Wrest Park, Bedford, third, with 91½ points.

## SCOTTISH TROPHY CLASS FOR GRAPES.

A large amount of interest centred around this class because if Mr. Dixon came out top he would hold the splendid Scottish Challenge Cup (presented by Mr. W. H. Massie) for good. Consequently, as the judges came near the finish of their work, excitement ran high, and most people seemed glad that Mr. Dixon, gardener to Lord Rowallan, Kilmarnock, won premier place again, and for the third time. Eight bunches of grapes, not more than two of one variety, were demanded, and each collection had to be decorated with flowers and foliage. There were four competitors. Mr. Dixon's bunches were: 1, Muscat Hamburgh, 7½ out of 9; 2, Madresfield Court, 8 out of 9; 3, Muscat of Alexandria, 8 out of 10; 4, Black Hamburgh, 6 out of 9; 5, Black Hamburgh, 6 out of 9; 6, Muscat of Alexandria, 7 out of 10; 7, Madresfield Court, 8 out of 9; and 8, Muscat Hamburgh, 7 out of 9; total, 57½ out of a possible 74. Francoa ramosa, montbretias, and berberis foliage were used as decorations. The judges could not be accused of over-pointing. Mr. J. H. Goodacre, Elvaston Castle Gardens, gained 50½ points out of 74, and his varieties were Black Hamburgh, Madresfield Court, Muscat Hamburgh, and Muscat of Alexandria; Mr. David Halliday, gardener to W. Mackay, Esq., Ascog, Bute, gained 53 points out of 71, and secured third prize, showing Muscat of Alexandria, Madresfield Court, Mrs. Pince (fine), Alicante, and Appley Towers. Mr. G. Mollison, gardener to P. J. Horne Rigg, Esq., Tarvit, Cupar, Fife, fourth with 42½ points out of a possible 74; his varieties were Muscat of Alexandria, Mrs. Pearson, Black Hamburgh, and Madresfield Court.

FIRST - PRIZE DECORATED DESSERT TABLE AT EDINBURGH.

Exhibited by Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby.

## GRAPE CLASSES.

Four competitors entered in the class for four bunches of grapes, and the fight was a keen one. Mr. J. J. Wann, gardener to Lord Balfour of Burleigh, Kennett, Alloa, led with Muscat Hamburgh, Mrs. Pince (fine), Muscat of Alexandria, and Alicante; Mr. S. Gordon second; and Mr. W. G. Pirie, gardener to C. W. Cowan, Esq., Dalhousie Castle, third.

The series of ten classes provided for special varieties of grapes invariably proves interesting, especially as the competition is generally good throughout. There was little to complain of in regard to the quality, though there were evidences that a little more sun heat would have improved matters. Mr. Wm. Campbell, gardener to the Earl of Seaforth, Braham Castle, Ross-shire, led for two bunches of Muscat of Alexandria with finely-coloured bunches; Mr. T. MacPhail, Archerfield, Direleton, second; and Mr. S. Gordon, gardener to Sir H. E. Maxwell, Bart., Monreith, Whauphill, third.

The Black Hamburgh class, two bunches, brought out five competitors, Mr. W. Galloway, gardener to the Earl of Wemyss, Gosford, taking the lead with fair-sized, large-berried, deeply-coloured clusters of this most popular grape; Mr. MacPhail and Mr. J. Wood took the remaining awards. Mr. MacPhail came to the front again in the class for one bunch of Muscat of Alexandria, defeating four other competitors, with a medium-sized bunch, ideal in colour and bloom; Mr. W. Campbell and Mr. G. Anderson, gardener to the Right Hon. A. J. Balfour, M.P., Whittinghame, second and third respectively. Nine single bunches of Black Hamburgh were staged, and here Mr. J. H. Goodacre, Elvaston Castle Gardens, Derby, came to the front with a densely-berried bunch, and he was followed in order by Mr. Middleton, gardener to W. Forbes, Esq., Callendar, Falkirk, and Mr. J. Wood, Larbert.

Alicante proved a popular grape, and brought out thirteen entries. A large bunch secured the premier award for Mr. M. Middleton, and an even larger bunch, that would have been the better for more thinning, won second place for Mr. D. Halliday, gardener to W. Mackay, Esq., Ascog, Bute; Mr. S. Gordon third.

Mr. S. Gordon was easily first for Alnwick Seedling, a variety not now grown very largely in the South; his was a very fine bunch. Mr. M. Stewart, Mollance, Castle Douglas, second; and Mr. J. MacPhail, third. A neat little bunch of deeply-coloured Gros Colmar gained first prize for Mr. Lewis Moodie, gardener to Miss Carse, Spring Gardens, Musselburgh; and easily defeated the big red-berried clusters of many competitors. Mr. J. Wood, second; and Mr. J. Shiells, Carstairs, third. Lady Downes was best shown by Mr. D. Kidd, gardener to Lord Elphinstone, Carberry Towers, Musselburgh, and his was a long, finely-berried cluster. Mr. Galloway and Mr. Middleton came second and third respectively. Mr. G. Andrews scored for Appley Towers, and Mr. Middleton was a close second.

## CHOICE FRUITS.

The best dozen dishes of dessert fruits were staged by Mr. William Hunter, gardener to the Marquis of Tweeddale, Yester, Haddington, with Muscat of Alexandria and Black Hamburgh grapes, Stirling Castle and Bellegarde peaches; Moor Park apricots; Humboldt nectarines, Jefferson plums, Brown Turkey figs, Pitmaston Duchess pears, Royal Sovereign melon, and Peasgood's Nonsuch and Emperor Alexander apples. Mr. D. Kidd, gardener to Lord Elphinstone, Carberry Towers, Musselburgh, came second with good grapes and a good dish of Souvenir du Congrès pears.

For a dozen dishes of orchard house fruits, Mr. G. Mackinlay, Wrest Park, gained first prize, and was the only exhibitor. Peaches were good, and Mr. J. H. Goodacre scored with fine examples of Princess of Wales. Mr. Pirie led for apricots, among no fewer than eight contestants, and his variety was Large Early.

Plums were quite good, especially the display of Magnum Bonum from Mr. R. G. Sinclair, Congalton Gardens, Drem; of Pond's Seedling, from Mr. J. Duff, gardener to Colonel Gordon, Threave House, Castle Douglas; of Black Diamond, from Mr. J. Barrowman, Stevenson House, Haddington; and the collection of dessert varieties shown

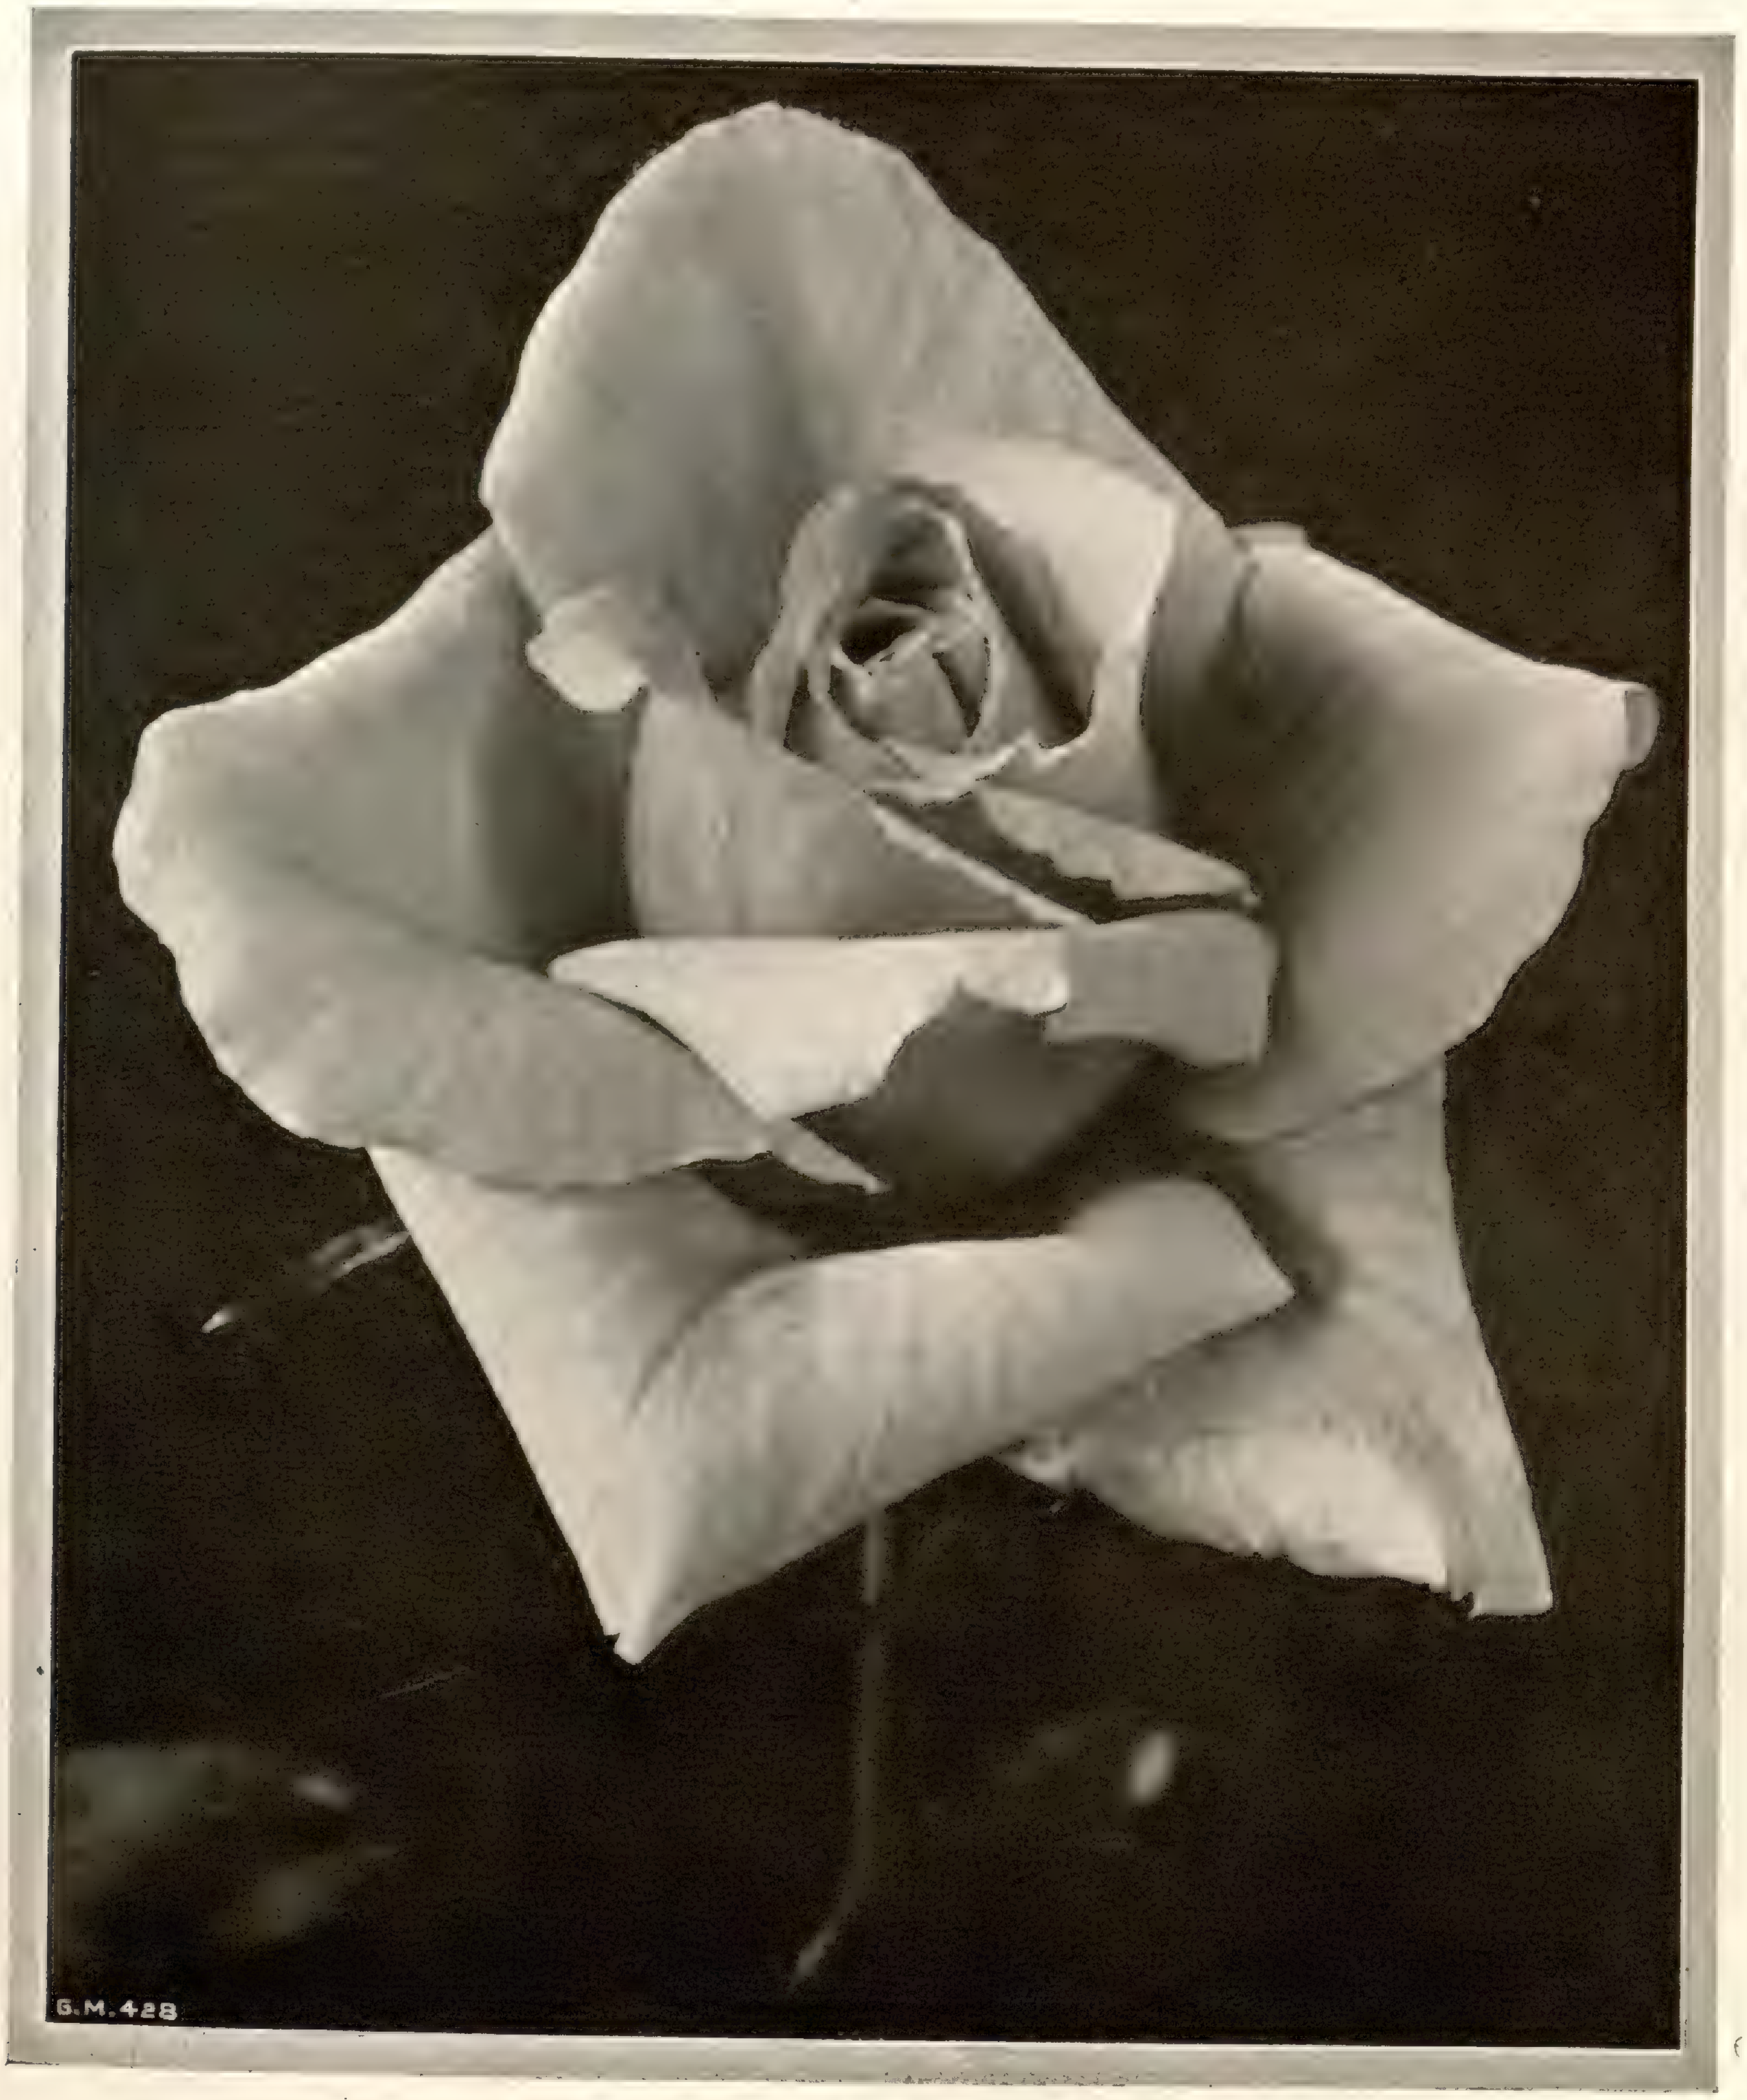
(Continued on page 713.)

## ROSE SUNBURST.

Few roses have of late years been so freely discussed as the beautiful hybrid tea of which we give an illustration herewith. The question at issue was not the merits of the rose, for they were recognised as being of a high order by those who had an opportunity of seeing plants in bloom; but whether the committee of the National Rose Society for judging new roses should, when the variety was submitted to them, have suspended the regulations for making awards to novelties. Under the regulations exhibitors had to submit with the blooms a plant lifted from the open ground, and the exhibitor, overlooking the fact that the plant must have been grown in the open ground, showed one in a pot. In consequence of this mistake, the committee were unable to consider the variety, and those who thought they should have made an award were apparently oblivious of the fact that regulations of the National Rose Society, as of other bodies, can only be altered by the governing body after due notice has been given. When in July last it was shown in strict accordance with the regulations, it received the distinction of a silver-gilt medal, an award that, if not the highest that could have been given, is such as to show that the rose possesses merit of a high order.

Sunburst is one of the several highly-coloured roses that have been raised by M. J. Pernet-Ducher, and was distributed in the spring of the present year. The raiser describes the variety as a very strong grower, but from what we have seen of the variety we should hardly regard the growth as "very strong." The time has not, however, been long enough to give a definite opinion upon this point, but it is evident that the rose has a good constitution, and that the growth is free and the shoots stout and erect. Sunburst appears to possess the good qualities characteristic of a bedding rose of the highest class, and it may be anticipated that it will show a considerable advance in every way next year, because the plants that were bedded out last spring will have become well-established, and, in the case of young plants, it will be possible to bed them out at a somewhat earlier period, and thus give them a longer time for becoming established before the commencement of the season of flowering.

For the production of flowers under glass Sunburst has much value, for both in the forcing pit and cool house it grows freely and blooms profusely and continuously. The flowers are of medium size, of the form indicated in the accompanying illustration, and the colour is cadmium yellow, orange in the centre, and passing to rather pale yellow at the margin of the petals. The leaves are bronzy-green, and form a fine setting to the richly-coloured and elegant flowers.



NEW HYBRID TEA ROSE SUNBURST.
Colour, cadmium yellow, orange in the centre, and paler at margins of petals.

## BORDER CARNATIONS.

Having been asked to state how I grow and show border carnations, I can only say that I have little to add to the information which has been printed on the subject. There are some points, however, in the culture of the border carnation on which I hardly agree with the older writers, and, perhaps, I ought to say that those who wrote about carnations forty or fifty years ago were advising for those who grew only the white-ground bizarres, flakes, and picotees. During the last twenty or twenty-five years, however, the principal border carnations have been the selfs, fancies, and yellow-ground picotees, and we have to thank that great raiser of new varieties, the late Mr. Martin R. Smith, for the grand flowers which now adorn our gardens and our tables.

I grew carnations as a mere boy in my native county, Ayrshire, when only bizarres, flakes, and white-ground picotees were to any extent known. True, there were selfs also in those early days, but such were only the sports of red, crimson, or purple, which had arisen from the said bizarres, flakes, etc., and in nearly every case such selfs were very different to those now in existence, being much more delicate in constitution than those of the present day.

Since the days of Mr. Martin R. Smith, however, we have not only had a new race of selfs, but also of fancies and yellow-ground picotees, and the grand colouring of these has as yet not even been approached by the many raisers of the newer kinds of perpetual-flowering carnations.

Although I admit that the perpetual-flowering carnation possesses many points in advance of the border race, notably in the fact that it may be had in flower at any time of the year, and that its stem is much stronger, and therefore more useful for indoor decoration, I must say that the border varieties far outstrip the perpetuals in varied colouring, as well as in hardiness during our trying winters.

### Layering.

The culture of the border carnation may be said to commence at the layering time, which is usually towards the end of July, but, owing to the early season through which we are passing, we commenced this year rather before the middle of the month, in the South of England at any rate.

Layering is one of the important operations in carnation culture, and such should not be put off until the grass has become hard and brittle, and it should generally be practised when the plants are in flower or immediately after. The best layers only should be selected, and all small and poor "grass" be cut away. It stands to reason that, unless the stronger layers are selected, the stock must gradually lose vigour, and in time become valueless. I never layer from a weak-growing plant, and if I have not good stock of any variety, I send to a specialist for it. The advice is frequently given to cut up through a joint, and bring the knife out accordingly, but for those who practice this I say emphatically insert the knife above the joint, and cut down through it, and the saving in time, as well as plants, will soon be apparent.

### Planting and Potting.

After layering, six weeks to eight weeks ought to elapse before the layers are detached from the parent plants, and those who wish to grow them in the open garden should prepare the ground beforehand by digging it deeply and enriching it about twelve inches under the surface with some good fresh stable or farmyard manure, according to the character of the soil. If heavy, use stable manure, but if light use cow manure.

I do not believe in well-rotted manure, either for border planting or pots, and this is where I differ from most of the older authorities on the subject. My experience of growing carnations in pots with fairly fresh manure is that you may kill one in twenty-five or thirty by doing so, but, those which stand such treatment are far stronger and better plants than those which are grown in a mixture of loam and well-rotted manure. I, therefore, plump for fairly fresh loam as well as fairly fresh stable manure for pot plants.

For exhibition culture in pots I advise taking up the layers two months after layering, and putting them into medium or large 60-sized pots, according to the strength of the layer. But those who wish to minimise space in the winter should put two plants well apart in either a small or large 54-sized pot. I generally find that two plants in a 54-sized pot surpass those in 60's by the time of the final potting in spring. The reason for this, I believe, is that the newly-rooted layer likes its roots against the side of the pot, and there is no doubt that layers put against the side of the pot root more surely, and are usually better than those put in the middle of the pot.

Another important point is to see that the young plants are not over-watered during the winter months. It is very seldom that I give water between the middle of November and the middle of January, and if the pots are stood on ashes, either in cold frames or the greenhouse bench, the young plants will obtain plenty of moisture from the ashes underneath. Any leaves near the base of the plants which turn sickly and yellow should be immediately removed, and every attention be given to cleanliness in all stages of the plant's growth.

### Spring Potting.

I usually commence potting about February 1, and like to have all my stock put into their final pots by the end of that month, as growth becomes active by that time. The compost I use is as follows: Five parts loam, one part each of leaf-mould and manure, and to this mixture I add a quarter-part each of coarse silver sand and medium-sized crushed oyster shell, as well as a similar quantity of good mortar rubble from between the bricks of an old building, preferably a chimney. A little soot is also a safe and useful ingredient, but it is not necessary. The two main ingredients are the loam and manure, both fairly fresh.

After the final potting give a good watering, and see that all the plants growing in the small pots are fairly damp before potting. See also that the soil is rammed tightly in the final pots, but take care that the compost used is a trifle dry, rather than damp, or the ramming will be injurious. The pots I use are mainly 16's, and into these I put three plants, but I also put four plants in a 12-sized pot, and two in a 24-size. I do not advise using smaller pots, such as 32's, even for a single plant, as they dry up much too quickly in the hot summer days, and require a great deal more attention as regards watering.

### Summer Quarters.

Potting over, I stand most of the big pots in span-roofed frames on ashes, and, after a week or two at the most plenty of air ought to be admitted, both at the top and sides of the frames. The frames I use are constructed with ventilators, both at the sides and ends, and this is very necessary for wintering, as well as for spring cultivation.

As soon as the plants are fairly established in their big pots, remove the top sashes of the frames during dry weather, and let the plants have all the air and light possible, but in wet weather keep the top lights on, admitting plenty of air by raising them with wooden blocks. In these frames I keep most of my selfs and fancies, as they will stand any amount of exposure until they spindle for bloom, which is generally in May, but the yellow-ground picotees are put into the cold greenhouse somewhat earlier, as I consider them less hardy, and the rains which fall in April and May would tend to make the foliage turn yellow and sickly, while the plants would suffer in consequence.

### Disbudding and Staking.

As the plants spindle for bloom, see that they are neatly staked and tied up loosely to keep the bloom stems straight and regular. I like the green-painted stakes, 3½ft. in length, as many varieties require more than a 3ft. stake. Many growers use thin bamboo cane points, but for neatness they do not compare with the round, green-painted wooden stakes.

Disbudding should be commenced by exhibitors as soon as the buds can be easily removed, but this is a matter which requires knowledge of the variety to be operated upon. The yellow-ground picotees give the best results disbudded to the top or crown bud, and so do many of the selfs and fancies, but in order to prevent a few of the selfs, and rather more of the fancies bursting their calyces, I always leave several side buds to develop, as well as the crown bud. With such disbudding the crown bud is left so as to have at least one foot of stem to it, leaving three or four of the lower buds on in order to keep the top bud safe from splitting. This means that the second, third, and fourth buds need to be taken away, leaving, say, the fifth, sixth, and seventh buds to develop.

I do not believe in feeding with artificial manures in any form, as these tend to produce rank growth, and the flowers from artificially-fed plants do not last on the plants, or when cut, more than a third of the time that naturally-grown flowers do. Although I do not practise natural liquid manure feeding myself, relying entirely on the rather strong stuff I use for my compost, I see no objection to such being used in a moderate way. The safest and best liquid manure is a mixture of fresh cow and sheep droppings put into a small sack, and left to soak in at least fifty gallons of rain water. Of course, soot water is also highly beneficial, as well as safe.

When the crown buds are three-parts grown it is advisable to put elastic bands round them to prevent bursting. Most of the filbert-shaped buds, however, such as the yellow-ground picotees develop, are quite safe without bands, but, as a precaution, it is best to use a band, even with them. A good few of the selfs and fancies have round and fat buds, and some of them must be tied with raffia to prevent them bursting; I use green raffia-tape, as it is much more easily split and worked than the ordinary raffia.

A greenhouse for carnation growing should not be too high at the ridge, and every sash on both sides ought to be made to open, as well as both sides of the roof. The doors also should rarely be closed, as all the air possible ought to circulate among the plants. Another important matter is the shading, and I strongly advise lath blinds in preference to cloth or scrim. Lath blinds are so constructed that there is a space of about ½in. between each lath, and, therefore, the shading is not so dense as that of cloth or scrim, and my experience is that the lath blinds keep the house cooler also. As regards cost, the lath blinds are little more expensive than cloth ones, and if the laths are properly prepared with wax there is no need to paint them.

Most of the blooms which I showed this year on July 23 had been out for a fortnight, and I attribute my success to the fact that I do not use liquid artificial or natural manures, and that I keep my blooms longer in condition than many, because I use lath blinds.

I hope that the hints I have given in this rather lengthy epistle may wake up some of those who have not followed the same plan as myself, and induce them to try other ways of growing their plants, and I may add, for those who are about to enter the field for exhibition, that they had better not pin too much faith to what they read in some of the older books on the subject, but aim, firstly, at strong plants; secondly, at cleanliness; and, thirdly, at giving plenty of room, as well as fresh air, and they are sure to succeed on the exhibition tables.

### Varieties to Grow.

I conclude by naming what I consider good reliable varieties in the three classes which I cultivate, although there are doubtless many omitted which other growers would advise. Most of the varieties mentioned I have had personal experience of, although a few of them are now being sent out for the first time. I might also add that my selection is for those who show them as grown:

Selfs.—Mrs. Eric Hambro, Mrs. Henwood, Furthest North, Crystal, and Attraction, white. Daffodil and Solfaterra, yellow. Mrs. Guy Sebright, Lady Hermione, and Rosy Morn, pink and rose. Miss Willmott, Cardinal, and Etna, scarlet. Mrs. George Marshall and Agnes Sorrel, crimson. Elizabeth Shiffner, maize; Mrs. G. A. Reynolds, buff; and Splendour, purple.

Fancies, Yellow, and Buff-ground.—Lord Steyne, Pasquin, Erl King, Linkman, Renown, Queen Eleanor, Donald McDonald, John Ridd, Forester, Mrs. Penton, Mandarin, and Rony Buchanan.

White-ground Fancies.—Nizam, Bride, Delicia, Hon. Dorothy Legge, Millie, Lady Gay, and Mrs. Andrew Brotherstone.

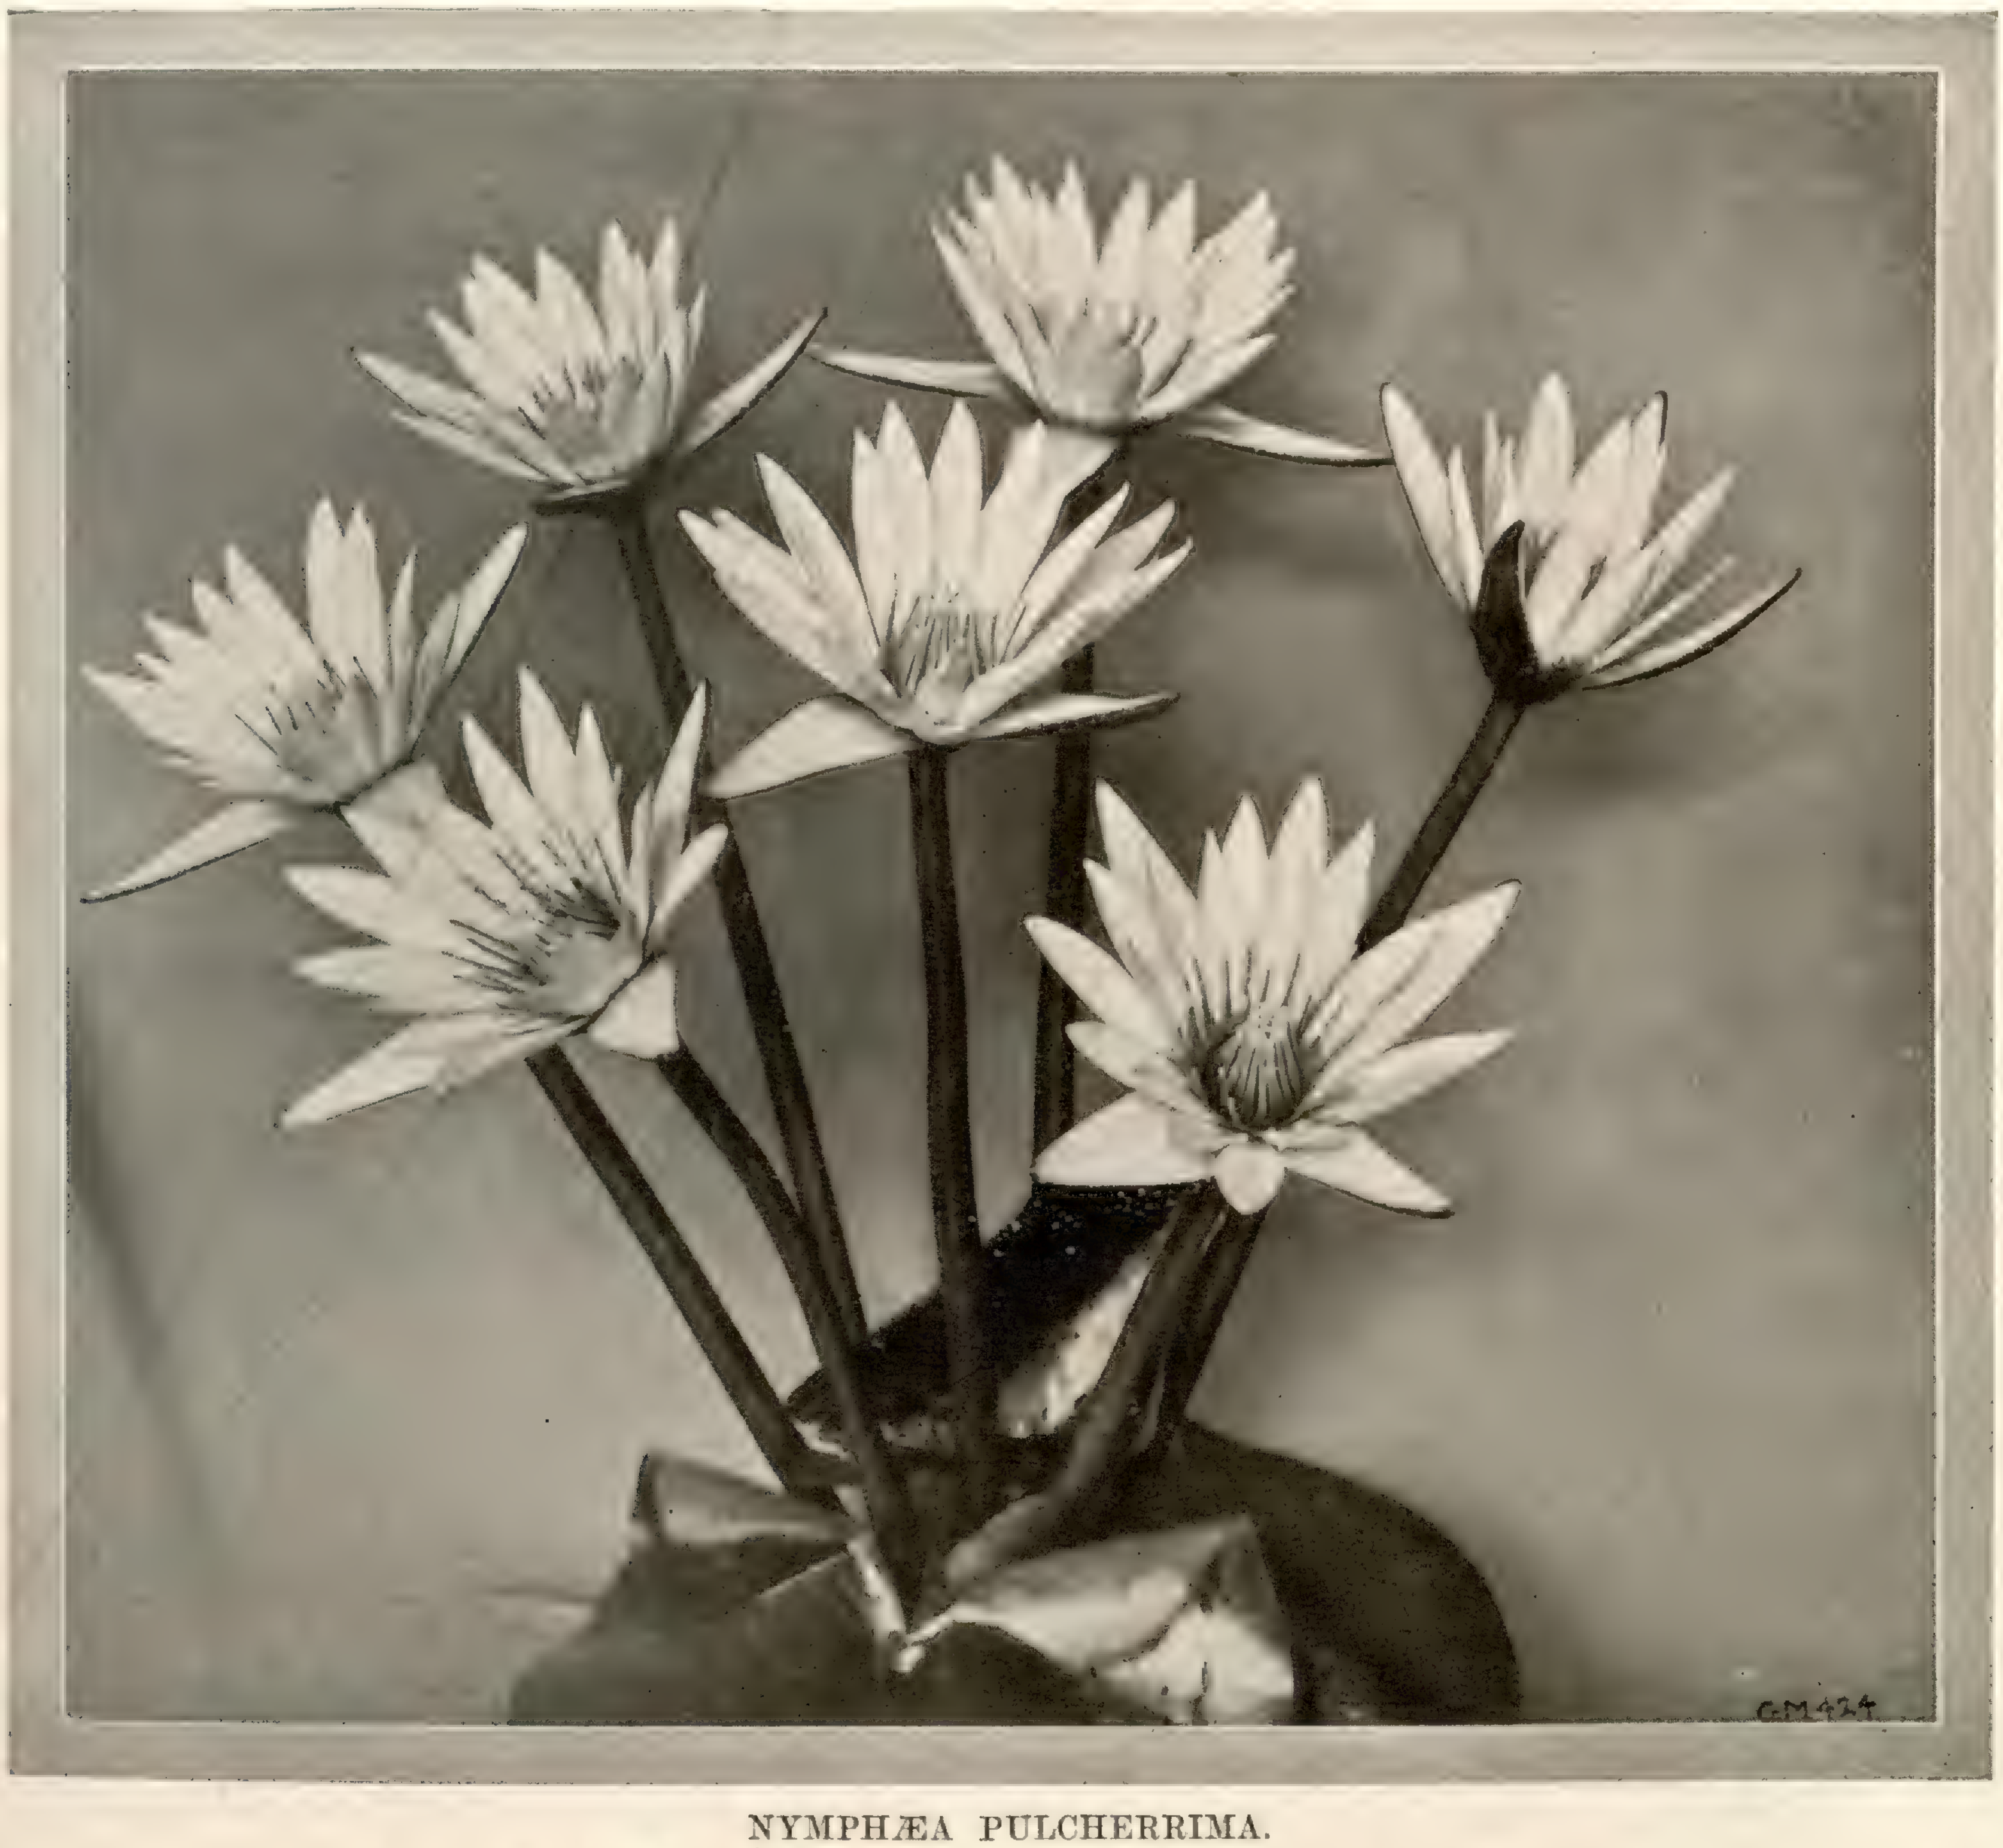
Yellow-ground Picotees.—John Ruskin, Onward, Togo, Santa Claus, Exquisite, Her Majesty, Mark Twain, F. W. Goodfellow, Neil Kenyon, Margaret Lennox, Agnes, and Constance.

R. Morton.

Grange Dene, Woodside Park.

## NYMPHÆA PULCHERRIMA.

This very beautiful water lily was very finely exhibited by Mr. James Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, at the meeting of the Royal Horticultural Society held at Westminster on Tuesday, August 27. The large, handsome flowers, blue, with a mass of yellow stamens, attracted a good deal of attention because they were larger and finer than those of N. stellata, of which N. pulcherrima is probably a variety. The blooms staged were from the open, but, as has been shown previously in these columns, the water in which they were produced is warmed as necessary by means of a small hot-water pipe. All the blue water-lilies are strikingly beautiful, as they raise their lovely blooms well above the water level, and form a distinct class from the Marliacea and similar groups. There are many gardens where, at very little expense, these fine aquatics might be grown out of doors with a little assistance in the way of artificial heat. At Kew N. stellata is grown in a pool of water that escapes, warmed, from the engines at the pumping station. In many instances a few yards of 3in. pipe attached to the nearest point of the heating apparatus would be all that is needed to produce the warmth requisite by N. stellata and its near relatives.



NYMPHÆA PULCHERRIMA.
A beautiful blue-flowered water-lily with a central mass of yellow stamens.

# CHOICE DAFFODILS IN THE GRASS.

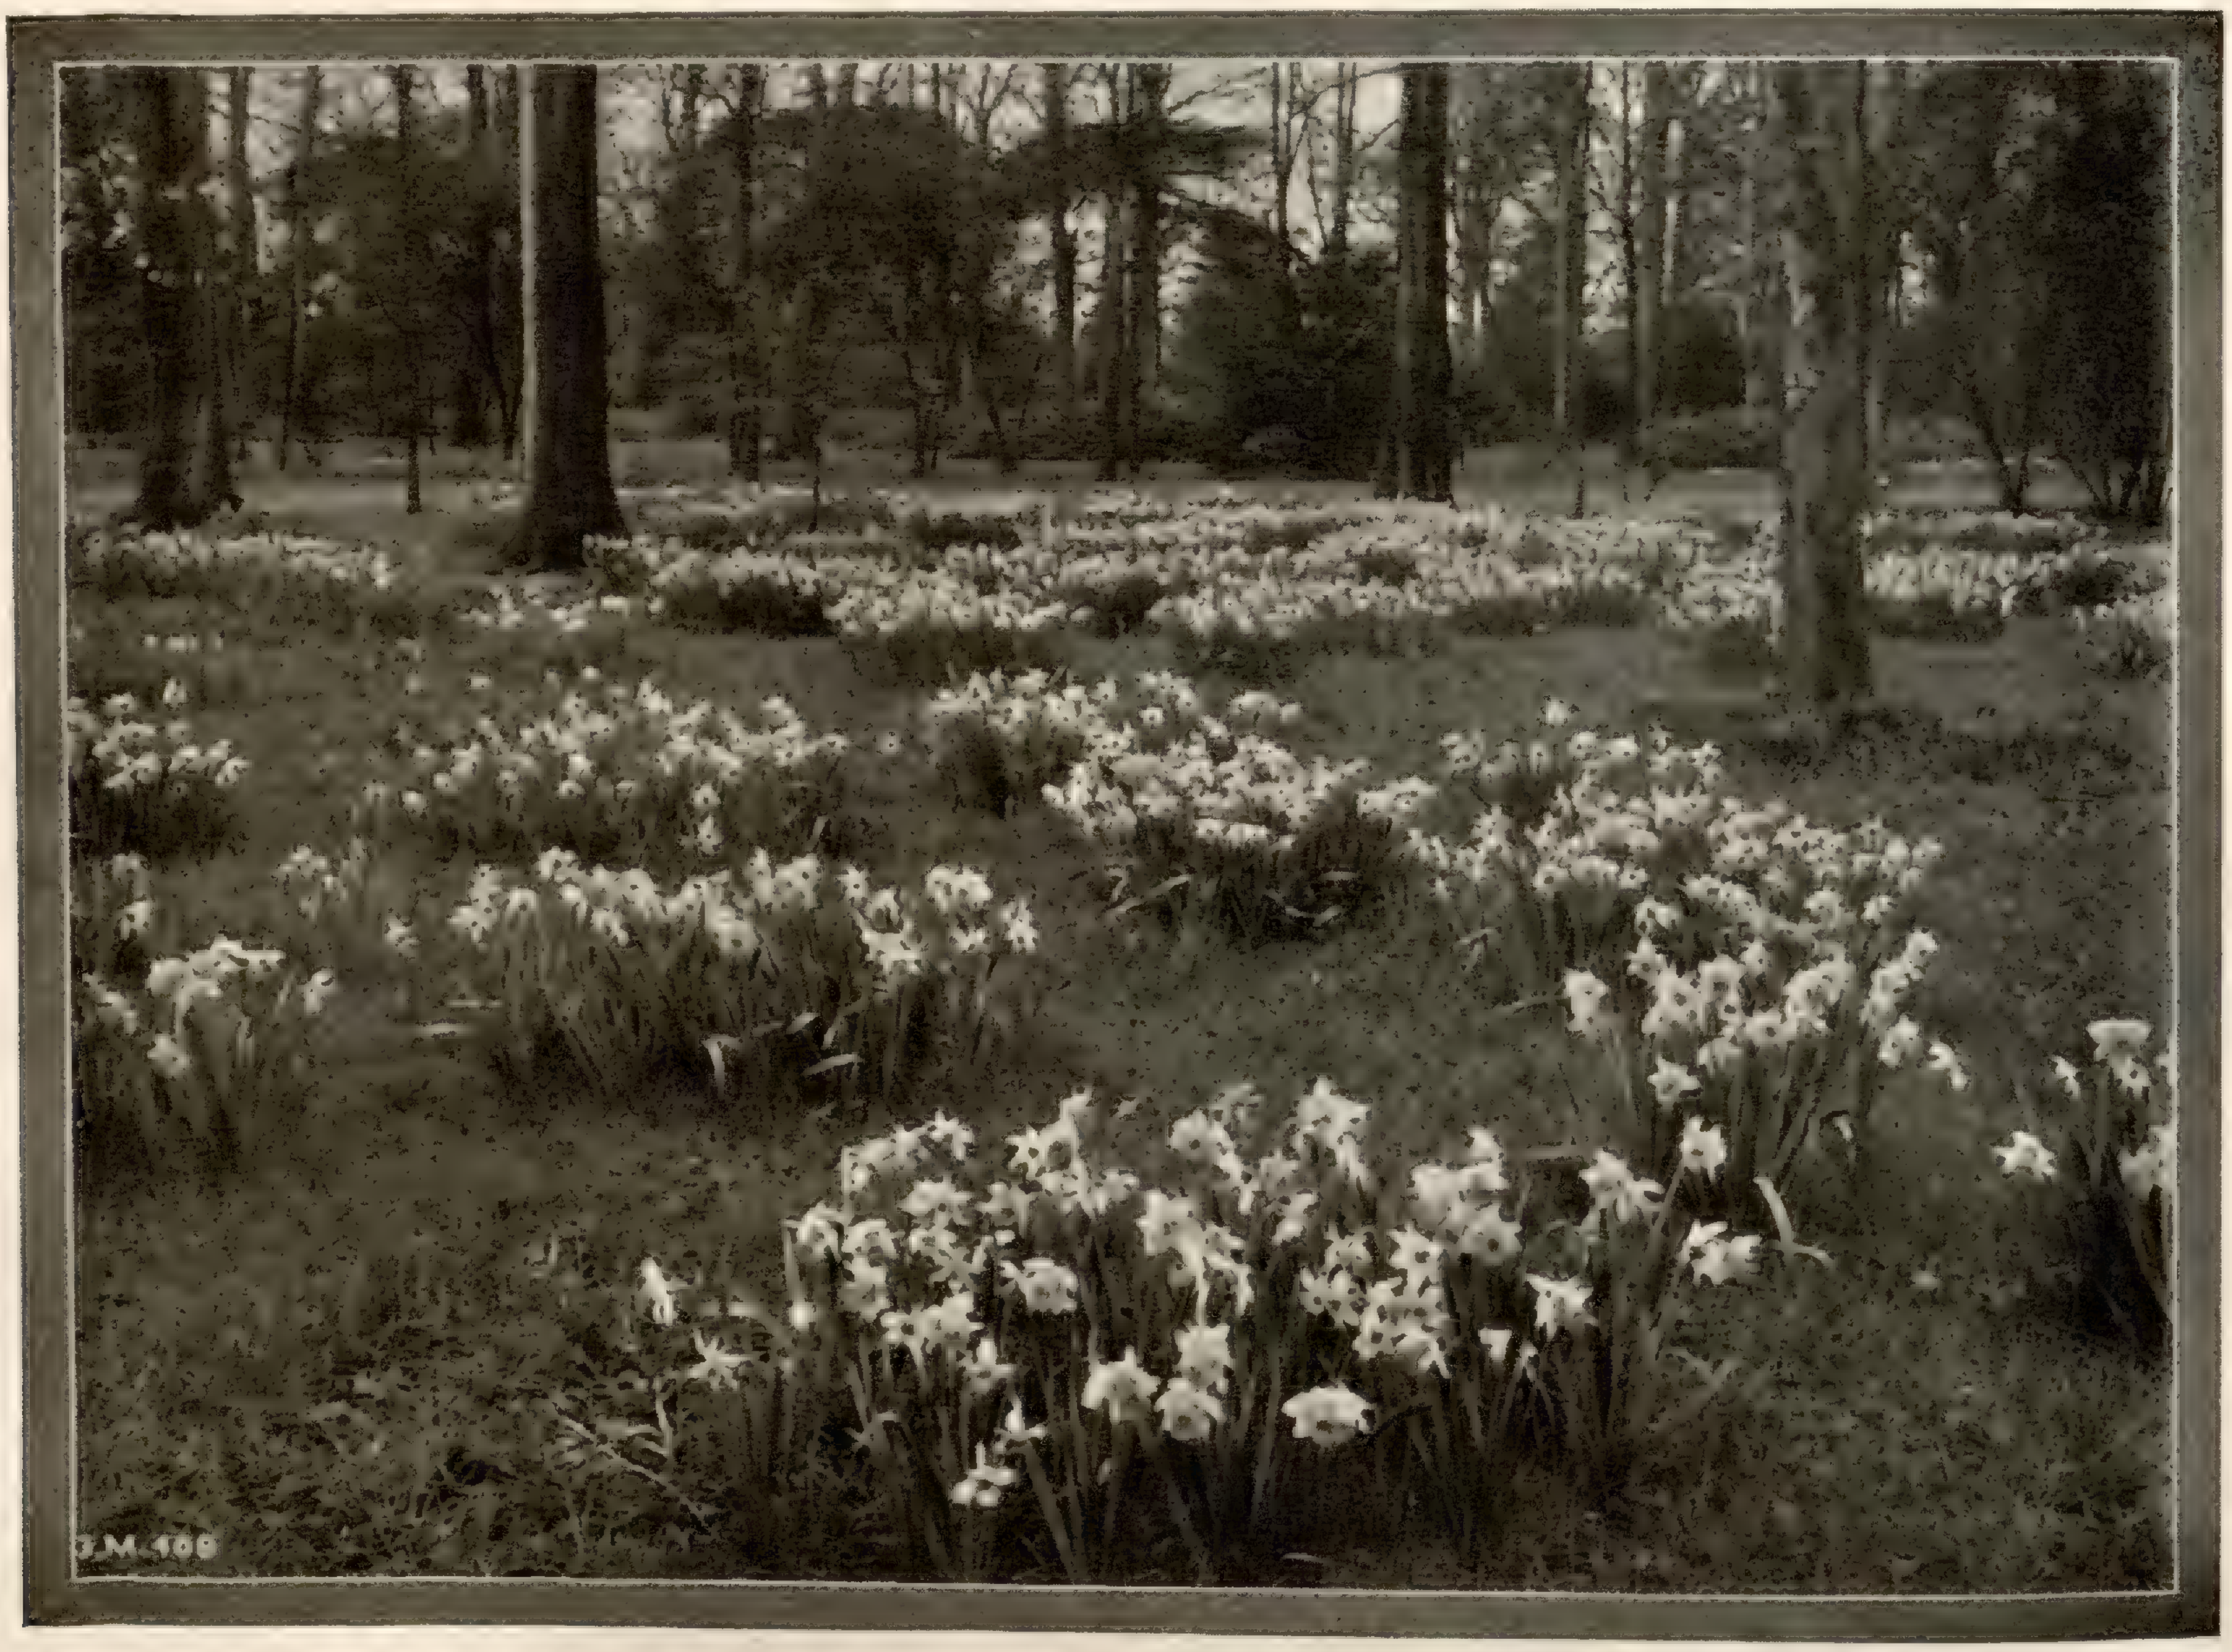
When enjoying, during the spring season of the present year, the exceedingly beautiful arrangement of daffodils which has been made in the arboretum at Kew within recent years, I was much impressed by the great value of the object-lessons it afforded the many thousands of visitors who crowded this part of the gardens that they might enjoy, as did Wordsworth in Lakeland:

> "A host of golden daffodils
> Beside the lake, beside the trees,
> Fluttering and dancing in the breeze."

The object-lessons that were to be derived from a close inspection of the flowers were two in number, and these differing but little in importance. It has, in the past been too much the practice in the cultivation of daffodils in the grass to plant the bulbs so thickly as to produce an effect more suggestive of a bulb ground of an extensive nursery or a field of a flower farm than of a part of the pleasure grounds of a private residence. Some visitors to gardens in which daffodils are grown in large and crowded drifts may, in describing what they have seen, have a feeling of satisfaction in being able to say with Wordsworth:

> "Ten thousand saw I at a glance,
> Tossing their heads in sprightly dance."

Such displays are impressive at first sight, and remain fresh for a long period in the memory of those whose opportunities for seeing large breadths of daffodils in the grass are but few. But the effect produced by great crowds of flowers extending over large areas is not such as to satisfy those whose artistic perceptions are of a high order, and even those who enjoy to the full great masses of colour soon lose their interest in them.



A SUGGESTION FOR PLANTING CHOICE DAFFODILS IN THE GRASS.

In the planting of daffodils in the grass as in their culture in the garden, they should be so arranged as to give the various varieties an opportunity of showing the individuality of the growth, as well as of the flowers. While the flowers are necessarily the predominating feature, much interest centres in the habit of growth, and, if this is hidden by overcrowding, much of the interest associated with daffodils is lost. Hence it appears to be a matter of considerable practical importance to direct attention to the method of planting which has of late been adopted by the Kew authorities with so much success. As will be seen from the accompanying illustration, the bulbs are irregularly arranged in clumps at sufficient distances apart to allow of their having a breadth of grass between them. This style of planting not only ensures the individuality of both flowers and foliage being preserved.

In walking among the flowers when they were in the full flush of their beauty, the delightful grouping suggested that the time had come when we should no longer be satisfied with the present method of devoting a large grass area to one variety. The practice had much to recommend it when the number of suitable varieties that could be obtained at a low price was small. But with a great increase in the varieties available, a considerable modification in the method of procedure might be made with advantage. The Kew example herewith illustrated suggests the formation of daffodil gardens in which each group is formed with a distinct variety, or two or more groups of one variety where the space is very large. But in the majority of gardens it will not be possible to find room for more than one group of a variety if an endeavour be made to fairly represent the several sections, that are adapted to grass culture. Nowhere do daffodils appear to greater advantage than when springing from a carpet of green grass, and nowhere could they be more readily seen and their many attributes of beauty enjoyed.

Where the pleasure grounds are comparatively small, the daffodil garden could be limited to the trumpet, the incomparabilis, the Barri, or the Leedsi varieties as the owner may prefer. Two or three sections may be grown in association, but the practice appears to be less desirable than having a representative selection from the trumpets or one other of the sections. The following will form a good selection of trumpets for a small daffodil garden in the grass, namely, Captain Nelson, Colleen Bawn, Cornelia, Duke of Bedford, Glory of Leiden, Golden Bell, King Alfred, Madame de Graaff, Monarch, Mrs. Buchanan, Mrs. Morland Crosfield, Rhea, and Weardale Perfection. From the Incomparabilis section may be selected Barn Owl, Blackwell Bountiful, Fireflame, Gaiety, Gloria Mundi, Homespun, Lady Margaret Boscawen, Lucifer, Queen Sophia, Strongbow, The Rival and Will Scarlet. A selection of Barri varieties should include Albatross, Armorel, Branston, Cresset, Firebrand, Incognita, Orange Frill, Oriflamme, Rosella, Seagull, Southern Star, and Vivid. The following may be selected from the Leedsi varieties with advantage: Amazon, Duchess of Westminster, Fairy Queen, Lucia, Peach, Phyllis, Salmonetta, Sylvia, Una, White Falcon, and White Lady. Some of the best of the older varieties may, of course, be associated with those enumerated if desired to have a larger number of varieties than those suggested.

G.

## VANILLA-SCENTED DAFFODIL.

The time being at hand when orders for bulbs are usually compiled, I am pleased to be able to direct attention to the qualities possessed by the above-named trumpet daffodil. Complaint is often heard that some of the new high-priced daffodils are not sufficiently distinct from one another to warrant the charges made, which, however, does not apply to the one under notice, and as it is listed by the Raynes Park firm at a comparatively moderate rate, it will undoubtedly be largely grown in pots and vases, both for room decoration and the conservatory, and the delicious perfume much appreciated by most persons. Apart from this, the fully-expanded flowers —for size, colour, and length of stem— are equal to the majority of noted sorts, thus giving a fine effect amid a cluster of ample foliage.

NARCISSUS DUKE OF BEDFORD.
A handsome bicolor of strong growth, the flowers large, with white perianth and yellow trumpet.

From three to five bulbs planted in soil or fibre, within the confines of a six-inch pot, and brought gradually on to the flowering stage, will be found when in bloom to emit sufficient aroma to make their presence known in a large room or entrance hall. In the future scented narcissus will probably be more prominent in the open garden than in the past, thus adding another charm, and enhancing the present popularity of this greatly varied family.

James Day.

## HARDY FUCHSIAS.

The fact that some of our hardy fuchsias are very pretty has been long recognised, but that there is such a great variety among them as actually exists is not so generally known. At the meeting of the Royal Horticultural Society, on August 13, a most interesting collection of fuchsias was shown, as stated in your report, by Mr. L. Russell. Some eighteen varieties of hardy fuchsias were included, and twelve or twenty of each variety were staged, and in this way their distinctive characters and general effect could be well seen. Of course, some of the varieties were familiar ones, but, on the other hand, some were decidedly uncommon. They were, for the most part, in five-inch pots, and had all passed the winter plunged outside. Some of them were raised many years ago by M. Lemoine, of Nancy, namely, Enfant Prodigue, a tall grower, with semi-dark-coloured flowers, a cross between one of the garden varieties and an original species; Elysée, another from the same source, of a decidedly erect habit of growth, with single, dark-coloured blossoms; Myrtifolia Minos, a compact, bushy plant, little more than a foot high, with a great profusion of semi-double flowers, with red sepals and purple corolla; Drame, a rather tall grower of compact habit, with a single bluish-purple flower; and Florian, of a sturdy, free growth, with a long purple corolla. Another very distinct variety was Brightoniensis, which forms a globular specimen about a foot high, and profusely laden with pretty distinct flowers, in which the rosy-purple corolla stands out crinoline fashion. Others were the old Fuchsia gracilis, F. gracilis variegata, F. globosa, F. Riccartoni, F. Thomsoni, like a small form of gracilis; Tricolor, pale rose sepals and lilac-purple corolla, suggesting somewhat a small-growing form of the old Rose of Castile; Madame Cornellison, with a white corolla; pumila, a dense, twiggy, upright plant, with tiny pointed leaves, and a profusion of very small dark flowers; virgata, like a strong-growing gracilis; and Corallina, a good old well-known kind. S. W.

## EARLY POT ROSES.

Where pot roses are grown it is generally to supply a few early blooms to come in a little before the climbers upon the walls of greenhouses. In order to secure this it is necessary to prepare the plants during August and September. Those which have flowered under forced treatment during last winter, and have been properly attended to since, will now need careful examination. Having been growing from January onwards, they have had quite time enough to make sufficient growth for our purpose, providing they were judiciously treated, and not allowed to become dry or starved at the roots, as is too often the case with forced roses immediately after their most useful crop of blossoms has been realised. My own plants have been standing out of doors since the middle of June, and are now rather more than three parts ripened. As usual, the hybrid perpetuals are the ripest. We can seldom get the whole of the growths upon the teas and their hybrids quite ripe until frost aids us, and even in the open ground it needs a considerable period of frost and colder weather before these are properly ripened.

When a plant has been in a pot for a couple of seasons it is wise to turn it out and remove as much of the old and worn-out soil as possible, without too much injury to the roots. Even when it is returned to the same sized pot, the presence of some entirely fresh soil is of immense benefit, in fact, is absolutely necessary to secure the best results. The best compost is a strong turfy yellow loam, helped by suitable manures. But this is hard to obtain, and not absolutely necessary. A good compost can be made as follows: Good loam and well-decayed vegetable refuse, one-third each, and the remainder made up of road sweepings, well-decayed manure, and a little sand. Do not use road sweepings from tarred highways, which is all the more deadly from the presence of petrol through leakage and waste from motor cars. Stable manure, unless thoroughly rotted, leaves the compost too loose as it decays, and I prefer that from a farmyard, or even a few pieces of dried cow manure, to the looser material from the stable. Do not have the compost broken up so finely as most use it. So long as some of it can be worked among the roots the remainder may be coarse, and will be better so if pressed down firmly. Too finely riddled a compost sets down hard from successive waterings, and soon stagnates. The roots must not be cramped nor bunched to one side of the pot, and if the plant can be potted a trifle deeper than it was before it will be better, as this will encourage lower growths that are stronger than those breaking higher up the plant.

Roses require a considerable amount of water, and the pots must be well drained. There is not nearly so much drainage material needed as many use, and I do not approve of crocks or pieces of pot alone supplying the drainage. Two or three pieces properly placed are ample, a few half-inch bones and coarser soil being added before the ball of the plant is set into the pot. Add a little of the prepared compost at a time, and press firmly with the fingers, or a piece of wood.

After potting stand the plants upon the shady side of a hedge or wall, and sprinkle the growth freely two or three times a day during fine weather. This will not only guard against any undue shrivelling, but prevent the growth from drawing all needed moisture from the roots for a short time. By the end of September the roots should have worked freely into the new soil, and the eyes upon matured wood will have plumped up and be ready to break into new growth as soon as put under cover once more.

Do not introduce the plants to heat hastily, but let them come along naturally as they will for a time when brought under glass again, afterwards giving just sufficient heat to keep the growth on the move until the flower buds appear, when it is generally safer to hurry them a little. Little pruning is needed; simply cut away weak growths, and shorten back the stronger rather less than would be practised upon the same variety in the open; but always keep the centre of the plants from becoming crowded. ROSARIAN.

## THE MIXED BORDER.

The numerous illustrated gardening books which issue from the press in a never-ending stream accustom us to pictures in which we see the whole of a mixed border one blaze of colour from end to end. Whether it is intended that we should believe them to represent the normal condition of a successfully managed border at any time during the height of the summer or no, the fact is that they are apt to make us very discontented with our own comparatively poor efforts. But a little reflection will show us that a border which in early June is a magnificent display of irises, tree lupins, eschscholtzias, and Oriental poppies, will present but a dull appearance from July to September, while a border which at the end of the same month has towering spikes of delphiniums, groups of white or orange lilies, and masses of the Dropmore anchusa, may be rather an eyesore in two or three weeks' time.

These picture-book effects are very fine for the visitor to admire, but for the man who wants to enjoy his garden from April to September, and even another month at each end, they are a mistake, unless he has so much space that he can afford to give up beds and borders to each season of the year, and, after a blaze of two or three weeks at midsummer, be content to expect little more from them for the rest of the summer than moderate tidiness.

The most that can be done with borders which are filled with perennials to produce a great effect for a short time is to use the spaces among the plants for bulbs to make a display before the perennials grow up, and with them may be associated such early-flowering spring plants as primroses, auriculas, leopard's bane, short-spurred columbines, wallflowers, and the like, by which means the great display of the summer may be preceded by a good deal of brightness early in the spring. Borders of this sort which are not expected to make any great show during some part of the height of the summer should not be located in the most prominent parts of the garden, notwithstanding their brave show when at their best, unless they are planted with subjects which are at least of neat and prosperous appearance after they have flowered, as is the case with Chinese pæonies, tree lupins, iris, erigerons, etc.

The average man, however, with a garden of moderate size, wants the whole of that section of it which is given up to flowers to be fairly presentable from May to September, and in such cases compromise must be the rule, though where the owners are away for the same period of the summer or autumn each year the scheme of planting will naturally be influenced by this, for it will be a bad arrangement to have a great show of perennial sunflowers, heleniums, rudbeckias, Japanese anemones, and so on, when the family is away the greater part of August and September each year, especially as such a display is necessarily at the expense of the effects in the height of the summer.

With this consideration borne in mind, the scheme adopted must be one in which there are always some effective subjects in flower in a given border during the season the garden is used, arranging it so that it is at its best when it is expected to be most seen and appreciated. Plants in flower should be surrounded by others which are full of growth and promise, those which have had their season, and are finished with, being so planted that later-flowering plants may grow up in front of them, or, in some cases, even spread over them, so that the sense of prosperity and general well-being may not appear to be on the wane until August is at least well advanced. To keep a mixed border fairly presentable all through the summer, and not without beauty in the spring and autumn, requires more thought than any other phase of open-air gardening, but it can be done if two or three general principles are borne in mind.

The first is that a stock of plants must always be kept in reserve to fill up any gaps which occur as the summer advances. These may be either plants in pots, or clumps in the open which can be easily lifted any time during the summer when the weather is damp, such as early-flowering chrysanthemums, annual asters, snapdragons, Michaelmas daisies, or even young plants which it is desirable to put in their flowering positions for the following year so as to avoid moving them late in the autumn, such as the Dropmore anchusa, Caucasican scabious, tree lupins, hollyhocks, and the like.

Another principle to be acted upon is that plants which, though making a great show, are soon over, and are untidy afterwards, must not be put in such a prominent part of the garden as the choicest mixed beds and borders usually occupy, but should be put where, while given full opportunity to display themselves, their subsequent untidiness will be of little consequence. Oriental poppies, delphiniums, and Madonna lilies may be treated in this way. This applies to many annuals, though some of the latter may well be grown in patches in the mixed borders, and their place taken by reserve plants as soon as they are getting untidy.

Still another useful principle to adopt in the management of such borders is that of having a group or two, at least, of some plants which make a good show during the greater part of the summer, such as gaillardias, Coreopsis grandiflora, pentstemons, violas, snapdragons, geums. French and African marigolds, etc., which form an excellent stand-by while other things come and go.

With a similar object in view, all mixed borders should contain at least some small-growing shrubs or shrubby plants, which, while beautiful in themselves, may act as a setting and a foil to give some little beauty to the border even through the dead season. Among many such might be mentioned lavender, rosemary, some of the shrubby veronicas, hypericums, and cistuses, santolina, myrtle, and young shrubs of laurustinus and Berberis Darwini.

ALGER PETTS.

---

**Linum grandiflorum rubrum.** —The different annuals contribute no small share to the embellishment of our gardens during the summer months, when all is gay and bright. Of this class a great favourite of mine is the linum above mentioned, with flowers of a rich ruby-red colour, and a darker centre. When the sun shines on them they are quite dazzling in their intensity. Seed is very cheap, and can be readily harvested.—W.

# SUMMER BEDDERS IN REGENT'S PARK.

Compared with last year the summer-bedding at Regent's Park possesses far more cheerful surroundings than in 1911, when the trees and grass, owing to the tropical weather we then experienced, presented a most unhappy appearance. Now they are both of the richest green, and serve admirably as a setting to the many brightly-hued blossoms.

Owing to the moist and cool summer, some of the flowers are not seen at their best, while, on the other hand, some of them simply revel in the prevailing conditions. Cannas show the want of warmer weather, and so do some of the stove plants, of which a great number of different kinds are plunged outside during the summer months. The moist weather we have experienced has led to pelargoniums of all kinds growing with unwonted vigour, while their floral display has not been in keeping with the growth of the plants.

Among the subjects that are seen at their very best this season a foremost place must be assigned the

### Fuchsias.

Regent's Park has long been famous for fuchsias, and this season they are, as usual, freely represented both as large plants sunk singly in the turf, or disposed in extensive beds, being edged with some of the smaller-growing kinds. The good, old, and well-tried varieties form the principal part of the collection, prominent among them being Mrs. Marshall, Mrs. Rundell, Display, Madame Cornellison, Abd-el-Kader, Beauty of Exmouth, Empress Eugenie, Scarcity, Mrs. E. G. Hill, and Ballet Girl. The dwarf-growing Alice Hoffmann, with a pure white corolla, has become a general favourite, not only here but wherever summer-bedding is carried out.

Of the more uncommon varieties especial mention must be made of The Doctor, which I have only met with in Regent's Park. It is somewhat in the way of Mrs. Rundell, but is more floriferous, while the blooms are stouter and more highly coloured. Another attractive variety is Lena, sent out by the late Mr. William Bull, of Chelsea, about a dozen years ago. The flowers of this have the tube and sepals white, flushed with pink, while the semi-double corolla is of a bluish-violet colour. A very pretty bed is planted with upright specimens, about a yard high, of this variety, and the bright red Scarcity, disposed alternately, underneath which is the yellow-leaved Golden Treasure, while the entire bed is carpeted with lobelia and Harrison's musk. This last, which is somewhat extensively used, is everywhere in particularly fine condition, the moist conditions that have obtained throughout the past summer being favourable to its full development.

### Vases.

Some of these are very large, and always form a feature of the summer display. Much the same arrangement is followed as in previous years, that is to say the large ones are furnished with plants so disposed as to form a dense cone, the bottom part consisting of Tropæolum Lobbianum and ivy-leaved pelargoniums, above this, zonal pelargoniums and fuchsias, the apex being formed with Abutilon Thompsoni and Eucalyptus globulus. Some of the smaller vases are planted with ivy pelargoniums, one variety only in a vase. Particularly noteworthy among these are the deep pink-flowered Galilee, sent out by M. Lemoine in 1887, and Abel Carrière, one of the oldest of the present-day race. This has rich purple-coloured flowers. Souvenir de Charles Turner is, of course, also represented.

### Succulents.

As Regent's Park possesses many large agaves as well as a fair collection of succulents generally, the material for an extensive bed of this class is ready to hand. What is more, a good use is made of it, and the succulent bed situated in the angle formed by two walks forms a very striking feature. It is a large, somewhat triangular-shaped bed, and is sufficiently extensive to be thrown up into several mounds. Each mound is topped by a large, well-furnished specimen of Agave americana, the space underneath as representing the upper part of the mountain, being carpeted with different greyish-toned or silvery-leaved subjects, chief among them being Cerastium tomentosum, Mesembryanthemum cordifolium variegatum, Lotus peliorhynchus, and Nepeta glechoma variegata. On the lower plane are disposed various succulents, such as opuntias, cereuses, echeverias, mesembryanthemums, etc.

### Mixed Beds.

The large palms and other warmhouse plants have for long proved to be a feature of the summer bedding at Regent's Park. Though still attractive, such subjects as crotons, acalyphas, and others of this class are not seen to the same advantage this year as when the summer is warmer. What may be regarded as the rank and file of the different flowering subjects for furnishing the mixed beds are, of course, freely represented. Included among them are such well-known kinds as calceolarias, lantanas, begonias, heliotrope, celosias, cupheas, hydrangeas, Solanum jasminoides, Streptosolen Jamesoni, Plumbago capensis, etc.

### Silvery-leaved Plants.

Of late years there has been a considerable increase in the employment of silvery-leaved subjects for bedding purposes. When used as dot plants, as they often are, the soft, neutral tone of colour serves as a foil to brightly-tinted blossoms. Those which are extensively used in this way at Regent's Park are Calocephalus (Leucophyton) Browni, which, both as dwarf and tall plants, is much appreciated; Artemisia arborea, whose prettily-cut leaves are of a pronounced silvery hue; Gnaphalium microphyllum, Gnaphalium lanatum, and raria maritima.

### Bedding Violas.

A very large, irregular-shaped bed is devoted to a collection of bedding violas, which make a goodly show. Brought together in this way not only can their distinctive features be readily compared, but the wealth of blossom that they maintain over a lengthened period can be easily seen. Prominent among the varieties represented are Blue Diamond, bright blue; Maggie Mott, yellow; Sunset, purple and gold; J. B. Riding, purplish rose; Bridegroom, pale lavender; Lilacina, lilac; Primrose Dame, primrose-yellow; White Beauty, white; and Endymion, lemon.

### Herbaceous Plants.

The long herbaceous border which runs on one side of the flower beds contains a good and varied selection of plants. The number of yellow-flowered composites now in bloom serves as a warning that the autumn season is fast approaching.

S. W.

# THE SCHIZANTHUSES.

There are few, if any, annuals that surpass the schizanthuses for conservatory and greenhouse decoration during the spring and early summer months. During recent years they have made rapid strides in public favour, and have become immensely popular. They are admirably suited to pot culture, and also highly appreciated for the supply of cut flowers. Not long ago they were looked upon as hardly worth cultivating, but at the present day they are regarded as quite indispensable.

Some considerable improvement has taken place among them during late years, and now excellent varieties are to be obtained which are much superior to the old ones. It is really astonishing what a wealth of blossom a well-grown plant will produce. Again, they yield such a vast range of colours in the most lovely shades imaginable. Apart from the graceful habit of the growth, and the beauty of the flowers, their simple and inexpensive culture should highly recommend them. Besides being so useful for pot culture, the schizanthuses are splendid subjects for growing in baskets to suspend from the roof. The worst enemies one has to contend with in the cultivation of schizanthuses are mildew and dampness, which are readily overcome. The old style of growing them was to place three plants in a pot, but by far the best results are obtained when they are grown singly.

To secure a batch of plants to flower in April the seeds are best sown during the last week in August, or, at the latest, the first week in September. For later flowering seeds are sown in January. Six-inch pots will be found most useful for the purpose of seed-sowing, and they should be filled with a compost consisting of two-thirds loam and one-third leaf-soil, with a liberal addition of sand. Sow the seeds thinly, and merely cover them with fine soil. A cold frame or greenhouse is the most suitable place for the seeds to germinate in, shading them to prevent too rapid evaporation.

When the seedlings are of sufficient size to handle, transplant them to seed boxes, using the same kind of compost, and place them in a cold frame. Here they should be kept as near the glass as possible, and shaded until recovered from the disturbance. After becoming established free ventilation must be afforded to promote a healthy, sturdy growth, and on favourable occasions the lights should be taken off during the middle of the day. Pot the plants immediately they are large enough into 2½in. pots. After potting frame culture is still the best if favourable weather prevails, but if very wet and damp the top shelf in a cool greenhouse is the most suitable place for them.

It must be borne in mind that schizanthuses ought not to be subjected to high temperatures at any time; 40 to 45 deg. at night is ample during the winter. As a rule, repotting is necessary early in January, for at this period growth will advance rapidly. Six-inch pots are best for this purpose, and a compost consisting of half loam, with the other half made up of equal parts dried cow droppings and leaf-soil, adding sufficient sand to keep the whole open. Guard against too hard ramming, as the soil should only be made firm. There can be no hard and fast rule made regarding the stopping of the growths; this must be left entirely to the discretion of the grower. Some plants will produce side growths, and form well-shaped plants naturally, while others must be induced to do so by pinching out the top of the growth.

As growth advances, and the pots become full of roots, eight-inch pots should be provided for the last potting, using the same kind of soil as for the previous shift. On no account must they be allowed to remain in a root-bound condition during the growing period, or premature flowering will result. One stake will be quite sufficient to support the whole plant, and should be placed in position when the final potting takes place. As growth proceeds all the shoots must be looped to this stake before they become heavy. The tying operations will require frequent attention to ensure well-formed specimens. Watering must be carried out in a very careful manner, for excessive moisture is most disastrous. Should mildew appear at any time, a dusting with flowers of sulphur will check it.

For basket culture the plants are grown in the six-inch pots until they are ready, when they are planted in the baskets. The number required for each basket will be governed by the size of the latter. A twelve-inch basket will hold four plants.

Regarding varieties suitable for pot and basket culture, there are grandiflorus hybrids, an excellent strain in every way; grandiflorus maximus, with large flowers, and a splendid range of colour; S. retusus and S. retusus albus, two of the older kinds, and, although both are suitable, they are quite out-classed by the two first-mentioned; S. Wisetonensis is of good habit, and very free-flowering.

Gnaton Gardens. E. C. Pooley.

## IXORAS.

Though large specimen plants are at the present time not grown to anything like the same extent as they formerly were, there does not seem to be any decline in the popularity of the ixoras, as among their desirable features is the fact that they will flower freely in a comparatively small state, at least most of them, for I. macrothyrsa or Duffi is only seen at its best when grown strongly, as the huge heads of brilliantly-coloured flowers demand the energies of a large plant for their development. On the other hand, the numerous garden forms derived from Ixora coccinea may be flowered freely in pots from five to seven inches in diameter, and they serve to render the cool part of the stove gay during the summer months. The different varieties bear flowers of, for the most part, some shade of orange, scarlet, or salmon, but there is one very distinct form, namely Ixora coccinea lutea, whose flowers are of a clear, soft yellow. Those of I. Westi are pink; while I. odorata has pure white blossoms. Exception is sometimes taken to ixoras on the ground that they take much trouble to keep them clean, but if in a healthy state this is in no way difficult. Thrips can be readily kept down by a free use of the syringe, and this will also prevent mealy bug from being at all comfortable. A bottle of methylated spirit and a small brush kept handy may be used at the first appearance of the latter pest with advantage. W.

**Pentstemon Newbury Gem.**—It may not be generally known that this showy pentstemon, which is so popular for bedding purposes, is regarded as a true species, for it is considered to be identical with Pentstemon Hartwegi, a native of Mexico, and introduced therefrom in 1825. It furnishes one of many instances of a good old plant, which, lost for a time, becomes very popular when re-introduced.—W.

## THE POSSIBILITIES OF A SCHOOL GARDEN.—III.

### A Field for Nature Study.

It dawned upon education authorities some years ago that while children in village schools went through a certain routine of education, more or less mechanically, and left after they had passed the sixth standard, say, in possession of a certain number of facts, they were not encouraged to observe anything, and the great and fascinating book of Nature was closed to them simply because the opening of it was no part of the curriculum of the elementary school. Here and there, it is true, you came across a teacher who was a naturalist, a botanist, or a student of Nature himself, who introduced Nature study into his school simply because it was natural for him to do so, and he couldn't help it, but, apart from such exceptions, children looked upon birds' nests as something to rob, flowers as something to pick, insects as something to kill, but as for making any study of the natural and animal life round about the school, well, the children could tell you much more about the polar bears in the Arctic regions or the elephants in India.

In view of all this, the introduction of Nature study was a good thing, though it has to be admitted that a certain amount of so-called Nature study was wrongly named altogether. It came suddenly, this new subject in the schools, and its coming found a good many teachers as ignorant of it as the children. They set out to teach Nature study without knowing Nature themselves, and they had to resort to one or other of the handbooks that came out with remarkable rapidity, and while some of them were very helpful, others failed to serve the purpose for which they were intended, not so much because the author was at fault, but because attempts were made to teach Nature study from the handbook alone.

I say that the introduction of Nature study into schools was a good thing, even if it did nothing more than encourage children to use their eyes and observe, but, apart from this, it did not, in many cases, lead up to anything, nor have any bearing on the economic side of life. As an illustration of what I mean, in how many schools, I wonder, do you find glass jars in which the children watch toad-spawn develop into tadpoles, and from that stage into the complete toad, which is afterwards liberated, or consigned to the tender mercies of the school cleaner, with the result that its fate is doubtful, and the study comes to an abrupt conclusion.

The advent of school gardening opened up a field for Nature study that had never been thought of before, and it is a Nature study that carries one much further than mere observation, because it has direct bearing on cultivation, and is as essentially a part of gardening as operations like digging, sowing, and planting. You have only to take the adult rural population to learn that it is mostly ignorant of the insect life to be found in fruit garden and orchard. "Blight" is the comprehensive term that is applied to the various pests of crops, and some extraordinary ideas are held as to the origin of these pests. Dozens of people in the country know nothing of the way the balance of Nature is maintained by one insect feeding on another, and, in their ignorance, they not infrequently destroy their best friends in the garden and orchard under the mistaken idea that because they are insects they must all necessarily be pests. Is there any reason whatever why this appalling ignorance should exist respecting the ways and habits of the living creatures which abound in gardens? None whatever, and yet one knows what a difficult matter it is to instruct grown-up people in these matters, and induce them to alter their views in respect of "blight." Obviously, the place to begin is the school, and the apt teacher may obtain abundance of material for all the Nature study he has time to teach without going beyond the limits of his school garden, or the nearest fruit plantation.

As a matter of fact, the school garden has many phases of Nature study to offer. There is the soil, to begin with. It offers itself for numerous simple experiments that are not only interesting and useful, but they are Nature study in its purest form, and boys can be taught, not only how the soil is formed, and what it is composed of, but also how it can be improved in order to render the maximum amount of service to the person who cultivates it. Plant life is a generally accepted phase of Nature study, and surely we have it in the garden. It is just as easy to study the habit, method of propagation, progress, and reproductiveness of a cultivated plant as it is of a wildling from the hedgerow, and infinitely more useful, as the child gets into close acquaintanceship with subjects that he may have to do with when his schooldays are over. Even the weeds of the garden have their uses in Nature study, and by learning how they increase, multiply and protect themselves, the boy also learns the best means of eradicating them.

One day, in a school garden, I noticed a boy was extremely careful not to injure a ladybird on one of his crops, and, at the same time, he was just as diligent in searching for, and destroying, the larvæ of the ladybird. The fact was, of course, that he knew the ladybird, and had been told that it was a friend, but he knew not the larvæ, and, simple because he didn't know it, he came to the conclusion that it was something injurious, and must therefore be destroyed. This is probably just what the boy's father would have done, because he would not have known any better, but surely also this is where the value of the garden as a field for Nature study comes in. How many cottage gardeners and allotment holders, I wonder, who see the white butterflies hovering over their cabbage beds, and notice the caterpillars feeding on the leaves, also know the story of the ichneumon flies, that follow in the wake of the above pests, prey on them, and prevent them doing anything like the damage they would if Nature provided no such means of keeping them in check.

Perhaps in rural districts the most striking thing is the ignorance that prevails in respect of the pests of fruit crops, and though, perhaps, in a large number of school gardens there is not sufficient material to study them, the teacher will have no difficulty in obtaining ready access to an orchard or garden at hand where they abound, and in the spring and early summer will find material in abundance for Nature study. This phase, too, mind you, has something more to offer than bare observation, because the rural education of to-day will not be complete if it turns out a generation of country dwellers and workers, who look upon the various injurious pests of fruit crops as merely "blight," and protests, as many do now, in spite of everything you may say, that this "blight" is spontaneous in appearance, or is brought in clouds on the wings of easterly winds. H.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

CYPRIPEDIUMS.—C. Charlesworthi will be in flower, or pushing up its flower spikes, according to the temperature in which it has been grown. It is a rather small and slow growing species, but is very free in producing flowers when its requirements are properly understood. It succeeds best in a shady position at the cool end of the intermediate house. Like all cypripediums, it is especially fond of moisture during the growing season. After flowering the plants will not be so active until February, therefore they should be kept drier during the winter months, but should not be allowed to become quite dry. Where this cypripedium is grown in quantity, there will be found a great diversity of form and colour among the flowers. The late autumn and winter flowering cypripediums of the intermediate section all bloom with remarkable freedom, making them of special value during the dull season of the year. No other orchids will produce flowers in such abundance, or provide such a display at that season, and undoubtedly the great popularity these plants enjoy is due to this, and to the length of time the flowers last when cut. The section includes C. insigne and its numerous varieties, both yellow and spotted; C. insigne Sanderæ is still amongst the best of the former, and C. i. Harefield Hall the best of the latter. These are often recommended to be grown cool, but I have not yet seen plants growing satisfactorily under these conditions the whole year round. They delight in an intermediate house temperature at all times.

SEEDLINGS.—At the present time it is undoubtedly the ambition of everyone who cultivates orchids to raise seedlings, and, as cypripediums are the easiest of all to succeed with, many start with them. The present is a suitable time to repot seedlings that have become root-bound, or require new rooting material, the general atmospheric conditions being favourable to root action. Small seedlings may also be removed from the seed beds, placing several together in small pots. For these the rooting material should consist of equal parts of peat fibre from which all the fine particles have been taken, and sphagnum moss. Place the soil moderately firm in the pots, and to encourage the small seedlings to take root-hold quickly and without check, a warm, moist, and shady position, where the rooting material will keep moist, with occasional waterings, should be found for them. Slight sprayings overhead on favourable occasions will be beneficial, but must be done with caution. The tiny plants must not receive an excessive amount of water at the roots at any time.—J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

CALADIUMS. — These handsome foliage plants will now be passing to rest, and will require less water than hitherto. Let the drying process be carried out gradually, for the corms still have to complete proper development. Place them in a sunny position in a warm house or pit, with air passing through in order to ripen the corms thoroughly, and when this is complete store them in the pots which should be laid on their sides in a warm house away from drip. Damp and cold during the resting period is fatal to caladiums.

ABUTILON SAWITZI.—Plants that have become leggy, or ill-shapen, may be cut down, and the strongest shoots used for the increase of stock. Insert the cuttings round the sides of small pots filled with light, sandy soil, and place in the propagating frame. When rooted put them singly in small 60's, and grow on freely on a shelf near the roof-glass. These will make strong plants before winter, and will prove useful for house and table decoration in the small pots, or they may be shifted into larger pots for specimens. In the former case no stopping should be done, but if to be grown on pinch out the leading shoot when strong enough.

CLERODENDRON BALFOURI.—Whether grown on the roof or pillars of the stove, or on a trellis in pots, the plants should have all calyces pruned away as they fade; also all weak shoots should be shortened in order to concentrate the energies of the plant on the development of the stronger growths, which will produce flowers next year. No time should be lost in placing them in a position where they will receive the maximum amount of sun and air before going to rest. Allow the plants to become on the dry side before applying water, and then give only sufficient to keep the wood plump.

OTHER CLIMBERS, such as allamandas, stephanotis, bougainvilleas, and dipladenias, require similar treatment at this season to ensure ripening of the wood, without which a wealth of flowers cannot be expected next year.

PLANTS IN COOL HOUSES.—Many occupants of plant stoves will bear a few week's sojourn in the conservatory in the majority of summers, but this year great care will have to be taken not to leave them too long, unless the structure is kept heated, or the plants will suffer much injury. Generally speaking, it is better not to risk them in such structures in seasons when the prevailing temperature is much below the average. —H. T. Martin, Warren Wood Gardens.

## THE FLOWER GARDEN.

HEATHS.—Many of these are making a showy display, and, when naturalised in large, irregular masses on rough banks and other open spaces, they create a pleasing feature. When once established they require little attention beyond weeding, and having the long, straggling growths shortened back after flowering. The various hardy ericas can be planted during the autumn and winter months, and they are not so particular about soil as is sometimes imagined. It is important to thoroughly cultivate the ground for their reception, and to let it settle down well before planting. Where the soil is heavy and retentive, incorporate a liberal supply of leaf-soil and coarse sand with it; and when planting, press the soil very firmly around the roots.

VIOLETS.—Plants that have been grown in the open to lift and plant in frames for flowering during the winter should now be placed in their permanent quarters. They succeed best in brick pits when planted in good turfy loam with a little leaf-soil and road grit mixed with it. Plant them firmly, and keep them well up to the glass. Give water as required, and give air on all favourable occasions. Keep the glass clean, so that the plants may derive the maximum amount of light during the dull days.

BORDER CARNATIONS. — When the layers are well rooted it is beneficial to sever them from the old plants a few days before they are taken up. In damp, cold districts, it is by far the better plan to pot them up and house in cold frames for the winter. Use a light, open compost containing plenty of coarse sand. Pot firmly in three-inch pots, and give a good watering, after which it is preferable to allow them to become moderately dry before giving more water. Remove the lights entirely during favourable weather, but afford adequate protection in case of frost. When they are planted in the open, beds should be prepared in a sunny and well-drained position, so that they will not remain too wet during winter. The ground should be well broken up, and have some old mortar rubble and wood ashes incorporated with it, and it must be made moderately firm before planting. Allow eighteen inches between the rows and fifteen inches between the plants. It is beneficial to dust a little soot around them occasionally to guard against slugs.

SEASONABLE WORK.—Cuttings of pentstemons should be inserted now, and they can either be placed in a cold frame or in boxes filled with a light, sandy compost. Give a good watering with clean water, and syringe them over on bright days; also keep the frame close until the cuttings are rooted. Later on they must be carefully protected from frost. Violas are readily propagated in the same manner, and will root easily if carefully treated. When it is desired to increase choice varieties it is an advantage to pot up the old plants, from which cuttings can be obtained in the early spring. Do all that is possible to keep the herbaceous borders gay and attractive by removing dead flower stalks, and keeping the later flowering subjects well tied. Delphiniums and herbaceous phloxes can be increased from cuttings inserted now, and rooted in a cold frame. Subjects like pyrethrums can be lifted and divided when it is necessary to increase the stock. Cuttings of roses will root readily in the open ground at the present time if inserted in soil containing plenty of coarse sand.—J. Gardner, Batsford Park Gardens.

## FRUITS UNDER GLASS.

LATE GRAPES.—It being essential that the berries of late grapes should be well coloured by the end of this month, plenty of air should be admitted to the house night and day. When the weather permits, artificial heat can be dispensed with on bright, sunny days, but during dull, sunless weather, and at night sufficient heat must be used to maintain a fairly dry atmosphere. Give copious supplies of water to the roots as required, with occasional applications of liquid farmyard manure. This operation should be done early in the morning, so that the atmospheric conditions of the house may become fairly dry before night. Pinch all laterals at one leaf, and do not on any account allow the growths to become unduly crowded and confused before undertaking this work. Wasps have been very troublesome here this season, and every effort should be made to allocate their nests and destroy them. We find it necessary to use a "wasp destroyer" in the house upon the berries that have been attacked. This remedy can be obtained from any sundriesman.

RIPE GRAPES.—Where the greater number of bunches in any of the houses have been used, the remainder should be cut and placed into bottles of water, in a fairly dark room, and also where sufficient heat can be maintained to dispel the damp. The bunches should be cut with a good length of young wood attached, and the end placed in the bottles containing water; ordinary wine bottles are excellent for this purpose, and means must be used so that the berries will not rub against the bottles, consequently they must be securely fixed in a slanting position. Examine the bunches occasionally, and remove any berries that show the least sign of decay, or if this is neglected the bunch will soon become disfigured and spoilt. The borders should be given several good soakings with liquid manure.

FIGS.—Trees that are carrying good crops of late fruits which will be swelling freely, will require a good supply of water to the roots. No hard and fast rule can govern the amount of water that should be given, but the best rule to observe is to give the borders sufficient water that the roots will take up. The soil, whether in pots or borders, should not be allowed to approach dryness at any time, but, on the other hand, sufficient care must be exercised not to allow the soil to become sour and stagnant through overwatering. Trees that are not over vigorous, and are swelling their fruits, will be benefited with weak doses of liquid manure. Keep a sharp look-out for red spider, and use the syringe freely among the foliage on fine afternoons. When the fruits begin to ripen the syringe must be dispensed with, and drier atmospheric conditions must prevail in the house. Admit plenty of air at all times, and reduce the supply of water to the roots, but not in such a manner as to cause the tissues of the plants to suffer.—Henry R. Farmer, Cardiff Castle Gardens.

# EXHIBITIONS AND MEETINGS.

## Royal Horticultural Society.

SEPTEMBER 10.

The exhibition held by the Royal Horticultural Society on Tuesday was fully equal to the average for this season of the year. The hall was well filled, and dahlias, in their diversity of form and colour, constituted the most prominent feature.

### FLORAL COMMITTEE.

Messrs. Hobbies, Lim., Dereham, staged a large collection of pæony-flowered and collarette dahlias, with a broad band of cactus varieties in front. The pæony-flowered section was represented by large masses of Red Indian, Dr. Hogg, The Geisha, Leveller, and London; while the most attractive of the collarette section were Diadem, Ville de Schildt, Goldstein, Meteor, Souvenir de Bernadeau, and Comte de Nodler. From Messrs. Barr and Sons, Covent Garden, came a fine display of hardy flowers, the phloxes being especially fine for the season; the heliums, too, were excellent, while asters, lobelias, and early-flowering chrysanthemums were in fine form, and a collection of gladioli was most attractive, especially such sorts as Madame Terrel des Chenes, Victory, Dawn, Glory, etc. The Misses Hopkins, Shepperton-on-Thames, presented a nice exhibit of rock and alpine plants. A very bright exhibit of hardy flowers came from Messrs. G. Bunyard and Co., Lim., Maidstone. The early-flowering asters formed the leading feature; these were brightened up with delphiniums, montbretias, phloxes, and liliums, the whole forming a pleasing display. Mr. Amos Perry, Hardy Plant Farm, Enfield, occupied a large space on the floor of the hall with hardy flowers. A central group of Artemesia lactiflora was most striking, while the new Achillea Perry's White reminded one of a carpet of snow; it is certainly the best white achillea to date. Delphiniums were also attractive, while the quaint Serratula atriplicifolia attracted much attention from the visitors.

Roses and carnations from Messrs. S. Low and Co., Bush Hill Park, made a bright patch of colour. The best roses were Jessie, Frau Karl Druschki, Beaute de Lyon, Rayon d'Or, Juliet, and Duchess of Westminster; while Carnation Lady Alington was in fine form. Messrs. W. and J. Brown, Stamford, staged a small collection of hardy flowers, making Dianthus Napoleon III. their chief item; these were particularly good, as were also pentstemons and gaillardias..

Messrs. Carter Page and Co. occupied the entire end of the hall with a fine collection of dahlias, in which all sections were represented. From Mr. L. Davidson, Borlasses, Twyford, came a small collection of decorative dahlias. Messrs. Felton and Sons, Hanover Square, had a display of nelumbiums tastefully arranged in baskets and bowls. The exhibit was at once unique and much admired. A fine group of dracænas was staged by Messrs. W. Cutbush and Son, Highgate. These were chiefly large specimen plants, and included Dracæna Veitchi superba, D. lentiginosa, D. australis variegata, and D. Bruanti variegata.

A fine collection of phloxes came from Mr. Jas. Box, Lindfield, Sussex. The varieties were massed in separate colours, the most prominent being Gloire du Marc, Le Mahdi, Iris, Asia, Rynstroom, Jules Cambon, Elizabeth Campbell, and General Von Hertz. The whole bank was well arranged. Mr. L. R. Russell, Richmond, had an effective group of clematises in pots, backed with vitis in variety, and edged with a collection of hardy fuchsias. Mr. A. Ll. Gwillim, Cambria Nursery, Sidcup, presented some very fine tuberous begonias arranged in their various colours, the exhibit being broken up at intervals with asters, which were certainly early, the fringed varieties in pink and salmon shades being especially attractive.

Hardy flowers were staged by Messrs. G. and A. Clark, Lim., Dover, in great variety, while similar flowers were also arranged by Mr. G. Reuthe, Hardy Plant Nursery, Keston. Messrs. W. Paul and Son, Lim., Waltham Cross, gave us a fine autumnal display of roses, tastefully arranged in baskets. Some of the most attractive were Marquise de Sinety, Beaute de Lyon, Madame Leon Pain, Paul Ledè, Lady Hillingdon, Juliet, Nerissa, and Lady Downe.

Mr. Chas. Turner, Slough, had a capital table of dahlias, which included some fine examples of the pæony-flowered type, collarette, and cactus forms. Some of the most striking varieties were Sunstar, Bayard, Eleanor, Bertram, and Elfrida; while the most striking of the collarette varieties were Antwerpia, Madame Poirier, Diadem, and Gallia. Messrs. Gunn and Sons, Olton, had an attractive table of phloxes, arranged in masses of colour, the result being excellent; the massing was carried out with good effect, a few of the best being Sheriff Ivory, Lady Stewart, George A. Stroehlein, Ellen Willmott, and Selma; while Mr. E. Dixon, West Hill Nurseries, Putney, was represented by a display of hardy flowers, which included some very good violas.

A really fine and most interesting exhibit of hardy shrubs and trees was staged by Messrs. J. Cheal and Sons, Lim., Crawley. This included many of the ornamental crabs, cratægus in variety, with quite a number of acers, in their autumn colours; Pyrus aria vestiba, ceanothuses in several varieties, also a number of berried plants. The same firm also staged a capital collection of dahlias, which included some attractive decorative kinds, while the cactus varieties were also in great form. Needless to add the singles were of the firm's well-known type, the best being Leander, Owen Thomas, Mrs. Joynson Hicks, Amy, and Mrs. Miller.

Messrs. B. R. Cant and Sons, Colchester, exhibited a beautiful assortment of garden roses. These were arranged chiefly in pyramidal form, and the cool atmosphere seemed to suit them admirably. A few of the best were La Tosca, Lady Hillingdon, Harry Kirk, W. R. Smith, and Beaute de Lyon.

From Mr. S. Mortimer, Rowledge, Farnham, came a large collection of dahlias, of the show and fancy types, also some well-grown cactus forms. A few of the most striking varieties in the former section were Tom Jones, Pleasaunce, Penelope, Gaiety, Standard, Virginale, W. Powell, Twilight, and Arthur Rawlings; these were grown with Mr. Mortimer's well-known skill.

Messrs. T. S. Ware, Lim., Feltham, contributed a bright display of hardy flowers, and a capital collection of dahlias. The cactus varieties were well developed, especially Conquest, F. Wenham, Mrs. D. Flemming, Golden Eagle, Florid, Pride of Essex, Richard Box, and Florrie Wells; the same remarks were equally applicable to the pæony-flowered varieties.

A large and varied collection of dahlias came from Messrs. H. Cannell and Sons, Swanley. The collarette section was very bright, the best being Henri Farman, Negro, A. Maumene, Vicomtesse des Monts, and Madame Pile. The decorative section was also well represented, some of the finest being Le Grand Maniton, Queen Mary, Mons. Capron, Madame F. Mollard, and Papa Charmet.

Messrs. Whitelegg and Page, Chislehurst, staged a bright collection of hardy flowers, the pentstemons being quite a feature, while the violas bore evidence of the cool weather we have experienced; while the Misses Price and Fyfe, Grove Park Nursery, Lee, staged a small collection of early-flowering chrysanthemums, which were nicely displayed with asters. Some of the most conspicuous were Leslie, Elstob Yellow, Nellie King, Golden Glow, and Touraine.

Mr. J. T. West, Brentwood, had a large exhibit of dahlias, which comprised many fine pæony forms, some of the brightest being Holman Hunt, Mrs. G. Gordon, Liberty, Turner, and Hebe; Mrs. Pearson, John Woolman, Marquise Purrier, and Fulgent being the most attractive cactus, while the pompons were represented by a large collection.

From Messrs. H. B. May and Son, Upper Edmonton, came a table of hybrid veronicas, edged and backed with ferns. Sweet peas were represented, and the exhibit of Messrs. S. Bide and Sons, Farnham, demonstrated the value of the flower in autumn by staging some fine vases, in which were noted Thomas Stevenson, Tarina, Isobel Malcolm, Mrs. R Haliam, and Mrs. W. J. Unwin.

### ORCHID COMMITTEE.

Messrs. Sander and Sons, St. Albans, exhibited a small group of orchids, in which were to be seen Vanda cærulea, carrying two spikes, one with eighteen developed flowers of a fine colour, also Renanthera Lowi, with racemes of flowers at least six feet long and with flowers the whole way. Lælio-cattleya Venusta and L.-c. Fred Gott were also noteable.

Messrs. S. Low and Co., Bush Hill Park, had a small but attractive exhibit. Some fine plants of Oncidium macranthum, O. incurvum, and O. variocosum were noted at the back, while there were good specimens of Cattleya Harrisonæ, C. aurea, and Brassocattleya Maronæ, with Stanhopea graveolens.

A very effective table was that arranged by Mr. T. W. Thurgood, gardener to H. T. Pitt, Esq., Rosslyn, Stamford Hill. This was rich in cattleyas, cypripediums, and odontoglossums. In the latter were to be seen O. King of Britain, a very fine form; also O. punctatum and a quaint masdevallia named Doris.

Mr. E. Davidson, Borlasses, Twyford, staged a few nice specimens, which included Odontoglossum Aurora, a very fine crimson-red colour, also Lælio-cattleya Nebus, the sepals being bright orange with a dull red lip.

A small collection also came from Messrs. Charlesworth and Co., Haywards Heath. Here were to be seen Cattleya Circe, a very dark variety; Dendrobium Dearei, with three good racemes, also Cypripedium leyburnense magnifica.

Mr. H. S. Goodson (gardener, Mr. G. E. Day), Fairlawn, Putney, also sent a few choice specimens such as Cattleya Memoria H. A. Tracy, a fine bold flower; also C. Atalanta var. Illuminator, with others.

From Mr. H. A. Tracey, Amyand Road, Twickenham, came a small collection of cypripediums such as C. Curtisi with seven flowers; C. Massianum, C. Jas. H. Veitch, and C. Lord Ossulston; also two well-marked odontoglossums.

### FRUIT AND VEGETABLE COMMITTEE.

A nice collection of fruit came from Mr. A. W. Merry, Danesbury, Welwyn (gardener Mr. G. Kelf), who had arranged his exhibit most attractively. The grapes were placed in single bunches, the best being Black Alicante, Muscat of Alexandria, and Madresfield Court. The boxes of plums were very fine, especially Pond's Seedling, Monarch, Transparent Gage, Jeffersons, Rivers' Late Orange, Coe's Golden Drop, Kirke's, and Autumn Compote. Melons were well represented, as were also apples and pears, filberts in variety, and alpine strawberries. A few light foliage plants and trails of smilax added the necessary finishing touches. Mr. Thos. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth, staged a splendid smooth Cayenne pine. A whole table was occupied with an exhibit of fruit from H. B. Brandt, Esq., Nutfield (gardener, Mr. T. Heron), who certainly has reason to be proud of his collection. The grapes were arranged along the back, and included fine examples of Appley Towers, Lady Downes, Prince of Wales, Diamond Jubilee, very fine, in berry and bunch: while the apples and pears were spaced out by coloured foliage in trails. The whole of the dishes were clean and well-grown. Two dishes of apples, Warner's King and The Queen, came from Mr. H. V. Woodgates, Old Malden House, Worcester Park, which were not only large, but of splendid colour.

### MEDALS AND AWARDS.

Silver-gilt Flora.—To Messrs. Carter Page and Co., for dahlias; to Mr. Jas. Box, for phloxes, etc.

Silver-gilt Banksian.—To Messrs. Hobbies, Lim., for dahlias; to Mr. A. Perry, for hardy flowers.

Silver Flora Medals.—To Mr. W. T. Pitt, for orchids; to Messrs. H. Cannell and Sons, for dahlias; to Messrs. B. R. Cant and Sons, for roses; to Messrs. J. Cheal and Sons, for trees and shrubs; to Messrs. Gunn and Sons, for phloxes; to Messrs. W. Paul and Son, for roses; to Messrs. Felton and Sons, for nelumbiums.

Silver Knightian Medals.—To Mr. Brandt, for fruit; to Mr. Merry, for fruit.

Silver Banksian Medals.—To Messrs. Barr and Sons, for hardy flowers; to Messrs. G. Bunyard and Co., Lim., for hardy plants; to Messrs. W. Cutbush and Son, for dracænas; to Mr. A. Ll. Gwillim, for begonias; to Messrs. H. B. May and Sons, for ferns and veronicas; to Mr. S. Mortimer, for dahlias; to Mr. L. R. Russell, for flowering plants; to Mr. C. Turner, for dahlias; to Messrs. T. S. Ware, Lim., for dahlias; to Miss Walters Anson, for painting of nelumbiums.

Bronze Flora.—To Mr. J. T. West, for dahlias.

First Class Certificates.—To Cattleya Memoria H. A. Tracey, from Mr. H. S. Goodson; to Dendrobium Schutzei.

Awards of Merit.—To Odontioda Devosiana Fowler's var., from Mr. J. Gurney Fowler; to Lælio-cattleya St. Gothard, from Mr. C. J. Phillips, Sevenoaks; to Chrysanthemum Crimson Polly, from Messrs. W. Wells and Co.; to Helianthemum autumnale rubrum and Achillea Perry's White, both from Mr. Amos Perry; to Dahlia Queen Mary, from Messrs. H. Cannell and Sons; to Dahlia Crawley Star, from Messrs. J. Cheal and Son; to Collarette Dahlias Ideal and Albert Maumene, both from Mr. J. B. Riding; to Dahlia Selma, from Mr. C. Turner; to Dahlias John Riding, Nantwich, and Dolly, from Messrs. Jas. Stredwick and Son; to Pentstemon Gaddesden Gem, from Mr. A. G. Gentle; to Dahlia Papa Charmet, from Messrs. Hobbies, Lim.; to Potato The Diamond, from Messrs. Barr and Sons; to Potato The Conquest, from Messrs. Dobbie and Co.; to Potato James Gibson, from Mr. T. Staward; to Strawberry Merveille de France, from Messrs. G. Bunyard and Co.

## Dundee Horticultural Association.

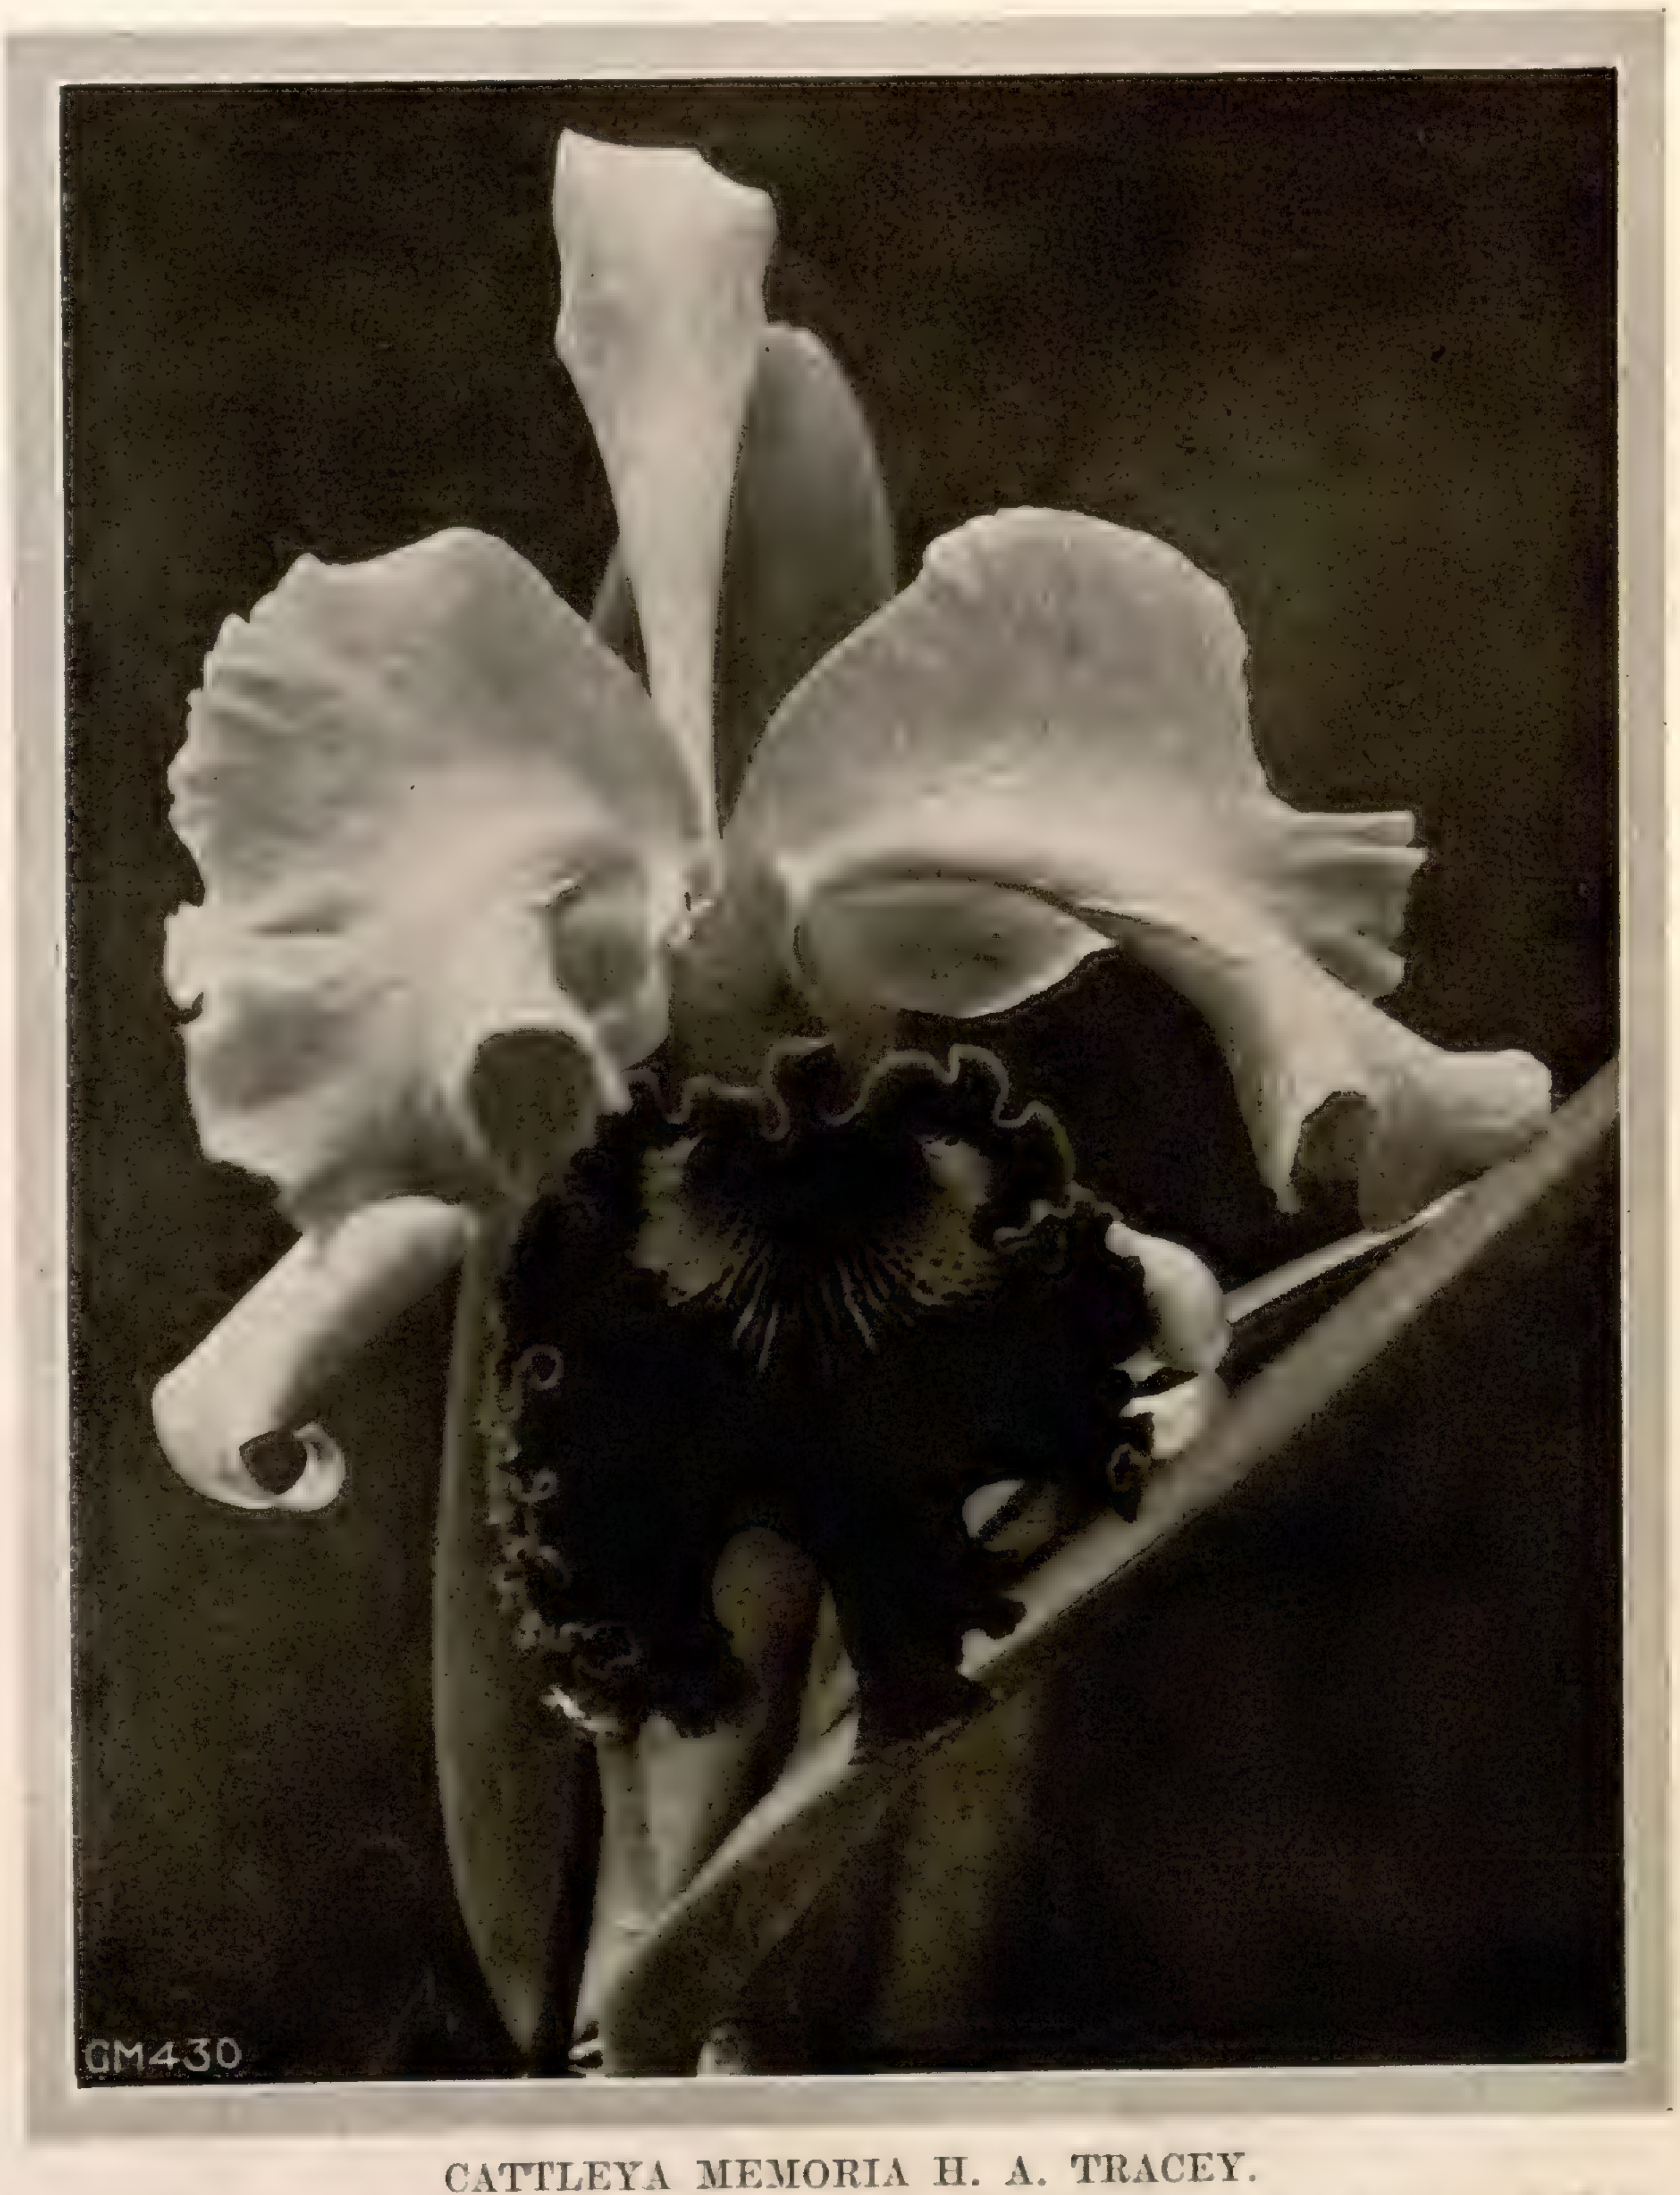
SEPTEMBER 5—7.

The annual exhibition of this society was held on the historic Magdalen Green, Dundee, and, synchronising with the meeting of the British Association in the city, a very special effort was put forth to make it worthy of the occasion. Right well did the effort materialise; no show produced better or more meritorious work; and this was all the more gratifying when one considers that it was the visit paid by the British Association to Dundee in 1867, and the handsome donation that learned body then contributed to the funds, which first placed the society in a position of stability, and enabled it ever since to hold an annual exhibition. On this occasion the British Association handed to the society the handsome sum of £100, and the very judicious manner in which, with the other prize money, this sum was utilised, brought out results which reflected the highest credit on the administrators. The entries this year were extremely satisfactory, amounting to no less than 2,600, being 350 over those of last year. The interiors of the spacious marquees presented to the thousands of visitors combinations of great beauty, and the admirable arrangements of the worthy secretary, Mr. W. F. Hill, left nothing to be desired. Once again the Countess of Strathmore opened the show in the presence of a large and fashionable gathering of ladies and gentlemen.

### PLANTS.

This section has ever been an outstanding feature at Dundee, and on this occasion there was, as usual, a capital display. Groups of plants, to be judged for quality and effective arrangement, were well shown. Mr. James Beats, gardener to Mrs. Boase, Binrock, Dundee, was a capital first, his arrangement being chiefly composed of capitally-grown crotons, chrysanthemums, pink clerodendrons, and Lilium auratum, with various fine foliage plants. Let it be noted here that this is the eleventh time Mr. Beats has taken premier honours at the Dundee show for groups of plants, surely a record of which any gardener might be well proud. Mr. James Bethel, gardener to C. G. Gilroy, Esq., Grange, Monifieth, Dundee, was a very good second; Mr. George Scott, gardener to A. Sinclair, Esq., Seathwood, Dundee, was third with a really excellent group. For nine stove or greenhouse plants, distinct, flowering and foliage, Mr. James Kinnear, Fernbrae, Dundee, made a very fine first, his chief foliage plants including same capitally-grown crotons, while clerodendrons and ixoras were the leading flowering plants; Mr. George Reid, Invertay, West Ferry, Dundee, was a capital second, his leading foliage plant being an exquisitely-grown dasylirion, and his flowering plant a statice; Mr. Beats was third here. Ferns, always a striking feature at Dundee, were well represented, the honours for exotics being divided between Mr. George Reid and Mr. James Beats. The begonias, both single and double, shown by Mr. George Scott, Seathwood, deservedly placed him in the first place; while in both classes Mr. Thomas C. Brown, Balcairn, Dundee, proved a worthy second.

For liliums and flowering chrysanthemums nothing could approach the fine specimens sent from Seathwood. Dracænas were a capital show, and Mr. William Grieve, Hazlewood, Broughty Ferry, Dundee, well earned the honours here. Pelargoniums, single and double, made a fine display, and Mr. John G. Clarke, Elmslea, Dundee, and Mr. James Beats lead finely in the respective classes. Mr. John G. Clarke, for three well-grown coleus, was deservedly first. For six stove or greenhouse plants (three foliage and three in flower), Mr. George Reid, Invertay, was first; Mr. Beats and Mr. Kinnear followed.



CATTLEYA MEMORIA H. A. TRACEY.
Flowers large; sepals and petals, rose-pink; lip, deep crimson. F.C.C., R.H.S., September 10. H. S. Goodson, Esq., Fairlawn, Putney.

Mr. W. T. Morrison, Gowrie House, Perth, had the best four British ferns, and also best six dwarf British ferns; while Mr. Reid, Invertay, led for best tree fern with a much admired specimen. For palms, the honours were divided between Mr. Beats, Mr. Kinnear, and Mr. James Bethel, Grange, Monifieth. Mr. Morrison, Gowrie House, had the best twenty alpines, distinct. Cockscombs were few, and Mr. Beats was first with fine examples. Mr. George Reid, Invertay, obtained premier honours for six exotic ferns, distinct, with capital specimens.

### CUT FLOWERS.

It was in this section, if anywhere, where the effects of the disastrous season experienced were most observable. The leading prize in this section was given by the British Association, and was awarded for the best display of cut flowers in vases, orchids excluded. There was a brisk contest, and the premier award was made in favour of Mr. George Scott, Seathwood, liliums in variety, finely-grown chrysanthemums, and beautifully-coloured sweet peas being the leading flowers shown; Mr. James Beats, Binrock, was second with an arrangement in which the carnations were especially noteworthy; Mr. James Bethel was third with a fine group. Mr. Beats was first for decorated dinner-table, bouquet of roses, basket of flowers, and wreath, with admirable entries. Sweet peas were an outstanding feature, and here Mr. John Machar, gardener to Mr. W. T. J. Stewart Fothringham, of Fothringham, won the Corporation challenge cup for a table of these flowers, judged for quality, variety, and effectiveness; Mr. J. A. Grigor, gardener to Mrs. Dunbar Dunbar, of Seapark, Forres, was second; and Mr. James Fairweather, Airlie Park, West Ferry, Dundee, was third.

For the special prizes open to nurserymen and florists the entries were not numerous, but the quality was exceedingly good. In the class for a table of roses, Messrs. James Cocker and Sons, Aberdeen, obtained premier honours; and Messrs. D. and W. Croll, Dundee, showed a very fine table for second place. For twelve vases decorative roses the last-named firm showed a superb collection. Messrs. Adam and Craigmile, Aberdeen, were first for six baskets of roses, distinct. For the best display of herbaceous flowers on table, Messrs. Cocker and Sons, Aberdeen, gained leading honours. For chrysanthemums Mr. Scott, Seathwood, was awarded the first prize for four vases and six vases, being closely followed by Mr. John Fraser, Dryburgh House, Lochee, Dundee, and Mr. James Bethel, The Grange, Monifieth. For six varieties of cactus dahlias, in bunches, one distinct, Mr. David Keilor, Seabourne House, Broughty Ferry, was first; and for pompon dahlias the chief honours went to Mr. John P. Summers, Ashcliffe, Perth Road, Dundee.

In the class for cut flowers of stove or greenhouse plants, Mr. A. Duncan, Carbet Castle, occupied the first place with a fine exhibit. Roses were well shown by Mr. William Grieve and Mr. John Simpson.

### FRUIT.

Considering the sunless summer, the display of fruit was worthy of the highest praise. The British Association prize in this section was given for six bunches of grapes, and was keenly contested. Mr. James Beisant, Castle Huntly, was successful in winning the handsome cup with a collection in which Muscat Hamburgh and Muscat of Alexandria were especially well represented; Mr. John G. Clarke, Elmslea, was second, his entry including grand clusters of Black Hamburgh; the third place went to Mr. Scott, Seathwood, who had also a fine collection. In the class for twelve distinct varieties of apples, the leading award was made in favour of Mr. Walter Staward, Aston Hall Gardens, Oswestry, Shropshire; Mr. Wm. Benvie, Murie Gardens, Errol, and Mr. Scott, Seathwood, followed. Mr. D. Nicoll, Forgandenny, staged a superb collection of orchard house fruit; and Mr. J. Farquharson, Kinfauns Castle, Perthshire, had a meritorious collection of hardy fruits, grown in the open air.

### VEGETABLES.

These were well shown, and the British Association prize given in this section fell to Mr. James Kinnear, Fernbrae, Dundee, for a capital collection of twelve distinct kinds; Mr. W. Harper, Tulliebelton, Perthshire, was second with fine produce.

### AMATEURS' CLASSES.

It was indeed refreshing to see the fine products staged in all the sections, and not a little credit attached to those who, in their spare time, could obtain such excellent examples of cultural skill. In competition for the Amateur Corporation Cup, offered for the best display of cut flowers arranged on a table, Mr. Alexander Easton, Lochee, Dundee, won finely with a beautiful arrangement, sweet peas predominating; Mr. D. Smith, 10, Cleghorn Street, Dundee, was second, with a fine entry. Plants in pots were remarkably good here, and the leading class in this section was for six stove or greenhouse plants, distinct, and the premier prize was worthily gained by Mr. William Robertson, 6, Blyth Place, Dundee; Mr. A. Easton, Lochee, and Mr. John Fairbairn, 96, Dens Road, Dundee, being second and third. In the class for display of vegetables, the leading prize went to Mr. Alfred Drummond, Fowlis, Crieff, for a collection which reflected much credit on the exhibitor; Mr. Peter Donaldson, Dunning Station, and Mr. John Hepburn, West Huntingtower, Perth, were second and third with meritorious products.

### NON-COMPETITIVE.

The nurserymen and florists in the Dundee district made a special effort this year, and one that earned for them the warmest praise. Messrs. D. and W. Croll, Dundee, contributed a superb display of roses, begonias, and sweet peas, and a choice collection of vegetables. Messrs. Harley and Sons exhibited floral arrangements, and the designs shown were beautiful and effective. Messrs. Laird and Sinclair had an excellent show, the dominating feature being a very fine ornamental rockery. Messrs. Thyne and Son exhibited a collection of hardy annuals, comprising over 100 varieties, all in a high state of development, and also hardy flowers and sweet peas. Messrs. Storrie and Storrie had a collection of fruit, comprising plums, pears, and apples, in a high state of development. Mr. David Nicoll, gardener to Messrs. Bell, Rossie, Forgandenny, exhibited fine baskets of pot-grown apples, the fruit of James Grieve and Emperor Alexander being of special excellence.

Altogether the show was a magnificent one, and did full credit to all concerned.

---

## Bournemouth Gardeners.

At the meeting of the members held on September 3, there was a very nice exhibition of pot plants and cut flowers. The principal exhibits staged were table plants, by Mr. Charles Pearce, gardener to Mrs. Ormond, who had almost perfect specimens of Aralia elegantissima, Dracæna elegantisimma, and Pandanus Veitchi. Mr. Evans, gardener to G. J. Fenwick, Esq., had cut roses and carnations; Mr. G. H. Heath, gardener to G. G. Russel, Esq., cactus dahlias; and Mr. Povey, coleus plants.

Mr. Evans was chairman at the meeting, which was addressed by Mr. Nippard, of Ashton Court Gardens, who gave his "Impressions of the International Exhibition." He said it was scarcely possible for him to tell others in one short address what the exhibition was really like. Gardeners would come away with different impressions as their various interests would claim attention. He would only refer to things that interested him most. The six acres of rockwork was a charming sight, but, in his opinion, one otherwise perfect rockery was marred by the use of cut flowers at the back. The orchids he went to look at first, and said that Sir George Holford's were, undoubtedly, grand, and formed the chief feature of the show. The staging of the plants, which were all specimens, was a perfect work, every plant being seen to the best advantage. The miltonias and odontiodes attracted his attention most. The amaryllis were remarkable for strength of growth, freedom of flowering, and size and colour of blooms. The advance made in the improvement of these plants was very great. The groups, each occupying about one hundred square feet, were most imposing. He was much attracted by the collection of selaginellas, and the hybrid anthuriums, the spathes of many of the latter being about 1ft. long. The begonias, dahlias, roses, carnations, sweet peas, and zonal pelargoniums were very good. The melons showed high cultivation, and the apples from last year, which had been in cold storage, looked as fresh as if they had only been gathered twenty-four hours. He did not consider that the rhododendrons were anything beyond very ordinary, and the annuals were poor. Mr. Nippard dwelt in much detail on the subjects above-named, and said that the dust would not have been troublesome if the authorities had put down a small quantity of short straw or bracken fern, and lightly damped it. Both the lecturer and the chairman received hearty votes of thanks at the close of the meeting.

---

## Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 3rd inst. Mr. Massie, the president, was in the chair, and there was an attendance of eighty members. Mr. John Highgate, Hopetoun Gardens, read a paper on "How to produce effective displays with hardy plants." There was no doubt, he said, that the use of hardy plants for garden decoration was yearly becoming more popular. No other plants gave such a variety of form and colour, and they could be had in bloom from February to November; but he did not believe that their use involved a saving of labour or expense. They required constant attention in the way of dividing and replanting, and it was generally the gems which required renewing. For formal bedding, however, the pelargonium, calceolaria, and lobelia were indispensable, and it was doubtful if in this kind of decoration we had improved much on the fine ribbon border displays of twenty years ago. In most cases the class of hardy plants to be grown would depend on the size of the place, or of the borders or beds to be furnished. No one, for instance, would dream of growing gunnera or some of the larger senecios in a garden of very limited size.

In some large places it was becoming the fashion to have borders devoted to a single colour. He had never been impressed by this arrangement. Another, and a more popular, style was to plant in patches of one variety, but it did not admit of such a great variety as in the more common mixed style. Good-sized clumps, with a large variety of subjects, so as to prolong the season of flowering as as much as possible was recommended, as in this way one could have a much better selection than if planted in patches, and, when possible, edgings should be formed of alpines like small linarias, thymes, sedums, or Erinus alpinus, instead of the more formal box edging. Another style which was becoming popular, and deservedly so, was to introduce Japanese maples, buddleias, Prunus Pissardi, roses, etc., in order to relieve the flatness of the herbaceous border. One could scarcely imagine anything more handsome than a few good plants of Spiræa ariæfolia, with its long plumes of white flowers, dotted along the back of the border, and against these such plants as Prunus Pissardi and Acer negundo variegata could be effectively used as dot plants. Golden privet could also be used effectively in this way. Then the roses could be used in a variety of ways, but perhaps the most common, and certainly the most effective, way to use them was against rustic poles or espaliers behind the border.

Other old favourites which could be used with advantage were the hardy fuchsias and the improved form of Monarda didyma called Cambridge Scarlet. For masses of colour the last-mentioned was certainly of much value, but it required to be replanted every year, or at most every two years, as it quickly exhausted the soil. A plant which was an acquisition for the herbaceous border was Artemisia lactiflora. It produced white flowers in autumn, and flowers of this colour were scarce then, but, like monarda, it required frequent replanting. Senecio Wilsoniana was another gem. For the backs of borders, or for planting by streams, it was a real acquisition. For late season effect a bed of Japanese maples and Lilium auratum with an edging of hardy heaths, gave great satisfaction. But the most imposing display one could imagine was one produced by bold groups of roses, with or without a background, and in this connection he stated that one was apt to get tired of the repetition of Dorothy Perkins and Crimson Rambler, and that there were many other varieties, such as Conrad Meyer (one of the finest of all when trained on a rustic pole), which could be used in this way. A simple and exceedingly pretty arrangement on the lawn was a bed of the little Phlox Regulus, with standard Hydrangea paniculata grandiflora as dot plants, and an edging of Cerastium tomentosum. On the motion of Mr. Fortune, Mr. Highgate received a very cordial vote of thanks for his interesting paper.

At the meeting on October 1 the secretary will give a paper on "Edinburgh's park and other trees" (with lantern illustrations).

## Edinburgh Fruit and Flower Show.

(Continued from page 700.)

by Mr. J. H. Goodacre, and of culinary varieties from Mr. S. Gordon, the latter especially good.

### APPLES.

The Malcolm Dunn Memorial Medal for a collection of twelve varieties of apples grown out of doors in Scotland was won by Mr. J. Duff, Threave House Gardens, Castle Douglas, with a good set of Duchess of Oldenburgh, Worcester Pearmain, The Queen, Gascoyne's Scarlet, Warner's King, Peasgood's Nonsuch, Stirling Castle, Baron Wolseley, Norfolk Beauty, Lord Suffield, Cox's Pomona, and Ecklinville; Mr. R. G. Sinclair, Drem, second; and Mr. A. Johnston, Annfield, Stirling, third. In the open class for twelve dishes of apples the prizes fall in order to Mr. R. Whiting, Mr. Caddick, and Mr. Mackinlay.

In the single dish classes some capital apples were shown. As the varieties are selected largely for their usefulness in Scotland we give the names of those required by the schedule, together with the name of the first-prize winner; Chas. Ross, Mr. R. Whiting, Credenhill, Hereford; Gascoyne's Scarlet, Mr. J. Duff, Threave House, Castle Douglas; Irish Peach, Mr. W. Galloway, Gosford; James Grieve, Mr. Caddick, Ross; Lady Endeley, Mr. Caddick; Worcester Pearmain, Mr. M. Stewart, gardener to J. Neilson, Esq., Mollance, Castle Douglas, fourteen entries; Beauty of Kent, Mr. R. Whiting; Bailie Neilson, Mr. A. Johnson, Annfield, Stirling; Bismarck, Mr. Caddick; Cellini, Mr. Caddick; Duchess of Oldenburgh, Mr. R. Whiting; Ecklinville, Mr. R. Whiting; Emperor Alexander, Mr. E. W. Caddick; Golden Spire, Mr. J. Duff; Grenadier, Mr. J. Duff; Lane's Prince Albert, Mr. Caddick; Lord Derby, Mr. Caddick; Lord Grosvenor, Mr. G. Mackinlay; Lord Suffield, Mr. R. Whiting; Peasgood's Nonsuch, Mr. Caddick; Pott's Seedling, Mr. Caddick; Stirling Castle, Mr. Whiting; Warner's King, Mr. Caddick; and Wellington, Mr. Whiting.

The best dish of dessert apples was of Ribston Pippin, from Mr. A. Robb, Dysart House, and the best dish of culinary apples, Credenhill Beauty, a crimson-cheeked variety shown by Mr. R. Whiting.

### PEARS.

Pears were not so fine as usual, either in size or colour. The best collection of twelve dishes came from Mr. R. R. Greenlaw, gardener to H. J. Younger, Esq., Benmore, Kilmun, whose best varieties were Doyenne du Comice, Pitmaston Duchess, Louise Bonne of Jersey, and Marguerite Marrillat; Mr. Mackinlay second, and Mr. R. Whiting, Credenhill, Hereford, third.

For a collection of six varieties of pears, grown in Scotland, Mr. W. Galloway, Gosford, was to the front, and his varieties were Beurre d'Amanlis, Williams' Bon Chretien, Beurre Hardy, Mdme. Treyne, Marguerite Marrillat, and Souv. du Congrès; Mr. J. Chisholm, gardener to the Marquis of Lansdowne, Meikleour House, Perth, came second with Clapp's Favourite, Beurre d'Amanlis, Dr. Jules Guyot, Beurre Diel, Marie Louise, and Margaret Marrillat, The latter pear was capitally shown by many competitors, and is of proved merit.

In the single dish classes Mr. R. Greenlaw, Kilmun, scored for Beurre d'Amanlis and for Conference; Mr. T. Smith, Coombe Court Gardens, Surrey, led for Doyenne du Comice; and Mr. P. MacAndrew, gardener to the Earl of Home, Coldstream, scored with Durondeau. Mr. W. Williamson, Trinity, had the best Jargonelles, and Mr. Greenlaw showed the best dish of Louise Bonne of Jersey. Pitmaston Duchess and Souv. du Congrès were best shown by Mr. Mackinlay, Williams' Bon Chretien by Mr. W. Cormack, Haddington.

The four dishes of orchard house pears, shown by Mr. A. Harvey, gardener to Miss Hamilton, Rozelle, Ayr, were grand examples of Pitmaston Duchess, Doyenne du Comice, Durondeau, and Beurre Superfin; Mr. D. Nicoll, gardener to J. Harriott Bell, Esq., Forgandenny, came second.

### CUT FLOWERS.

Sweet peas were fairly good for the time of year, and the kind of season experienced, but there was scarcely a bunch which did not contain some spikes showing evidence of cold and rain. Mr. J. Herbert, Auchenheath, Lanarkshire, scored for a dozen bunches, and his best varieties were R. F. Felton, Edrom Beauty, Elsie Herbert, Wenvoe Castle, Elfrida Pearson, and Purity; Mr. W. F. Landreith, Coldstream, was second with spikes largely run to stem; Mr. G. Wilson, Ashley, Raltho, third; five entries. Mr. Fletcher was also ahead with six bunches in a class where grasses and light foliage were allowed; a pale cream variety named Paragon provided his best bunch; Mr. Landreith second. Mr. J. Fletcher led for a bunch of a variety not in commerce, showing the large maroon and purple Mrs. Cowdy, which Mr. R. Bolton is sending out this coming season.

Mr. T. M. Whitehead, Selkirk, showed a fine set of twelve bunches of carnations, but practically every one of his clean flowers, chiefly yellow-ground fancies, were wired; he was awarded first prize.

Eighteen bunches of chrysanthemums formed a fine class, and there were three competitors. When Mr. J. Smellie, Busby, Glasgow, competes, he is hard to beat, and on this occasion he scored with ease, winning the chief prize with splendid bunches of beautiful flowers of Abercorn Beauty, Caledonia, Hector, Elstob Yellow, Cream Perrier, Mdme. C. Perrier, Polly, Touraine, Mrs. A. Willis, Dolly Reeves, White Masse, Improved Mdlle. Masse, Nina Blick, Galatea, Leslie, Mrs. W. Sydenham, Holmes' White, and Fée Parisienne. Messrs. Mason and Co., Arthurstone Nursery, Jameston, second.

Messrs. George Nair and Son Prestwich, staged gladioli finely, and were first for two dozen spikes; Snow Wreath and Prestwich Gem (pink) were very fine, and carried flowers of wonderful size and substance; Messrs. A. E. Campbell and Son, Gourock, second. Amateurs showed gladioli well also, and we were especially struck by the fine twelve spikes exhibited by Mr. James Stewart, jun., Woodend Cottage, Whins, Alloa, who staged his flowers boldly in a semi-circular stand that provided a variation from the usual three rows of four spikes each. Mr. A. Brydon, Tweedbank, Innerleithen, scored for six spikes of these handsome autumn flowers.

Mr. G. Pirie, Dalhousie Castle, scored for six bunches of perennials with Montbretias Prometheus and George Davidson, Helianthus multiflorus, Chrysanthemum maximum Moonlight, Chelone barbata, and Anemone japonica; Mr. J. Sheills, Carstairs, second.

### ROSES.

In the rose classes some capital flowers were shown, and there was a good competition in most of them. Messrs. Jas. Cocker and Sons, Aberdeen, won premier place for thirty-six blooms, and showed the Lyon Rose, Marchioness of Londonderry, Gloire de Chedane Guinoisseau, and Mrs. T. Roosevelt very well; Messrs. A. and W. Croll, Dundee, second; and Mr. W. Ferguson, Dunfermline, third. Mr. R. C. Ferguson, Dunfermline, annexed first prize for eighteen hybrid tea roses, and Mdme. Melanie Soupert and Lyon Rose were very good and of lovely colour in his stand; Messrs. Adam and Craigmile, Aberdeen, second; and Mr. W. Ferguson third. For eighteen tea roses Messrs. D. and W. Croll scored with Mrs. Alfred Westmacott, Nita Welldon, and Medea in fine form.

### VEGETABLES.

Vegetables were good, but in the open class for eighteen dishes the subjects were not staged with that taste and care one expects nowadays in a very important class. Mr. W. Young, gardener to Mrs. Fleming, Hamilton, Craiglaw, Kirkcowan, won the first prize with capital leeks, red and white celery, Windsor Castle and Snowball potatoes, Ailsa Craig onions, beet, tomatoes, Quite Content and Gladstone peas, runner beans, cucumbers, very fine Maltese parsnips, Intermediate carrots, Golden Ball turnips, Winningstadt cabbage, Masterpiece cauliflowers, and King of Cauliflowers; Mr. J. E. Davis, gardener to Colonel E. R. Stewart Richardson, Ballathie, Perthshire, second. Mr. E. Shaw, gardener to Stephen Mitchell, Esq., Kippen Station, scored well in the class for a display of vegetables, twelve dishes, grown in Scotland. This was a particularly fine set, consisting of Solid White celery, Purity cauliflowers, Prizetaker leeks, grand Ailsa Craig onions, New Red Intermediate carrots, Sutton's Black beet, the Gladstone peas, Matchless dwarf beans, Satisfaction potatoes, Matchless cucumbers, Best-of-All tomatoes, and Golden Ball turnips. Mr. W. P. Bell, gardener to the Earl of Home, Rothwell Castle, came second, and showed very fine Sutton's Mammoth cauliflowers and Dobbie's Selected parsnips; Mr. R. Stuart, gardener to Lord Lauderdale, Thirlestane Castle, Lauder, third; five competitors.

### PLANTS.

Plants are not made the most of at Edinburgh, and though fairly largely shown they never seem to form a really serious part of the exhibition. The flat staging does not help matters, and rarely does a competitor use pot or block to raise his hindermost specimens. Mr. A. Millar, gardener to the Earl of Home, Douglas Castle, led for four foliage plants with large examples of alocasias, marantas, anthuriums, dieffenbachia, and Phyllotænium Lindeni. For half a dozen specimens in pots not exceeding nine inches in diameter, Mr. Millar again scored with similar subjects. Mr. A. Knight, gardener to Sir Wilfred Lawson, Bart., Brayton, Carlisle, had a very fine Croton Russelli in his pair that won first prize. In the orchid classes Mr. A. Findlay, gardener to A. Dryburgh, Esq., Gogar Park, led for cypripediums and for one orchid the latter being Lælio-cattleya Bletchleyensis with seven flowers. Mr. A. Jeffs, 17, Blacket Place, had the best four orchids, his kinds being Cypripedium Lord Derby, Odontoglossum grande, O. crispum, and Oncidium incurvum.

The best four stove and greenhouse plants in flower were two statices, an ixora, and a begonia, staged by Mr. J. McNiell, gardener to Major Thorburn, Craigerrie, Peebles; Mr. G. McKenna, gardener to Sir Robert Usher, Bart., Ratho, came second here, but he was first in some other classes.

Mr. W. T. Galloway, gardener to Mrs. Dewar, Drylaw House, was invincible with double and single begonias. Mr. G. Telford, gardener to Sir R. Somerville, Eskbank, had things all his own way with fuchsias; while for chrysanthemums in pots, six specimens, Mr. W. Page, Gilmerton, led the way with fine bushes of early sorts.

### NON-COMPETITIVE.

One of the largest, and, at the same time, one of the most noteworthy of the trade displays was that contributed by Messrs. Dobbie and Co., Rothesay. At one end they had a brilliant array of collarette dahlias, including many of their own raising, and, if one is to judge from the interest taken in these flowers by the visitors, the section is sure of a great future. Next followed early chrysanthemums, set up in bold pyramidal masses, and then followed roses, in bunches, representing the best of the autumnal bloomers, and, finishing the display, came beautiful sweet peas finely staged, with pyramids of white, pink, and red varieties of Cosmos as a graceful background. Messrs. Tillie, Whyte, and Co., Edinburgh, were large exhibitors of gladioli, asters, and well-grown vegetables in variety.

Messrs. Webb and Sons, Stourbridge, showed a fine collection of well-grown vegetables and fruits, their melons being especially good. With these were sweet peas, asters, liliums, spiræas, and chrysanthemums, all very tastefully disposed. Opposite this display was a bank of hardy flowers from Messrs. J. Cocker and Sons, Aberdeen, and collections of perpetual carnations, orchids, and apples from Messrs. Stuart Low and Co., Enfield. Gladioli from Mr. David W. Thomson, George Street, Edinburgh, made a brave show; Empoclus, Velocity, Prince of Orange, J. Lewis Childs, Baron Hulot, Royalty, and Duke of Richmond were a few of the best. Messrs. John Forbes, Lim., Hawick, exhibited dahlias, phloxes, pentstemons, border flowers, and carnations, the latter quite good for so late a date, and therefore attracting a good deal of attention.

Messrs. Young and Co., Hatherley, Cheltenham, were represented by perpetual carnations staged over ferns and green moss; Mrs. Greswold Williams, May Day, Queen (primrose), and Montgomery were some of the best. Messrs. G. Gibson and Co., Leeming Bar, Yorks, had a bold bank of hardy flowers that included Aconitum cæruleum, Blue Jay, and a fine lot of gaillardias. Mr. D. M'Omish, Crieff, displayed hardy flowers, largely using the fine Chrysanthemum maximum Etoile d'Anvers as a central feature.

An array of chrysanthemums from Messrs. Mason and Co., Jamestown, was almost too suggestive of November, but the pansies saved the situation. Close by Mr. R. C. Ferguson, Dunfermline, put up a goodly set of fragrant roses. Mr. Jones, Kilkenny, exhibited gladioli largely, and made a special feature of the purple-blue Baron Hulot. Other exhibitors included Messrs. T. Kennedy and Co., Dumfries, hardy flowers and dahlias; Mr. G. W. Miller, Wisbech, violas and apples; and Mr. H. N. Ellison, West Bromwich, choice ferns in great variety and lily of the valley.

Messrs. Storrie and Storrie, Glencarse, contributed a fine lot of pot fruit trees, apples, pears, and plums, carrying first-rate fruits, clean and highly-coloured; the celosias were also very fine, the colouring being unusually bright. Phloxes from Messrs. Gunn and Sons, Olton, were shown in the usual fine style this firm adopts. A large table of apples from Messrs. Little and Ballantyne, Carlisle, showed how well a large number of varieties succeed in the border district. Montbretias and gladioli made up the bulk of a large exhibit contributed by Messrs. R. Wallace and Co., Colchester, and, needless to say, Montbretia Star of the East was the outstanding and striking novelty.

Very fine were the begonias from Messrs. T. S. Ware, Lim., Feltham, who filled the centre of their bold display with a group of the exquisite pink Lady Cromer. Messrs. Thyne and Son, Dundee, contributed a selection of annuals and border flowers, as well as sweet peas, phloxes, etc. The pæony-flowered dahlias from Messrs. Bakers, Wolverhampton, attracted no little attention; Geisha, Faust, Turner, and Codsall Gem were especially striking among many showy varieties. Messrs. W. Wells and Co., Merstham, filled a large space with a selection of phloxes, and an admirable collection of early chrysanthemums, including their new variety named Crimson Polly.

Messrs. George Fairbairn and Sons, English Street, Carlisle, presnted a very fine lot of cactus dahlias, on boards, with stands of pompon, collarette, pæony-flowered, and cactus varieties behind the boards; Geisha, the new deep heliotrope carnation, was also well shown by this firm. Messrs. Cunningham, Fraser, and Co., Comely Bank, Edinburgh, presented border flowers and roses in excellent style, and also put up a very bold group of evergreen shrubs, choice hollies, and cypresses being the chief subjects. Messrs. R. B. Laird and Sons, Lim., Edinburgh, contributed a big group of golden cupressus and variegated yews.

A little group of choice orchids from Messrs. Sander and Sons, St. Albans, provided an item of special interest and beauty; Cattleya Adula perfecta, Lælio-cattleya Hiawatha, Brasso-cattleya Leemanæ, Cypripedium Cæsar, and Cattleya Suavoir were a few of the gems. Mr. D. McLeod, Manchester, also showed orchids. Very fine grapes and tomatoes, the former including the big-berried Diamond Jubilee variety, were largely shown by Messrs. Thomson and Sons, Lim., Cloverfords. A bright and artistically arranged group of stove foliage plants, including the newer ferns, was submitted by Mr. John Downie, Edinburgh, who also set up a group of begonias. From the King's Acre Nurseries, Hereford, came a splendid group of fruit trees in pots, the crops being remarkable for their development in size and colour; Allington Pippin, Rival, and Emperor Alexander apples, and Pres. d'Osmanville, and Glou Morceau pears were ususually fine. Liliums, particularly L. auratum and L. speciosum, were used with great liberality by Messrs. Thos. Methven and Sons, Edinburgh, in a large and effective group, in association with palms and ferns, begonias, clematis, and heliotropes. Mr. L. R. Russell, Richmond, had a conspicuously good exhibit of variegated tree ivies grown in various shapes and sizes. Messrs. W. Cutbush and Son brought up a great exhibit of hardy flowers from Highgate, and made special features of gladioli, pentstemons, kniphofias, and polyantha roses.

Mr. R. Bolton showed Hercules, R. F. Felton, Melba, Wenvoe Castle, Red Star, and other new sweet peas. Mr. E. F. Fairbairn and Sons, Edentown, contributed an effective collection of the better varieties of phloxes.

### MEDALS.

Gold.—Messrs. Dobbie and Co., Edinburgh.

Silver-gilt.—Messrs. Thomas S. Ware, Lim., Feltham; Messrs. E. Webb and Sons, Stourbridge; Messrs. Young and Co., Hatherley; King's Acre Nurseries, Hereford; Messrs. Wm. Cutbush and Son, Highgate; Messrs. Cunningham, Fraser, and Co., Edinburgh; Messrs. Thyne and Son; Messrs. Storrie and Storrie, Glencarse; Mr. D. W. Thomson, Edinburgh; Messrs. Wm. Thomson and Sons, Edinburgh; Mr. John Downie, Edinburgh; Messrs. Little and Ballantine, Carlisle; Messrs. Sander and Sons, St. Albans.

Silver.—Mr. S. A. Jones, Kilkenny; Messrs. R. Wallace and Co., Colchester; Bakers, Wolverhampton; D. M'Omish, Crieff; Messrs. J. Forbes, Lim., Hawick; Messrs. G. Gibson and Co., Leeming Bar; Messrs. Tillie, Whyte, and Co., Edinburgh; Mr. L. R. Russell, Richmond; Messrs. Thomas Methuen and Sons, Edinburgh; Messrs. R. B. Laird and Sons, Edinburgh; Messrs. Stuart Low and Co., Enfield; Messrs. W. Wells and Co., Merstham; Messrs. James Cocker and Sons, Aberdeen; Mr. W. Muir, Linlithgow (cypripediums); Mr. W. McLeod, Manchester; Mr. H. N. Ellison, West Bromwich.

Bronze.—Messrs. G. Fairbairn and Sons, Carlisle; Messrs. J. Mason and Co., Jamestown; Mr. Robert Bolton, Carnforth; Messrs. E. F. Fairbairn and Sons, Edentown; Messrs. Thomas Kennedy and Co., Dumfries; Mr. G. W. Miller, Wisbech; Mr. R. C. Ferguson, Dunfermline; Messrs. Gunn and Sons, Olton, Birmingham; and the East of Scotland College for bottled fruits, etc.

WEST'S PATENT GARDEN SUNDRIES have been invented during 30 years of practical experience. By better cultivation, and pleasure by which gardens are kept in order, their expense is doubly repaid. Samples and Illustrated Catalogue free. C. E. WEST, Higham Hill, London, N.E.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

---

INSECTS ON BEGONIA AND CYCLAMEN LEAVES.—Halifax: Could you tell me, through the pages of the Gardeners' Magazine, what is wrong with my seedling begonias, and whether I can do anything to restore them to health? My seedling cyclamens appear to be attacked in the same way; specimens enclosed.—Both begonias and cyclamens are suffering from an attack of "rust," and we refer you to the answer to "J. H. C., Duffield," for the remedy.

FAILURE WITH CARNATIONS.—H. T., Stone: I shall be much obliged if you can tell me what has caused my carnations to lose their foliage so badly. I have them in a cold frame, and they were potted into 8in. pots in June. While they were flowering in the 48-sized pots I was obliged to have them in the greenhouse, which had permanent shading on its roof. I have wondered whether this heavy shading had anything to do with the loss of foliage.—Excessive shading would undoubtedly have a distinctly detrimental effect upon the plants, and if potting and exposure to full light followed immediately upon their sojourn in the heavily shaded greenhouse then the sudden and severe change of conditions would largely account for the failure. Beyond all this, it seems to us, if we interpret your letter aright, that, under the circumstances, the shift from a 48-sized pot to one eight inches in diameter was too large.

PEACH FOR NAME.—B. T., Swindon: Enclosed in box I am sending you a peach, which I hope you will be able to name for me. The variety is a bad one for dropping its fruits just before colouring, but the ripe fruits are of good quality.—We despair of ever receiving a peach in condition for identification. The specimen sent was hopelessly mixed up with the cotton wool. For purposes of identification a peach should be sent before it is ripe; a few leaves should also be sent, and particulars be given of the size and colour of the flowers, and the conditions under which the tree is growing.

RUST ON BEGONIA LEAVES.—J. H. C., Duffield: I should be much obliged if you could tell me the cause of the rusty appearance of the enclosed begonia foliage. The plants grew to a fair size, and then seemed to stop growing. I have several varieties, but all are more or less affected.—The rusty appearance of the begonia foliage is due to the presence of a tiny mite, a species of Tarsonymus, which chiefly attacks the under surface of the leaves, thus preventing the plant from properly fulfilling its functions and thereby causing failure or death. Dusting with tobacco powder at frequent intervals will stop an attack if the matter is taken in hand before the trouble is widespread, but when the attack has assumed the proportions indicated by the specimens sent a more drastic method must be adopted. Take a good handful of soft soap and knead into it a quantity of flowers of sulphur; then dissolve the soap and sulphur compound in a gallon and a-half of warm soft water. In this solution dip the plants, and repeat the operation once a week until the pest is disposed of. The need for regular dipping at short inter-

# "A GRAND FERTILIZER."

"The value of CLAY'S FERTILIZER needs but little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur growers are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."—NURSERYMAN AND SEEDSMAN, July 20, 1912.

# FOUR PRACTICAL BOOKS ON GARDENING.

## GARDEN FOES.

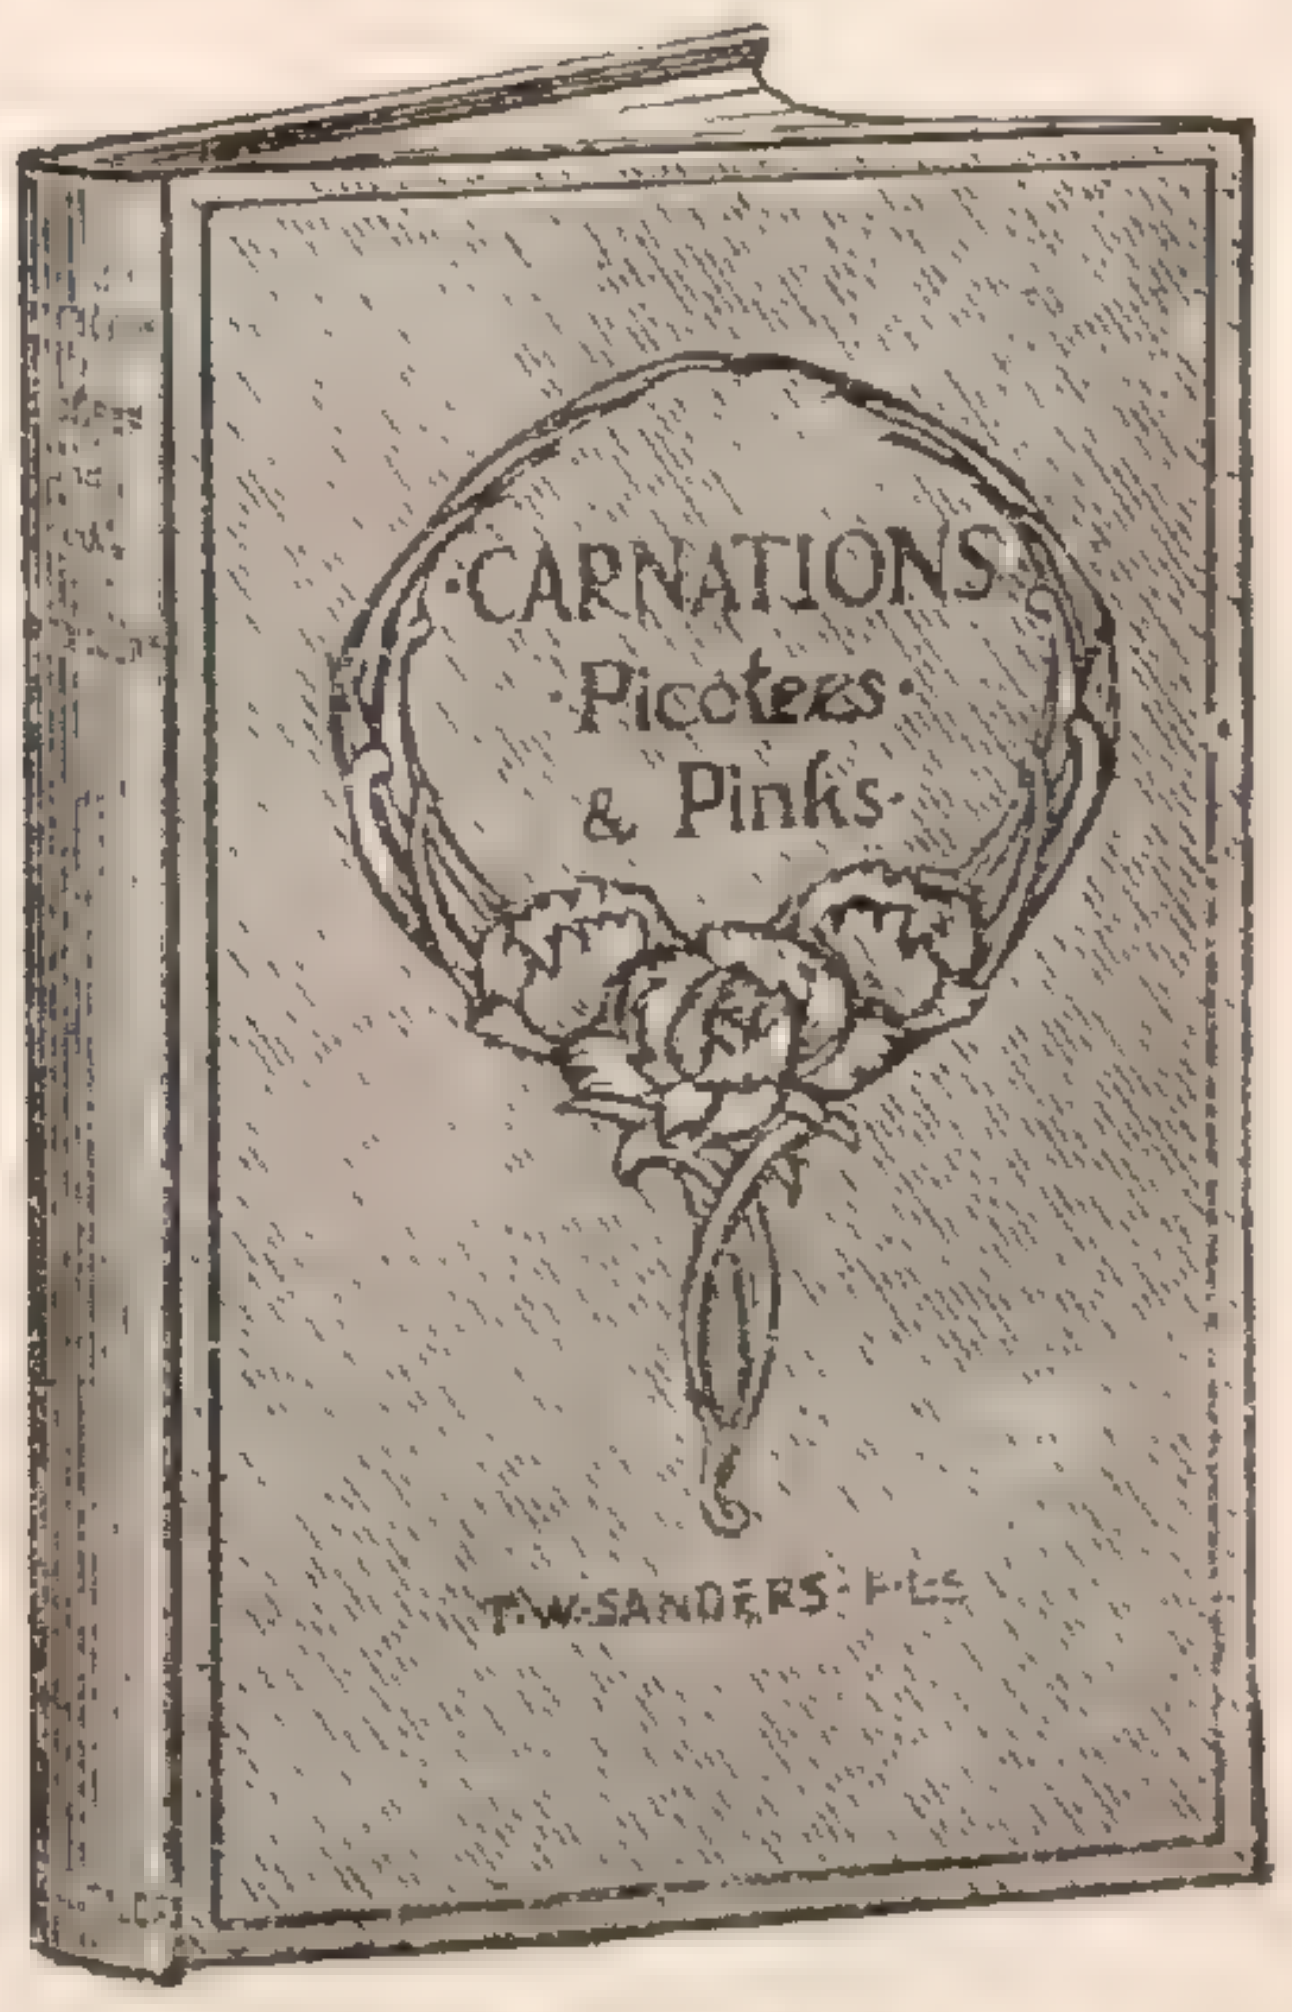
By T. W. SANDERS, F.L.S.

A description of Insect, Animal and Fungoid Pests Injurious to Fruit and Vegetable Crops, Hardy Plants, Trees, Shrubs, and Greenhouse Plants, with all the latest Remedies for their Eradication, etc.

"An excellent book. Mr. Sanders has a remedy for every disease and a means for exterminating the most persistent pest, and the directions given are so minute that the most inexperienced may apply them." PALL MALL GAZETTE.

Cloth, 336 Pages, 150 Illustrations.

PRICE **TWO & SIXPENCE**
By Post, packed in Box, 2/10



## CARNATIONS, PICOTEES AND PINKS

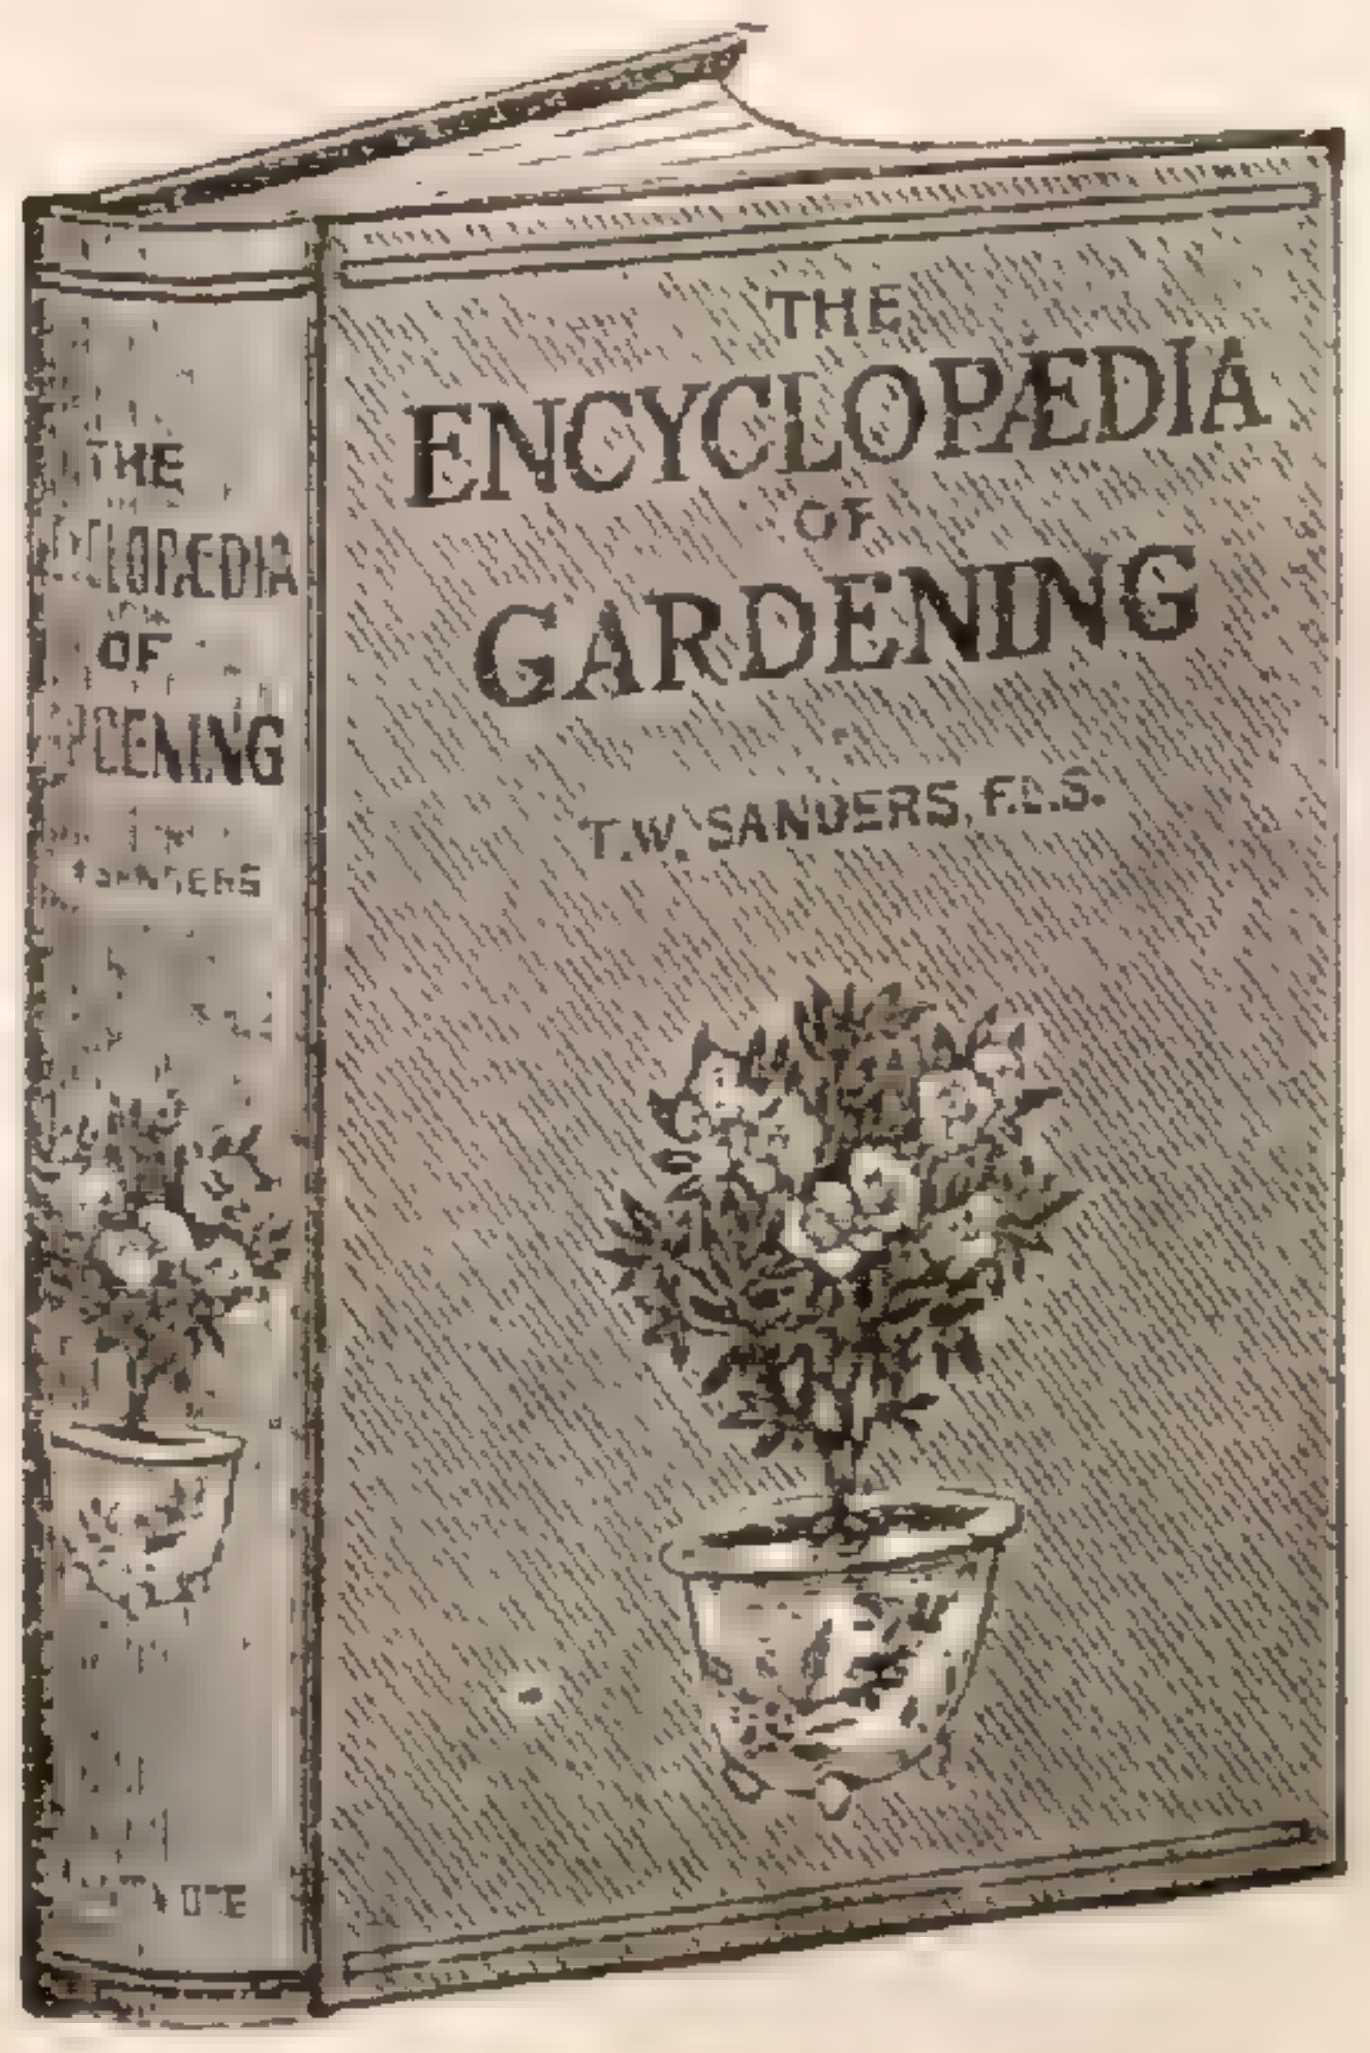
By T. W. SANDERS, F.L.S.

A Complete Guide to the Cultivation and Propagation of Border, Perpetual and other Carnations, Picotees, Garden and Alpine Pinks, Sweet Williams, etc.; including Lists of Varieties, and a Description of the various Pests and Diseases thereof.

"The man who cannot grow good carnations with this book to guide him, had better give up gardening." THE FIELD.

Cloth, 188 Pages. Numerous Illustrations, 16 Photo Plates.

PRICE **TWO & SIXPENCE**
By Post, packed in Box, 2/10



## ENCYCLOPAEDIA OF GARDENING

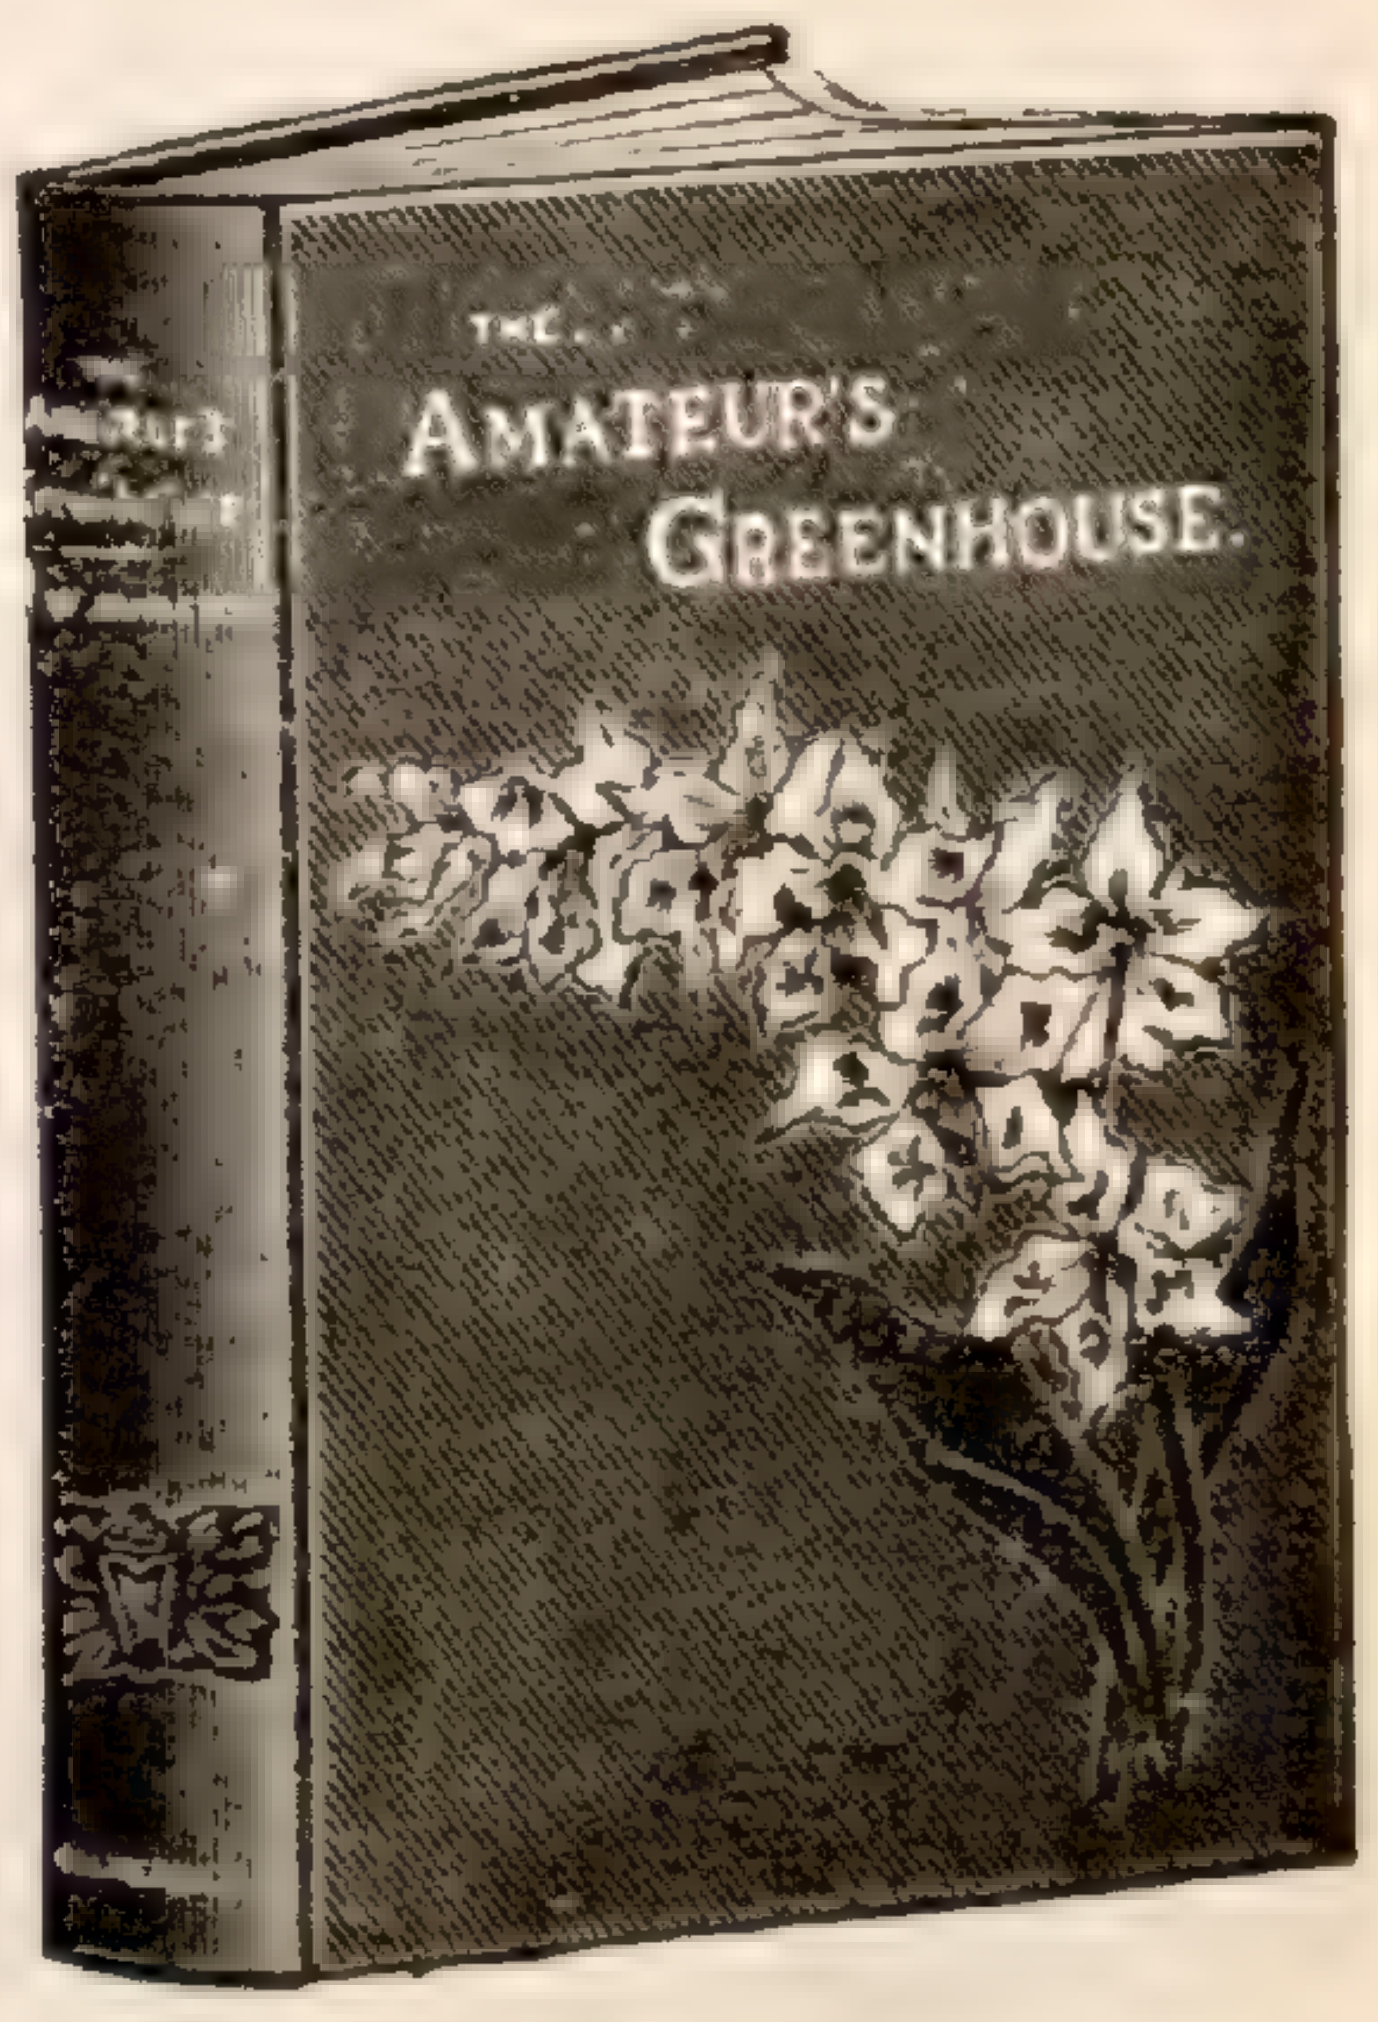
By T. W. SANDERS, F.L.S.

A Complete Guide and Dictionary in Alphabetical sequence, giving the Culture, Propagation and Description of Flowers, Fruit, Vegetables, Plants, Trees, Shrubs, etc., including Time of Planting, Colour, Height, Time of Flowering, etc., etc.

"A valuable book of reference conveying in a nutshell all one needs to know about plants of every description." THE QUEEN.

Fourteenth Edition. Rewritten and Enlarged. Bound in Cloth. 482 Pages

PRICE **THREE & SIXPENCE**
By Post, packed in Box, 3/10



## THE AMATEUR'S GREENHOUSE.

By T. W. SANDERS, F.L.S.

A Complete Guide to the Construction, Heating and Management of Greenhouses, and the Cultivation of Greenhouse Plants.

"This is a handy book, and one that is likely to be of great assistance to the ever-increasing class of residents in towns and the suburbs who either have greenhouses already, or who intend to build one." THE FIELD.

Fourth Edition. Revised and Enlarged. Crown 8vo, bound in cloth, 438 Pages, 152 Illustrations, 16 Plates printed on art paper, and 2 Coloured Plates.

PRICE **FIVE SHILLINGS**
By Post, packed in Box, 5/6

vals is great because, while the solution is deadly to the living mites it does not dispose of the eggs, so that one or two dippings may not suffice to eradicate the trouble.

BREWERS' YEAST AS A FERTILISER.—A correspondent asks whether any preparation of brewers' yeast can be used as a fertiliser in horticultural practice.—So far as we are aware, brewers' yeast is not put to any use as a soil fertiliser, and we very much doubt whether any preparation from it would be commercially successful. Yeast has a very complex chemical composition. About 7 per cent. is reducible to ash, the rest is combustible. Yeast ash, according to Mitscherlich's analysis, consists mainly of phosphoric acid (54 to 59 per cent.), united with potash (28 to 40 per cent.), magnesia (6 to 8 per cent.), and lime (1 to 4 per cent.).

SCHEDULE OF THE NATIONAL DAHLIA SOCIETY.—G. S., Neath: Please tell me where I can obtain a schedule of the forthcoming exhibition of the National Dahlia Society.—A schedule and full particulars concerning the work of the National Dahlia Society may be obtained from Mr. E. F. Hawes, the hon. secretary, Ulysses, Fortune Green, London, N.W.

SWEET HERB GARDEN.—C. W. P., New market: I propose to make a sweet herb garden, and should be glad if you would inform me where I can obtain suitable quotations for each of the various subjects that such a garden would include. Any information would be greatly valued.—In our issue of March 30, 1907, we published an article entitled "A Bunch of Herbs," which you would find useful. Such books as "The Shakespeare Flora," by Leo. H. Grindon (Simpkin, Marshall, and Co.); and "Bards and Blossoms," by F. E. Hulme, F.L.S. (Marcus Ward and Co.), would give you plenty of opportunity for the selection of appropriate quotations.

ANTHOLYZA PANICULATA.—S. W., Bristol: Will you be kind enough to give me some information concerning a plant named Antholyza paniculata, which I am told is a beautiful subject for autumn flowering?—Antholyza paniculata is a South Africal bulbous plant that bears tall spikes of bright scarlet flowers in the autumn. It is by no means common in gardens, and is only a success in specially-favoured localities, though it is hardy in most parts of the United Kingdom. Though the flowers are quite different in their form, the plant as a whole at once suggests resemblance to a montbretia. Corms should be planted six inches deep and six inches apart in groups in a warm border, and the ground thus occupied should be covered with a little rough cocoanut-fibre refuse, or ashes during the winter. Planting should be done as soon as corms can be obtained, and once planted there is no need to disturb a colony until over-crowding is evident.

FRUIT GROWING IN WESTERN AUSTRALIA.—R. F. H.: I have been reading about the possibilities of fruit-growing in Western Australia, and the openings the industry offers for young men. I have a liking for outdoor life, enjoy very good health, and have a few hundred pounds at my command. Would you advise me to go to the colony for the purpose of engaging in fruit-growing?—Advising a young man on a matter of this kind involves so much responsibility that we cannot undertake to give definite advice, especially when we have no personal knowledge of those seeking information. So much depends upon the capacity of the individual for the acquisition and utilisation of knowledge for both the production and sale of fruit, and for business methods that it is extremely difficult even when acquainted with the enquirer to say whether he is likely to succeed in fruit culture for market. We must leave you to decide whether you will go or not, but if you determine to emigrate we strongly advise you not to part with one penny of your money in the hire or purchase of land or orchards until you have worked for two or three years in an establishment in which the growing and marketing of fruit is carried out in accordance with the most modern methods. This will give you an opportunity of becoming acquainted with the soil and climate of the colony, the fruits most suitable for planting in the several fruit-growing areas, and the methods of marketing.

NIPPLE WORT.—D. P., Guernsey: I have been asked to obtain plants of the Nipple wort, but do not know any subject that bears this name, and no books to which I have access afford me any help. Can you tell me the correct name of the plant? — There are two native plants that are occasionally referred to as Nipple worts. The true Nipple wort is Lapsana communis, found from Orkney to the Channel Islands; it is a slender, erect, branching annual, with heads of yellow flowers, and it belongs to the Composite Order. Arnoseris pusilla, another composite, is a small, yellow-flowered annual, known as Swine's Succory, as well as the Dwarf Nipple wort. This has not such a wide distribution as Lapsana communis. The latter was formerly eaten as a salad.

### NAMES OF PLANTS.

H. T., Stone.—Spiræa Douglasi.

Halifax.—A clematis; please send flowers.

G. W. B., Ipswich.—1, Jasminum simplicifolium; 2, Eranthemum Andersoni; 3, Hedychium flavum.

S. E. J., Weymouth.—1, Escallonia macrantha; 2, Berberis Wallichi; 3, Nandina domestica; 4, Bougainvillea glabra; 5, Santolina incana; 6, Leycesteria formosa.

W. W. L., Farnborough.—The specimens were not particularly good ones; 1, Fuchsia corallina; 2, F. gracilis. The other plants were Phygelius capensis and a sedum we do not recognise.

## TRADE NOTE.

We have received from Mr. E. J. Wootten, Fairoak, Eastleigh, a very handy little two-ended hoe, which is called Wootten's Patent Moss and Weed Destroyer. The purpose for which this little implement is designed is to remove all moss and weeds growing in pots, and to keep the surface of the soil in the pots free and open. The larger end of the two is suitable for use on chrysanthemum pots, perpetual carnation pots, and others of a large size; while the smaller end is convenient for anything from a "60" pot upwards. With the hoe comes also a small triangular file for the purpose of keeping a keen edge on the blades. We consider that, at the reasonable price Mr. Wootten offers the two articles, there should be a good demand from carnation growers, and in fact, all classes of plant growers.

## CATALOGUES RECEIVED.

MESSRS. E. H. KRELAGE AND SON, HAARLEM, HOLLAND.—The comprehensive catalogue issued by this firm is of special interest for the full lists of tulips it contains.

ROBERT VEITCH AND SON, EXETER.—A concise, yet excellent, guide to the selection of bulbous plants for the production of rich displays of colour in the conservatory and flower garden is the catalogue of bulbs we have received from this well-known firm.

MESSRS. DICKSON AND ROBINSON, CATHEDRAL STREET, MANCHESTER.—The catalogue of bulbs that is being issued by this firm is comprehensive, interesting, and attractive, and will be found useful both in selecting and carrying out the cultural details.

MESSRS. WILLIAM PAUL AND SON, WALTHAM CROSS, LIM.—From this well-known firm, who have long been closely identified with bulbous plants, we have received their catalogue of bulbs, which is comprehensive, and remarkable for the judgment with which the lists of the several kinds has been prepared. The catalogue is additionally interesting owing to the inclusion of the list of varieties of camellias, that form the famous collection of these flowers at Waltham Cross.

ANT. ROOZEN AND SON, OVERVEEN, NEAR HAARLEM.—Although the autumn publication of this firm is, as usual, described as a catalogue of bulbs, it might well be regarded as a handhook, for such it assuredly is, of bulbous flowers. It contains lists of all the bulbous plants generally grown for the production of displays in the flower garden and conservatory, and a comprehensive list of miscellaneous kinds, which, although not largely known, are of great beauty. Messrs. Ant. Roozen and Son's general agents for Great Britain are Messrs. Mertens and Co., 3, Cross Lane, St. Mary-at-Hill, E.C., from whom the catalogue may be obtained.

## Situations Wanted.

AS JOURNEYMAN (Inside and Out, or Outside); one year and eight months in present place (Inside and Out); 7½ previous in jobbing gardening; age 23; good references; Bothy preferred. Apply 276, Office of this Paper.

E. DEAN, Esq., highly recommends GARDENER (Head or Single-handed); 5½ years with him; 29 years' experience Inside and Out; age 43. Apply WELSTEAD, Woodvale, Woodvale Avenue, South Norwood.

E. MILLER MUNDY, Esq., Shipley Hall, Derby, high recommends A. HARRIS as GARDENER (Head) in good establishment; six years as General Foreman; experienced in all branches, Inside and Outside. A. HARRIS, Shipley Hall, Derby.

G. BATES, Head Gardener to A. D. ACLAND, Esq., Digswell House, Welwyn, Herts, can thoroughly recommend strong LAD, age 17, as IMPROVER (Inside); two years' experience; Bothy preferred.

GARDENER (Head), age 32, married, one child, aged 4½; seventeen years' practical experience in carnations, chrysanthemums, fruit, stoves, house and table decorations, etc., seeks SITUATION where five or more are kept; six years as head. Apply, G. MOWBRAY, The Gardens, Tansor Court, Oundle, Northants.

GARDENER (Second of six), requires similar position, or manage smaller place; no fault, estate being sold; age 27.—E. DAMANT, Kenwick Hall, Louth, Lincolnshire.

GARDENER (Single-handed) seeks SITUATION; age 26; 12 years' good all-round experience (Inside and Outside); good references; abstainer; married when suited; near London preferred.—A. F., 39, Flash Walk, Hampstead, N.W.

GARDENER (Head Working, where three are kept); life experience Inside and Out; 12 years' good references; age 32; single. H. WARD, Woodrising Hall Gardens, Hingham, Norfolk.

GARDENER (Head Working), thoroughly experienced in Vines, Peaches, Melons, Cucumbers, Tomatoes, Stove and Greenhouse Plants, Kitchen Garden, Flower Gardens, and Pleasure Grounds; good references; married. G. F. HALL, Bagpath, Brimscombe, Stroud, Glos.

GARDENER (Head Working).—Mr. COLLETT, Kirtlington Park, highly recommends H. STEDMAN where three or more are kept; life experience Inside and Out; Vines, Fruit, Flowers, Kitchen Garden; age 35; married, two children; life abstainer; good references. STEDMAN, Bicester Lodge, Kirtlington Park, Oxon.

GARDENER (Head Working), age 32, seeks SITUATION( where two or three are kept; thoroughly experienced in Fruit, Flowers, and Vegetables, Roses, and Herbaceous Plants; 8½ years' excellent reference from present situation. T. H. ORAM, Grangehyrst Lodge, Grange Hill, South Norwood, S.E.

GARDENER (Head) seeks SITUATION, where one or two are kept, 14 years' experience in all branches, Inside and Out, in large establishments; excellent ref.; highly recommended. H. PAYNE, 59 Thorpe End, Melton Mowbray.

GARDENER (Single-handed, or with help); experience inside and out; vines and poultry; good references; married, one child (boy, 8½); age 39. C. H. SMITH, 44, Ravenbourne Road, Catford. (No circulars.)

GARDENER seeks SITUATION (Single-handed); experienced (Inside and Out), or good Kitchen Gardener; good references; married; age 32. E. REYNOLDS, 93, London Road, Maidstone, Kent.

GARDENER (Head); life practical experience in all branches; disengaged when suited; six years' good reference from present employer. KETTLE, Violet Cottage, Whitstone Road, Pen-y-lan, Christchurch, Newport, Mon.

GENTLEMAN recommends LAD (17½) as Improver; understands Kitchen and Flower Garden; anxious to learn greenhouse work; good reference; Bothy preferred. Apply, 2,842, Office of this Journal.

GARDENER (Head Working, or good Single-handed); highly recommended by late employer; good experience with Fruit, Flowers, and Vegetables; married, no family; excellent references; disengaged. SAUNDERS, 41, Sussex Road, Tonbridge. (No circulars.)

GARDENER (Head Working, where several are kept); life experience in all branches of the profession, both Inside and Out; especially well up in Hardy and Herbaceous Plants, Bog and Water Gardens; excellent references; married, no family. A. T., 70, Peel Road, North Wembley, Middlesex.

H. DE LA RUE, Esq., Six Mile Bottom, wishes to recommend W. SCOTT, Gardener (Head Working, where two or more are kept); experienced Inside and Out; married, no family; middle age; disengaged. Apply, SCOTT, Bulwick, Wansford.

J. D. ATKINSON, The Gardens, Attingham Park, near Shrewsbury, wishes to recommend Albert Pugh as JOURNEYMAN (Inside and Out); age 21; 2½ years present situation.

LAD, age 16½, seeks SITUATION as IMPROVER; 2½ years present place; Bothy preferred. Apply, F. KNIGHT, Holly Bush Cottage, Windsor Great Park.

MR. W. FOREMAN, Stoke Park Gardens, Guildford, would like to recommend his Foreman to any Head Gardener requiring the services of same or Second; has a good general knowledge of Indoor work; personal character good; leaving through reduction of staff.—Address as above.

REQUIRED, by PRACTICAL GLAZIER, constant work in large gardens, for upkeep of large ranges of glasshouses; quick painter; good references by writing "FIDE," School House, Sturminster Newton.

TWO YOUNG MEN seek SITUATION; ages 20 and 25; 2½ and 5 years' experience, Inside and Out; Kitchen Garden and Pleasure Ground preferred; good references. A. H. FORSEY, Winsham, Chard, Somerset.

THE FLORAL DEPOT are pleased to recommend a very good Gardener (Single-handed or otherwise). Inquiries will be answered at the above, 47, Baker Street, W.

WANTED, an opening for a YOUTH of 17 to learn Intensive Gardening. SECRETARY, 91, Parliament Chambers, Great Smith Street, S.W.

WANTED, a place as FOREMAN; life experience in Market Gardening; well up in French culture; also a little knowledge of Nursery work.—Box 632, Office of this Journal.

YOUNG MAN (19-20) seeks SITUATION as IMPROVER on Gentleman's Estate (Inside and Out); 4 years' experience, nursery and private. E. WESTON, The Fir Bothy, Lambley, Mottingham.

YOUNG MAN, 22, seeks SITUATION (Inside and Outside); five years' experience; Bothy preferred. H. E. H., Box 2,984, Office of this Paper.

YOUNG MAN seeks a SITUATION as IMPROVER (Inside or Inside and Out); Bothy preferred; good references; abstainer. ALBERT HOUSE, 29, Rowley Road, Reading, Berks.

YOUNG MAN seeks SITUATION as IMPROVER (trade or private); some experience; age 20. W. HOLBROOK, Trinity Place, Tewkesbury, Glos.

YOUNG MAN, educated, slight experience, seeks SITUATION with Nurseryman; give services one month; salary required after; excellent character. E., care of BESSELL, 24b, High Street, Sutton, Surrey.

YOUNG MAN, age 22, seeks SITUATION as Single-handed or Groom-Gardener; 7 years' experience; good references.—W. JARRETT, Ivy Farm, Southleigh, Witney, Oxon.

YOUNG MAN seeks SITUATION as GARDENER (Under); age 21; four years' good reference; South Devon preferred.—H. COOK, Hailey Lane, Hertford, Herts.

YOUNG MAN (23) seeks SITUATION in or near Surrey, as CHAUFFEUR-GARDENER, or Groom-Gardener; can ride and drive well, single or pair. Apply BOATWRIGHT, The Gardener's Lodge, Alton Lodge, Roehampton, S.W.

## Situations Vacant.

WANTED, a WORKING FOREMAN, with experience in cultivation of first-class Flowers, Shrubs, Fruit Trees, etc. Permanency to a steady, energetic, up-todate man. Apply, stating experience, age, and wages required, to "HORTICULTURE." care Eason and Son, Lim., Advertising Agents, Dublin.

THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Storage of Potatoes.

So appreciably does the keeping properties and the quality of potatoes grown for winter and early spring use depend upon the manner in which the tubers are stored that at all times it is of much importance that careful attention should be given to them when lifted. In a season such as this through which we are now passing, with the soil in many instances heavily charged with moisture, and a considerable proportion of the tubers infected by the disease caused by Phytophthora infestans, special care is necessary to reduce the losses in the store to a minimum. Our readers will be well acquainted with the fact that the effects of an attack of this fungus are seen first in the form of brown patches on the leaves; and that when the conditions are favourable to its development, as in a wet summer such as the one through which we have just passed, the mycelium rapidly passes through the tissues of the haulm, destroying it in its course, and penetrates some of the tubers. A portion of these are so badly infected that there is no difficulty in at once recognising their diseased condition, while others receive so light an attack as to be able to pass a close scrutiny undetected. These latter give rise to much anxiety among those who are acquainted with the fact that when the tubers are subjected to the warmth and moisture incidental to newly-formed clamps, the disease spreads through them, thereby causing their decay, and, it may be, bring about an infection of the sound tubers. When the cells have been invaded by the mycelium of the phytophthora, certain bacteria obtain an entrance and effect the decay of the tubers, which is commonly known as "wet rot." Moreover the fungus known as Nectria solani, which causes winter rot, is able to more readily attack diseased tubers than those which are quite sound. If these facts are borne in mind, there will be no difficulty in understanding the desirability of removing, as far as practicable, all the diseased tubers from those that are sound when the crop is lifted. With regard to this important operation, it cannot be too generally known that there is no advantage in leaving potatoes in the ground after the haulm has died down. There cannot be any increase in the bulk, or an improvement of the tubers after this stage has been passed; but there may be additional losses from the ravages of the disease. From this time onward, whether the haulm has died down or is quite green, the lifting of the crop should be proceeded with as rapidly as circumstances will permit, and dry weather should be taken full advantage of. When the work has to be proceeded with in showery weather, the tubers should be dried by being spread out on the floor of a dark shed, and the ventilation be so regulated that a current of air will pass over them. Should a dark shed be not available, spread the tubers on the floor of a light one, or of a fruit house that may be free, and cover with a layer of dry straw about twelve inches in thickness. Placed somewhat loosely on the potatoes, the straw will exclude the light, and allow the moisture to escape. If the weather is dry the tubers may be allowed to lie on the surface a few hours before being gathered up, but previous to storing it will be advisable to keep them in a dry shed for a few weeks. Moisture in the store so seriously impairs the flavour of potatoes as to fully justify whatever labour may be necessary to have them dry at the time they are placed therein. Moreover, it is so favourable to the spread of disease among them that considerable losses may follow a neglect of this precaution. In all seasons there is more or less objection to storing potatoes in wide clamps, but in those such as this it is most essential that the clamps be quite narrow. Three and a half feet in width at the base will be the most suitable, for they will hold a goodly quantity of tubers in proportion to their length; while the bulk will not be so large as to occasion much apprehension with regard to either moisture or temperature. Unless the ground is naturally dry it will be advisable to have the base of the clamp level with the surface, if not somewhat above it, and not, as in ordinary seasons, considerably below the general level. The practice that sometimes obtains of completely covering with soil the straw laid over the tubers immediately the clamp is formed is not a good one. There is in all cases a certain amount of "heating" and "sweating" for some time after the tubers have been clamped; and when the moisture cannot escape there are losses from diseases or a deterioration of quality, both of which should as far as possible be avoided. Covering the ridge with straw only for a time is probably best, for, while allowing the moisture rising from the tubers to escape, there is no danger of the rains finding their way into the clamp, provided the straw is laid on carefully. In four or five weeks it will be safe to complete the earthing up, and before this is done insert drain pipes along the ridge at intervals of a few feet for the purpose of securing sufficient ventilation. This practice is one that can be adopted in the most favourable of seasons, but at the present time its adoption will be found so advantageous as to merit it

MR. EDWARD LAXTON.

receiving the strongest recommendation. For a long period we have, in seasons in which there has been some difficulty in storing the tubers in so dry a state as could be wished, sprinkled a small quantity of fine lime among them during the process, and have found it most beneficial in its effect. Newly-slaked lime has been used with most excellent results; but, according to some experiments that were carried out at the Leeds University, ground quicklime is preferable to slaked lime, but it has not the advantage of being so readily obtainable. The lime not only keeps the sound tubers safe from infection, but prevents any deterioration in their quality, a matter of some consequence when the potato crop has been lifted under conditions that are distinctly unfavourable.

---

**Mr. Edward Laxton,** who, with his brother, Mr. W. Laxton, carry on the business of nurserymen and seedsmen, as Messrs. Laxton Bros., Bedford, is one of the most capable and enterprising of the younger generation of horticultural traders. He was trained by his father, the late Mr. Thomas Laxton, and has carried on the work of raising new fruits and vegetables with great vigour and success. As raisers of new strawberries the Laxtons stand pre-eminent, and probably no strawberry has ever had such widespread popularity as their Royal Sovereign. Much time and space are devoted to strawberry culture and to raising and testing new varieties, and many thousands of seedlings have to be raised and grown for several years before such varieties as The Laxton, Bedford Champion, Laxton's Latest, New Connoisseur, Reward, Rival, The Queen, and King George V. can be placed on the market. The most careful records are kept of all crosses made, and of the results secured. Mr. Laxton has raised new red and black currants, new raspberries, and the quite new Laxtonberry, a strong-growing, free-cropping fruit that may be described as a coreless, raspberry-flavoured loganberry. Hybrid and cross-bred fruits of many kinds have been raised at Bedford by Mr. Laxton and his brother, and many are passing through severe tests before making their bow to the public. Fruit trees, roses, etc., are grown extensively under Mr. Laxton's supervision, and culinary peas are another special feature, the firm having long been famous for their fine varieties, of which Gradus, Thomas Laxton, and Alderman may be mentioned as examples. Mr. E. Laxton and his brother have not only sustained the reputation their father made, but have made reputations for themselves, and, being in the early prime of manhood, there is every prospect that new fruits to come will add further lustre to their achievements.

**Sweet Peas.**—In our issue for the 28th inst. we shall give several special articles and illustrations relating to sweet peas, with a view to assist cultivators in the fullest possible manner in carrying out the cultural details requiring attention at this season of the year. The articles will deal with such important matters as new sweet peas, sowing sweet peas in autumn, culture for exhibition, and sweet pea culture under glass.

**Monument to M. Ernest Calvat.**—It will be remembered that soon after the sudden death of the great French chrysanthemum raiser, Ernest Calvat, of Grenoble, a movement was started to raise a fund to erect a monument to his memory. The fund, contributed to by growers all over the world, amounted to a considerable sum, and a handsome bronze medallion, designed by M. Chorel, was the result. Quite recently, in the presence of a few members of the family, and of the representatives of the societies to which M. Calvat belonged, the inauguration took place in the cemetery at Grenoble, where his remains were interred. On behalf of the French Chrysanthemum Society M. Philippe Rivoire regretted the premature end of the great raiser, who had done so much for the honour of French horticulture, but rejoiced in the fact that the world at large had participated in raising a lasting memorial to his honour. Thanks were returned on behalf of the family by M. Calvat's son-in-law, Captain Douillet.

**The National Sweet Pea Society** will hold its London Exhibition of 1913 at the Royal Horticultural Hall, Westminster, on July 17. It is hoped that a Northern Provincial Exhibition may be arranged for the second week of August, 1913. The Society's annual meeting will be held this year on October 17, at the Hotel Windsor, Victoria Street, Westminster, and will be followed by a conference.

**New Pleasure Grounds for Penrith.**—The Penrith Urban Council has received the sanction of the Local Government Board to borrow £1,800 for the purchase of the ruins of the castle and grounds for conversion into public pleasure grounds. The total area of the site is seven and a-half acres, and the purchase price was £2,000, but an offer of £200 towards the cost rendered the borrowing of the whole amount unnecessary. The Penrith Castle Acquisition Committee have guaranteed £1,000 for laying out the grounds. The castle was erected by Ralph Neville, Earl of Westmorland, in 1397, and dismantled by the Royalist Commandant during the Civil War.

**French and Italian Flowers.**—The cultivators of flowers for market in certain parts of Italy are at the present time perturbed by the restrictions that have been placed upon the importation of some of their products into France. The growers at Ventimiglia held a meeting the other day, at which it was resolved to petition the King of Italy to ask the French Government to repeal the decree which is in force prohibiting the importation of Italian flowers into France. It was further resolved that, should the French Government refuse to repeal the decree, the flower growers of Liguria would boycott all flowers coming from Nice and Provence. The controversy between the flower growers in the two countries in question has arisen from the prohibition by the French Government early in the year of the importation of cut flowers from Italy, because of the silkworm breeders of Provence fearing that the insect pest known as Diaspis pentagona, which was prevalent in Liguria, might attack their mulberry trees.

**Botany of the Abor Expedition.**—Mr. J. H. Burkill, who occupied the position of Government botanist to the Abor expedition, delivered a semi-popular lecture in Section K (Botany) of the British Association, in which he described the forests of the Abor hills in Eastern Himalaya. He said forest was the natural clothing of these hills, where it obliterated the clearings of man very quickly. The forest of the plains, like all tropical rain forests, had a great variety of foliage. The vegetation was in three layers—giant trees, which were small-leaved, the seeds being wind-dispersed; lesser trees, which were large-leaved and animal dispersed; and the ground vegetation. On the north slopes in the lower hill region ruled a most distinct and characteristic forest composed chiefly of a tree called by the Abors "Sling-keng." Above the base of the hills oaks appeared, and ruled in places; and on very steep slopes a giant bamboo ruled. Grasses were very rare in the whole countryside. The climate was so humid all the year round that it was only on the bluffs and south slopes of the hills that deciduous trees were found bare for more than a month after their leaves had fallen.

**The National Chrysanthemum Society's Meetings** for the ensuing season will be held either at the Crystal Palace or Essex Hall, Strand. At the former place there will be exhibitions on October 2 and 3, and October 29, 30, and 31. The Floral Committee will meet at one o'clock on the first day of each exhibition, and at three o'clock at Essex Hall, on September 23, October 21, November 11, November 20, and December 2. On November 20 there will be an exhibition at Essex Hall, and this will be open at one o'clock and at seven p.m. A conference will be held.

**A Flower Show Problem.**—We are pleased to find that our views on the importance of effecting a reduction in the number of local horticultural societies for the purpose of a concentration of effort on a few of those most favourably situated with a view to their holding exhibitions that are worthy of the present position of horticulture is finding favour. With reference to this matter, the "Oxford Chronicle" observes: "One of the most striking developments in the history of horticultural societies is the growing tendency to transform the modest show of garden produce into a popular fête, with attractions of a quite irrelevant character in the shape of sports and other amusements. The presence of the public is naturally essential to the success of any show, but is not the adoption of such methods a confession of weakness? It is surprising to what an extent, outside the small coterie of enthusiastic horticulturists, the actual show is neglected. Many persons do not trouble to enter the exhibition tents at all, or are satisfied with a very cursory survey. The wisdom, or otherwise, of these 'side shows' is a matter on which some considerable difference of opinion exists, but if they are necessary then it may be suggested that the fact proves that we have more flower shows than enthusiasm for floriculture warrants. Shows at this period of the year are innumerable, and it is questionable whether so many in a comparatively small area serve any really useful purpose. A remedy might be found in the amalgamation of various societies, and a series of shows might be arranged at, say, intervals of a month during the summer. Flower shows would then be flower shows, and not miscellaneous fêtes, and one fancies that the public would appreciate the change."

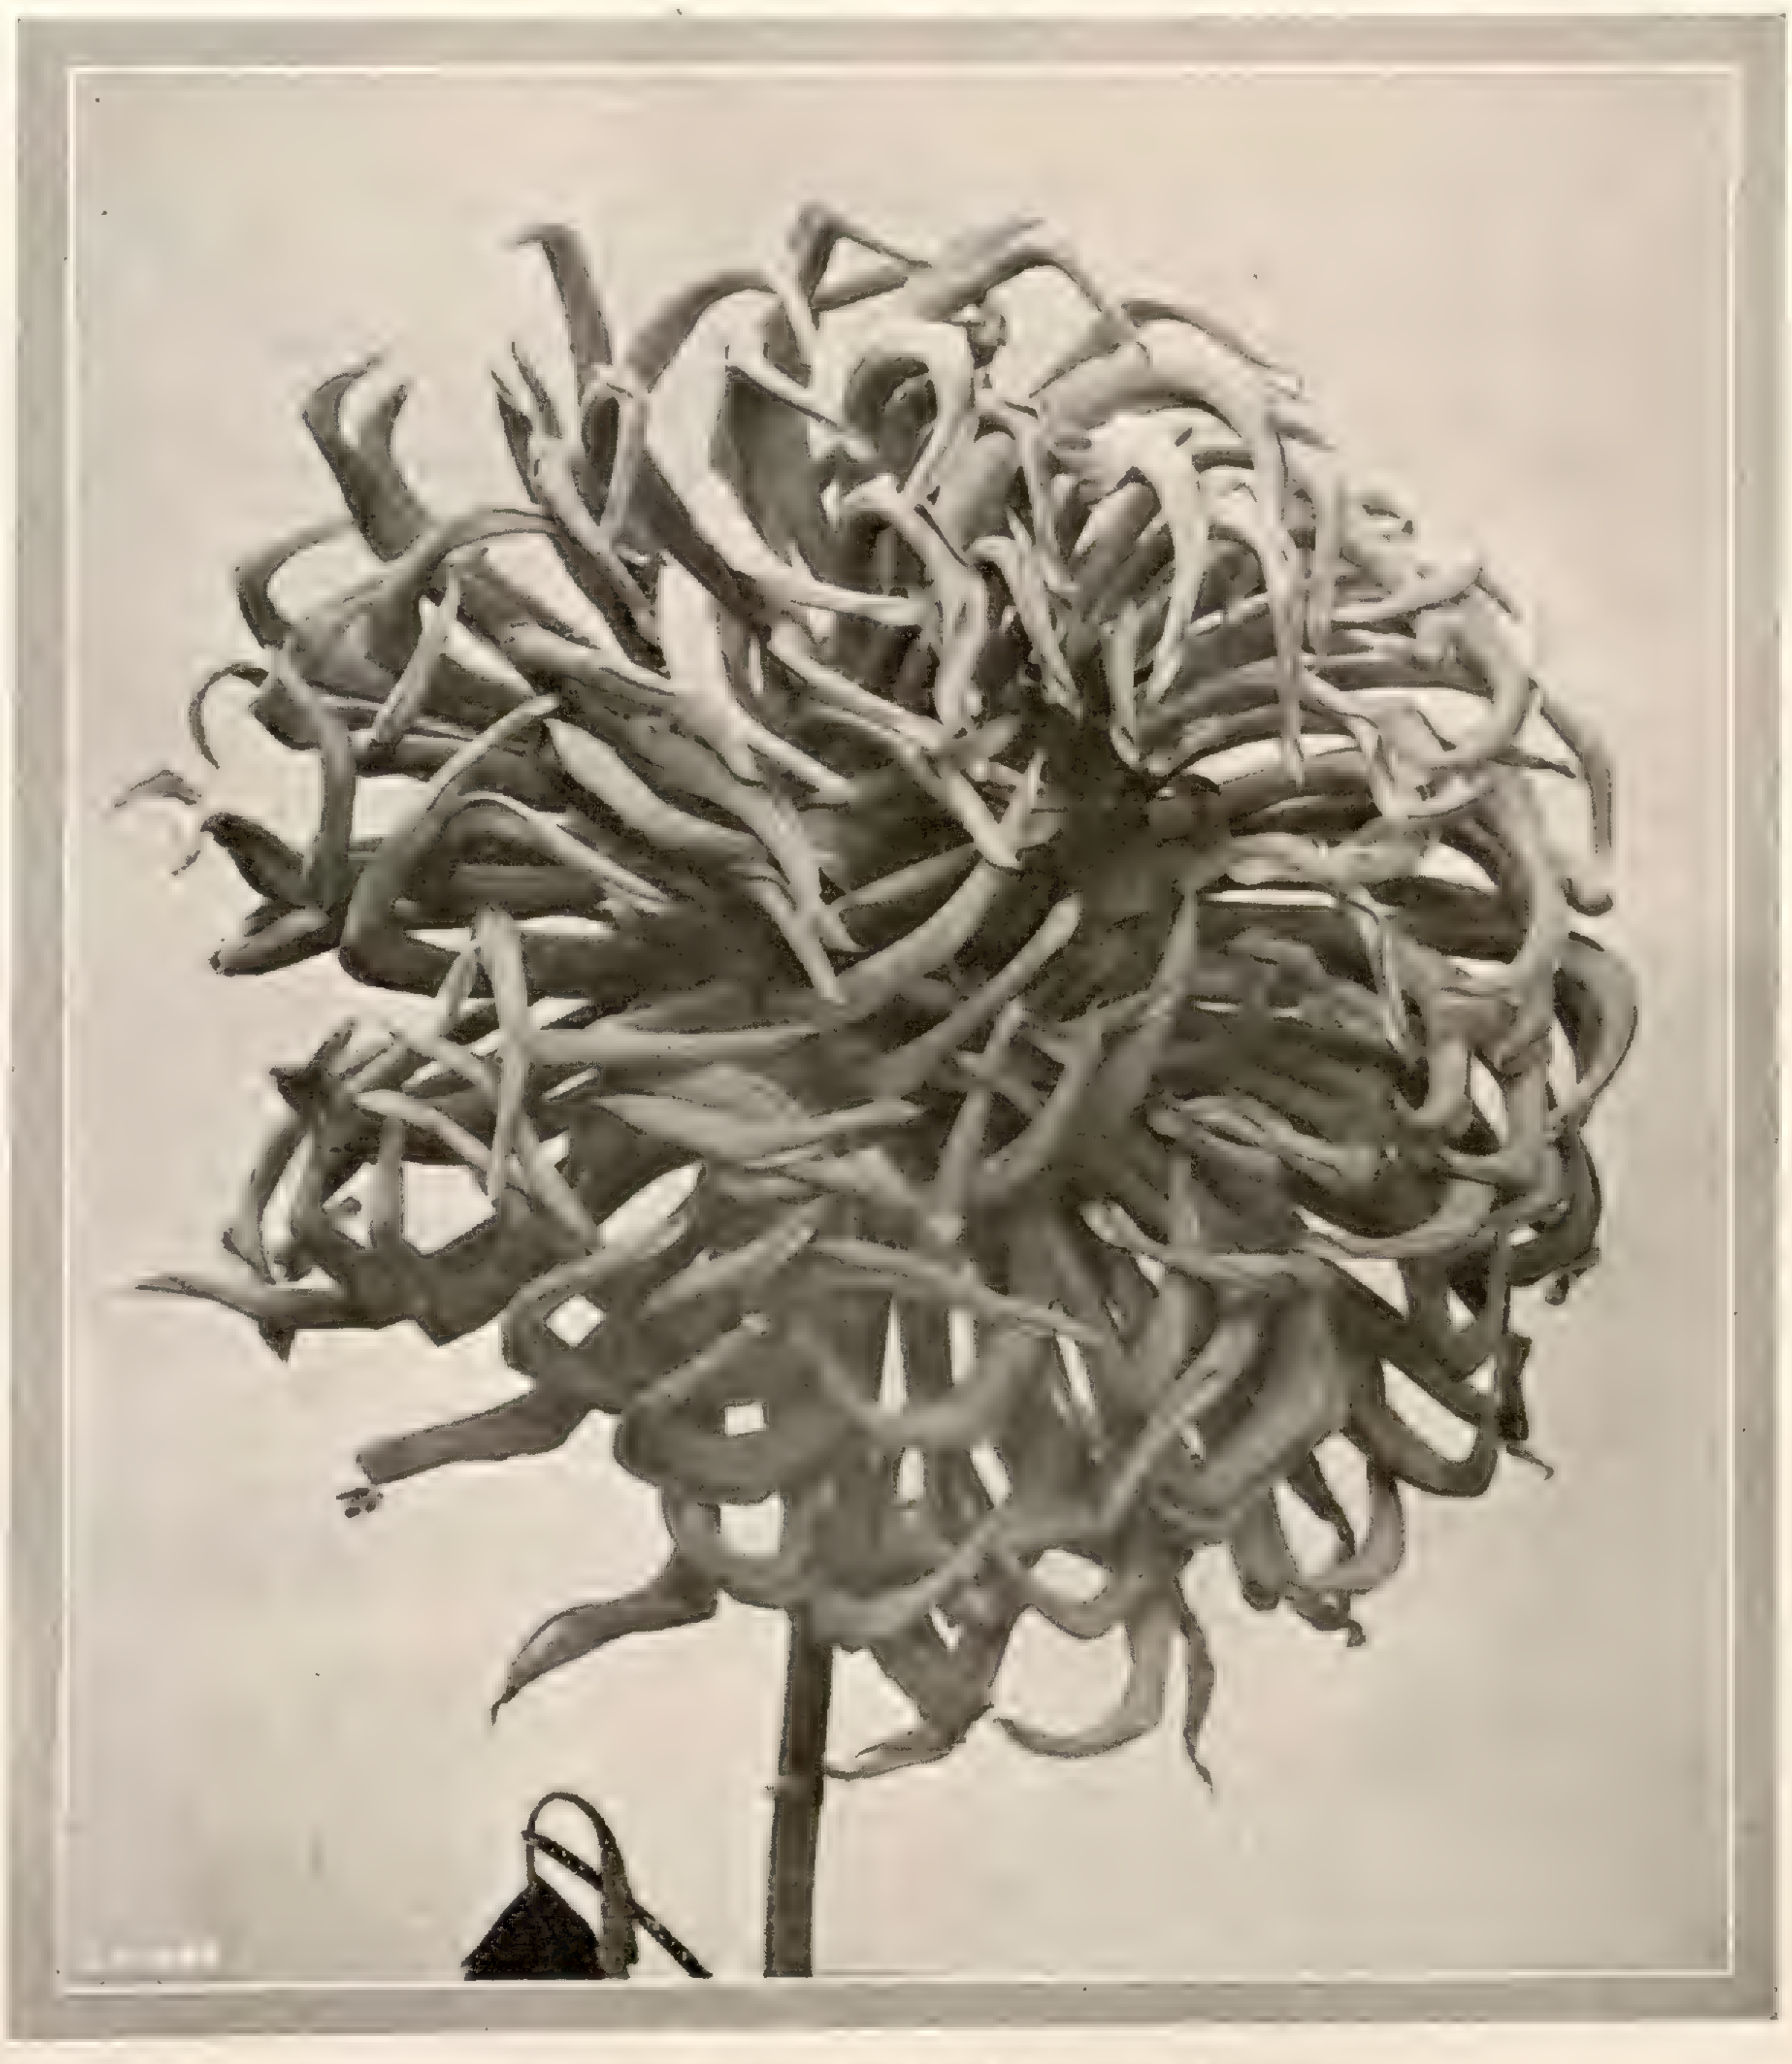
**Sale of Seedling Daffodils.**—Some time previous to the commencement of the planting season for daffodils we directed attention to the advantages that would result to both raisers and growers of these flowers were the practice adopted by raisers of distributing, through the usual trade channels, seedlings of high quality that for some reason or other it would not be desirable to distribute under name. We pointed out that when the varieties of exceptional merit had been selected for distribution under name from seedlings that had been raised from carefully made crosses, there must remain many of great beauty. We therefore suggested that the same practice might be adopted in the case of daffodils as had given such good results in the case of tuberous begonias. It was hardly to be expected that all the raisers would be in agreement with our advocacy of so wide a divergence from the orthodox practice, but we are pleased to find that several of the leading firms who are closely associated with the daffodil cult are this season offering unnamed seedlings. For example, Messrs. J. R. Pearson and Sons, of Lowdham, Notts, offer seedlings obtained from their highly-successful crosses between Madame de Graaff and Minnie Hume, that gave Lowdham Beauty and several other notable varieties. Messrs. Cartwright and Goodwin, Kidderminster, also offer seedlings of the Leedsi type; and Messrs. Barr and Sons, of King Street, Covent Garden, W.C., give growers an opportunity of obtaining selected seedlings that have been obtained from the intercrossing of such fine trumpets as King Alfred, Weardale Perfection, and Madame de Graaff. We mention this new departure as a matter of general interest to growers of daffodils, and shall watch its development with much interest.

**The Japanese Larch and Drought.**—The planting of Japanese larch in preference to European larch has been advocated in recent years on account of its superior growth when young, and its resistance to disease, and hitherto the only reason against its cultivation has been the lack of knowledge as to whether the Japanese variety will attain the size of the European as a timber tree at the age of 70 to 100 years. Japanese larch, however, seems, according to the "Quarterly Journal of Forestry," to have suffered more from the drought of 1911 than the European variety. The latter, therefore, seems a far safer tree to plant under unfavourable conditions as to rainfall, and under the worst conditions would probably have to be filled up to the extent of only 25 per cent., as against entire replanting of a Japanese crop. However, under a moderate setback the Japanese variety seems to throw out a new leader, stronger, better, and more quickly than the European, and, taking into account the disease-resisting power of the Japanese variety, and the exceptional character of the weather of 1911, it may be well worth planting, and among a strong growth of bracken, or for planting up clear-cut coppice woods, provided there is a reasonable amount of moisture in the soil, it may be more useful than European.

**Nicotine as an Insecticide.**—A recent issue of the "Journal of Economic Entomology" contains a report on some experiments that were carried out to test the efficacy of a solution of pure nicotine as compared with tobacco extracts of various strengths. The pure nicotine used was a 10 per cent. solution, and the extracts were of strengths containing 8 per cent., 25 per cent., 30 per cent., and 40 per cent. of pure nicotine, and in addition a 7 per cent. solution of nicotine sulphate made from pure nicotine was tried. Four different dilutions were made of all the solutions, the dilutions containing respectively 0.50, 0.75, 1, and 2 per cent. of pure nicotine. Insects (Cimex lectularius) were immersed in the solutions for one minute, and then taken out and examined after five days. It was shown that the effects of the treatment were not due to drowning, since insects immersed in water for one minute were unharmed. Practically the whole of the insects were killed by the 2 per cent. dilution of each solution tested, the number killed in each case decreasing with the decreasing strength of the dilution. Pure nicotine appeared to be quite as efficacious as the four tobacco extract preparations, and to be superior to the nicotine sulphate solution. Of the extracts the 40 per cent. solution (the strongest) was the most effective.

## NATIONAL DAHLIA SOCIETY.

On September 17 and 18, the National Dahlia Society held its exhibition at the Crystal Palace, the scene of so many brilliant horticultural displays. This exhibition was a large one, but it was by no means one of the best the society has held. The cold, wet weather of this season has not been favourable to high-class dahlia blooms, although it has not been a bad season for dahlias as considered solely from the point of view of garden decorations. Cultivators who have had in view the production of exhibition flowers have had some difficulty in managing their plants this year. The competition was not keen, save in some of the smaller classes for amateurs; indeed, there was very little of that bustle and excitement an hour previous to the time of judging, on September 17, so characteristic of, say, a rose or a sweet pea show.



NEW CACTUS DAHLIA GIGANTIC.
Colour, old gold. F.C.C., N.D.S., September 17. Messrs. J. Stredwick and Son, St. Leonards.

The committee was sparing in its awards to new varieties, but it granted a First Class Certificate to Gigantic and George Schofield, two cactus varieties, from Messrs. J. Stredwick and Son; to Kathleen, garden cactus, and Johnnie, pompon, from Mr. J. T. West, Brentwood; to Autocrat, a yellow show variety, from Messrs. Keynes, Williams, and Co., Salisbury; and to Mrs. A. Brown, the soft yellow single variety, staged originally as Yellow Prince, and exhibited by Mr. A. Brown, Grange Road, Leagrave, Beds.

### NURSERYMEN.

There was but one entry in the class for forty-eight blooms, distinct, of show dahlias, and this secured the first prize for Mr. E. Mortimer, Rowledge, Fareham, whose set was a good one, and contained fine blooms of Penelope, Crimson Globe, Florence Tranter, Pleasaunce, Model, Primrose, David Johnson, and Mrs. Langtry. Mr. Chas. Turner won first place for two dozen show blooms, and especially good were his Perfection, Jas. Cocker, Mrs. Langtry, Chieftain, Marjorie, and Arthur Rawlings; Messrs. J. Cheal and Sons, Crawley, were placed second, but it must have been a close fight between them and Messrs. W. Treseder, Lim., Cardiff, who were placed third.

Mr. S. Mortimer was first prize-winner for eighteen fancy dahlias, and here the best specimens were of Gaiety, Duchess of Albany, and Fanny Short. For a dozen fancy dahlias Mr. Chas. Turner was a good first, followed by Messrs. W. Treseder, Lim., and Mr. M. V. Seale. Fancy dahlias were not, however, up to best form.

The Silver Challenge Cup for eighteen bunches of cactus dahlias, distinct, six blooms of each, was won by Messrs. J. Stredwick and Son, St. Leonards, with finely-grown specimens of H. H. Thomas, Rev. A. H. Lowe, Mrs. Randle, Scorpion, Heroine, Moonlight, Golden Wave, Conqueror, F. W. Fellows, Frances White, John Riding, Mrs. D. Fleming, Gigantic, Miss Stredwick, Carrie Hammond, Emu, and Phyllis; Messrs. J. Cheal and Sons, second, and Messrs. J. Burrell and Co., Cambridge, third. Mr. Seale was the only exhibitor of twelve bunches of cactus dahlias, his best being Harold Peerman, H. H. Thomas, and Enchantress.

Messrs. Keynes, Williams, and Co., Salisbury, were first for forty-eight cactus dahlias, on boards, winning with a beautifully even set that included Olympia, Golden Crown, Clincher, Lacemaker, Cavalier, Dr. Roy Appleton, New York, Esther, and Flossie Ridout in fine form; Messrs. J. Stredwick and Son second and Messrs. J.

Burrell and Co., third. Premier award for two dozen cactus dahlias, distinct, staged on boards, fell to Messrs. W. Treseder, Lim., Cardiff, for a good set of bright clear blooms of Ivernia, Mrs. Brandt, Johannesburg, Evening Star, Miss Stredwick, Red Admiral, New York, Florrie Wells, etc.; Mr. M. V. Seale, second.

The class for a dozen bunches of garden cactus dahlias, the flowers staged with grasses and autumn foliage, is of great interest. Messrs. J. Cheal and Son led with Duchess of Marlborough, Coral, Mrs. Forester Paton, Helene, Lustre, Hon. Mrs. Greville, Mrs. Freeman Thomas, Miss A. Dyer, and Mrs. Landell; Mr. M. V. Seale second.

Premier award for two dozen pompon varieties, ten flowers of each, fell to Mr. Chas. Turner, Slough, who had very neat, bright flowers of Mary, Glow, Ideal, Adela, Nelly Broomhead, Ganymede, Emily Hopper, Jessica, and Donald; Messrs. J. Cheal and Sons, Crawley, was second; and Mr. M. V. Seale, Sevenoaks, third. For a dozen bunches of pompon varieties, Messrs. J. Burrell and Co., Cambridge, gained the first prize with a charming set of neat blooms; they were the only exhibitors in the class.

Messrs. J. Cheal and Sons led for twenty-four bunches of single dahlias, ten blooms of each, with a very gay set of Mrs. Joynson Hicks, Kitty, Cardinal, Mrs. Miller, Fugi San, Winona, Miss Morland, Bridesmaid, Glencoe, Royal Sovereign, Leopold (a new crimson-scarlet), Snowdrop, Rosemary Bridge, Brilliant, Lady Bountiful, Sunray, Lunder, Flambeau, Leslie Seale, Flora, Princess of Wales, Elaine, Owen Thomas, and Miss Roberts; Mr. M. V. Seale second.

For pæony-flowered dahlias six varieties, six blooms of each, Mr. Chas. Turner was first prize-winner with Orlando, Bertha von Statner, Salome, Liberty, Sunstar, and Bayard; Messrs. J. Cheal and Sons second, and Mr. J. Emberson third. Mr. Chas. Turner showed a fine set of twelve bunches of collarette dahlias, winning with Leistern, Corbeille de Feu, Prince de Venosa, Diamant, Mdme. Gyga, Souv. de Bernardin, Maurice Rivoire, Pres. Viger, Mdme. Porier, Henri Farman, Antwerpia, and Gallia; Messrs. J. Cheal and Sons second, and Mr. M. V. Seale third.

### AMATEURS.

Mr. S. H. Cooper, Chippenham, won the Silver Challenge Cup offered for the best twenty-four show and fancy dahlias; he had a very even set of good blooms, and showed Shottesham Hero, R. T. Rawlings, Mr. C. Clark, J. Cocker, Mrs. J. Downie, and M. Fellowes in fine form; Mr. H. Tysoe second, and Mr. G. Densley third. For a dozen show varieties the awards fell in order of mention to Mr. H. Tysoe, Mr. Densley, and Mr. S. H. Cooper, these being the only three exhibitors.

Only one competitor came forward with six varieties of garden cactus dahlias, six stems of each, staged in vases with suitable foliage, etc., and this was the Rev. A. Bridge, Worth Rectory, who had handsome vases of White Ensign Mrs. Lordale, Mary Purrier, Sweet Briar, Hon. Mrs. Greville, and Arthur Pickard, pleasingly associated with grasses and autumn foliage. The Crystal Palace Company's silver cup was the prize in this class.

The silver challenge cup for nine varieties of cactus dahlias, three flowers of each, was secured by Mr. F. W. Fellowes, The Lane House, King's Walden, Hitchin, with fine examples of Indomitable, Mrs. Douglas Fleming, Ivernia, Glory of Wilts, Mrs. Stephens, Red Admiral, Jupiter, Richard Box, and Miss Stredwick; Rev. A. Bridge, Worth Rectory, Three Bridges, second; and Mr. F. Densley, Nags Head Hill, St. George, Bristol, third. The best two dozen cactus blooms, on boards, were from Mr. H. Peerman, Glencross, Nantwich who scored with clean, fresh, but somewhat small flowers of popular sorts; Mr. G. Densley second. The awards for a dozen cactus dahlias, on boards, fell in order to Mr. F. W. Fellowes, Mr. G. Davidson, Bensham Manor Road, Thornton Heath; and Rev. A. Bridge. Indomitable, Red Admiral, Mrs. D. Fleming, Ivernia, Dr Roy Appleton, and H. H. Thomas, were capital blooms in the winning stand.

A silver cup was offered for the best dozen varieties of pompon dahlias, six blooms of each, and this was won by Mr. H. Brown, Dahlia Dene, Havelock Road, Luton, with Jessica, Marietta, Nerissa, Little Winnie, Emily Hopper, Sylvia, Best of All, Violet, Nellie Broomhead, Lessie, Bacchus, and Nora Reynolds; Mr. A. P. Ironsides, The Hamlet, Chippenham, second; and Mr. S. H. Cooper, third.

The Rev. A. Bridge led for a dozen bunches, six blooms each, of single dahlias, and presented beautiful blooms of Columbine, Leslie Seale, Owen Thomas, Lady Bountiful, Mrs. Joynson Hicks, and Rosebank Scarlet; Rev. S. S. Pearce, Coombe Vicarage, Oxon, second.

### SMALLER AMATEURS' CLASSES.

Mr. C. Luckin, Apsley, Thakeham, Pulborough, scored for a dozen show and fancy dahlias, and was followed by Mr. A. Robbins, Prospect Place, Keynsham, and Mr. R. C. Unwin, The Green, Histon, Cambs. Mr. Luckin; Mr. T. W. Bunnage, Burrell Street, St. Neots; and Mr. R. C. Unwin secured the awards for six show and fancy dahlias in the order given. Two bunches of garden cactus dahlias found Mr. C. Luckin to the fore with Mary Purrier and Mrs. D. Fleming well displayed with berries, grasses, and autumn foliage; Mr. A. F. Tofield, Holmesdale, Chandlersford, second, and Mr. W. Mitson, Anerley, third.

Mr. C. Luckin and Mr. A. Longridge were first and second respectively for six varieties of cactus dahlias, in bunches, while for a dozen blooms, on boards, Mr. A. H. Farmer, Kitchener Road, Walthamstow, led the way, followed by Mr. J. Hicks, Thornton Heath, and Mr. R. C. Unwin. Messrs. C. Luckin, Mr. J. Hicks, and Mr. Tofield won for six blooms in eleven entries.

The amateurs showed pompons well, and there were six entries of six bunches, Mr. A. Robbins, Prospect Place, Keynsham, annexing the leading award with Nerissa, Darkest of All, Sylvia, Phœbe, Jessica, and Marietta; Mr. A. Brown, Grange Road, Leagrave, second, and Mr. C. Luckin third. Mr. C. Luckin and Mr. A. Brown were the only exhibitors of six bunches of single dahlias and they gained awards as placed, Mr. Luckin staging Rosebank Scarlet, Mrs. Joynson Hicks, Owen Thomas, Columbine, Snowdrop, and Winona.

In the classes for those who had not previously won a prize at the National Dahlia Society's shows, Mr. A. Jefferies, Langley Burrell, Chippenham; Mr. J. J. Jenner, Manor Park, Sutton; Mr. A. W. Bower, Queen's Road, Dalston; and Mr. R. P. Brown, Bensham Manor Road, Thornton Heath, were the leading prize winners. Mr. H. Edwards, Norton Priory Gardens, Chichester, led for a vase of twelve blooms, with salmon-pink cactus blooms, set up with grasses and bracken; Mr. R. P. Brown second, with yellow, white, and crimson flowers; Mr. J. J. Jenner third.

### OPEN CLASSES.

Messrs. J. Burrell and Co. led for a dozen bunches of pompon cactus dahlias, with neat flowers of Minima, Lena, Martha, Nora, Agnes, Nain, Sweet, Argus, Bessie, Atala, Nancy, and Mrs. Marshall; Mr. M. V. Seale, second; and Messrs. J. Cheal and Sons third. For six blooms of one cactus dahlia Mr. C. Luckin scored with Snowdon, and Messrs. Stredwick and Son came second with big blooms of F. W. Fellowes; ten entries. Messrs. W. Treseder, Lim., led for six of any one show or fancy dahlia with Duchess of York; Messrs. Keynes, Williams, and Co., Salisbury, second, with Tom Jones; and Mr. S. H. Cooper third with R. S. Rawlings.

Messrs. W. Treseder, Lim., gained first prize for a dahlia bouquet and for a basket of dahlias, the latter being a fine effort in gold and crimson-maroon cactus varieties. Mr. J. Emberson, Grove Road, Walthamstow, scored for a vase of pompons, and Mr. A. Brown came second.

Messrs. J. Cheal and Sons, Crawley, scored for a dozen fancy single dahlias, and Messrs. J. Stredwick and Sons led for six bunches of fancy cactus dahlias with Orion, Magpie, Uranus, Jupiter, Pierrot, and Cygnus; Mr. W. V. Seale second. Premier place for six bunches of decorative dahlias fell to Mr. Chas. Turner who staged beautiful flowers of Delice, Papa Charmet, Yellow Colosse, Attraction, Mdme. Van der Dael, and Mdme. Lumiere; Mr. J. Emberson second.

### NON-COMPETITIVE.

Mr. J. T. West, Tower Hill, Brentwood, secured a Gold Medal for his handsome exhibit of pæony, cactus, show, and pompon dahlias. Dorothy Vasey, a new pink pæony variety; Useful, a mauve-pink, stiff-stemmed decorative sort; and Kathleen, purplish-mauve garden cactus variety, were specially attractive. Brentwood Yellow was also very much in evidence. In tall stands, Messrs. Hobbies, Lim., Derham, staged pæony-flowered and collarette dahlias in large numbers; Exposition de Lyon, Maurice Rivoire, Meteor, Diadem, Henri Farman, Joseph Goujon, and Gallia were well displayed, and two huge baskets of autumn roses were not the least attractive part of the exhibit; Silver-gilt Medal.

Messrs. H. Cannell and Sons, Swanley, made a fine display with dahlias set up in large triangular bunches. Decorative, pæony, collarette, cactus, and single sorts were all well represented, and among the latter Cannell's Favourite, Mrs. Walter Jackson, Marie Corelli, Dr. Hickin, and White Cloud were large, effective varieties. A Gold Medal was awarded. Mr. J. Emberson, Hoe Street, Walthamstow, was an exhibitor of pæony-flowered, cactus, and single dahlias, and received a Silver-gilt Medal; he had a fine stand of Attraction, M. Silvent, and Le Colosse.

Mr. J. B. Riding, Chingford, submitted a large collection of dahlias, pæony-flowered and collarette varieties predominating; of the latter there were such new sorts as Mdme. Legrange, Orphée, A. Maumene, and B. Siegfurth. A circular group of choice cactus and pæony-flowered dahlias, set over ferns and edged with asters, was a conspicuous exhibit from Messrs. Jas. Carter and Co., Raynes Park, and merited a large Silver-gilt Medal.

Messrs. T. S. Ware, Lim., Feltham, contributed pæony-flowered dahlias in great variety, as well as a selection of cactus varieties, and they also displayed a wonderfully fine lot of begonias, both plants and flowers. Messrs. Spooner and Son, Hounslow, presented a fine collection of apples, pears, etc., and well deserved the Gold Medal awarded.

**Cypripedium Leeanum,** with its most beautiful varieties, of which perhaps C. L. Clinkaberryanum and C. L. giganteum are the best known, are among the most beautiful and useful members of the genus. The flower buds are now prominent in the new growths of the earliest plants, and, as the days shorten, these orchids should be raised as close to the glass as possible, so that they may receive all the light. Shading must only be given when strong sunshine prevails. As the flower spikes extend they should be neatly tied to thin stakes, and in an upright position. These plants require a liberal supply of fresh air at all times whenever the conditions are favourable, even in the depth of winter. They must have liberal supplies of water both at the roots and in the atmosphere until the flowers are developed. Root-bound specimens may have an occasional application of weak liquid manure until the flowers commence to expand, but after this stage clear soft water only should be given. I do not, as a rule, recommend the feeding of orchids. It is advisable, before the plants come into bloom, to thoroughly clean them and their surroundings.—J. T. Barker.

# EARLY-FLOWERING TULIPS FOR BEDDING.

Prominent among the several classes of bulbous plants that are available for the production of colour effects in the flower garden during the spring months are the early-flowering tulips in their wondrous diversity of colour. They should not be planted to the exclusion of other kinds of proved excellence, such as the daffodils and hyacinths, but it must be admitted that in no other class of bulbous plants flowering during the earlier months of the year do we find such varied and brilliant colouring as in the flowers of the tulips, This is a point of some importance, and to large numbers of flower lovers it is not less important that the bulbs of a considerable number of highly meritorious varieties can be purchased at a price which places them within the reach of owners of gardens of all classes. Hence it is that they should be fully utilised in arrangements of spring flowers in the garden. The finest of the varieties of recent introduction should be purchased and planted by those to whom the cost is not a matter for serious consideration because of the pleasure that may be derived from them, but for the production of distinct and beautiful displays of colour either alone or in association with hyacinths and daffodils, it is not necessary to have varieties costing more than seven or eight shillings per hundred, and a goodly number of tulips of much merit for bedding purposes can be obtained at prices ranging from four to six shillings per hundred. Reference is made to this point for the purpose of suggesting that where the amount to be expended is limited the cheaper varieties should be obtained, so that the bulbs can be planted at the proper distances apart for the production of a really satisfactory display. In many instances the more expensive varieties are purchased, and the bulbs planted so far apart as to render it impossible for them to produce a really satisfactory effect.

AN EFFECTIVE BED OF TULIP WOUVERMAN AT KEW.
The flowers of this variety are of large size, and in colour are rich claret-purple.

The selection of varieties is a matter that requires rather more attention than is usually given. It is, of course, essential they should be of good quality, and the colours suitable for carrying out the colour scheme that has been prepared, but this fact is so fully recognised that there is not much cause for criticism. It is, however, sometimes overlooked that not only should the height of the flower stems and the colour of the flowers be such as to properly fit into the scheme, but the varieties used in carrying out a design should bloom simultaneously. Therefore in selecting tulips for a geometric or other scheme varieties that bloom about the same time should alone be included. When they are required for filling beds occupying more or less isolated position, or for forming groups in the mixed border the exact period of flowering is not a matter of any consequence.

The earliest of the tulips to bloom are the Van Thols, but for bedding arrangements they need not be taken into consideration. Putting these on one side, the remaining varieties may, so far as regards their flowering, be formed into three groups. The periods of flower development are relative rather than actual, but the date is immaterial provided those used in a design bloom simultaneously, or nearly so. The earliest of the single tulips to bloom after the Van Thols include the following, which can be strongly recommended for bedding purposes; Bacchus, dark crimson; Belle Alliance, brilliant scarlet; Crimson King, scarlet-crimson; King of the Yellows, rich yellow; Mon Tresor, another fine yellow variety; White Hawk, pure white. The mid-season varieties are more numerous than the foregoing, and the following may be mentioned for their high merit: Artus, scarlet; Chrysolora, deep yellow; Cottage Maid, pink shaded white; Duchesse de Parma, bright orange-red with yellow margin; Joost Van Vondel, rose-crimson; Keizerskroon, scarlet with bright yellow margin; La Reine, white tinted rose; Ophir d'Or, rich yellow, very fine; Pottebakker, scarlet; Prince de Ligny, deep yellow, rather tall; Prince of Austria, rich orange-scarlet, fragrant, very fine in colour; Snowflake, pure white; and Wouverman, purple-violet, very distinct and useful for the contrast of colour it affords. The most useful of the late varieties comprise: Couleur Cardinal, deep scarlet; Rose Grisdelin, rose shaded white; Thomas Moore, orange-red; and White Swan, pure white.

Tulips should be planted as early in October as the beds and borders can conveniently be prepared for their reception. Three inches is a good depth at which to plant the bulbs, and they should be planted five or six inches apart each way. The accompanying illustration of the beautiful bed of the deep claret-purple Wouverman, which, with a number of others formed, flanked the broad walk in the Royal Gardens, Kew, in the spring of the present year, is of interest as showing the splendid effect produced when the bulbs are planted rather close together, as here advised. When tulips are grown in association with the golden alyssum, the white arabis or wallflowers of suitable colours, the bulbs may be allowed more space, but when grown in beds wholly devoted to them thin planting is a mistake. G.

# EARLY-FLOWERING GLADIOLI.

This section of the gladioli family has become immensely popular during late years, and for providing a quantity of cut flowers the several species and varieties are quite indispensable. The old G. Colvillei alba has been a great favourite for some time, its pure white flowers being highly appreciated both for garden decoration and for cutting, and it is grown extensively for the latter purpose. A vast improvement has taken place lately among the early-flowering gladioli, and there are now some beautiful varieties obtainable, usually at a cheap rate. The rich colouring of the flowers, with the vivid blotches on the lower segments, almost rivals the colouring of orchids. The blotches are usually surrounded by a shading quite distinct from the ground colour, and this enhances the beauty of the flowers.

Not only on account of their beauty are these plants recommended, but also for the ease with which they may be cultivated. They adapt themselves to pot culture equally as well as they do to the borders, and when grown in pots they are of great value for conservatory decoration during the spring. Their natural period of flowering outdoors is June and July, but by growing them in pots and gently forcing them flowers are to be obtained in May, and at this season they are highly appreciated, for the daffodils are practically over then, and the supply of flowers for cutting is none too plenteous. These early gladioli are wonderfully free in flowering, and also have great lasting properties when in a cut state, for every bud opens quite to the end of the spike. It is impossible to say too much in favour of these easily-grown and lovely flowers, and they certainly deserve to be extensively cultivated. The section comprises varieties of the G. nanus and G. ramosus groups, as well as such fine sorts as G. Colvillei, G. Colvillei alba, G. byzantinus, and G. cardinalis.

### Outdoor Culture.

A well-drained border is necessary for the successful cultivation of early gladioli, and one that is sheltered from cutting winds, and slightly shaded from the midday sun. The soil should be of a light, friable nature, enriched with well-decayed manure, and should be thoroughly prepared some time before being planted. The corms may be planted at any time from the beginning of September until the end of October, for preference the earlier date, as growth commences soon after the foliage has died down. They should be planted from four to six inches deep, in rows about twelve inches apart, allowing six inches' space between each corm. During severe weather the growths will need some protection from frosts. Bracken will be found to be a most suitable protective material, as it is light and airy, and does not become so heavy and rotten as straw litter. This should be lightly laid over the border on the approach of sharp weather, and removed altogether in March.

During dry spells in the winter it is beneficial to lightly loosen the protecting material to allow it to dry up, and if this is occasionally attended to there will be no fear of the soil becoming sour. In the favoured districts of the south and south-west, where the winters are mild, protection is not necessary in any shape or form, and beyond the initial work of planting there is hardly any labour attached to their cultivation. A good mulching in the late spring will greatly improve the flowers and lengthen the spikes, and an occasional watering with weak liquid manure during dry weather will do good.

### Pot Culture.

Five-inch pots will be found the most convenient size in which to grow these gladioli, and from four to six corms may be placed in each pot, according to their size. The potting compost should consist of two-thirds loam and one-third well-decayed manure, adding to this a sprinkling of sharp sand. When the work of potting is completed the pots should be placed in a cold frame, withholding water until growth commences. Free ventilation must be allowed at every opportunity, only closing the frame when absolutely necessary; in case of frost protect with mats. In the early part of the year the plants may be placed in a cool greenhouse, where they will grow steadily. On no account should there be any attempt at sharp forcing; a high temperature must be avoided at all times, or there will be complete failure.

### Varieties.

A good selection includes Ackermanni, Crimson Queen, Delicatissima, Lord Grey, Ne Plus Ultra, Peach Blossom, Prince Albert, Queen Victoria, Queen Wilhelmina, Rosy Gem, Salmon Queen, The Queen, and Zimmerman. E. C. POOLEY.

Gnaton Gardens.

# THE AUTUMN COLOUR OF LEAVES.

Although we are inclined to associate the rich autumnal tints of the foliage of certain deciduous trees and shrubs with bright, sunny weather, we are now and then brought face to face with the fact that sunshine is not the only or principal factor at work in the production of colour. In this year of cold and rain there is every indication at present, mid-September, that the colour of the foliage of some subjects will be superior to that of last year, which was one of record sun. This may be due to the fact that the leaves are better nourished after a damp summer, for there is nothing to be seen at present of the flabbiness and partly dead leaves which were prevalent on many trees in 1911.

There does not appear to be much difference between a dry and wet summer in the date when the leaves commence to colour, for, although a dry time causes leaves to fall before their proper time, such leaves are usually minus showy colouring matter, and at their best are but a dingy yellow or brown. Perhaps the years when colour has been most brilliant are those when a moderately wet early summer has been followed by a fine late summer and an early autumn, for it appears that to obtain good colour there must be no check to the plants during the season of growth.

The effects of autumn are usually first noticed on Ampelopsis Veitchi, for as early as the middle of August the leaves have often changed from green to scarlet, bronze, or dark red. Fortunately, the leaves do not fall quickly after changing colour, their brilliancy often extending over a period of from four to six weeks. Vitis Coignetiæ, which in Japan is credited with being one of the most showy of all shrubby plants in autumn, is rather disappointing in this country, yet it promises to be really good this year, for many leaves are already brightly coloured. There are many vines that are worth planting for the sake of their autumn effect. The large-leaved species, which is usually grown in gardens as Vitis Thunbergi, is one, whilst V. Henryana, V. armata, V. Thomsoniana, V. Romaneti, and V. serianæfolia are other good kinds. Several sorts of deciduous euonymuses are very beautiful in autumn, although their attractive qualities do not appear to be fully appreciated. E. alata is dressed in orange and scarlet, the leaves of latifolius and americanus turn red, planipes changes its colour from green to purple and deep red, and the common E. europæus often colours well. Added to the colour of the leaves is the ornamental appearance of the bright-coloured fruits in most cases. This is an instance of a group of plants making up in autumn for the insignificance of their flowers in spring. The same may be said of the American Tupelo, Nyssa sylvatica, for its leaves are very highly-coloured previous to falling.

The leaves of some of the cornus take on a good deal of colour, but perhaps the most showy of all is the Californian C. Nuttalli. At its best, in September, the foliage is red. Unfortunately, it is not largely grown here, but from American descriptions it has few equals for showy colouring in its particular region. Some of the barberries colour very prettily, perhaps the most noticeable one being Berberis Thunbergi, the colour in this case being scarlet and gold. Liquidambar styraciflua is easily one of the most showy of tall-growing trees, for the leaves are made up of numerous shades of red, bronze, and yellow. The hickories, as a rule, are conspicuous by reason of golden leaves in autumn. Of the several species, Carya tomentosa is easily the most attractive. Amongst the maples are many effective kinds, for rich colouring is observed from the dwarf-growing varieties of Acer palmatum and A. japonicum to such large-growing sorts as A. rubrum and A. darycarpum. Perhaps the most conspicuous of all is A. Ginnala, for in this case the leaves are vivid scarlet.

Ribes aureum, although usually grown as a spring-flowering shrub, is decidedly attractive in autumn, for the foliage assumes a rich reddish-purple hue. Oxydendron arboreum, a member of the Ericaceæ, changes to scarlet, whilst the enkianthuses, which belong to the same order, assume the same colour. Deciduous rhododendrons are amongst the most attractive of all shrubs in autumn, for their leaves give us almost as many shades of colour as their flowers do earlier in the year. The rhus family is renowned for bright foliage in autumn, the most beautiful of all, perhaps, being R. cotinoides. In this case, the colour is orange and scarlet, the various shades being very delicately blended.

Pyrus, both of the pear and apple groups, give numerous decorative examples, whilst there are also many showy thorns. Of the latter Cratægus prunifolia is perhaps the most conspicuous of all. The snowy mespilus, Amelanchier canadensis, is another low-growing tree, which colours well in autumn, whilst in the allied genus Cotoneaster frigidus is very conspicuous. Such deciduous conifers as Pseudolarix Kæmpferi, Ginkgo biloba, and Taxodium distichum are very attractive, the two former by reason of their golden leaves and the latter by its rich brown foliage.

Amongst British trees the beech is, perhaps, the most showy, for its leaves are brown in colour. Oaks and elms are, however, showy, whilst the birch is also conspicuous. Although bright colour is to be seen in many more instances those mentioned are sufficient to direct attention to the value of autumn tints as an aid to the embellishment of garden and woodland.

## "A GRAND FERTILIZER."

"The value of CLAY'S FERTILIZER needs but little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur growers are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."—NURSERYMAN AND SEEDSMAN, July 20, 1912.

## ASTER SATURN.

Prominent in the large and exceedingly beautiful collection of hardy flowers exhibited by Messrs. G. Bunyard and Co. at the meeting of the Royal Horticultural Society held on the 10th inst., was the handsome Aster Saturn, of which an illustration is given herewith. This fine addition to the Michaelmas daisies originated in the nurseries of the firm, and is equally deserving of attention for its robust growth, free-branching habit, and abundant production of flowers. The portion illustrated is but a small spray, and that reduced in reproduction, and those who are familiar with the Michaelmas daisies will have no difficulty in understanding that a bushy specimen bearing a crowd of such sprays must present a highly attractive appearance throughout the season of flowering. The flowers are mostly semi-double, about one and a-half inches in diameter, while the colour is very pleasing, and may, perhaps, be best described as lavender-blue. Apart from its merit, this aster is of special interest, as evidence that Messrs. G. Bunyard and Co. do not devote the whole of their attention to fruits and fruit trees as might be assumed from the success they have achieved in connection therewith. So far from this being the case, they have had for many years past a collection of perennials so extensive and meritorious that, were it not for the overpowering influence of their culture of hardy fruits the nurseries would have been regarded as famous for hardy flowers.

## BRITISH FERN NOMENCLATURE.

As the hon. secretary of the British Pteridological Society, to which reference is made in your leader of August 24 (the annual report of which appears on p. 657 of the same issue), I venture to solicit a little space for a reply to the very kindly and sympathetic remarks and suggestions made in the above connection. I also avail myself of this opportunity of thanking the Gardeners' Magazine for the support to the cult which it has given for the past quarter of a century at least, and to my efforts to restore to our beautiful native ferns the popularity which it is now generally recognised they so fully merit. I cannot but agree that the names given are in many cases very long ones, but it must be conceded that if a descriptive name can be given to a plant, it must perforce be better than a purely fanciful one, which conveys nothing at all without the aid of the description which accompanies it in the florist's catalogue.

Taking the daffodil as the example quoted, though numberless flowers are so varied as to render this example one of a legion, I would point out that there is little or no parallel between the cases. With a flower which, by virtue of selection, crossing or hybridising, yields eventually hundreds of varieties, characterised by often small differences of form, tint, and size, which it is impossible to define beyond a certain limit, fancy names, personal, local, or other, must inevitably be adopted, but with our native ferns it must be remembered that they stand alone in the fact that all the varieties have originated from wild sports, which at the time of their discovery, were certainly entitled to be descriptively named on botanical lines, and being referred to the botanist or fern experts of the time, were treated accordingly. It is due to this that we inherit, as it were, varietal names thus given to the extent to take Lowe's list as an example, of nearly two thousand. As time went on by selection from the spores of these wild plants and their progeny, other varieties arose, and their distinctive differences from their parents were indicated by additions to the parental names. The result, I admit, is in many cases cumbrous, but it is not to be forgotten that this is partly due to the fact that the specific names themselves are often lengthy, such as Polystichum angulare, P. aculeatum, Athyrium filix-fœmina, and others, and hence when these are cut down to P. ang., P. acul., and A. f. f. much of the evil disappears. Mr. Lowe did an immense service to the cult by dividing the varieties of the more variable species into sections, each embracing a predominant character, and in practice this greatly facilitated naming on descriptive lines. Personally I have found that new disciples to the cult find little difficulty in grasping these principles, and I have never come across one who has been frightened away by the names when once he or she, as the case may be, has obtained a few fine varieties, and thus acquired a visual acquaintance with their charms. Furthermore, for the beginner there exists sufficient simple English names for his guidance; let him send an order to one of the trade for a selection, say, of frilled and tasselled or crested hartstongues, plumose, and tasselled lady ferns, tasselled male ferns, and plumose and tasselled shield ferns, and I am perfectly sure that the attachment thereto of labels bearing the accepted Latin names will form no handicap to his admiration. Moreover, even the Latin names are mostly so indicative of the English ones—congesta, cristata, minus, etc., etc., as to be easily interpreted and speedily learnt. In short, my experience has taught me that once a taste for the cult has been acquired, the name difficulty disappears entirely, or becomes so unimportant, in comparison with the plants concerned, as to be ignored; while, as I have indicated, those of the public who are content to see their gardens decorated with fine varieties without taking up the cult as a hobby, can quite well do so by using the common names of the species when giving their orders.

I may say, on behalf of the society with which I am associated, that it is our earnest desire to simplify names, as far as possible, but we cannot see our way to the adoption of the daffodil style of nomenclature, which conveys usually nothing but compliments to those whose personal names are given to the plants, and thus loses all scientific interest. Another point is that the term "garden varieties" is most inappropriately applied to the large number of our native fern forms which have originated as perfectly wild "sports," and form the foundation of the cult; in daffodils and other flowers this peculiar factor is non-existent, and no true fern-lover could agree to rechristen such "sports" with commonplace names of persons, places, etc. We have inherited them, and must retain them as the basis of our nomenclature.

One point which the society has adopted nowadays is to refuse to name any but such forms as are distinct improvements and perfect in make. In old days the most imperfect, irregular, and inconstant types were christened, regardless of merit; these are now ignored.

Chas. T. Druery, V.M.H., F.L.S.

ASTER SATURN.
Flowers semi-double, lavender-blue. Introduced by Messrs. G. Bunyard and Co., Maidstone.

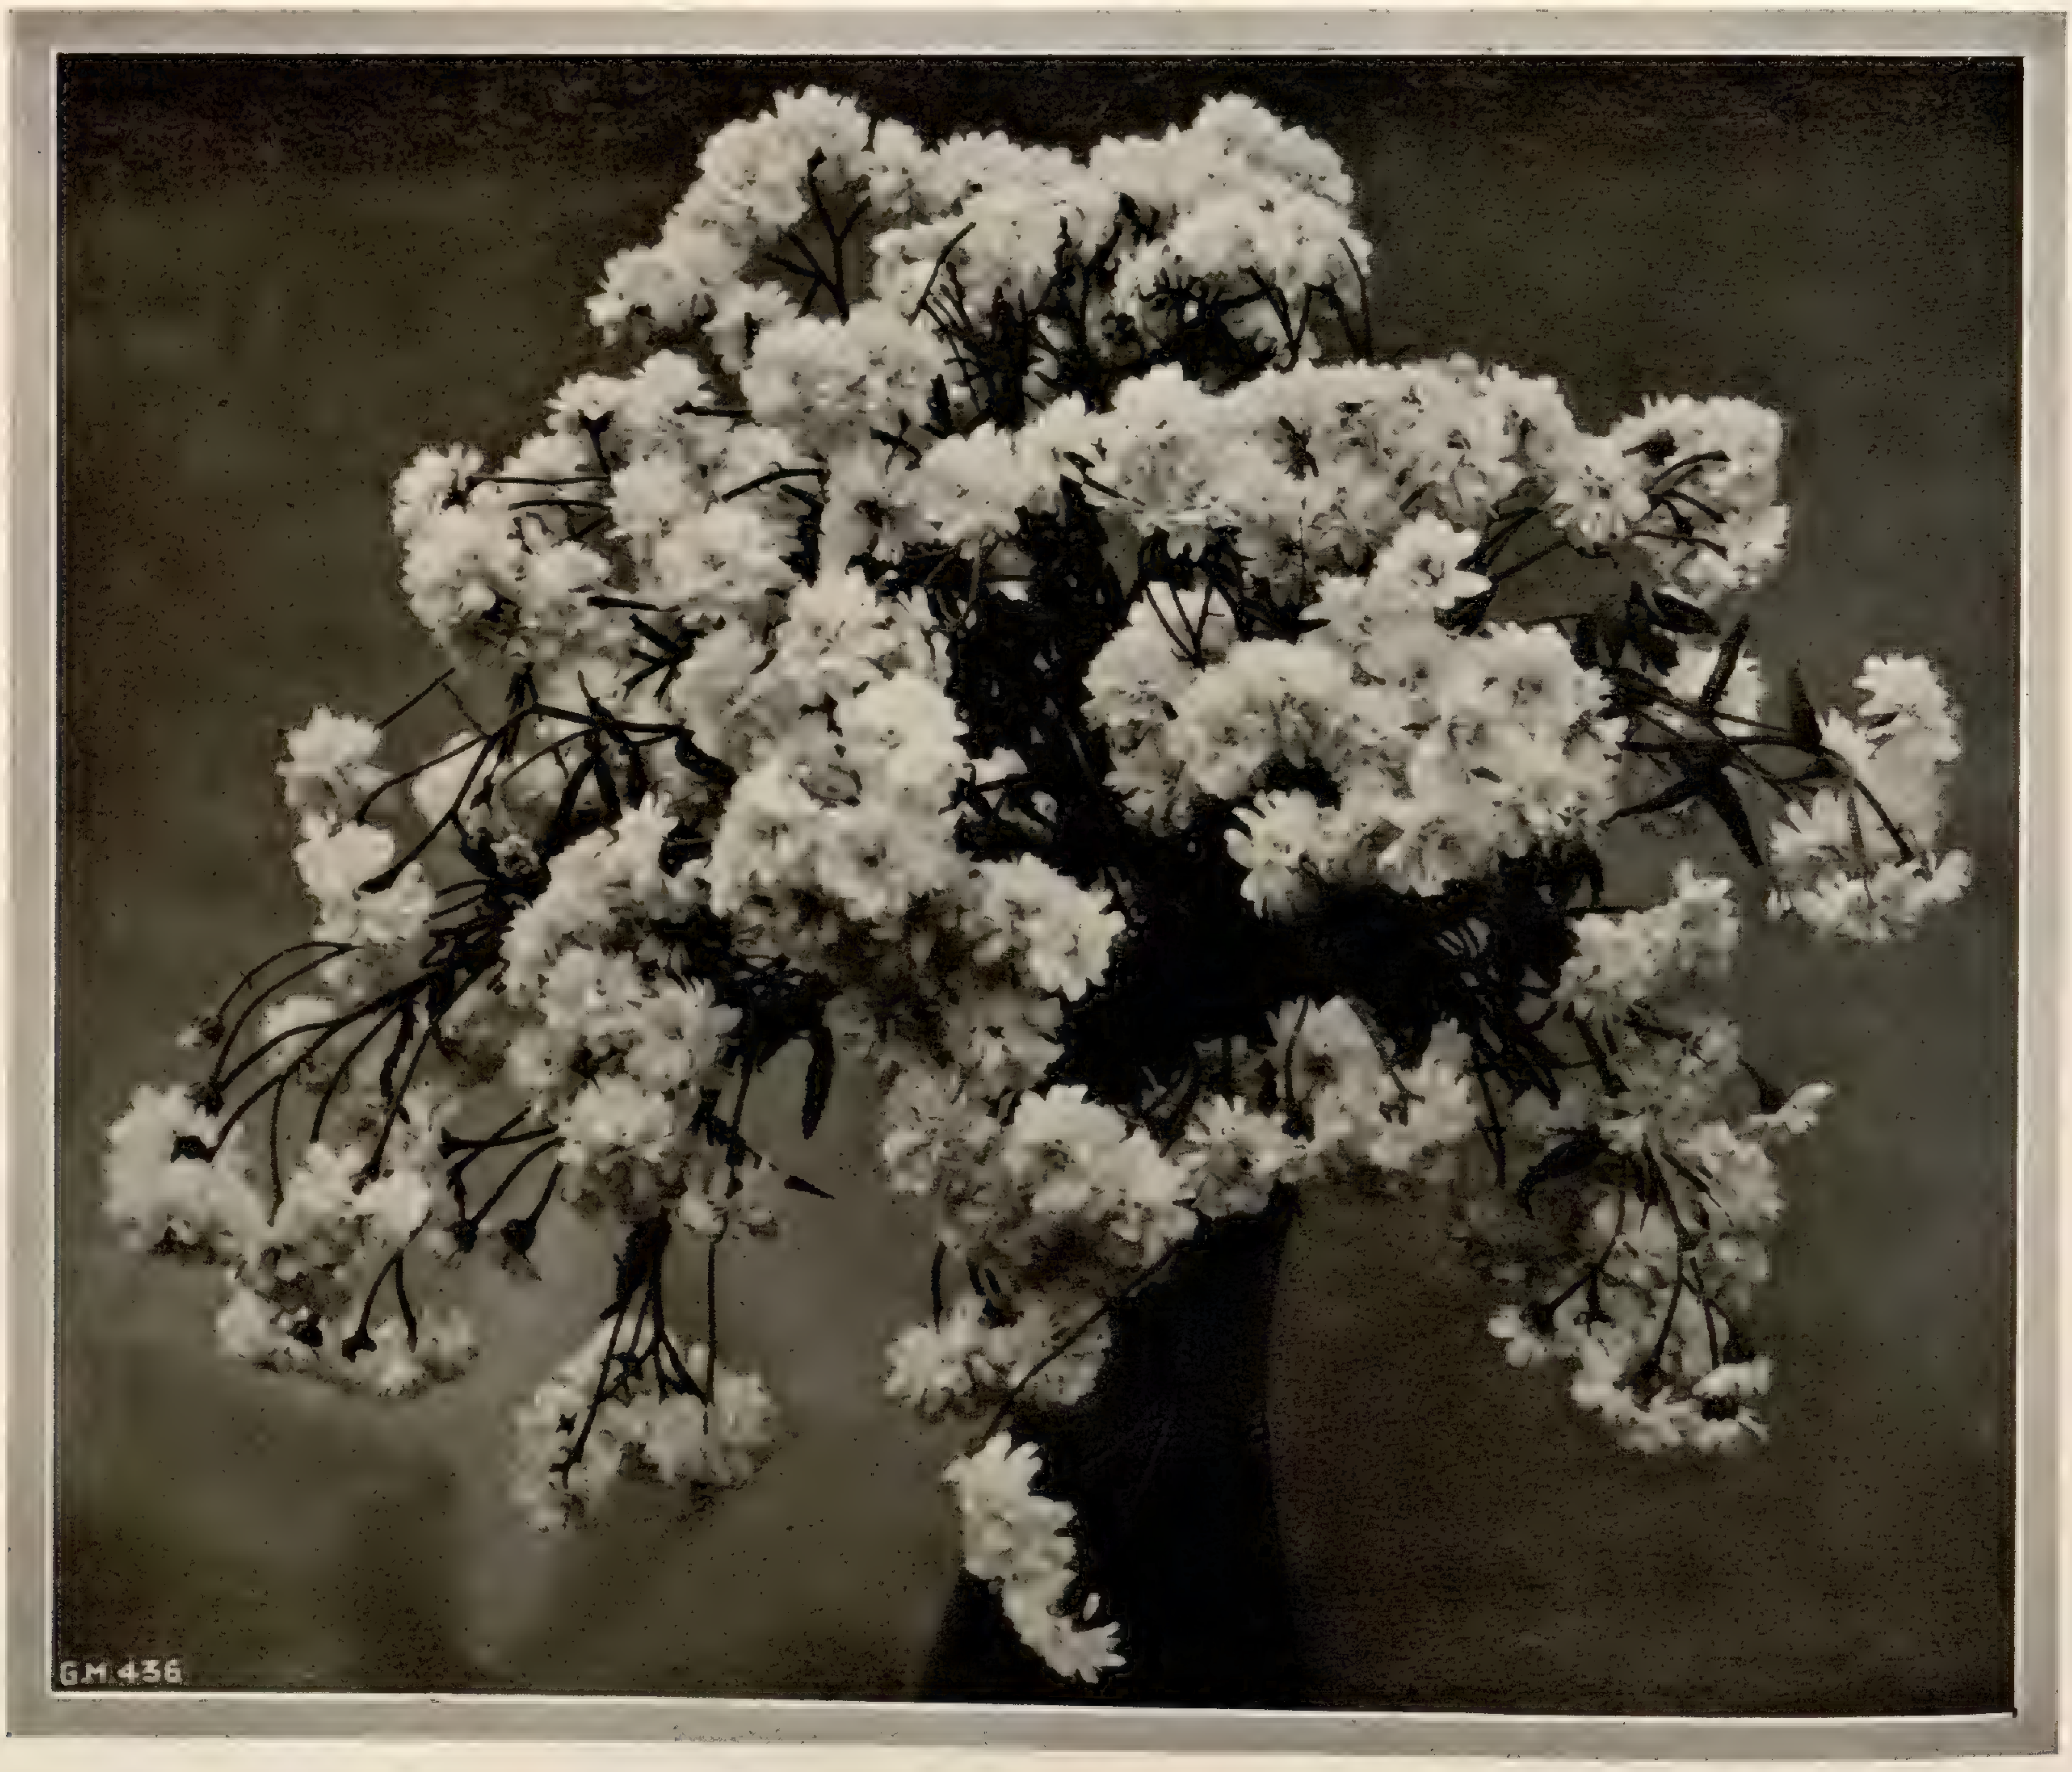
## NEW PLANTS, ETC.

### LÆLIO-CATTLEYA MEMORIA H. A. TRACEY.

This must rank among the largest and finest of lælio-cattleyas. In size, shape, and substance it is of exceptionally high class. The white sepals are tinted with light rosy-lilac, and the wide petals are deep rose with paler margin. The lip is crimson-purple with yellow markings, and is most attractive. F.C.C., R.H.S., September 10. H. S. Goodson, Esq. (gardener, Mr. Day, Fairlawn, Putney.

### LÆLIO-CATTLEYA ST. GOTHARD, GLEBE VARIETY.

The inflorescence of one parent, i.e., Cattleya Hardyana, is very evident in this hybrid. The flowers are large and handsome, the fine ruby crimson, yellow-marked lip being well set off by the deep lilac of the sepals and petals. A.M., R.H.S., September 10. C. J. Phillips, Esq., The Glebe, Sevenoaks.



GM 436

ACHILLEA PERRY'S WHITE.
Flowers white. A.M., R.H.S., September 10. Mr. Amos Perry, Enfield.

### ODONTIODA DEVOSSIANA, FOWLER'S VAR.

A strong-growing form of the hybrid between Odontoglossum Edwardi and Cochlioda Noezliana. It carried a tall, branching spike of deep red flowers, each bloom having a yellow base to the lip. A.M., R.H.S., September 10. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

### DENDROBIUM SCHUTZEI.

Of rather dwarf habit, rarely exceeding a foot in height, this fine new species bears some likeness to D. formosum giganteum. It is a native of the Philippine Islands. The flowers are carried four or five together on a sturdy spike, and are white, save for some green marks on the lip. The flowers are well expanded, and very effective. F.C.C., R.H.S., September 10. Messrs. Sander and Sons, St. Albans.

### CHRYSANTHEMUM CRIMSON POLLY.

Polly is a well-known, early-flowering chrysanthemum, and Crimson Polly is similar in every respect, save colour. The fairly large flowers are bright chestnut-crimson, with an old gold reverse to the florets. A.M., N.C.S., September 9. Messrs. W. Wells and Co., Merstham.

### ACHILLEA PERRY'S WHITE.

This should prove a most useful flower for the herbaceous border, as it is a far finer thing than A. ptarmica The Pearl, the flowers being much larger and of the purest white, and it blooms somewhat later. A.M., R.H.S., September 10. Mr. Amos Perry, Enfield.

### HELENIUM AUTUMNALE RUBRUM.

A distinct variety, bearing a profusion of deep brownish-red flowers. A useful addition. A.M., R.H.S., September 10. Mr. Amos Perry, Enfield.

### PHLOX RIJNSTROOM.

A beautiful and effective variety, the large, rounded blooms coloured soft rose, paling slightly to the centre. A bold and showy phlox. A.M., R.H.S., September 10. Mr. James Box, Lindfield, Sussex.

### PENTSTEMON GADDESDEN GEM.

A handsome pentstemon that carries large finely-formed flowers of the florist's type in stately spikes, and are bright scarlet with white centre. A.M., R.H.S., September 10. Mr. A. G. Gentle, Little Gaddesden, Berkhamsted.

### DAHLIAS.

Ideal.—A very handsome collarette variety, deep crimson, with yellow collar florets. A.M., R.H.S., F.C.C., N.D.S., September 10. Mr. J. B. Riding, Chingford.

Albert Maumene. — A large and showy variety with broad, mauve flowers, having a pale lilac collar. A.M., R.H.S., F.C.C., N.D.S., September 10, Mr. J. B. Riding, Chingford.

Papa Charmet.—This is an effective decorative variety with very large, rich crimson-maroon flowers, borne on stout, stiff stems. A.M., R.H.S., F.C.C., N.D.S., September 10. Messrs. Hobbies. Lim., Dereham.

Queen Mary.—A charming decorative dahlia of fine form, and a lovely shade of rose-pink. A.M., R.H.S., F.C.C., N.D.S., September 10. Messrs. H. Cannell and Sons, Swanley.

Selma.—A charming little pompon variety, buff-coloured, with deeper shading as the flowers attain age. A.M., R.H.S., F.C.C., N.D.S., September 10. Mr. Charles Turner, Slough.

Crawley Star. — This distinct variety scarcely conforms to any recognised section, but it is a capital garden dahlia of deep, rosy-mauve colour. The flowers are of medium size, and have two rows of ray flowers, the inner row shorter than the outer, and alternating with it, so as to form an elegant and yet substantial bloom. A.M., R.H.S., F.C.C., N.D.S., September 10. Messrs. J. Cheal and Sons, Crawley.

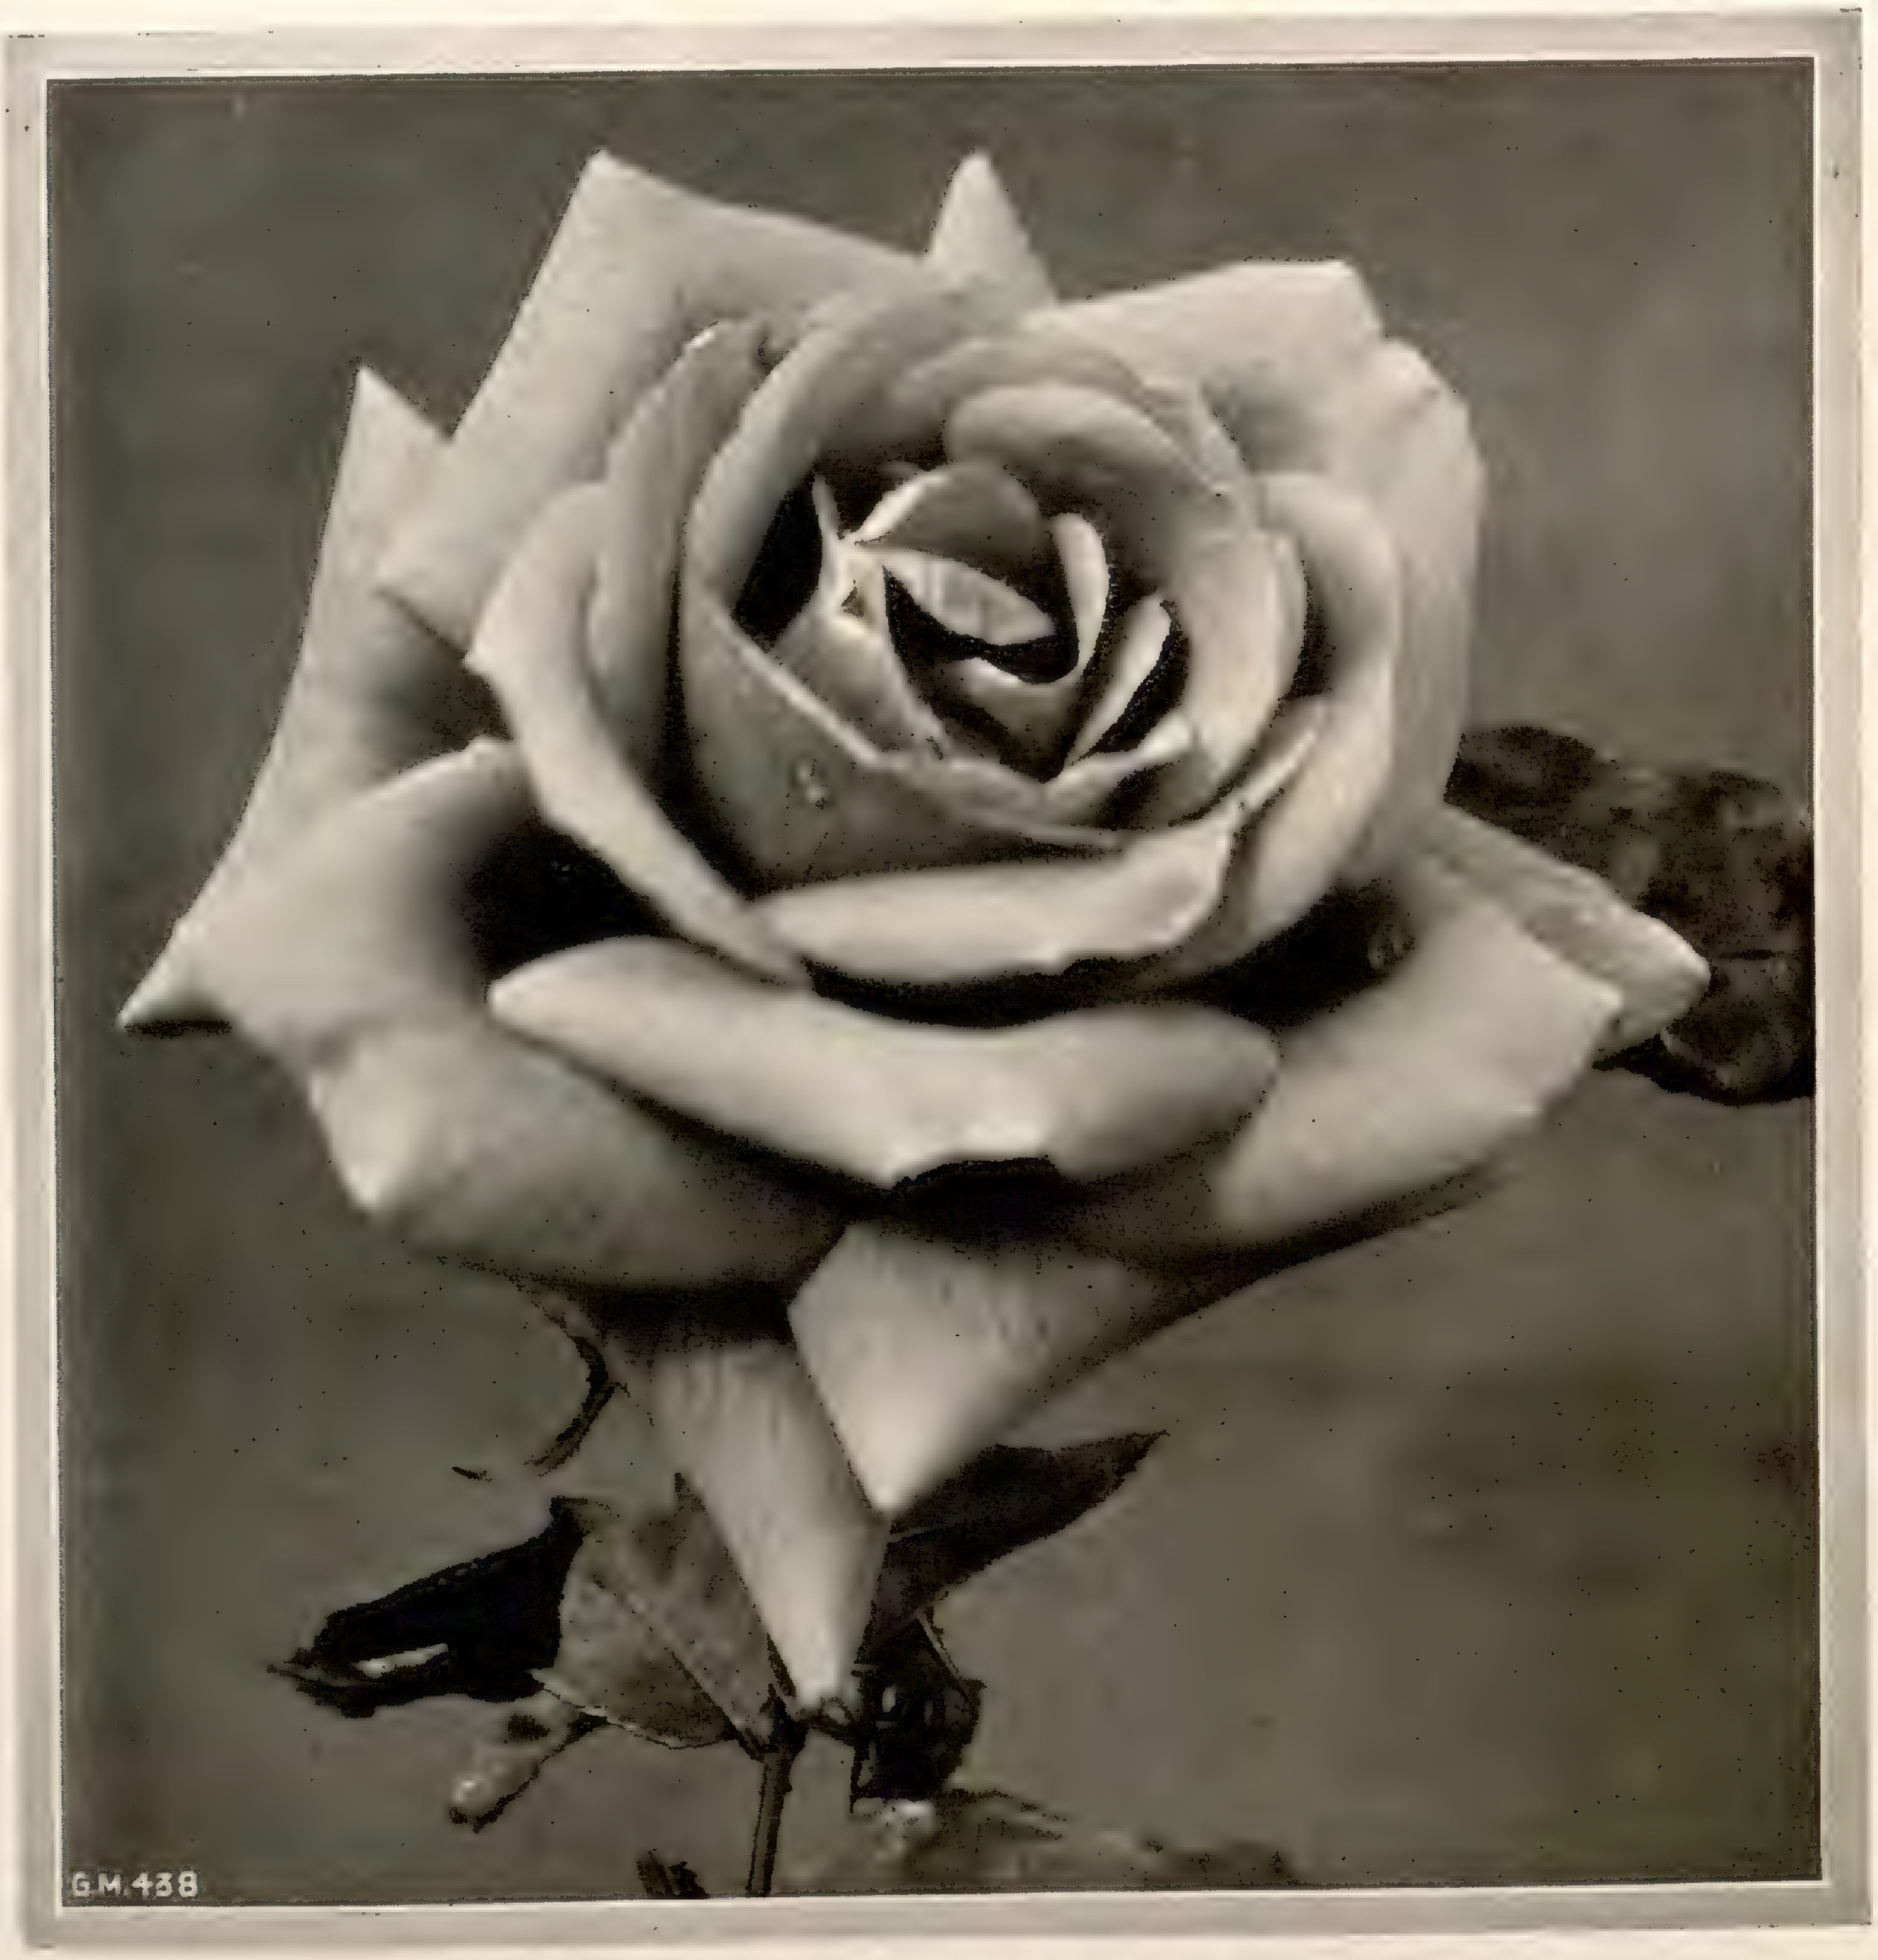
John Riding.—A bright red cactus variety with long incurving florets. A.M., R.H.S., F.C.C., N.D.S., September 10. Messrs. J. Stredwick and Son, St. Leonards.

Nantwich.—A pale-yellow or buff-coloured cactus variety, the incurving florets sometimes shaded with bright red. A.M., R.H.S., F.C.C., N.D.S., September 10. Messrs. J. Stredwick and Son, St. Leonards.

Dolly.—A shapely cactus dahlia, and of fair size; scarlet, tipped with white. A.M., R.H.S., F.C.C., N.D.S., September 10. Messrs. J. Stredwick and Son, St. Leonards.

ROSES.

British Queen.—A lovely and shapely H.T. rose of good size and substance, and cream-white colour; it is an altogether charming rose, a trifle pointed in shape, and sweetly scented. Gold Medal, National Rose Society, September 12. Messrs. Samuel McGredy and Son, Portadown.



NEW HYBRID TEA ROSE MRS. C. E. PEARSON.
Flowers bright golden-salmon. Gold Medal, National Rose Society, September 12. Messrs. S. McGredy and Son, Portadown.

Mrs. Chas. E. Pearson.—A H.T. rose of glorious colouring, and with effective round-petalled flowers. It is the Lyon out-Lyoned, and has all the brilliance of the gold-yellow and salmon of that popular variety without the rose shading. Exquisitely beautiful. Gold Medal, N.R.S., September 12. Messrs. S. McGredy and Son, Portadown.

Little Dorrit.—A charming tea rose of beautiful shape and free habit. The broad petals are salmon-pink, the outer ones deeply edged and flamed with rose and rosy-crimson. Silver-gilt Medal, N.R.S., September 12. Messrs. Paul and Son, Cheshunt.

Sunburst.—This is a beautiful H.T. roses, of pretty cadmium-yellow variety, tinted with orange and salmon; long-stemmed and long buds. Gold Medal, N.R.S., September 12. J. Pernet-Ducher, Venissieux les Lyon, France (shown by Messrs. G. Beckwith and Son, Ware Road, Hoddesdon, Herts. (See page 701.)

Queen of the Musks.—A very elegant and pretty cluster rose, sweetly scented, carrying neat semi-double flowers in great profusion. The colour is blush with yellowish-centre. Silver Medal, N.R.S., September 12. Messrs. Paul and Son, Cheshunt.

PYCNOSTACHYS DAWEI.

An attractive winter-flowering Labiate, first discovered in Uganda in 1898 by the late Mr. A. Whyte, and introduced to cultivation by Mr. M. T. Dawe who sent seeds to Kew in 1905. In cultivation P. Dawei forms a somewhat straggling shrub, and at Kew is grown under the same conditions as Coleus thyrsoideus, which also was received from Uganda, and is now in general cultivation. The blue flowers are produced in short dense spikes, and are liable to injury from the fogs experienced in town districts. "Bot. Mag.," t. 8,450.

## ROOT PRUNING FRUIT TREES UNDER GLASS.

The necessity for checking the too exuberant growth on certain kinds of fruit trees, but more particularly those familiarly classed as stone fruits, will now be apparent to the observant cultivator. The sooner this work is performed after the gathering of the crops, the more probable will be the beneficial results accruing therefrom during the ensuing year. How best to achieve the end in view may differ somewhat in very diverse cases and situations, but, as a rule, the simple process of lessening the excessive flow of sap by severing a fair proportion of the stronger roots, whereby growth for the season is considerably reduced and maturity of the shoots accelerated, is generally most conducive to success. In all cases care must be taken that the operation is not carried out too severely, especially in the case of young trees in full vigour, but which probably show but little or no sign of changing the colour of their foliage in the way of ripening.

## Peaches and Nectarines.

These, in respect to the matter under consideration, are identical, and the same treatment answers equally well for both. These, too, more often than any other kinds of fruit grown under glass, stand in need of some assistance to induce fruitfulness, which attained, is often sufficient of itself to keep the tree or trees in normal condition without any root manipulation being necessary. Many trees, however, are not of this type, and to such, to induce fertility, some means of limiting growth by way of checking root action, must be employed. In the case of a young tree having a root-run of a border several feet in depth and area, through which strong feeders are suspected of extending at the present time, root pruning is best for giving a check. Commencing at about four feet from the stem, a trench of convenient width for working and of sufficient depth to ensure the strong, lower roots being reached, may be taken out. Into this trench the soil about the roots may then be worked, using by preference a garden fork for the purpose until the tree stem is closely approached, taking care in the operation that as few as possible of the smaller and more fibrous roots are damaged.

NEW TEA ROSE LITTLE DORRIT.

Salmon-pink, flamed rose-crimson outer petals. Silver-gilt Medal, National Rose Society, September 12. Messrs. Paul and Son, Cheshunt.

For safety, one-half of the root medium only should be thus treated at one time, more particularly when the subject is a young and very vigorous specimen, the remaining portion being similarly treated in future, according to resulting effects. Having laid bare the roots these should have all damaged portions cut away, and several of the more strong-growing be reduced in length, say, to about three feet from the base of the tree, and these, if bare of fibrous roots, may be notched at intervals with a knife to aid the emission of these to the subsequent assistance of the tree. In a case of this kind it may be presumed that the soil is good in quality, hence any addition by way of new loam would be superfluous, but if the staple is lacking in lime moderate quantities of this obtained from old buildings, and free from pieces of lath or other objectionable matter, might with advantage be added as the refilling of the excavation proceeds. In doing this, the aim should be to keep the roots near the surface, but if the tree in the first instance was planted deeply, the difficulty of carrying this out is correspondingly increased.

Having refilled the excavation to the proper level, spread out the roots evenly, and in such a way that when finished these very gently slope downwards from the base of the tree. A little fresh soil—good fibrous loam is best—may with advantage be used between and about the roots to encourage the formation of fresh fibres, and press all firmly as the work proceeds. Apply water freely to settle the soil, and damp the foliage at frequent intervals according to the weather to maintain health and vigour and to prevent this flagging in bright sunshine.

## Plums, Cherries, and Apricots.

These, though less addicted to excess of vigour, especially so when the fruiting stage is reached, are nevertheless often benefited by having their root system restricted, which, being attended to in good time, may counteract the evils of gumming of the branches, which is almost sure to follow upon the too free use of the pruning knife in the removal of rank sappy shoots. These remarks, it may be observed, refer principally to young trees, as it is with such that very severe measures should not be taken, because of the risk of causing a check to the growth from which it may take them a whole season, or more, to recover. Should, however, a repetition of the work be necessary in future, this may be carried out in comparative safety owing to the presence of numberless rootlets resulting from the first or previous operation. A slight shade applied to the roof glass is commendable in very bright, warm weather, but this, alas! is not much in evidence this season. JAMES DAY.

Galloway House, Garlieston.

## SEEDLING DELPHINIUMS.

Most people are well acquainted with delphiniums and the fine effect they produce in the herbaceous borders during the summer months, for when well grown the long spikes of flowers tower above everything else. This season, in many places, old clumps that were planted in well-prepared borders, and allowed plenty of room to develop, have done remarkably well, throwing up their spikes from eight to ten feet high. It is when grown thus that they show themselves to advantage. By the end of July, however, most of the varieties have ceased to bloom, and unless other provisions are made to extend the usefulness of these plants, their flowering period will be of but short duration.

To have plants to bloom early a batch may be potted up in the winter and brought forward under glass, as the protection of a cold frame is all that is needed to induce them to make early growth, but it is not to these that I wish to draw special attention at the present time, but to the raising of seedlings to succeed those that are planted out. Where a gentle heat can be provided there should be no difficulty in raising a batch early each year. The seed should be sown in boxes early in February, which should afterwards be placed in a gentle heat, either on a hotbed or in a house where a temperature of from 50 degrees to 55 degrees can be maintained. Here the seed will soon germinate, and when the plants are large enough to handle they should be pricked off into other boxes, and grown on until it is safe to transplant them in the open ground. Choose a plot in a sunny position, which should be liberally manured and deeply dug. Here the plants should be put out from a foot to fifteen inches apart each way, when, if well looked after in the way of watering and keeping free from weeds, they will commence to produce their flower spikes early in August, and continue to bloom until late in the autumn.

The other day my attention was drawn to a large batch of seedlings that had been treated in this manner. There were several hundreds of them raised from seed saved from some of the finest named varieties. The plants had grown remarkably well, some of them producing spikes from five to six feet high, of all the various shades of blue one could imagine, both double and single. By growing batches in this manner each season, and selecting the best varieties thus produced, a very fine strain has been obtained, giving flowers of large size and varied colours. Delphiniums seed very freely, and as it ripens in July, those who have not the convenience to raise plants in heat in spring would do well to sow the seed as soon as ripe in well-prepared soil either in the open or in a cold frame.

New seed germinates very readily, and would produce nice little plants by the autumn, which, if pricked out singly about two inches apart in a cold frame would be ready to start into growth as soon as the weather is favourable in spring. Delphiniums are most useful for the supply of cut flowers, especially those varieties producing pale blue flowers on loose spikes, as there are but few flowers of that colour on long stems, especially late in the season. Where cut flowers in large quantities are required in the autumn long spikes of these will be found very useful, and when they can be produced in such abundance with so little trouble a quantity should be grown for that purpose. Where large conservatories have to be kept furnished plants of these in pots will be found most useful, especially seedlings having one spike, as such could be arranged in groups of various shades to suit the tastes of the most fastidious. But to have fine spikes the plants will need to be well looked after during the growing season, never allowing them to suffer for want of moisture at the roots.

H. C. P.

## PHLOXES FOR GARDEN COLOUR.

During the interval between the summer and autumn seasons of rose blossom, the herbaceous phlox is of especial value in the garden, and should be far more lavishly planted to meet this serious need of colour. No other flower is equally suitable.

In a Midland garden the best dwarf phloxes are alternated with dwarf roses, twenty inches distant from them, and it is found that in rich, deep soil, with recourse had to liquid feeding and chemical dressings, the roses not only do not suffer in the least, but are actually benefited by the shade to their lower stems and the ground above their roots that the perennial phloxes afford. This method enables an infinite variety of exquisite colour combinations to be arranged; white roses with salmon phlox, white phlox with orange-scarlet roses, mauve with lemon, blush with maroon, cream with carmine, vermilion with gold, purple with rose-pink, and so on through the wondrous range of hues.

Though early winter is the time for phlox planting, the clumps that exist in the garden, if of sufficient size to divide advantageously, should be broken up, and replanted in small portions in semi-shady borders, as soon as they have ceased to bloom. By this method vigorous young specimens are gained for final removal in October or November, whereas if clumps were divided, then winter would be upon them before they had time to develop; and several months' less growth would have ensued before the next year's florescence. Rich ground is essential for the nursery borders or beds; if preferred, a trench across vegetable land will suffice, without semi-shade, if left with sides raised six inches or so to left and right of the row of plants. Old cow-manure is the best to use at the base of the soil for phloxes in dryish ground, but horse-manure will answer the purpose fairly well if mixed with leaf-mould. At all periods of growth the phlox needs humus in great quantity, which is why it seldom shows at its best in hurriedly-made new gardens, but luxuriates in old borders by cottages or farmhouses. Of course, new land can be made perfectly satisfactory by the incorporation of turf-loam, leaf-mould, and vegetable ashes in addition to manure.

During summer notice should be taken of the colours that phloxes actually are, and these compared with those of any roses that they are to accompany. Catalogue descriptions are apt to be confusing, if not absolutely false. For example, the familiar Coquelicot is called bright scarlet with purple eye, but from a slight distance the magenta-maroon eye in question entirely destroys any vermilion of the whole mass, rendering this an unsuitable flower for use among vermilion roses. There is another admirable method of making phloxes supply garden brilliance while roses are resting. This is to alternate beds of each, or surround the rosery with borders of the herbaceous plants.

Early-flowering dwarf varieties of Phlox suffruticosa blossom during June and July, while the later varieties of Phlox decussata begin in late July and continue until October. The former are less common than the latter, but probably even better adapted to the garden's needs. Excellent named sorts cost but sixpence a plant. Snowdon and Lady Napier are pure whites, while White Swan is extra floriferous. Oberon, Rose of Castille, Miss Mima, and Mrs. Leekie are all rose-eyed whites. Walter Anderson is a charming rose, flaked with white, while the Rev. Dr. Hornby is a white, striped with rose, with a purple eye, a most effective flower.

Pale tints obtain most among the early varieties, but Mrs. Miller is magenta-purple; so, too, is Col. Flatter. Chas. Dawnie is deep lilac-rose, and E. L. Lewan a beautiful pale mauve. Of late-flowering varieties only dwarfs will be mentioned here, the tall kinds being far more known. Jocelyn is the best scarlet, Profusion a magnificent rose-pink, other self-coloured beauties being Naine Bébé, pale magenta; Ouragan, violet-blue; Souvenir, violet-purple; Terra Neuve, grey-lilac; Suffrage, salmon-rose; Tapis Blanc, white; Francillon, deep pink; and Burnous, crimson-scarlet.

Well-manured borders against house walls may be kept gay all the summer and autumn months by massing them with phloxes from both classes, a pyramidal effect being easily gained from a plant that has one-foot tall Tapis Blanc and the three to four-foot orange-scarlet Aurore among its members. Phloxes by the water-side flourish exuberantly. Phloxes on rockeries will revel in deep soil pockets between stones. As hedges in front gardens, against outer railings or dividing the tradesman's path from the small lawn, the tall varieties are magnificent; a shaded range of colour should be planned, starting from white by the gate, through blush, pink, rose, pale magenta, carmine, to magenta-purple, and finally claret maroon against the gray or white walls of the house. A red-brick building would require the phloxes to be of salmons, scarlets, with perhaps lavenders and blue-violets.

Phloxes can be chosen freely to create bold colour groups in shrubbery clearings, and will thrive even in woodlands. M. H.

**Tamarix pentandra.**—One frequently meets with this tamarisk under the names of Tamarix hispida astivalis and Tamarix Pallasi rosea, as well as that at the head of this note. Though opinions may vary as to the name, there is no question that it is a most desirable flowering shrub, which is at its best during the latter part of the summer, and often well on into the autumn. Seen in a bed or mass, the rich pink feathery inflorescences are particularly striking, and anyone unacquainted with it in this form would, at a little distance, be puzzled as to the identity of the charming flowers.—K.

**Pancratiums.** — Large, established bulbs will now be flowering, and should be placed in a light position in the intermediate house or pit. When the flower spike is well advanced cease overhead syringing, but give copious waterings at the roots. New growth will commence soon after flowering is over, and this is a capital time to repot or topdress where required. It should be borne in mind that pancratiums are impatient of much disturbance of the roots, and if the soil remains in a sweet condition once in two or three years is often enough to repot. At the same time the drainage should be examined, and a top-dressing of good, loamy soil applied occasionally. They delight in abundance of water at the roots, a humid atmosphere, and frequent applications of an approved manure during active growth. I prefer to grow the bulbs singly in 32-sized pots, and when repotting is necessary carefully remove all side bulbs, and pot these three in a pot for growing on for increase of stock.—H. T. Martin.

## PLANTS IN RELATION TO SOILS.

It has often occurred to me that one of the best object-lessons gardeners and all those engaged in the cultivation of plants could have of the requirements of the different forms of vegetable life would be obtained in the course of visits to localities of varying geological formations and geographical and atmospheric conditions. By this means the kind of soil to secure a healthy, vigorous growth in certain subjects would be manifest, and the sickly appearance of the same species of plants under cultivation in another composition accounted for. To reap the full benefit of excursions of an educational nature of this kind, it is necessary that those participating in it should possess a knowledge of our native plants in a more or less degree, and be able to make their own deductions from what came under their notice.

If botanical societies would add geological and geographical to their names, and combine the three sciences in their outings of research, some real benefit would be more likely to result from their usual annual excursions. Under such conditions, the members would know that, if they found one of the butterworts growing in a peat bog it would not grow in lime, or on a dry rockery. Practical teaching on these lines is likely to lead to the avoidance of many failures among some of our commonest garden flowers, and arouse a keener thirst for safer guides to the successful cultivation of favourite plants.

The daffodil is familiar to almost everyone, and yet how few, judging by results, know its geological requirements, or can give any reason for some varieties giving way to weakness and disease. Upwards of twenty years ago I found about three acres of daffodils in a wild state in robust health, growing on a limestone formation, and was able to profit by the "wrinkle" in after years. Since then I have not had any sickly plants, as I have always provided an ample supply of this mineral plant food within the reach of the roots. Violets, also, are lime-loving, and, although they will exist on soils deficient in this important constituent of fertile mediums, yet strong, free-flowering plants are only found on ground where an ample supply of lime is available. The dog-violet will betray a limestone soil in spring by carpeting the surface with its pale blue flowers.

These facts go to show that for all lime-loving plants an abundant supply of lime is indispensable to their health, and its absence, or scarcity, is bound to cripple their vitality, and foster weakness and disease.

Then, again, there are plants that have a decided aversion to an excess of lime in soils, and whose presence will indicate its absence, or presence only in infinitely small quantities. Heaths, and all peat-loving plants, dislike lime, and attempts to grow them on a formation containing a high percentage of it cannot fail to lead to disappointment. Some other plants have a preference for potash. Rhubarb is a specially gross feeder of potash compounds. Holly luxuriates where it is in abundance; the herbaceous plant, Heuchera sanguinea, blooms profusely on potash soils, and the colours of all flowers are most decided where this mineral ingredient is a distinguishing part. Weak growth, feeble efforts in flowering, and washed-out colours in the blooms are sure indications of an insufficiency of potash in the soil for potash-loving plants.

Besides these factors in plant growth, which may be taken as a guide to the composition of soils, there is another of equal importance where the aim is the production of fruit, viz., phosphates. All soils in which phosphates are plentiful and available to plant life will help fruit-bearing plants in the formation and maturation of their fruits. Well-developed heads of grasses and large sound seeds of weeds may be taken as a criterion of an ample supply of phosphates in the soil. Clover is very partial to phosphates, and will only luxuriate in compositions abundantly provided with these valuable constituents of a fruit-producing soil. The absence of phosphates is manifested by the mere existence of clover, small seeds of the natural herbage, and a softness in the growths of plants. In such a condition, plants are not equal to resisting severe strains of an adverse climate, or the attacks of fungoid and other diseases, and, sooner or later, have to yield the ground they occupy to vegetation suitable to the soil.

It is by noting the relations of plant life to soils that much is learned as to the special needs of certain plants, and this can only be done by covering a wide area containing variety in geological formations, knowing their composition, and closely observing the vegetation upon them. Armed with information obtained in this manner, the plant cultivator will be in a position to make his own deductions regarding the subjects he wishes to grow, and, at the same time, avoid the pitfalls in the path of the uninitiated.

Hibernia.

## POT-HERBS IN THE GARDEN.

We can obtain some idea of the fragrance of the old gardens of our ancestors where pot-herbs and salads ran riot amid the wild beauty of the old-fashioned flowers that have now disappeared, from the contents of the old herbals or books on plants, written by Gerarde and others in the sixteenth century and onward. But, like the flowers of the long borders, tall, stately, and delicious in scent and colours, where are the herbs of a century ago, with their delightful aroma? The answer is obvious—"the old order changeth, giving place to the new." And there are probably few or no gardens where we should find a complete series of the herbs of the gardens of the eighteenth century. Moreover, it was not until the sixteenth and seventeenth centuries that we really had in our garden those staple vegetables which now form so important a part of the modern outdoor establishment. The parsnip was introduced, for instance, in 1548, the potato after the discovery of the new world, and so on. Even in the seventeenth century cabbage, cauliflower, turnip, carrot, parsnip, peas, and rape were rarely cultivated, and largely brought over from the Continent. Lying to hand amongst our wild plants, moreover, are the wild cabbage, carrot, parsnip, celery, seakale, and asparagus, amongst others, which have been introduced into use here by foreigners as a rule.

In the absence of such well-adapted plants for vegetable use, others have been used as pot-herbs. Probably the majority of folk would connect this term with but three or four common plants—mint, sage, thyme, and parsley. But, though not in general usage to-day, there are a few others of fairly frequent use here, and still better known on the Continent where good cooking is a sine qua non with the gourmand and the epicure. Thus one may find the leaves of pilewort eaten in some parts as a relish.

In addition to the universal parsley, mint, etc., we find the sweet-scented cicely eaten as a salad or boiled, in soups, especially in Germany, where the celebrated sour krout is a common dish. Chervil is more often than not found in the garden as a pot-herb. Alexanders, cultivated for the ointment for which it was famous, is still to be found in a few old haunts. Sweet marjoram, aromatic as it is, is more frequently cultivated than some others. Goosefoot and mercury are nearly always to be found on cultivated ground. The latter is an excellent spinach, but is not so often cultivated as it used to be. Star of Bethlehem is to be found here and there in the garden, kept for its bulbs, which are very nutritious when boiled. Spiked ornithogalum is also eaten as asparagus in some localities in the South of England, where it grows wild. In the same way Solomon's seal owes its presence in our gardens to the fact that the root is eaten dried and ground. The roots of sea holly were candied more frequently in Shakespeare's day, when they were known as "kissing comfits."

Formerly much employed as a drug, fennel, which is used as a condiment with fish, is often grown in the garden as a valued herb, and so also was smallage, little used now. Clary was nearly always to be found in the garden till recently as an eye-salve. In the same way house-leek may almost be regarded as a pot-herb, being used for ointments, and commonly cultivated all over the kingdom in its own particular habitat, a thatched roof. There are also many country gardens where balm and hyssop are to be found at the present day, where they are used as herbal remedies.

Burnet, so useful as a spice in wines, tansy used in cakes, and ox-tongue, were often used, and still linger here and there. Borage is still used for cooling tankards, and the way in which it lingers around the house and garden in the case of old properties shows how prevalent it was formerly. For the same reason bugloss may often be detected in the shrubbery, where it is quite a straggler from the garden, and it may still be found in some old-fashioned kitchen gardens along with its close allies comfrey and borage. Purslane may be used as a pickle, too, here and there, with others of the same kind.

Then many gardens, besides the purely domestic pot-herbs, one also furnished with others that are used as herbal remedies for different complaints, a practice which is becoming the vogue again. Amongst these we may refer to horehound (white or black), which is very largely used to-day for herb-beer. Of course, peppermint must not be overlooked. Dill water was once much more frequently used than to-day, but it is still employed for the same purpose. Caraway, moreover, is purely artificially dispensed with as being an escape from the garden, where it is yet grown for flavouring, etc. Valerian, again, was once commonly grown as a herb, but not now so frequently. Mallow, rue, chamomile, and the now rare elecampane, are all old-fashioned herbal remedies for various complaints, used formerly in some abundance, but more rarely now in the garden along with the true pot-herbs.

Leicester Museum. B. R. Horwood.

**Phœnix Roebelini.** — It is somewhere about twenty years since this pretty dwarf-growing form of Phœnix was introduced into cultivation. For a long time after that it remained a rare palm, but within the last decade or so large quantities of seed have been sent to this country, the result being that pretty little examples can now be purchased at a cheap rate. It is in a small state by far the prettiest of the date palm family.—S. W.

## RED ROSES IN AUGUST.

"In the sun red roses blush and blow."

So writes Christina Rossetti, through whose poetry, touched as it is with the sadness and evanescence of life, there glows a true sense of the beauty of nature, especially as it manifests itself in flowers, and more especially in the rose. In another poem, she writes:

"Sunlight cheers the rose."

This quotation brings me to the object of this little paper, which is to tell of those red roses whose bright flowers cheered our dripping gardens, although deprived of their usual meed of sunshine throughout the inclement month of August.

If my reader will allow me, I will take him round my garden, and show him what red roses were blooming there during the past month. As we enter a little gate on the south side and at the far end of the garden we see, on either side of a broad grass path, clumps of Ecarlate and Marquise de Salisbury. Ecarlate was very gay with its brilliant but thin blossoms as nearly scarlet as any rose I have come across, while the dusky Marquise de Salisbury only showed a few of its deeper red flowers. A big standard of Grüss an Teplitz and another of J. B. Clarke made bright patches of colour in the background, while in the distance a pillar of Hiawatha, which is shaded from the western sun, was covered with its brilliant trusses of bloom. The new Excelsa, though even more brilliant in its early flowering, was before the close of the month deprived of its old wood and neatly tied up ready for next year's inflorescence; so has the dark red early-blooming Diabolo.

In walking up this grass border we come to some groups of China roses, and here Charlotte Klemm was the most effective among the reds. It is a big rose for a China, not very shapely, but exceedingly bright and free flowering. A group of Richmond claimed a full share of attention—it was almost too densely covered with its light crimson flowers, at that period of the year lacking in the form and brightness of colour they have early in summer. Looking across to another bed we saw a bloom or two of Liberty, but to find them at their best we had to walk on to a little lawn on a lower level, where in semi-shade some plants of this variety were putting up big sprays of good red flowers. As a friend pointed out to me, there is a sort of soft bloom on the red of Liberty, which gives it the appearance of being looked at through a mist, and is in decided contrast to the clear red of Richmond.

Some tall straggling sprays across the lawn bore aloft the fine blooms of Hugh Dixon, almost the only red H.P. which was flowering on August 23, though earlier in the month we had some well-nigh perfect specimens of Victor Hugo. Two young plants of the new climber, Sheilagh Wilson, are justifying their claim to be perpetual by putting forth new fresh buds and flowers; they seem a little prone to mildew, and their flowers have more the soft rose-red tint of Morgenrott (which, by the way, flowered freely in August on an 8ft. pillar) than of the more brilliant but short flowering Carmine Pillar.

Some bushes of the single crimson rugosa Carmen, kept up a supply of their fragrant blooms throughout August, but the rugosas generally add to the red tints in the early autumn garden, not so much by their flowers as by their brilliant red berries. A big bush of Fedschenkoana crossed with rugosa is smothered with its dazzling red fruits, and little Nitida had covered itself with orange-red berries before the end of the month, and its dark green leaves were changing to the brown and red tints that make it such a decorative autumn shrub.

But here my readers will remind me that I am straying a little from the red roses, and they may, perhaps, point out to me I have written nothing of General MacArthur, a rose which is said to be very perpetual. Let us look at our group of it, which we have had planted in the dampest and heaviest soil we can find in this gravelly garden. Its strong, dark foliage was in August rather badly affected with mildew, and the stiff spikes of deliciously fragrant flowers were not nearly so attractive, to my eye, as those of either Richmond or Liberty. But it is worth a place in the garden, and so, also, I think, is the newer Mrs. Edward Powell. This variety has equally good dark foliage, which here seems immune from mildew, and its very bright crimson flowers keep their colour and shape far better than those of General MacArthur do. The fragrance, however, though sweet, is not so refreshing and satisfying as that of most red roses. From a little round bed we have of this variety we could pick any morning a nice shapely buttonhole rose.

Before ending these notes I must leave our own garden, and go nearer to London just to tell of a very fine display of the H.T. Grüss an Teplitz I saw a few days ago growing in the well-kept grounds of Finsbury Park. Here there is a bed some fifty yards long, I should say, in which were blooming scores of plants of this bright red fragrant rose. The superintendent is to be congratulated on the very good effect he has obtained by massing these roses together in the way he has done; he evidently understands the requirements of this particular variety as to soil, pruning, etc., for the whole group was bright with hundreds of crimson blossoms, and the foliage looked wonderfully fresh and healthy.

This brings me to an end of my list of real crimson roses that I noticed blooming freely in the past, and very wet, August. But there are two other roses which were very effective in the garden and though they can hardly be called crimson, yet they certainly are red roses. These are Laurent Carle and G. C. Waud. Laurent Carle may perhaps best be described as claret colour. The petals have a satiny surface, and the flowers, of good size and shape, are borne on strong upright stems. It continues flowering till quite late in the autumn.

G. C. Waud is of a brilliant carmine, flushed with orange-vermilion. At its best it is a wonderful colour. The flowers appear almost as if they were lit from within. It is free flowering, and when of a good shape makes a fine exhibition rose. Unfortunately, many of the blooms come quartered. Neither of these roses have the "real rose" scent, which we expect from a red rose, the possession of which goes a long way to make the crimson rose the most beloved of all English flowers. This delightful fragrance is to be found in a marked degree in many of the roses mentioned here, namely, in Richmond, Liberty, General MacArthur, Grüss an Teplitz, and Hugh Dixon, while Victor Hugo is as remarkable for its delicious scent, as for its superb colour.

White Lady.

CHRYSANTHEMUMS.—For full instructions on the Culture of Early-flowering Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE, by D. B. Crane, price 2s. 6d. net; or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## WORK FOR THE WEEK.

### THE ORCHID HOUSES.

MASDEVALLIAS are not grown at the present day, owing, perhaps, to their small pecuniary value, as extensively as they deserve. Yet they include many most beautiful, curious, and interesting species and hybrids. Many produce most brilliant coloured flowers, and it is very questionable whether such species as M. Veitchiana, M. amabilis, M. ignea, and the many varieties of Harryana are surpassed for the brightness and richness of their blooms. When well grown they bear an abundance of flowers, and produce a splendid effect when arranged with the white flowers of odontoglossums. There are other distinct species well deserving of cultivation, such as the pure white M. tovarensis, the yellow-flowered M. Davisi, M. rosea, the orange-red M. racemosa, besides several attractive and useful hybrids. Amongst the most beautiful are M. Chamberlainiana, M. Gairiana, M. Courtauldiana, M. Rushtoni, M. splendida, M. Chelsoni, M. Stella, M. Curlei, and many others. Among the dwarf-growing kinds is the remarkable M. muscosa, with its extremely sensitive lip, and the still rare M. xipheres, which never fail to attract attention whenever in bloom.

CULTURE OF MASDEVALLIAS.—Well-grown plants of these floral gems, when in bloom, are always appreciated. The dwarf growers should be suspended in a damp situation in the cool house, the stronger growers, such as M. Harryana, and M. Veitchiana, are best accommodated on the stages. They should not be allowed to become dry at the roots, neither should they be kept in a saturated condition, or the dreaded black spot will appear upon the leaves; and should this not appear, there is still the danger of many of them damping off.

CLEANSING.—This month is always considered to be the best in the year to overhaul masdevallias, and thoroughly cleansing both the plants and the house, both inside and outside. No half-hearted measures should be allowed in the means adopted in the cleansing of plants and bushes at this season.

POTTING.—If any of the plants need more pot room, or old, overgrown masses require breaking up, they should have attention at once. The winter-flowering M. tovarensis, M. Davisi, and M. ignea should not be disturbed at the present season, unless they are in an extremely bad condition, but left over until they are seen to be pushing roots early in February. Masdevallias form many roots, therefore they should be given a fair amount of root run, and, owing to the large amount of water required when in full growth, the drainage must be ample. Exhausted and worn-out plants that have few roots should be divided, and put into pots that will just accommodate them for one season, and when thoroughly re-established they may again be placed in one receptacle.

COMPOST.—Masdevallias will succeed in a similar compost to odontoglossums, and when repotting, the base of the plant should be kept on a level with the top of the pot, and the compost should be worked carefully between the roots. The plants should be potted with moderate firmness, as the compost keeps sweet, and in a healthy condition much longer if placed in the pots or pans firmly, than when in a loose condition.

WATERING.—As with most other orchids, the critical time with masdevallias is during the first two or three months after repotting, and great care should be taken in the application of water to the roots. It is an easy matter to overwater them, especially in the winter months. All the masdevallias will succeed in the cool house, some at the warm, and others at the cool ends.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

MALMAISON CARNATIONS. — Plants raised from layers in July will now be sufficiently rooted to be potted. Most of them can be accommodated in 3½in. pots for the present, and these must be clean with one piece of crock placed in each. The compost most suitable at this stage will be one formed with two parts loam, one part leaf-mould, and one part coarse sand, with some fine mortar rubble. The plants should be lifted with a ball of soil and be properly labelled. In addition to the number of plants required, a few of each variety should be potted up to allow for losses during the winter. After they are potted the plants should be placed in unheated frames, and the pots stood on an ash bed, placing each variety together. Where the growth is of some length stake at once, using neat sticks 9in. long. This will prevent the growths being bent and probably broken. Water will not be needed for some time, but the plants will be benefited if the lights are removed at night, so that they may have the full advantage of the heavy dews that occur at this time. They must not, however, be subjected to heavy rains or the leaves will become badly spotted. In about three weeks after lifting they will have filled their pots with roots, and will be ready for shifting into 32's. The compost should consist of two parts fibrous loam, one part leaf-soil, one part coarse sand, and to this mixture should be added a liberal sprinkling of soot, wood ashes, and lime rubble, and an approved fertiliser, the latter at the rate of a 5in. potful to a barrowful of soil. When repotted place in the carnation house. If it is a span-roof the large plants should be stood on the centre stage and the smaller ones on the side stages. Abundance of air must be admitted night and day. The plants should have water only when they require it, generally keeping them on the dry side.

TUBEROUS-ROOTED BEGONIAS. — that have passed their best should be encouraged to pass into the resting stage by gradually withholding water. After they have died down the pots should be stored in a dry place for a time. The bulbs may then be shaken out, if room is limited, and placed in boxes in sand and leaf-mould. If some are required to maintain a succession of bloom a little longer they should be fed regularly. Seedlings in borders for testing should be labelled forthwith if not already done, for frost may cut them down at any time now. Should this occur the bulbs must be lifted at once and placed in boxes to mature, their labels being placed with them.

HOUSING PLANTS.—The time has now arrived when practically all greenhouse plants ought to be housed, and preparations for carrying out this work must have attention. Chrysanthemums take up much room, and the plants that have occupied the houses during the summer must now make way for them. It will be necessary to propagate many of the latter, and as they are moved out they should be cut down and the cuttings be utilised for the increase of stock. The houses should be cleared one at a time, the shading, if permanent, cleaned off, all woodwork inside thoroughly scrubbed with strong, hot soda water, to which has been added a quarter of a pint of paraffin to every pail of water. This is a very important matter, for cleanliness is absolutely necessary to the well-being and health of the occupants. Soft-wooded plants such as primulas, cinerarias, salvias, and zonal pelargoniums, will be arranged in the plant houses, and chrysanthemums also, if possible, but very often they have to be placed in an early vinery.. They must have plenty of air.—LEWIS SMITH, Norwich.

## HARDY FRUITS.

PLANTING OF BUSH FRUITS.—Gooseberries and currants in variety may be planted as bushes for supplying fruit for ordinary purposes. The bushes should have long, clean stems—with the exception of black currants—as the fruit is not then so liable to be splashed in rainy weather. For dessert supplies, gooseberries are decidedly best grown as cordons, and trained to walls, wire trellis, or fences; if a wall with a northerly aspect is available, a late supply both of currants and gooseberries may be ensured. Raspberries, both summer and autumn fruiters, yield the best crops when trained to wire trellises. Bush currants and gooseberries may be planted in rows six feet asunder, and six feet apart in the rows; single cordons one foot apart, and triple cordons three feet apart. Raspberries trained to trellises should be allowed a distance of three feet between each stool and five feet between the rows, if tied to stakes allow three feet to three feet six inches to each stool in the row and from four to five feet between the rows.

VARIETIES OF BUSH FRUITS.—Black currants, Boskoop Giant, Baldwin's, and Lee's Prolific are the best varieties. New Dutch, Raby Castle, and Scotch are good red varieties. Dutch or White Grape and Transparent are select white varieties. A selection of twelve varieties of gooseberries useful for every purpose is as follows: May Duke, Crown Bob, Rifleman, Warrington, Whinham's Industry, Langley Gage, Whitesmith, Keepsake, Leader, Leveller, Greengage, and Red Champagne. Raspberries: Superlative is decidedly the best, other good varieties being Baumforth's Seedling, Carter's Prolific, and Fillbasket. For a yellow raspberry select The Guinea. Autumn raspberries: Belle de Fontenay, November Abundance, and that fine new variety, The Alexandra, are good varieties.

PEACHES AND NECTARINES.—The end of this month or early in October is a good time to effect any necessary operations in the way of root-pruning, lifting, and replacing in same position, or transference of young trees from nursery quarters to their permanent positions. By carrying out the operation before the foliage ripens, root action at once becomes active, and the trees will receive but a slight check. Trees making a too luxuriant growth should be root pruned. To do this, dig out a trench clear of the radius of root action, carefully remove the soil towards the tree to avoid injury to any fibrous roots which may be found, and cut away any thong-like roots which are causing too rank a growth. It may be necessary to almost entirely lift the tree to find the roots of the latter class. This is a matter, however, in which the operator must use his own judgment. After pruning the roots, carefully spread out the fibrous ones on some fresh loam, to which add some old lime rubble and wood ashes, and cover with similar material. It is imperative that the soil should be thoroughly consolidated to induce the formation of fibrous roots. Established trees showing signs of failing vigour may often be rejuvenated by entirely lifting them and replacing the worn-out soil with fresh loam, wood ashes, and lime rubble. Possibly the drainage may be faulty, and may require attention. This is an important point, for the peach requires a well-drained rooting medium. Should the foliage flag, syringe the tree two or three times during the day, particularly towards the latter part of the afternoon afford a slight shade during bright weather. The soil should be thoroughly moistened after the operation of lifting, etc., is completed.—W. MESSENGER, Woolverstone Park Gardens, Ipswich.

## THE KITCHEN GARDEN.

BEETROOT.—Seasonable weather having at last visited us, this crop should be carefully lifted without delay. Nothing whatever is gained by leaving the roots in the ground, but many of them may become coarse and inferior. Should, however, some have failed to grow to a convenient size, examine the bed and carefully draw only those that are large enough. This thinning out will assist the air and sun in completing the development of the later plants. When lifted a sharp twist in the hand is all that is needed to remove the tops, leaving the roots to lay on the ground for a few hours till fairly dry. They can then be gathered up and stored in a clamp, on the north of a wall for preference, covering them with sand when finished. Treated thus they will remain firm and fresh till late in spring.

PARSLEY.—If there is any doubt about a sufficiency for winter and spring supplies sow more seed at once in an unheated frame in a sheltered and sunny situation. A good compost should be used to ensure a quick and robust growth. The plants raised from this sowing will be found very useful early in the spring, when those outside have been almost stripped.

TURNIPS. — The crop raised from seed sown recently will need every assistance in the way of Dutch hoeing, thinning, and dusting at times with soot. Take up turnips that are large enough for use and store as advised for beet.

CARROTS must be treated in the same way as beetroot, the difference, if any, will be in drawing or digging the whole crop, and sizing them for storing. Do not store any roots that are cracked, but use them up at once, or utilise them as food for cattle. The smaller carrots could be laid in lines on damp sand, and used for some time as freshly-drawn, small carrots, thus saving for use later on the small roots that were raised from seed sown specially for the production of late supplies. For this purpose those who have failed with the late-sown Short Horns can still sow in a frame with a good chance of success. The carrots grown for the maincrop have a tendency to decay, therefore every care should be taken in drying and storing them. Apply a dusting of fine lime over them before the final earthing or sanding.

CELERY.—The late plantations will now need a slight earthing after removing side growths and decaying leaves. A good application of soot when earthing will be beneficial. Continue paper blanching for exhibition sticks, proceeding with this operation about every ten days.—GEO. ELLWOOD, Swanmore Park Gardens.

---

**Crocus medius.**—A very beautiful species is Crocus medius, one of the autumnal-flowering crocuses which help to give a charm to the best of gardens, and which endear themselves by their beauty to all lovers of flowers. Not so cheap as some, it is yet within the reach of most gardeners, even if one has to content oneself with a single corm, or two or three, until the corms increase and a little group is formed. Even one flower gives a feeling of delight as we look upon the large bloom of an exquisite rich violet colour, but prettily veined with deep purple towards the base, and ornamented with the brilliant orange-red stigmata, which forms a fittting culmination to the graces of this flower. It has been well said that C. medius is in the first rank of autumn crocuses, and those who want to have the élite of the species in their gardens should not be without this kind. It is as easily grown as any if planted in light, sandy soil at a depth of an inch or rather more—up to two inches is a depth the writer prefers in light earth. Like all the crocuses, it should be as short a time out of the soil as possible.—S. ARNOTT.

**Russelia juncea.**—Introduced from Mexico as long ago as 1833, this Russelia was at one time more popular in gardens than it is now, being in the olden days often grown into large specimens. It is very interesting as being a member of the order scrophularineæ, though in general appearance widely removed from its immediate relatives. It forms a mass of long, slender, rush-like branches, the minor ones being of a pendulous nature. The tube-shaped flowers are about an inch long, and bright scarlet in colour, so that a well-flowered specimen forms a very pleasing and graceful feature. —K.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

## National Rose Society.

The finest autumn show yet held by this society filled the Royal Horticultural Hall on September 12 with beauty and fragrance. Many flowers showed evidences of the wet and wind of recent days, but the blooms were large, and of good substance, and lasted well. The competition was first-rate, and the attendance quite unusually large.

### NEW ROSES.

Five new roses secured recognition, and these are described under "New Plants, etc."

Gold Medals were granted to Sunburst, from M. J. Pernet-Ducher, Venisseux les Lyon, France; to Mrs. Chas. E. Pearson, from Messrs. S. McGredy and Son, Portadown; and to British Queen, also from Messrs. McGredy.

Silver-gilt Medal, to Little Dorrit, from Messrs. Paul and Son, Cheshunt.

Silver Medal, to Queen of the Musks, from Messrs. Paul and Son, Cheshunt.

### NURSERYMEN.

There were nine competitors in the class for three dozen exhibition roses, distinct varieties, staged in boxes, and first prize was won by Messrs. Hugh Dickson and Co., Lim., Royal Nurseries, Belfast, whose leading varieties were Leslie Holland, Mrs. Foley Hobbs, Frau Karl Druschki, Mrs. Mawley, Caroline Testout, Mrs. Maynard Linton, Alex. Hill Gray, W. R. Smith, Miss Cynthia Ford, Lyon Rose, Lady Pirrie, Mrs. D. McKee, Chas. de Lapise, and Gloire de Chedane Guinoisseau. Second prize fell to Messrs. J. Jefferies and Son, Cirencester; third, to Messrs. Jas. Cocker and Sons, Aberdeen; and fourth, to Messrs. Adam and Craigmile, Rubislaw, Aberdeen. Twelve blooms, distinct varieties, of exhibition tea and noisette roses, proved an attractive class, there being seven contestants, and Mr. Henry Drew, Longworth, scored with W. R. Smith, Maman Cochet, Mdme. Constance Soupert, Mrs. E. Mawley, F. von Marschall, etc.; Mr. G. Prince second, and Mr. J. Pigg, Royston, third.

### ROSES IN BASKETS.

The display of roses in round baskets has proved far more successful than the method of staging blooms in bamboo stands. The class for nine baskets of roses, in as many varieties, each basket to be fourteen inches inside diameter, brought out but one entry. The successful exhibitor was Mr. John Mattock, who staged beautiful blooms of Mdme. Jules Gravereaux, Mrs. Sharman Crawford, Mrs. D. McKee, Frau Karl Druschki, Hugh Dickson, Caroline Testout, Bessie Brown, Pharisaer, and Mrs. Wakefield C. Millar.

Another basket class, open to nurserymen, was one for a dozen blooms of any exhibition rose, and here Messrs. Frank Cant and Co. scored with Frau Karl Druschki in fine form; Messrs. Hugh Dickson, Belfast, second, with Hugh Dickson; and Messrs. S. McGredy and Son, Portadown, third, with the pretty Mrs. Herbert Stevens.

In the class for nine baskets of perpetual decorative roses, the entries numbered five, the winning set coming from Messrs. Hugh Dickson, Belfast, who showed fine sets of Irish Elegance, Betty, Harry Kirk, Reine Marie d'Halie, Lady Pirrie, Dorothy Page Roberts, Gen. McArthur, Mdme. Melanie Soupert, and Mrs. Chas. E. Allan; Mr. J. Mattock, New Headington, second; and Messrs. S. Bide and Sons, Alma Nurseries, Farnham, third. The easier class, for five baskets of decorative roses, brought out five entries, Messrs. W. Spooner and Son, Woking, leading, with Joseph Hill, Gen. McArthur, La Tosca, Mdme. Abel Chatenay, and Orleans; Mr. J. Crossling, Penarth, S. Wales, second, his Marie Van Houtte being especially good; Mr. H. Drew, Longworth, third. For one basket of one variety, Mr. S. W. Burgess scored in the amateur section with Frau Karl Druschki; Miss B. H. Langton coming second, and Mr. G. Clare, Meadowside, Twickenham, third.

### NURSERYMEN'S DECORATIVE ROSES.

A good class is that for eighteen distinct varieties of roses, not more than seven stems of each, shown in vases, the vases, in sizes, being respectively 9½, 8, and 6½ inches high. There were but two entrants, and first prize was won by Mr. J. Mattock, Headington, with Teresa Bevan, Bardou Job, Marie Van Houtte, Mons. P. Lede, Lyon Rose, Mrs. Aaron Ward, and Dorothy Page Roberts, etc.; Messrs. Frank Cant and Co., Braiswick, Colchester, second. Nine distinct varieties, not more than seven stems of each, staged in vases, were set up by six competitors, the chief prize-winner being Mr. E. J. Hicks, Twyford, Berks, whose Rayon d'Or, Pharisaer, and Lyon Rose were charming; Mr. Will Taylor, Hampton, and Messrs. G. and H. Burch, Peterborough, took the remaining awards.

The decorative value of autumn roses is fairly well demonstrated by the class for two dozen distinct varieties, not less than three or more than seven trusses of a variety, the whole arranged on a space 8ft. by 3ft. Mr. J. Mattock, Headington, gained first prize, and showed pretty bunches of La Tosca, Lady Hillingdon, General McArthur, A. R. Goodwin, Irish Elegance, Mons. Paul Lede, and Lady Pirrie; Messrs. Frank Cant and Co., Colchester, second; and Mr. J. Pigg, Royston, third.

Under similar conditions, but to fill a space 5ft. by 3ft., and to consist of twelve varieties, another class was provided, and here there were five entries, the best being from Messrs. W. Spooner and Son, Arthur's Bridge, Woking, who showed Gustave Regis, General McArthur, Lady Pirrie, La Tosca, Souv. de M. de Zayas, Miss Dorothy Mocatta, A. R. Goodwin, Irish Elegance, Jessie, Trier, and Orleans; Mr. G. Prince second; and Mr. E. J. Hicks, Twyford, third.

The best set of twelve dwarf polyantha roses, six trusses of each, came from Mr. G. Prince, Oxford, whose selection was Orleans, Petit Constant, Perle d'Or, Madame N. Levavaseur, Jessie, Jean d'Arc, Cecile Brunner, Edward VII., Mrs. Cutbush, Leonie Lamesch, Roseland, and Phyllis; Messrs. W. Spooner and Son, Woking, second; Mr. B. R. Cant and Sons, Colchester, third.

### GROUPS OF ROSES.

An area of 150 square feet is allowed for a representative display of roses, arranged on the floor. In this class pot plants and cut flowers variously arranged, but not in exhibition boxes, are required. Ferns and foliage plants are permitted as edging and background. The gold medal and first prize was awarded to Messrs. Hobbies, Lim., Dereham, for a pleasing arrangement of weeping standards, arches of ramblers, and a central basket bed of the pretty polyantha rose Jessie. Around and among these subjects were stands and vases of Lemon Queen, Lyon Rose, Lady Ursula, Madame Abel Chatenay, and other good roses. Messrs. Paul and Son, Cheshunt, gained second prize with a somewhat low arrangement of good blooms massed in vases and baskets under tall standards.

The most effective class in the whole exhibition is the one in which the schedule requirements are "A representative group of cut roses to be placed on the staging. To be shown in plain glasses, vases, jars, baskets, etc., but not in exhibition boxes. Space occupied by exhibit not to exceed 18ft. by 6ft. The four entries were all good ones, but it was unfortunate that one exhibit had to be placed in an annexe while the others were staged against the wall opposite the main entrance. The gold medal and first prize fell to Messrs. Gunn and Sons, Olton, who had charming arches of white, pink, and red roses, supported by pillars of Madame Abel Chatenay, Lyon, and other fine sorts. In the front centre the Lyon Rose was massed finely between arching stands of Lady Hillingdon, and on either hand were fine stands and vases of Frau Karl Druschki, Lyon, Betty, Liberty, Gruss an Teplitz, etc., the whole making up a most delightful exhibit of lovely flowers. Messrs. W. and J. Brown, Peterborough, came second with a very high, bold design of arches and pillars at the back, and low arches and baskets of Lyon Rose, Lady Hillingdon, Hugh Dickson, Frau Karl Druschki, etc., in front. There could have been no great difference between first and second prize groups in this case. Each display was a credit to the exhibitors and to the society. Mr. George Prince, Longworth, was third, and his chief features were bold stands of Rayon d'Or, Lyon Rose, and Frau Karl Druschki.

Scarcely of less interest was the class for a similar display, but arranged on a space not exceeding 60 square feet. Messrs. R. Harkness and Co., Hitchin, annexed the leading award here with a charming display of fine blooms. The stands they used were of varied height and shape, and the principal varieties of roses used were Rayon d'Or, Frau Karl Druschki, Irish Elegance, Harry Kirk, Lady Hillingdon, La France, Madame Abel Chatenay, and Lyon Rose. Mr. F. M. Bradley, Peterborough, secured the second award with a pretty exhibit that was a trifle thin at the back; Mr. G. Jackman and Son, Woking, third.

The best set of three dozen distinct varieties of roses, not fewer than three trusses of each, was from Messrs. Frank Cant and Co., who set up grand bunches of Hugh Dickson, Madame Ravary, Madame Melanie Soupert, Rayon d'Or, Lady Hillingdon, Lyon Rose, Frau Karl Druschki, Papa Gontier, Gottfried Keller, A. R. Goodwin, Comtesse de Cayla, Gustave Nabonnand, Marquis de Sinety, General Gallieni, etc.; Mr. J. Mattock was second with a splendid exhibit; and Messrs. J. Jefferies and Son were third with very clean blooms and foliage; six entries.

### AMATEURS.

In the open amateur class for eighteen blooms, distinct, the best of seven entries was the one from Mr. Conway Jones, Gloucester, who staged fine flowers of Mdme. Wagram Comtesse de Turenne, Florence Pemberton, Lyon Rose, Lady Ursula, and Earl of Warwick; Mr. F. Dennison, Cranford, Leamington, second; and Mr. W. Boyes, Middleton, Yorks, third. Growers of fewer than 2,000 plants had a class for a dozen distinct varieties, and here the premier award fell to Mr. G. Speight, Market Harborough, whose best flowers were of Mdme. C. Soupert, H. Dickson, and J. B. Clark; Rev. F. Page Roberts, Strathfieldsaye Rectory, Mortimer, second; and Mr. W. O. Times, Bedford Park, Hitchin, third. Nine entries.

A class for nine blooms, distinct, was provided for growers of fewer than 1,000 plants, and the winner was Mr. G. Moules, Hitchin, who had a good set of Mildred Grant, Frau Karl Druschki, Mrs. Mawley, Caroline Testout, W. R. Smith, Mdme. V. Verdier, W. Shean, Bessie Brown, and D. Cordell; Mr. E. B. Lehmann, Crawley, second; and Mrs. H. Balfour, Langley Lodge, Headington, third. For six blooms, open to growers of fewer than 500 plants, Mr. W. Panckridge, Petersfield, scored, followed by Rev. L. Chalmers Hunt, Hitchin, and Mr. P. T. Davis, North Warners, Burgess Hill. Nineteen entries. Growers of fewer than 200 plants had a class for six blooms in not less than four varieties. Mr. L. P. Roberts, Westcott, Dorking, was first; Mr. H. F. Matthews, London Road, Stevenage, second; and Rev. R. F. Cobbold, Stony Stratford, third. Nineteen entries.

The best nine blooms, teas or noisettes came from Mr. Conway Jones, whose set consisted of White Maman Cochet, Mrs. E. Mawley, Mrs. Foley Hobbs, Maman Cochet, Souv. de P. Notting, Boadicea, W. R. Smith, Medea, and Mdme. Constant Soupert. Mr. Slaughter second, and Rev. F. R. Burnside third. Seven entries. Mr. Conway Jones, Hucclecote, Gloucester, was first prizewinner for seven vases of roses, seven stems of each variety, and led with Mdme. Jules Gravereaux, Mons. J. Hill, Mr. Foley Hobbs, Earl of Warwick, Hugh Dickson, Frau Karl Druschki, and White Maman Cochet; the Rev. J. H. Pemberton, Havering, came second; and Mr. E. B. Lindsell, Hitchin, was third. Six entries.

For five varieties, five stems of each, in vases, the leading prizewinner was Mr. W. P. Panckridge, Petersfield, whose Mdme. Jules Gravereaux was fine; Rev. F. R. Burnside, Stambridge Rectory, Essex, second; and Miss E. B. Langton, Raymead, Hendon, third. Six amateurs came forward with three baskets of roses, representing three varieties, and Mr. Conway Jones led with White Maman Cochet, Auguste Comte, and Hugh Dickson; Mr. G. A. Hammond, Burgess Hill, coming second with Lady Ursula, Mdme. Melanie Soupert, and Frau Karl Druschki; Rev. J. H. Pemberton third.

The best dozen varieties, three trusses of each, came from Mr. Conway Jones, who had a grand set of popular sorts; Rev. J. H. Pemberton second; and Mr. H. R. Darlington, Potters Bar, third. Mr. Conway Jones led for twelve varieties of decorative roses, not fewer than three or more than seven trusses of each variety; W. A. Richardson, Mdme. Antoine Marie, and Marie Van Houtte were very good; Rev. J. H. Pemberton second. The best six varieties of decorative roses were from Miss B. H. Langton, Hendon, who showed Trier and La Tosca finely; Mr. H. A. Gerhold, Penarth, second; and Mr. E. Mawley, Berkhamsted, third.

DECORATIVE EXHIBITS.

The table decoration class was accommodated in the lecture hall, and the competition was excellent. Mrs. Robinson, Park Hill, Carshalton, won first prize with a combination of Irish Elegance and the Lyon Rose; Mrs. Hale, Virginia Lodge, Warminster, was second; and Mrs. J. W. Smith, Bushey Heath, third. First prize for a bowl of roses fell to Mrs. L. Courtney Page, Earldoms, Enfield, for a beautiful arrangement of Kaiserin Augusta Victoria; Mrs. E. M. Burnett, Westwood Road, Southampton, second, with Irish Elegance; and Mrs. J. Walker Smith, Sparrows, Herne Hill, Bushey, third, with Gustave Regis and Rayon d'Or. Mrs. J. W. Smith led for a decorative basket of roses with a bold design of Irish Glory; Mrs. E. Williamson, Wilstead, Canterbury, second; and Mrs. C. Hale, Virginia Lodge, Warminster, third; ten competitors. Mrs. F. H. Cooke, Birch, Colchester, led in the open bowl class for lady members with Frau Karl Druschki; Mrs. J. W. Smith second, with Irish Elegance; and Miss Maud West, Firth Dene, Reigate, third.

SILVER MEDAL ROSES.

The Silver Medal blooms in the trade section were as follows: Best tea rose, Mrs. Foley Hobbs, shown by Mr. George Prince, Longworth; best hybrid tea rose, Miss Cynthia Ford, and the best H.P. rose, Gloire de Chedane Guinoisseau, both exhibited by Messrs. Hugh Dickson, Lim., Belfast. In the amateurs' section the best H.P. rose was Frau Karl Druschki, staged by Mr. F. Slaughter, Steyning; best H.T. variety, Mdme. Wagram Comtesse de Turenne, shown by Mr. Conway Jones, Gloucester; and the best tea rose, White Maman Cochet, also shown by Mr. Conway Jones.

## French Horticultural Society of London.

On Saturday week quite a large party of young French gardeners visited, under the guidance of their excellent president, Mr. George Schneider, the newly-constructed premises at Raynes Park belonging to the well-known firm of James Carter and Co.

The party was received by Mr. Harold Beale, and after a full inspection of the offices, warehouses, the trial seed grounds, etc., they were entertained to an excellent lunch at which Mr. Harold Beale presided. Speeches were made by Mr. George Schneider, thanking the firm for their great hospitality to his young countrymen, and by Mr. Beale in reply.

After lunch a further round of inspection was made, and then a substantial tea was provided. The party left Raynes Park about six p.m., after being photographed on the front steps of the entrance, and were well pleased with the most enjoyable and instructive visit.

## Finchley Chrysanthemum Society.

A special meeting of the society was recently held at the Railway Hotel, to bid farewell to Mr. J. Kirkwood, on his leaving Finchley to take up an appointment as head gardener to Lord St. Ceryes at Walington, Lymington, Hampshire; and also to present him with a handsome timepiece to mark the society's appreciation of the splendid services rendered by him as an exhibitor and a member of the committee.

Mr. J. J. Ward, the president, in making the presentation, said it gave him the greatest pleasure to offer Mr. Kirkwood the small token of respect. But it was with the deepest regret he had to say good-bye to such a horticultural expert. He knew wherever Mr. Kirkwood went he would attain the highest position possible, and the respect of all he came in contact with. Mr. S. Wildash, treasurer, said he was very delighted to hear of Mr. Kirkwood's success, but was extremely sorry for the loss the society would sustain. Councillor Pateman said he had been connected with the society for more than twenty years, and he never felt a loss more keenly than he did the present. He had opportunities of knowing the respect with which Mr. Kirkwood was held, and he considered there never was a better or more unassuming exhibitor.

The presentation was suitably acknowledged, and, after passing a hearty vote of thanks to the President, the remainder of the evening was spent in pleasant harmony.

## Bristol Gardeners' Association.

The monthly meeting of this association was held on August 29 at St. John's Parish Rooms, Clifton. Mr. Theoday presided over a large attendance, and a paper was read by Mr. Rich from Bath on "Hardy Flowers." The lecturer said that some plants may be grown from seed and others propagated by division. He recommended using well-decayed manure, and, as the plants soon draw the nutrient matter from the soil, he advised when they are coming into bloom giving some of the choicest of them a little artificial manure. He showed how useful some plants are for cutting purposes, and how some can be made to grow on walls, etc. With the aid of the many species of plants, flowers may be had in beds and borders from March to November. He also mentioned the more useful bulbs such as the narcissi and tulips, and showed how they can be successfully grown. Mr. Rich was awarded a special certificate for a magnificent arrangement of flowers. The prizes given by Mr. J. C. House for four bunches of phlox were won as follows: Mr. Woodward first, Mr. Scott second, and Mr. Curtis third.

## United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Royal Horticultural Hall on Monday, September 9, Mr. C. H. Curtis in the chair. Thirty-four new members were elected, making a total of nearly 400 since July last. The committee have arranged to hold special meetings, so as to give every gardener an opportunity of making "the United" his approved society. The sick pay for the month amounted to £27. Two members, having reached the age of 70, withdrew from their deposit accounts the sums of £68 and £49 10s. respectively, still leaving a balance of £10 for their nominees. This being the last occasion on which Mr. W. Collins would officially act as secretary, he took the opportunity of thanking the committee for their kindness to him, and regretted his inability to further carry on the work. The Chairman, on behalf of the committee, expressed high appreciation of Mr. Collins' long and valued services, and hoped that Mr. Collins would long be spared to render assistance to the society. All communications should be now addressed to Mr. A. C. Hill, secretary pro tem., 35, Alexandra Road, West Kensington Park.

## Horticultural Trades Association.

The annual gathering of nurserymen and seedsmen took place this year at Scarborough, and, though the numbers were somewhat reduced owing to the deplorable weather which has been general over the country, the meeting was a very successful one. The weather was very favourable for such a season, the only rainfall being on the afternoon of the day when no outside excursions were arranged, so that the party was able to visit the local nurseries (Messrs. Walshaw and Son) and gardens, and enjoy a sixty-mile motor run to Scampston Hall, Castle Howard, and the beautiful ruins of Rievaulx Abbey. One day was devoted to York, its glorious Minster and other buildings, and Messrs. Backhouse's nurseries. The world-famed rock garden, ferneries, etc., at Halgate, and the fine new nursery recently established ten miles out of town at Cattal were inspected and admired. The evenings were devoted to the discussion of trade matters, including the effect of recent legislation on the nursery business, the vexatious restrictions on foreign trade by the absurd regulations imposed during the phylloxera scare, the best methods of checking unfair and dishonest trading, and similar matters. Mr. W. J. Jefferies, of the Cirencester Nurseries, was unanimously elected as president for the coming year, in place of Mr. A. W. Paul, retiring in accordance with custom at the conclusion of his year of office.

## The National Vegetable Society.

On Wednesday, October 2, the annual exhibition of the National Vegetable Society will be held in the Clarendon Hall, Watford. The previous shows of this important society have been held in London, and they have demonstrated to what excellence vegetables are grown. On the present occasion it is anticipated that the produce staged will be greater in bulk and superior in quality to anything that has been seen in any part of the world. Not only will the society have the practical support of the members as in previous years, but all the most famous vegetable cultivators of Hertfordshire are rallying round, and will show visitors what can be done. The classes in the schedule number seventy-five, and the total prize money offered is, in round figures, £200. Intending competitors will find that, so carefully has the schedule been compiled, large and small growers have excellent and equal opportunities of showing their prowess. The cottagers of Hertfordshire will have their chance of winning some valuable prizes in a special class reserved for them, and doubtless the number and quality of the vegetables contributed by them alone will constitute a splendid object-lesson. Six distinct kinds of vegetables are required, and the prizes are 30s., 25s., 20s., 15s., 10s., and 5s. respectively. The president of the National Vegetable Society is the Duke of Portland, and the Earl of Clarendon has most kindly consented to open the show in the hall which bears his honoured name at 2 p.m. Entries for all classes close on Monday, September 23, and those who have not yet procured copies of the schedule should write immediately to the hon. secretary, Mr. E. G. Quick, Kelmscott, Locket Road, Wealdstone.

The small annual subscription of 5s. entitles a grower to free entry in all the classes in which he is eligible to compete, and to full information relative to the valuable educational trials annually conducted by the society.

### Messrs. Dickson and Robinson's Vegetable Show.

For some half-dozen years Messrs. Dickson and Robinson, the well-known Manchester seedsmen, have held an annual show of vegetables grown from their seeds. In the beginning the show was held in the firm's warehouse at Cheetham, but it was last year found desirable to engage premises in a more central spot, and, as we then recorded, that show was the largest and most successful of the series. This year we have to record still further advance. Entries came in so freely that it became necessary to engage a larger hall, and the Coal Exchange was selected as the venue of the show, which opened on September 12, and continued over the following day. It may at once be said that in every respect this year's exhibition was better than any of its predecessors, and the vegetables shown provided ample proof that the cold, wet season has, after all, not been a bad one for vegetables.

A special feature of Messrs. Dickson and Robinson's shows has always been a class for four bulbs of their Premier onion, which was introduced about eight years ago, and is a handsome globular bulb, with smooth, finely netted, straw-coloured skin.

There were fifty-nine entries in the open onion class, and in the entire show over 370 bulbs were staged, exhibitors coming from as far apart as Kirkcudbright and Cardiff, thus showing the widespread popularity of this excellent variety. There were, however, other big classes, that for beetroot mustering thirty-nine entries, and the carrots thirty-eight. In the open onion class first prize was secured by Mr. T. Avery, gardener to J. Kerr, Esq., Loudwater, Rickmansworth, who put up four beautifully-modelled bulbs of good size, and very well finished. Second went to Mr. H. Folkes, Gaddesden, his onions not being quite so even in size as the winner's. Mr. Wheeler, gardener to Mrs. Jenner, Wenvoe, came third, his bulbs not being as large as many of those shown, but of very fine quality and perfect finish. Mr. West, gardener to the Right Hon. Earl Curzon, Hackwood Park, Basingstoke, won fourth prize; Mr. Cook, gardener to the Hon. Mrs. K. Thornton, Hildersham, coming fifth; and Mr. Cobb, gardener to R. Cory, Esq., Cardiff, sixth. One of Mr. Cobb's onions was the most perfect specimen in the show, and quite a model of what an exhibition onion should be.

There was another class for onions open to growers north of Birmingham. Here Mr. T. Jones, Ruabon, scored with four excellent specimens, second prize going to Mr. Smith, gardener to Captain A. Briscoe, Newtown, the other prizes in the class going to Mr. Mills, gardener to Captain Lonsdale, Market Drayton; Mr. Haydock, gardener to E. P. Potter, Esq., Preston, and Mr. Keay, gardener to R. Crosfield, Esq., Ulverston. Six roots of Market Favourite beet made a big display, occupying a long table. The leading award was placed to the credit of Mr. Stannard, gardener to Countess Cowper, Hertford, his beet being grand in colour, and of beautiful shape. Mr. H. Folkes was second, and Mr. Bishop, gardener to the Right Hon. James Round, third. Carrots were exceptionally fine, the roots being of good size, fine form, and bright colour. In a keenly-contested class the prizes went to Mr. Jas. White, Bampton; Mr. H. Tysoe, Bedford; Mr. Stannard; Mr. Lloyd, gardener to Lord Willoughby de Broke; and Mr. W. Hooper, Barnet.

For so late in the season there were some excellent peas shown, there being two classes, one for thirty pods of Hercules, and the other for Lancastrian, both of which are peas of fine appearance and sound quality. The first prize for Hercules was taken by Mr. H. Tysoe, Bedford; Mr. W. Hooper, Barnet, being second; Mr. E. Winchester, Birmingham, third. The Lancastrian premier was won by Mr. Leakey, gardener to the Right Hon. Lord Bishop of Bath and Wells, second going to Mr. Brickell, and third to Mr. Jones, gardener to the Misses Howell, Berriew. Runner beans were shown in fine form, entries being numerous, and the beans of rare size, without roughness. Mr. H. Tysoe led, the second prize going to Mr. West, Basingstoke; and third to Mr. Young, gardener to C. E. Ellis, Esq., Lincoln. Messrs. Dickson and Robinson have a very good type of hollow-crowned parsnip, and prizes were offered for the best six roots. The winner was Mr. Bishop, gardener to Right Hon. James Round, his roots being very long, straight, and clear in skin. Mr. Stannard and Mr. Avery took second and third prizes respectively.

A PERFECT SPECIMEN OF "PREMIER" ONION.

Exhibited at Messrs. Dickson and Robinson's Show at Manchester

Among the principal awards in other classes were first for turnips to Mr. Mills, gardener to Captain Lonsdale, Market Drayton; first for savoys to Mr. Guy, gardener to C. L. Blundell, Esq., Ormskirk; and to Mr. T. Jones for three Standwell cauliflowers. Mr. H. Tysoe led for leeks, and Mr. E. Winchester for a bunch of Moneymaker tomato, a variety that maintains its excellent qualities as a good profitable sort. Altogether, there were somewhere over 400 entries in the sixteen classes in the show, nearly all the classes being allowed five prizes.

It was a capital display, and the attractiveness of the show was much increased by large banks of dahlias, phloxes, roses, and other flowers, which were brought from the firm's nurseries, and arranged in tasteful manner in groups about the hall. Messrs. Dickson and Robinson also showed onions from their own seed grounds, and specimens of mangolds, swedes, cabbages, etc., all of fine types and showing good cultivation.

## NOTES OF OBSERVATION.

◆

**Manettia bicolor.**—This has often been noted as a desirable climber for the warm greenhouse, especially if that structure is a rather small one, for it is not suitable for clothing lofty roofs, being, in fact, seen at its best when the bright-coloured flowers are brought near the eye. A most desirable feature possessed by this Manettia is that the small tubular flowers, scarlet and gold in colour, are borne nearly throughout the year.—S. W.

**Zonal Pelargonium Champion.**—This variety was recently given an Award of Merit by the Royal Horticultural Society, and bids fair to prove one of the best of all the pink zonals for bedding purposes, while it is also seen to considerable advantage when grown in pots. It is of a sturdy, freely-branched habit of growth, with good foliage, while the flowers are borne in bold trusses, and are of a bright rose-pink colour with a lighter centre.—K.

## SCOTTISH FORESTRY DEVELOPMENT.

Mr. William Dawson, lecturer in forestry, in opening a course for foresters at Aberdeen University, referred at some length to the present unsatisfactory position of forestry in Scotland, and to the slowness with which the long-looked-for developments were taking place. The present agitation in favour of State afforestation, or, at any rate, of some measure of State assistance in the matter, had been going on for several decades, though recently it had become more active. No doubt certain advances had been made in the time. Educational facilities had been increased, and, in some measure, wood management had improved, and public opinion had been educated, but till quite recently the State had refused to recognise the existence of this branch of rural industry.

Indeed, even now, when public opinion had greatly increased in favour of afforestation, it did not so far seem to have formed a very strong motive force with their members of Parliament. Evidence of this was to be found in the fact that even now, when money could legally be provided for purposes of afforestation (Development Act, 1909), they showed no great anxiety to help forward practical schemes for the afforestation of the magnificent timber land to be found everywhere in Scotland.

It was interesting to note that the indifference of the present day did not always exist in Scotland. Early in the fifteenth century they found Acts relating to the creation of woodlands, and even at that time they found reference to the existence of artificial plantations which then existed. In 1503 a further Act was passed calling on proprietors to plant areas where the country was bare. Such Acts were recorded periodically, and in 1661 they found an Act requiring heritors to enclose and plant four acres yearly for the next ten years, and in that case the Act went so far as to prescribe the kinds of trees to be planted. In this particular district, too, there were estate records showing that not only was natural wood maintained in the seventeenth century, but plantations were actually created. The indifference of the present day was thus a lapse from a higher state.

But the position was hopeful in the extreme, and great things were expected from the Scottish Board of Agriculture, which was now the authority in this matter in Scotland, and indications were not wanting that some substantial advance was likely to be made. Everyone was agreed that Scotland was the field for afforestation, and in light of this fact it was singular that both England and Ireland were already in advance of Scotland with their scheme for development. They in Scotland had a big distance to make up, and further delay could only do harm. All branches of industry were suffering from the ever-increasing price of wood, and there was no denying the fact that the price would yet become higher.

## FORTHCOMING ENGAGEMENTS.

MONDAY, September 23.—National Chrysanthemum Society: Meeting of Floral and Executive Committees.

Harby Flower Show.

TUESDAY, September 24.—Royal Horticultural Society: Meeting of Fruit, Floral, and Orchid Committees, noon; General Meeting at 3 p.m., with lecture by C. Hermann Senn on "How to Cook some of the Root Vegetables"; Meeting of Scientific Committee, 4 p.m.; Meeting at the Horticultural Hall of a Joint Committee of the Royal Horticultural Society and the National Dahlia Society for adjudicating on new dahlias.

TUESDAY, October 1.—Scottish Horticultural Association: Meeting, with lecture, by Mr. A. D. Richardson, on "Edinburgh's Park and Other Trees."

WEDNESDAY, October 2.—National Chrysanthemum Society's Exhibition of Early-flowering Chrysanthemums, at the Crystal Palace; two days.

National Vegetable Society's Exhibition at the Clarendon Hall, Watford.

SATURDAY, October 5.—Société Francaise d'Horticulteur de Londres meeting.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

FOREST AND ORNAMENTAL TREES FROM CUTTINGS.—C. G. and Co., Finsbury: Is there any known method of growing forest and ornamental trees from cuttings, that will assure approximate success with every kind or variety? Willows, we know, and believe mulberry and hazel, will form roots in damp soil, but most other trees will not, and it is these trees we want to know how to raise from cuttings, if that be possible.—There is no single method that will prove successful for the propagation of all kinds of forest and ornamental trees from cuttings. The majority of forest trees are raised from seeds, and not a few ornamental trees are raised in the same way. Special varieties are raised from cuttings, or propagation is effected by grafting and budding. Certain trees are best raised from cuttings of half-ripe growth, while others, like the willow, grow readily from cuttings of ripened, leafless growth. Further, cuttings of some trees grow well if placed in the open, whereas others need frame protection at this stage. If you will specify the kinds of trees you wish to propagate from cuttings we will do our best to assist you.

VARIETIES OF ANNUALS. — C. S., Northampton: When a schedule requires "Eight distinct varieties of Annuals," and an exhibitor sets up three vases of statice, but of distinct colours, would he come within the meaning of the schedule, or should he be disqualified? — In all probability this is another case of faulty wording, and we expect the committee desired "eight distinct kinds of annuals." If an exhibitor had shown eight distinct varieties of sweet peas, of asters, or of godetias, he could not have been properly disqualified. If the competitor referred to showed annual statices of distinct colouring, he was quite within the meaning of the schedule, though, perhaps, not within the intention of the committee.

HORTICULTURAL EXAMINATION. — T. P., Cheltenham: Please tell me to whom I should apply for information relative to an examination in horticulture for gardeners.—For particulars of the Royal Horticultural Society's examination in horticulture, apply to the Secretary, Royal Horticultural Society, Vincent Square, Westminster, London, S.W. For particulars of the examination held by the British Gardeners' Association apply to Mr. Cyril Harding, Ulysses, Fortune Green, London, N.W.

HYBRID ORCHIDS.—T. W., Torquay: I am becoming much interested in orchids, and have already made a number of crosses, but I know quite well that hybrids have been raised from most species, and that secondary hybrids and varietal forms of cypripediums, cattleyas, lælio-cattleyas, and odontoglossums have been cross-fertilised freely. What I want to know is whether there is a pedigree book or stud book which gives a list of hybrids and parents. Such a book would be a great help.—On this particular subject the best book is the "Orchid Stud Book," by R. A. Allen and C. C. Hurst, and obtainable from F. Leslie and Co., 12, Lawn Crescent, Kew. The work contains an enumeration of hybrid orchids of artificial origin, with their parents, raisers, date of first flowering, references to descriptions and figures, and synonymy. There is also an historical introduction, a chapter on hybridising, and raising orchids from seeds, and the book is freely illustrated. No raiser of orchids can afford to be without the "Orchid Stud Book."

POT MEASUREMENTS.—C. S., Northampton: I recently exhibited in a class for pot plants, and the schedule stated that the pots should not exceed 10 inches in diameter. I used a No. 12 pot. Was I right or wrong? Kindly also tell me how the diameter of a flower pot is measured.—You were wrong. A No. 12 pot is 11½ inches in diameter at the top, measuring from the inside on one side to the outside at the opposite point. The Chiswick standard of sizes and measurements is as follows: Thimbles, 2in. diameter, 2in. deep; thumbs, 2½in. by 2½in.; 60's, 3in. by 3½in.; 48's, 4½in. by 5in.; 32's, 6in. by 6in.; 24's, 8½in. by 8in.; 16's, 9½in. by 9in.; 12's, 11½in. by 10in.; 8's, 12in. by 11in.; 6's, 13in. by 12in.; 4's, 15in. by 13in.; 2's, 18in. by 14in.

KIPE AND POT.—M. E. A., Cheltenham.—Can you tell me what are the correct dimensions of a pot and of a kipe, both of which are west country measures for garden produce?—A kipe is a round wicker basket, and should be 18in. wide at the top, 1ft. wide at the bottom, and 1ft. deep. The pot is a fairly popular measure, and should be a wicket basket of oblong shape, twenty-one inches in length, fourteen inches wide, and fifteen inches deep.

CODE DES COULEURS.—A. W. F., Rugby: The "Code des Couleurs" is by Klingseick and Valette, and its publisher is M. Klingseick, Paris, but the work can be obtained through Messrs. Wesley and Co., 28, Essex Street, Strand, W.C.

### NAMES OF PLANTS.

H. E., Everton.—Hoya carnosa.

L. E. A., Alnwick.—1, Solanum jasminoides; 2, Lonicera sempervirens; 3, Trachelespermum jasminoides.

B. M. R., Chippenham.—1, Helenium cupreum; 2, Polygonum Baldschuanicum; 3. Monarda didyma; 4, Pinus insignis; 5, Abies Nordmanniana.

P. J. F., Oswestry.—1, Armeria maritima; 2, Lysimachia clethroides; 3, Matricaria inodora; 4, Sempervivum arachnoideum; 5, Cratægus pyracantha Lelandi; 6, Rudbeckia laciniata.

R. P., Yorks.—We regret our inability to undertake the naming of florists' flowers; the correct naming of most varieties is only possible where a very large collection of any particular kind is grown, therefore it is always a good plan to sent a florist's flower, whether it be rose, dahlia, sweet pea, phlox, etc., to some nurseryman who specialises in the particular subject. In most instances a stamped addressed postcard, with the specimen and request, will ensure an answer. So far as we are able to judge, your dahlia is an old form, and represents a type of decorative dahlia not now in cultivation. This opinion we give assuming the flowers sent were of fair average quality.

Syringes

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No.1 Four Oaks Undentable, 1½ × 20in. 21/-; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1⅓ × 20 in. 12/6 or with Angle Joint, 18/-

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:— The FOUR OAKS SPRAYING MACHINE Co., No. 30, Sutton Coldfield.

# Employment THE GARDENERS' MAGAZINE Register.

**The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.**

**A list of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.**

## Situations Wanted.

A QUARTER Century's experience and study of horticulture; unimpeachable testimony of character and abilities; presentable; agreeable; intellectual; seeks Scientific, Experimental, Practical, or Educational work in Horticulture. RICHARDSON, F.R.H.S., Brook Bank, Onchan, I. of M.

C. PAXTON, Branches Park Gardens, Newmarket, highly recommends YOUNG MAN as Rose Grower and Assist in Pleasure Grounds in a large establishment; smart, civil, and obliging; 7½ years' experience here; desires a change; age 31.

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

IT IS WORTH WHILE TO PLANT A PERENNIAL GARDEN.

It will be a saving in pocket and a Perennial Delight, as one season succeeds the other.

It is a garden of which you can make a *hobby*, which can hardly be said of the bedding system. Plant it with Kelway Artistic Colour Borders. Now is the time to plan them. Kelway's will save you all the trouble connected with them if you will send particulars as to area, position, soil, etc., to

KELWAY and SON, The Royal Horticulturists,
LANGPORT.

From J. S., Greenock.—"You will be pleased to hear that the £10 or so which I have sent you in the last few years have made my garden (¼ acre) one beautiful mass of colour all the year round. This year especially the place has been a perfect picture—quite as fine as any of the pictures in Walter Wright's 'Perfect Garden.'"

KELWAY'S PÆONIES.

NOW IS THE TIME TO PLANT Pæonies—the best time in the whole year. No garden is complete without the new Pæonies. Kelways recommend the following Collection (E) as being representative of their celebrated varieties. They will give great satisfaction, and be a credit to any garden: Agnes Mary Kelway, Beauty's Queen, Ethel Davey, Griff Thomas, Kelway's Queen, Lord Cromer, Lyde, Moonbeam, Mrs. Fleming, Snowy Coles, Pride of the West, Socchieva. 54s. for the dozen good plants true to name; immédiate delivery. Carriage and packing free for remittance with order (mentioning this advertisement).

VOL. LV.—No. 3,074. SATURDAY, SEPTEMBER 28, 1912.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Gardening as a Hobby.

To any lover of Nature, even the most superficial, the question of the value of a garden as the object of a hobby can only be answered in one way, viz., that it ranks with the most delightfully interesting of all branches of natural study open to the mere amateur. It adapts itself to the pockets of both poor and rich, since even the smallest backyard, devoid of any apparent claims to be considered as a garden at all, is capable of accommodating in sympathetic hands quite sufficient material to evoke and stimulate its owner's interest from year's end to year's end, since, as we see in the well-known story of "Picciola," even a single plant may suffice therefor. In point of fact, we have often thought that a restricted collection of plants, where every individual becomes as it were a personal friend, where every phase of growth and development can be watched and noted, contributes more thoroughly to the hobby-rider's enjoyment than does an immense collection of innumerable kinds of plants, whose very extent involves a more superficial acquaintance with the individuals composing it. Here of course, comes in the question of the amount of leisure available for study, but for the ordinary amateur with whom such leisure is very limited, there is no doubt that a small number of choice plants, well within the scope of careful study, is capable of evoking and affording much more interest and consequent pleasure than mere numbers. It is in this direction naturally that the specialist scores who devotes his energies to some particular species of plant or plants adapted to the accommodation he can afford them, and in this way many a working man has obtained a reputation and carried off many prizes over the heads of wealthier competitors, purely by virtue of the personal concentration which he devotes to study and culture. In many towns and villages, more particularly in the Midlands, men of this class abound, who, instead of wasting the little leisure they have in public houses or futile amusement, devote it to their special hobby, and are thus at once better men and wiser ones, plus the happiness when success attends their efforts. As regards space, more than one lecture delivered of late at the Horticultural Club, and illustrated by most interesting lantern slides, has demonstrated what can be done in the gardening line under most unpromising conditions, and that, if only the "will" be present, the "way" can be found. We have a vivid recollection of a series of views taken at various seasons of a small suburban garden cramped up between the high walls of adjacent houses. Here, by careful study and judicious arrangement, an uninterrupted succession of beautiful plants was maintained throughout the year by means of perennials and annuals, arches, suspended baskets, and even prosaic butter tubs, whose crudeness was entirely veiled by the pendent foliage of ivy-leaved pelargoniums surrounding erect-growing flowering plants, and forming most attractive groups in corners and elsewhere. Another still smaller area was devoted to alpine plants, which, with a little care, adapt themselves splendidly to small spaces, and afford unlimited variety. It is, indeed, in this particular direction of variety that the gardening hobby stands supreme; there is no limit to the scope it affords for different tastes and environment, nor to the intelligent observer is there any limit to the material for observation which it, like every other natural hobby, provides. Furthermore, if the hobby-rider be a sociable man or woman, for gardening is as open to the fair sex as the so-called sterner one, what greater pleasure is there than consorting with one's fellows of like tastes and comparing notes, making exchanges, and vieing with each other in the same natural pursuits? In the garden there is ever something new to observe and note, every month brings its particular phase of development, every season demands its particular arrangements, not merely in its own special connection, but as regards preparation for future ones. The gathering of seed or its sowing, the planting of bulbs, propagating, repotting, or planting, and indeed a thousand and one matters of that kind, each and all of which involve study and care, and possess a particular interest of their own, as contributory to eventual success. The gardening hobby, in short, is one which brings its pursuer into immediate contact with Nature and all her infinite wonders, and by virtue of such infinity constitutes an inexhaustible fount of pleasure and instruction.

MR. H. MERRYWEATHER, J.P.

**Mr. H. Merryweather, J.P.,** the head of the firm of Messrs. H. Merryweather and Sons, Lim., whose portrait we have the pleasure of giving herewith, has long occupied a leading position in the horticultural trade of this country and enjoyed the esteem of the residents in the City of Southwell, which he has, in the course of his active life, done much to beautify. The Southwell Nurseries, of which a brief account is given in this issue, were founded about the middle of the last century by Mr. Merryweather's father, who was a keen horticulturist and gave his son the thorough training so essential to success in horticultural activities. Early in life Mr. Merryweather became connected with Dean Hole, who then lived at Caunton, near Southwell, and he served on the committee of the old Notts Horticultural Society, of which Dean Hole was then chairman. He was a contributor to the first National Rose Show, held in the fifties of the last century, at St. James's Hall in London. Of this show Dean Hole was the secretary. With the National

Rose Society Mr. Merryweather has been associated since its foundation, and, notwithstanding the immense amount of work involved in the development of the immense establishment of which he is the head, Mr. Merryweather has found time to take an active part in the administration of the affairs of Southwell, and he has held office on most, if not all, the public bodies connected with that City. During the past summer he was made a Justice of the Peace for the County of Notts, an honour that gave much pleasure to those who were acquainted with the splendid services he has rendered in the course of his public activities.

**Roses and Rose Culture** will be specially dealt with in our next issue (October 5), and among the articles for which arrangements have been made are new medal roses, the improvement of rose soils, the pegging-down method of rose culture, dwarf polyantha roses, and yellow outdoor roses. The issue will be freely illustrated, and prominent among the illustrations will be those of some of the finest of the new roses that have received distinction during the year.

**National Rose Society.**—The Council of the National Rose Society will, we understand, make a new departure next year, and hold a spring exhibition at the Royal Agricultural Hall, and the date will probably be Thursday, May 1. The metropolitan exhibition will be held on Friday, July 4, and the provincial show will be held at Bath about the middle of the month, and the autumn exhibition at the Royal Horticultural Hall in probably the third week in September. We are very pleased to learn that the society has decided to include a spring show in its programme, and should it prove the success we anticipate, it will be one of the most pleasant of the functions that will have a place in the society's programme. It is whispered that the September show may extend over two days, with a view to making such arrangements as will enable a much larger number of those who appreciate the beauties of the rose to enjoy the charms of the autumn flowers than is now possible. Owing to the cooler conditions that obtain in September, there is not the same objection to a two-days' show in that month as in June, July, or August.

**Congress on Electroculture.**—The utilisation of electricity in horticulture is receiving considerable attention in France, and a congress of an international character will be held at Reimes on October 24 and the two following days for the purpose of discussing the various questions relating to electroculture. The subjects arranged for discussion include the influence of atmospheric electricity on the growth of plants and the nitrification of the soil; the use of electricity artificially generated, and its influence on the plants, soil, and artificial and natural manures; the influence of electricity on the germination of seeds; and on the fungoid and insect pests. The use of electricity in protecting crops from the injurious effects of hailstorms and in accelerating the growth and flowering of plants, and the influence of the electric light will be discussed. Those who are interested in the subject may obtain programmes from the Secretary-General, 58, Boulevard Voltaire, Paris.

**The Oldest Vine in Scotland.**—Miss Isabella Duke writes, from Bearehill, Brechin: "I was much interested in the notice of our old vine, which appeared in your issue of August 10. Your correspondent, however, is not quite correct. My father, Mr. Duke (not Duthie), bought this property forty years ago, and the vine has been under the care of Mr. Tosh for thirty-eight years. It is a Black Hamburgh vine, and about 135 years old so far as we know. About seventeen years ago the house was doubled in size, and it is now quite filled, and the vine carries 450 bunches this year. I should be greatly interested to know if ours is the oldest vine in Scotland, and perhaps some of your Scottish readers may help me to find out whether it is or not."

**Birmingham Horticultural Society.**—The committee of this new society are able to announce a highly satisfactory result from their recent show, because, notwithstanding many difficulties and inclement weather, the profits amount to over £100. We are informed that the committee recently passed a sincere vote of thanks to the exhibitors, who made the show a success. The shortage of tent accommodation was due to an error on the part of the contractor, and is a matter that will be remedied in the future, and no effort will be spared to ensure the comfort and convenience of exhibitors. Mr. W. E. Carradine, the secretary, 84, Hamstead Road, Handsworth, will welcome any suggestions for future exhibitions.

**North of England Horticultural Society.**—The exhibition that will be held by this society in the Leeds Corn Exchange on October 17 and 18, promises to be a great success. We are informed that the committee of the Leeds Workpeoples' Hospital Fund are offering a challenge cup, of the value of 80 guineas, for the best exhibit in the show. This cup will remain the property of the donors, but will be held by the winner for the time being. This committee are also offering a 15-guinea challenge cup to the best exhibit from other than the members of the trade. Lady Barran will open the show at two p.m. on October 17, and the profits will go to the Hospital Fund. Mr. A. J. Allsop will be in charge of the arrangements.

**Propagation of Resinous Plants.**—In the course of one of his recent lectures on plant propagation Professor Bayley Balfour made special reference to the propagation by cuttings of resinous plants and plants with thick juices. Examples given were mostly drawn from the gymnosperms. Many of them, it was pointed out, do not callus freely—pine trees, for example, do not form stool shoots—because the healing by callus is replaced by healing by resin, and this may be cited as an argument against the suggestion that the retrogression of the gymnospermous type in the history of the world's plant covering is a consequence of the want of a protective callus. The two critical points in striking cuttings of such resinous plants are—to prevent the drain upon the plant resources through excessive outflow of resin when the cutting is made—which may be achieved by plunging in boiling water—and to provide easy exit for new roots by scraping off the protecting resin skin. Callused and rooted cuttings of pines were exhibited, special attention being directed to them because the striking of pines by cuttings is regarded by many as impossible. The cuttings were struck by Mr. Laurence Stewart, plant propagator of the Botanic Garden.

**The Farrer Cup for Rock Plants.**—The Council of the R.H.S. offer (subject to the general rules of the society, and the special regulations indicated below) a silver cup, presented to them by Mr. Reginald Farrer, to be competed for at the spring show, on May 20 and 22, 1913. The class requires six new or rare dwarf rock plants, naturally about nine inches in height, not less than six or more than twelve specimens of each. New colour forms of well-known plants admissible; double flowers excluded. Variety, novelty, interest, and correctness of name to rank above size of specimens. It is not essential that all, or even more than one, of any species should be in bloom, e.g., no one would expect to have six Saxifraga florulenta in bloom simultaneously, but a group of it with a flower spike should take precedence of another without. Every exhibitor must attach a card giving in print, or in very clear writing, the personal history of each set of plants (e.g., whence he obtained the plant, or through whom, and when, its habitat, etc.), and observation remarks (e.g., ease or difficulty of cultivation, suitable soil, positions and uses, method of propagation, peculiarities, etc.). Judging will be by points: Novelty and interest, 20; beauty, 20; garden value, 15; culture, 10; correctness of name, personal history, and quality of observation remarks, 20; rarity, 15. First prize, the Farrer Cup in silver. The Council will award suitable medals according to merit, at their discretion, to the exhibitor adjudged second, and possibly to the third.

**M. George Gibault.**—This gentleman, who is the highly-respected librarian of the National Horticultural Society of France, and an eminent writer on the historical and literary aspects of horticulture, has recently been appointed a corresponding member of the Royal Horticultural Society. Some of our readers will no doubt remember M. Gibault's latest addition to horticultural literature, his "Histoire des Légumes," a work involving much research, and the result of many years' literary activity.

**A New Park for Llanelly.**—Sir Stafford and Lady Howard celebrated the first anniversary of their wedding day by throwing open to the public a park that is to be called Parc Howard. This park, of twenty-five acres, was formerly known as the Bryncaerau estate, and contains a castle that has been converted into a museum, with reading and refreshment rooms. Parc Howard has been presented to Llanelly at a yearly rental of £5.

**Mme. Phillippe de Vilmorin.**—There are some of our readers who are personally acquainted with M. Philippe de Vilmorin and his charming wife, for they are not unknown in this country, where they have attended important horticultural functions at various times. The news has just reached us that the French Government has recently bestowed upon Mme. Ph. de Vilmorin the Cross of Chevalier of the Mérite Agricole for services she has rendered to French horticulture. We congratulate her and her husband upon this distinction, in which all their English friends will join unanimously.

**Scottish Railway Station Gardens.**—In announcing the awards for the best-kept platform gardens on the Glasgow and South Western Railway, Mr. D. Cooper, the manager, says that the directors view with satisfaction the efforts made in the way of station decoration, and informs the station masters that for next season the premiums will be increased from a gross of £100 to £150, and that they will be divided into five classes, with the prizes as follows: First-class, 12 of £5 each; second class, 10 of £4 each; third, 10 of £3; fourth, 5 of £2; fifth, 10 of £1 each. The principal awards this season fall to the following: First class, £6 each, Mr. W. B. Kirkpatrick, Dalbeattie; Mr. James Barr, Ruthwell; Mr. Robert Fisher, Dalrymple; Mr. Wm. Taylor, Dalmellington; Mr. John Rae, Carronbridge; and Mr. George Macdonald, Moniaive. Second class, £4 each: Mr. Andrew Morren, Annbank; Mr. William Yeudall, Sanquhar; Mr. George Hay, Paisley West; Mr. John Hamilton, Cunninghamhead; Mr. James Candlish, Southwick; Mr. W. R. Becket, Dunure; Mr. Thomas Gillies, Alloway; Mr. Peter Lawson, Holywood. There are four in the fourth class, and six in the fifth.

**American Gooseberry Mildew in Hants.**—According to a report presented to the Hants County Council, the American gooseberry mildew has been located in three additional parishes within the county. The report also stated that there are now 286 gardens in which the gooseberry bushes are infected, and that the area of these gardens is nearly 556 acres.

**Horticultural Congress at Ghent.**—Intending visitors to the Ghent Quinquennial Flower Show in May next may like to know that in conjunction therewith there will be held an International Horticultural Congress, to which foreign horticulturists are cordially invited. The fee payable to enter one's name as a member is five francs. The programme of subjects to be discussed has been drawn up and circulated, and in connection with the Congress, besides the practical work, there will be the usual round of festive gatherings. Forms of membership and all particulars can be obtained of the secretary, M. Ed. Rodigas, 79, Avenue Chazal, Brussels.

**Flower Shows for Children.**—For the encouragement of Nature study, and to supplement the efforts of teachers to encourage the study of botany and horticulture among scholars, the Manchester authorities provided about 25,000 plants in May and June, at a charge of twopence each. These plants were grown by the children throughout the summer, and when the schools reopened after the summer holidays about 9,000 plants were brought to the schools, and 2,500 of these were selected for exhibition at the chief centres. Medals, fern cases, etc., were awarded as prizes for the best plants, and all plants selected for the final display gained certificates for their juvenile owners.

**Sparkhill Horticultural Society** experienced a loss of about £100 in connection with their exhibition of August 17. This loss follows one of £75 6s. 3d. in 1911, so that matters are in a bad way financially. An appeal is being made to members and supporters for assistance, and a hope is entertained that a special fund will be raised to meet the heavy deficit.

**Large Fruits of Warner's King Apple.**—Mr. W. W. Yates, of Wrington, states that from a young tree of Warner's King apple he has gathered one fruit that turned the scale at 21½oz., and seventeen other fruits weighing in the aggregate 10½lb. The dimensions of the tree are not stated.

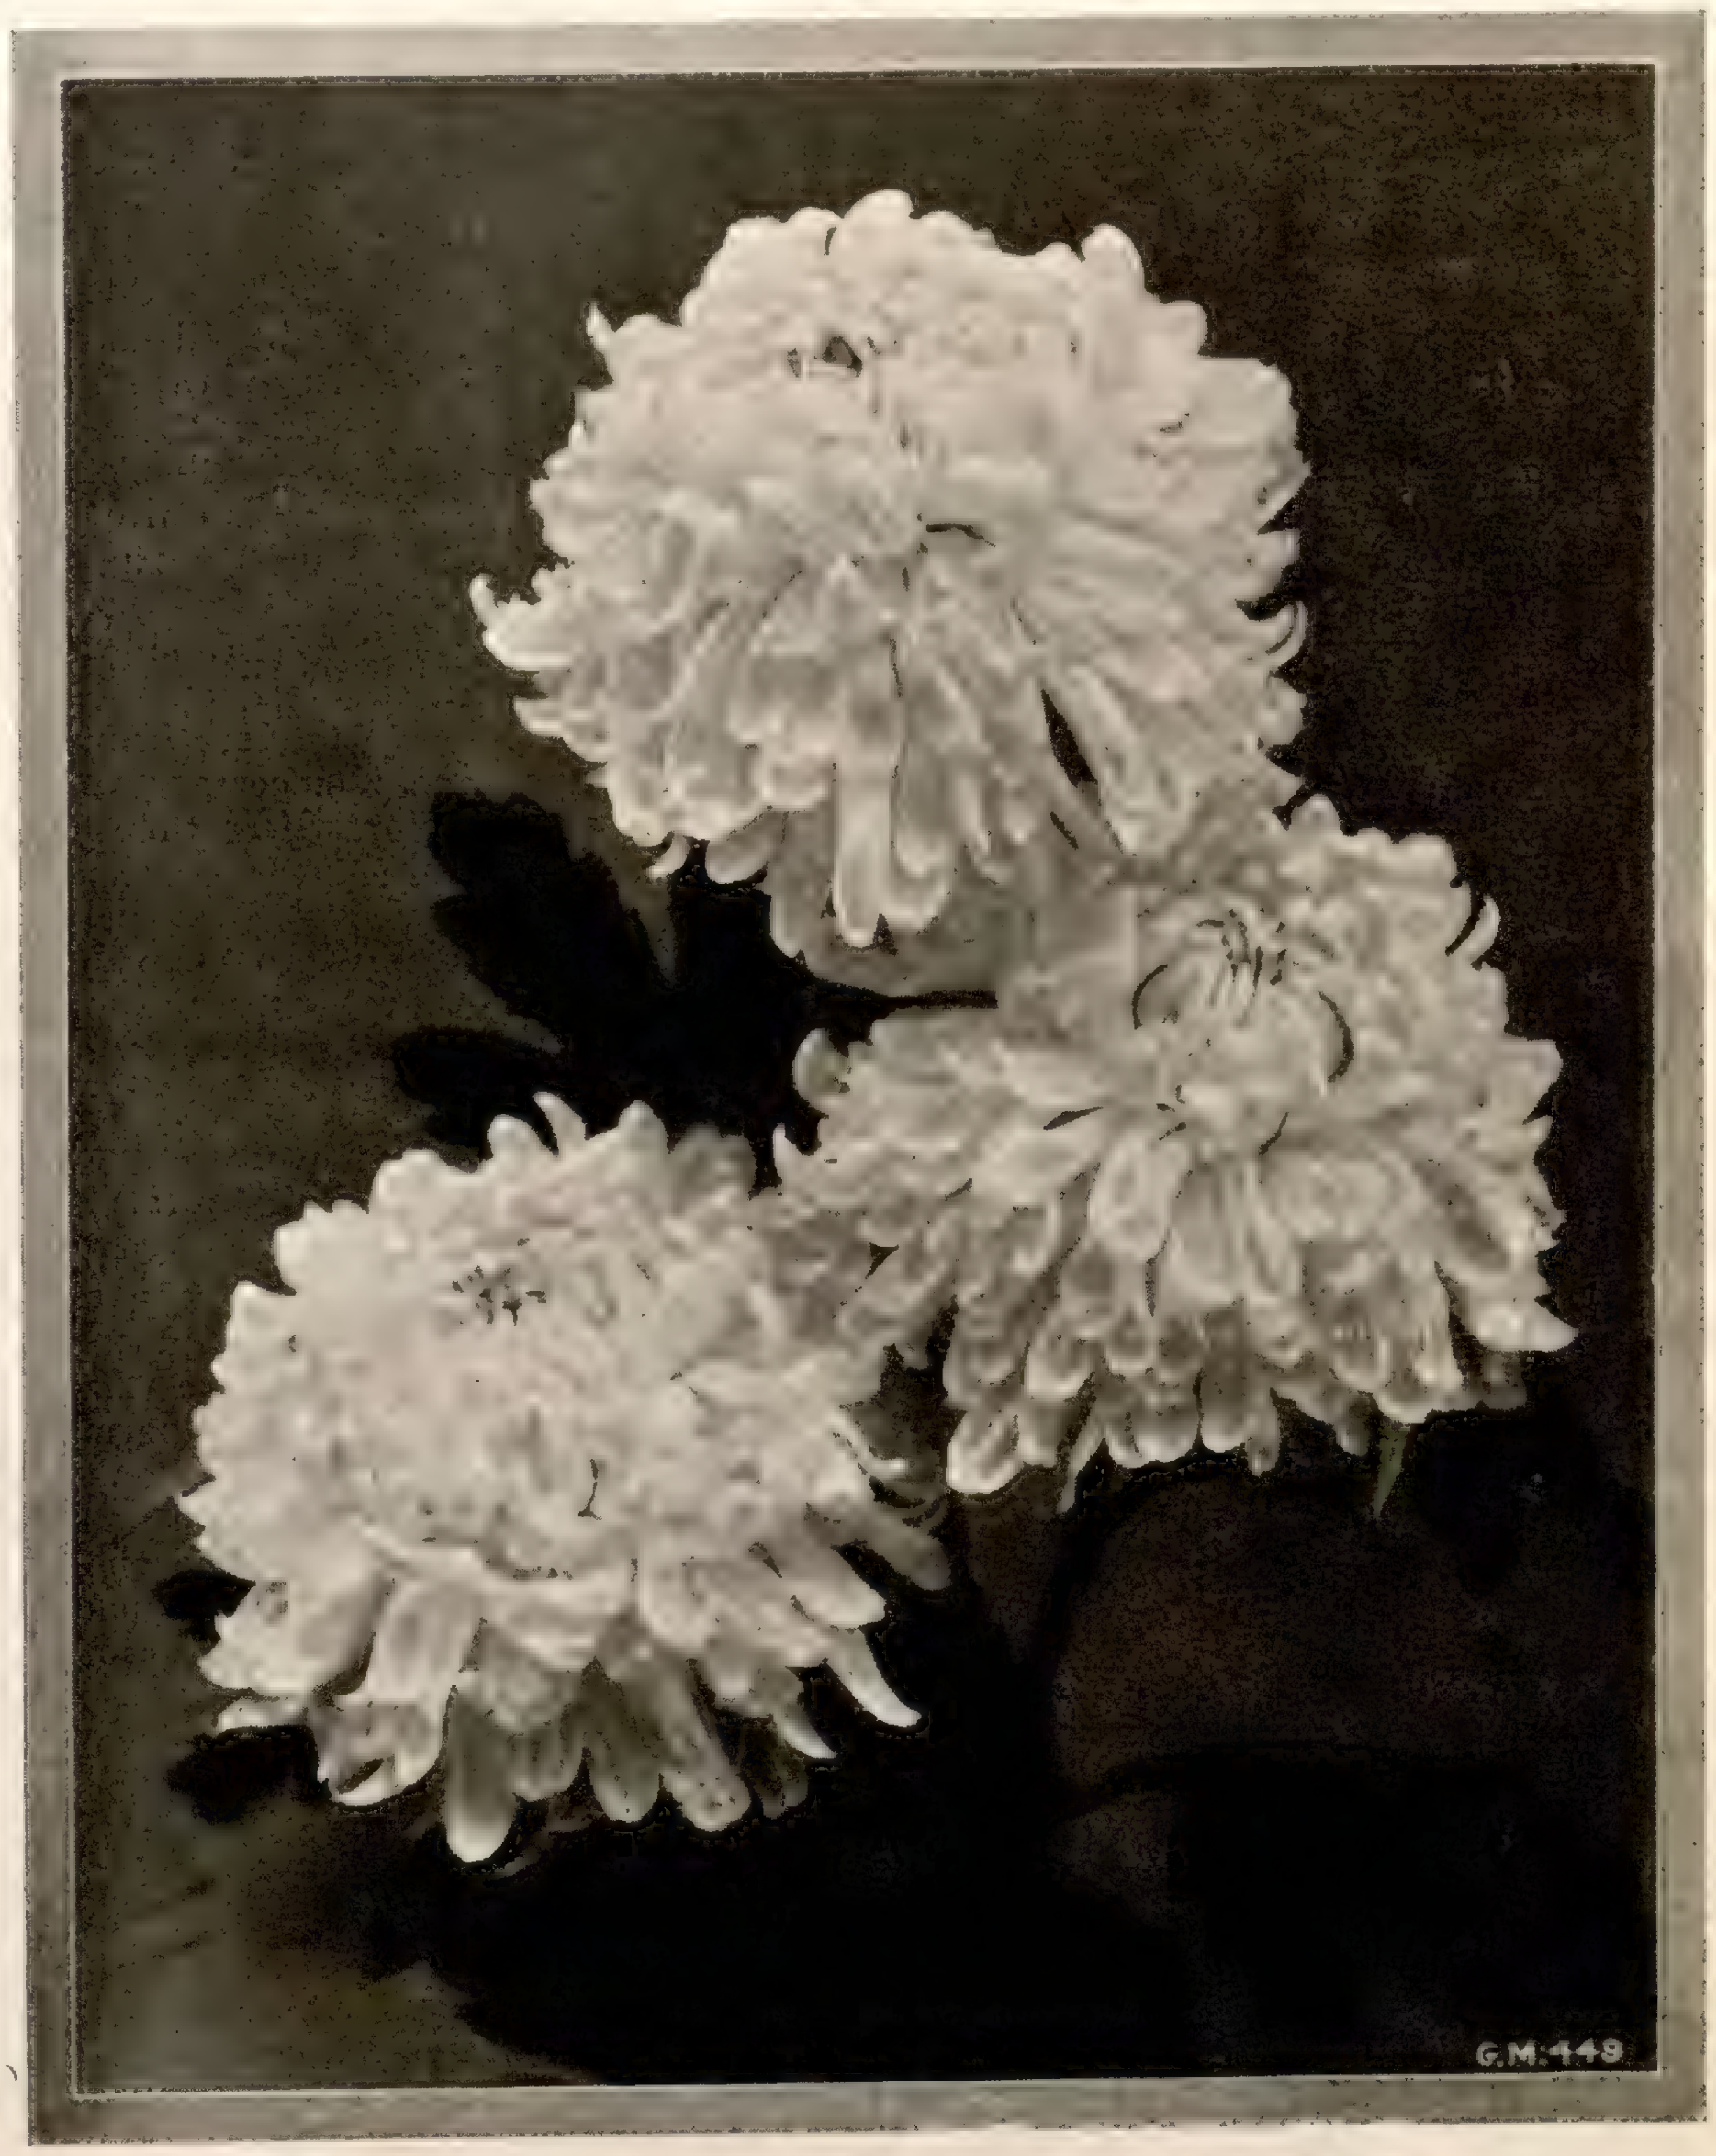
**Bacteria and Lime.**—In giving an account at one of the sectional meetings of the British Association of experiments which were designed to show how far the micro-organisms of the soil were affected by applications of caustic lime, Dr. H. B. Hutchinson said that the addition of small quantities of quicklime to field and garden soils stimulated general bacterial growth, but large quantities caused an initial depression in the numbers of bacteria and the destruction of certain large protozoa, and a cessation of all biological processes. Conversion of the lime from the caustic form into the carbonate or combination with soil compounds was followed by a great increase in the numbers of bacteria and increased ammonification of soil compounds. The length of the period during which bacterial growth was suspended would appear to be determined by the quantity of lime applied, the initial reaction of the soil, and the amount of organic matter present.

## NEW PLANTS, ETC.

◆

### CHRYSANTHEMUMS.

Framfield Early White.—A beautiful early-flowering variety of prettily incurving Japanese form, and yet by no means formal, because the outer florets droop a little and then curve at the tips. The flowers are of good size, four to six inches across, stoutly built, and of a lovely pearly whiteness. A splendid addition, and one that is already popular in Covent Garden Flower Market. (Section II., sub-section 1, b, N.C.S. classification.) F.C.C., N.C.S., September 23; A.M., R.H.S., September 24. Mr. Norman Davis, Framfield, Sussex.



CHRYSANTHEMUM FRAMFIELD EARLY WHITE.

Flowers pure white. F.C.C., N.C.S., September 23; A.M., R.H.S., September 24. Mr. Norman Davis, Framfield.

Mrs. J. Fielding.—A very bright and attractive early-flowering Japanese variety, with rather flattish flowers of vivid bronzy chestnut colour, the elegant florets lightly tipped with gold. (Section II., sub-section 1, b, N.C.S. classification.) F.C.C., N.C.S., September 23. Mr. J. Fielding, East Keswick, Leeds.

Alcade.—A wonderfully beautiful, long-stemmed Japanese variety of great value for market, and for general decorations. A grand sport from Almirante. The florets are even, pointed, and make up a substantial flower; while the brilliant chestnut-crimson colouring makes the variety eminently desirable. (Section II., sub-section 1, b, N.C.S. classification.) F.C.C., N.C.S., September 23. Messrs. Lowe and Shawyer, Uxbridge.

## SWEET PEAS UNDER GLASS.

The wonderful sweet peas that appear in the leading markets and horticultural exhibitions during the months of April and May, have doubtless aroused a sincere longing in the hearts of many. There are, however, those who argue that such flowers are out of season, but the gardener or grower who succeeds in bringing a crop to perfection weeks ahead of its natural period achieves some little renown if not pecuniary benefit. Modern glasshouses and heating apparatus enable a skilled grower to turn the seasons upside down; therefore it is not surprising that sweet peas are made to bloom ahead of their natural season, and, so far as market culture is concerned, it has been proved that the early blooms make the most money. To some it may appear incredible, but it is nevertheless true, that bloom spikes were sold in the open market in London at 15s. per gross, whilst some shipped to Paris realised 18s. during the early part of last May. It must be admitted, however, that the growers who can produce bloom early enough and good enough to make such prices are to be easily numbered upon the fingers of one hand. Scores there are who grow sweet peas under glass, but few indeed succeed in achieving a great success.

That things will improve, there is no reason to doubt, and I venture to think that the sweet pea, as an indoor flower, is as yet merely an infant. Indeed, I go so far as to say that the time will come when high-class blooms will be produced from December onwards. American growers have for years been producing sweet peas under glass from November till June, but the type of flower produced is not to English tastes.

### Sweet Peas for Glass Culture.

For some reason, the Zoolanck and Telemly varieties are not satisfactory here, yet in America the first-named type can be made to grow 10ft. or more, and produce 12 to 18in. stems, the flowers oftentimes selling wholesale at one dollar per 100 or more. American growers, however, admit that their flowers are not nearly equal to those produced under glass by British growers, but there is just the difference that America has sweet peas in November, whilst none worthy of the name are to be seen at home until mid-April or later. The reason is as stated; Americans grow the early Zoolanck type, while home growers depend upon the Spencer types. The difference between the two is that the early-flowering kinds are active all the time, and they run up without a check, while the Spencer, or late-flowering type, stand still after germinating, while they are breaking at the base, and any attempt to force them along ends in failure. The British public has been educated up to big blooms, and the small flowers of the Zoolanck type are not acceptable.

It is generally admitted that the early sorts already in existence are not satisfactory. Apart from their small size and hooded form, they are sometimes much mixed, but nevertheless I am convinced that the treatment generally accorded them is not conducive to their well-being. Owing to our dull winters the seed ought to be sown early in August instead of late September or October as is usually the case. Treated properly, the early types will flower weeks ahead of the ordinary forms, but no treatment will make them take on the size so much desired. We therefore must confine ourselves to the giant Spencers already in favour.

### The Most Suitable Structure.

To grow sweet peas under glass one must have a good and suitable house. It is useless to expect high-class blooms from plants grown in a house where sundry other things calling for a high temperature have residence. Neither can one expect big blooms and long stems from plants growing in 32 or even 24-sized pots. Excellent decorative plants may be grown in the latter, but nothing approaching the high-class exhibition flower, as grown outdoors, must be expected. Given a house to itself, the sweet pea is happy, but the ideal house must be light and airy. The American cultivators usually grow their crops in span-houses 30ft. to 50ft. wide, and I question whether any grower in this country produces choice exhibition flowers in a house less than 20ft.

### Raising Seedlings and Repotting.

The time is at hand when the seed must be sown, and they should be put in without delay. Three-inch pots filled with good loam, with a little sand and rotted manure added, should be the home for one seed only, and to ensure good and even germination, select the plumpest seeds available, and chip each with a knife if it happens to be dark. Cover with about a quarter of an inch of soil, and stand in a cold frame with the lights closed. White seeds may be merely pressed into the soil and lightly covered with sand. No watering is necessary if the soil is sufficiently moist. Tilt the lights well up as soon as the seedlings are through, and never let them want for air. If the leading growth keeps fat and succulent, let it alone, but, if any of the plants commence to plump up the lower eyes, and cause the leading growth to stand still, pinch out the top, and carry up the strongest shoot that follows. If the house is ready by December, prepare the ground by double digging and manuring, choosing, of course, the centre of the house.

A house 20ft. wide will allow for three rows of pots, with a pathway of about 24in. between each. A house with high eave-plates will allow for more, but it must be understood that if the roof is not 8ft. above the ground level there will be trouble. Prepare sufficient soil to fill the 12in. pots required, and it may be mentioned that the pots are to stand close to each other in the rows. Good holding loam, and well-rotted manure are the main things to have. Leaf-soil is unnecessary, but sufficient sand to keep the soil open should be added. Make the soil firm, and then stand the pots in the house. Bring in the plants and allow them to remain for a day or two until they are used to the change, but on no account shut off air. Heat is quite unnecessary. After a brief spell, turn out the plants, and set four in each of the big pots, allowing two on either side opposite each other. Set a trifle deeper than formerly, and make the soil very firm. Give a stake to each plant if necessary, and stand the pots in a position where they have full light. Avoid watering more than necessary, but if the weather becomes severe, turn on sufficient heat to keep out frost. Do not attempt to hustle the plants or they will soon become spindly, and have a bad attack of greenfly. Watch for this pest at all times, for it can do much damage.

### Arranging and Training the Plants.

When the plants are growing well, and the roots have taken good hold of the soil, it will be necessary to prepare the stations where the plants are to stand permanently. The soil in the house having been prepared beforehand will be in good trim, and trenches deep enough to take the pots to the level of the rim should be made. Stir a little well-slaked lime and soot in the bottom, and set the pots in position. Supports must be prepared at once, and there is nothing better for the single-stemmed plants than tall bamboos. Wires strained taut to uprights at each end of the house will give the canes the support they need.

Keep the plants well tied, and pinch out all laterals. About the middle of February more heat can be given, but never force up the temperature above 55 degrees; 50 degrees is really ample, and a drop of 5 degrees at night is more beneficial than otherwise. On sunny days give plenty of ventilation, but avoid draughts, or mildew may come along and spoil one's efforts. A syringing with clear water overhead at midday in bright weather is appreciated, but do not damp down at night. Never shut the ventilators at any time.

### Watering and Feeding.

A little liquid cow-manure may be given occasionally when the plants are about two feet or so high, but avoid nitrates or strong chemical manures. Sulphate of potash, about ½oz. to the gallon, will tend to keep the plants from getting too soft, and occasional waterings with permanganate of potash will keep the soil sweet. Dust the soil with slaked lime about once a fortnight, and do not allow the plants to become dry. Thoroughly soak the entire ground when watering.

Flower buds are usually slower at showing under glass than in the open, and it is not uncommon for the plants to be 4ft. before buds appear, and these early ones not infrequently fall off, but if the temperature and ventilation are attended to, there is little trouble in this direction. At this stage the plants will take plenty of feeding, and from April onwards a good supply of liquid manure may be given once or twice a week according to the growth. At this time of the year, all top, and often the side, ventilators, should be open on bright days and no artificial heat should be necessary during the day, except when the weather is damp or very dull. After flowering commences the plants grow at an amazing rate, and it becomes a problem how to give them head room. Sometimes one can pull them down a bit if the ties are not tight, but this has to be carefully done. Odd laterals that may appear can be carried up to replace any growth that has to be cut away, and if thinning has not been too thorough, one can usually obtain some good basal laterals.

### Why Grow in Pots?

Some may be disposed to ask why pots are necessary. They act as a check on rampant growth, and, further, they give the plants a better start as the soil keeps warmer, and air, not ground draughts, circulates amongst them before the pots are sunk. If planted out direct into the ground they are slower to get away, and later on, if the soil is highly fed, the plants will be against the roof before many flowers are produced.

The cultivator must aim at keeping his plants down without checking them, and here is where the skill comes in. Even when sown or planted rather closely, the plants will persist in going up. This past season I saw several houses with plants set out in the ground, which had actually reached the limit, and come over several feet, totalling, I should imagine, some 16ft. or more of growth.

As stated, very good blooms may be grown in 8in. or 9in. pots, not sunk, but two or three plants in each are ample. Giant exhibition blooms are, however, impossible, but anyone who has a use for neat flowers on 9in. or 10in. stems can get them. High feeding is necessary, but the life of the plants is short compared with those grown as described.

Diseases other than mildew do not affect plants under glass, at least I have never seen such. American growers, however, know only too well what havoc can be wrought by various diseases, including the twin brother of our own detestable "streak." Greenfly must be kept down by fumigation, but so long as the plants are grown hard this pest causes little trouble.

### Varieties.

Almost any variety will succeed under glass; indeed, some varieties, such as Afterglow and Stirling Stent, are better indoors than out. The average gardener needs but few colours, however, and I would recommend Moneymaker, white; Empress, mauve; R. F. Felton, lavender; Orange Perfection or Thomas Stevenson, orange-pink and orange-scarlet; Scarlet Emperor or Dobbie's Scarlet; Doris Usher, deep cream-pink; and Lady Knox, cream, tinted pink. It must be understood that while all varieties do well under glass, the colour is apt to be misleading. Avoid all the very pale or weak shades, for with few exceptions, all varieties come considerably paler under glass than outdoors. Shading is not necessary, and the plants must have all the light possible.

T. A. Weston.

# COMBINATIONS OF SPRING FLOWERS.

Bulbous and other hardy flowers that are usually grown in large numbers for the production of rich colour effects in the flower garden during the spring season are highly attractive when grown in separate beds, provided the contrast of colours is tasteful and the planting is so carried out that the space is well filled without being overcrowded. Many are the examples that could be mentioned in proof of this, but for the present purpose it must suffice to state that this is the case. This much must be readily admitted—that the planting of the several kinds in beds wholly devoted to a separate kind or variety, as is so frequently done, more particularly in the smaller gardens of amateurs, is not a practice that can be recommended.

A CHARMING COMBINATION OF HYACINTHS, TULIPS, AND VIOLAS AT HAMPTON COURT.

One of the chief objections to devoting each bed to a distinct kind or variety is the difficulty of obtaining in a colour scheme a soft tone of colouring that is so much appreciated at the present time, and a harmonious blending of colours is far more pleasing and satisfactory than the strong colour contrasts that enjoyed a considerable degree of popularity in the past, and are still met with in gardens, but, happily, in rapidly diminishing numbers. Another objection to the method is the bare appearance presented throughout the winter months by beds that are wholly devoted to bulbs. From the time of planting in the autumn until the leaves begin to pierce the earth in their endeavour to obtain the warmth, light, and air so essential to their full development, the beds are bare instead of being carpeted with green leafage as they might, and indeed should, be. There is no great difficulty in giving each bed its carpet of green during the winter, for the number of fibrous-rooted plants suitable for associating with spring-flowering bulbs is considerable, and the most useful of them are readily raised by means of seed or cuttings. The combination of fibrous-rooted plants, such as arabis, alyssums, and wallflowers with bulbs adds to the labour and attention involved in the production of displays of spring flowers, but this addition is not of great moment, having regard to the improvement in the appearance of the beds during the winter and the enhanced charm of the floral display in the spring.

Most beautiful combinations may be effected by the use of two or three colours of the same class of bulbs in one bed. These different shades must be provided, not with mixtures obtained at a cheap rate, but with separate varieties planted in due proportions. This method of planting can be most successfully carried out with hyacinths, as evidenced by the results that are annually obtained in the London parks and gardens that are open to the public. By planting such pink varieties as Gertrude, L'Ornement Rose and Rosy Gem, a much more pleasing effect is obtained than when any one of these varieties is planted separately. In like manner, Blondin, Count Andrassy, and Leonidas, in their various shades of light blue, produce a delightful effect. Certain of the early-flowering tulips may be associated with hyacinths with much success, as in the bed of which an illustration is given herewith. This bed contained a selection of two or three light blue hyacinths and a white tulip, probably Snowdrift, which attains a height of ten or twelve inches. Some of the soft yellow tulips may be associated with the light blue hyacinths, but in the writer's opinion, white tulips present the most pleasing appearance in association with blue hyacinths. For planting in conjunction with pink and red varieties of the last-named flowers, white, pink, and rose-coloured tulips are all suitable, and Cottage Maid, La Reine, Rose Grisdelin, and Snowflake may be mentioned for their usefulness for growing in association with hyacinths.

Whatever may be the method adopted of planting the chief classes of bulbs, fibrous-rooted plants should be grown in association with them for the purpose of carpeting the ground in winter and contributing to the floral display in the spring. Among the white-flowered plants suitable for carpeting the surface of beds and borders planted with bulbs, the double-flowered form of Arabis albida is pre-eminent.

The golden Alyssum saxatile and its lemon-coloured variety known as citrinum are both of much value in their respective shades of colour, and are especially useful for planting in association with the crimson-red, scarlet, and white tulips. Aubrietias, in their several shades of lilac and rose, form an admirable setting to hyacinths, but on cold, heavy soils they suffer more or less during the winter. Forget-me-nots are exceedingly useful for carpeting beds of white and blue hyacinths and white tulips, and should be taken full advantage of. Double daisies also possess much value as they bloom freely until the time arrives for preparing the beds for their summer occupants. Polyanthuses and wallflowers should be freely planted in combination with bulbs and other plants where spring flowers are appreciated. The strong colours of the wallflowers are most useful for association with tulips and daffodils, for they not only harmonise with them, but they continue to yield a profusion of their fragrant blossoms until the beds have to be cleared of spring-flowering plants. G.

# SOUTHWELL NURSERIES, NOTES.

The home of the "finest apple on earth," as Messrs. Merryweather and Sons style their well-known Bramley's Seedling, has for many years occupied an important place among the nurseries of Britain, and the Southwell Nurseries take rank to-day among the most extensive, best equipped, and ably managed of our horticultural establishments, a place where all who love gardens and admire beautiful trees, fruits, and flowers may take their fill of pleasure, and add much to their knowledge.

Southwell itself, with its fine old Norman cathedral, and the many historic associations with both the Norman and Roman periods that are still in evidence, is a place all Englishmen ought to visit, and gardeners above all should see both the city and its lovely surroundings of well-wooded slopes and prolific orchards, as well as the nurseries which are the subject of this review.

The dictionary defines a nursery as "ground for rearing trees, fruit, flowers, etc.," and verily the Southwell Nurseries justify this definition to the full.

The nurseries are three in number, separated a considerable distance apart, but in fine weather the drive from one to the other, and the ramble through each will provide a full day's enjoyment for anyone who is a plantsman or pomologist. The total acreage under fruit and general nursery stock cannot be far short of two hundred acres. Naturally, one sought first the famous apple already mentioned, Bramley's Seedling, and truly a wonderful sight it is to see both the vast "brakes" of young trees of all shapes and sizes, and the extensive orchards of magnificent trees in full bearing. The Bramley Orchard, situated on the opposite side of the road to the Brinkley Nursery, is indeed well called an ideal orchard. It was planted some twelve years ago with five and six-year-old trees, and these are about three feet in girth at the main trunk, and have a wonderful spread, the variety being exceptionally free-growing. It is characteristic of the whole establishment that appearances might lead one to think that the Messrs. Merryweather, by some magic charm, keep all pests and diseases at bay. The real secret, however, is that spraying with reliable fluids is persistently and systematically carried out, and good husbandry prevails in every detail. Last year the total crop of Bramley's amounted to something like one hundred and fifty tons, and although this year the crop falls short of this high figure, there are big crops on every tree. The many thousands of young trees of Bramley attaining saleable size convinced us that the Messrs. Merryweather must find an extraordinary demand for them. The big field of maidens, and the great breadths of two to four-year-old bush and standard trees were as fine as one could wish to see.

It must not be supposed that Bramley's Seedling is the only apple grown, for one finds big breadths of many other sorts, both culinary and dessert. Some bush trees of Cox's Orange Pippin on paradise stock particularly impressed us with their fine, healthy appearance. Four-year-old Charles Ross carried handsome highly-coloured fruit, and there were remarkably fine two-year-old Grenadiers and Lord Grosvenors, the latter being a splendid cooking apple. Cordons, too, are extensively grown, and also plums, with gooseberries, and currants in between the permanent apple trees.

Among ornamental trees, hollies occupy an important place, and it was good to see plenty of fine, shapely pyramids, and healthy young stock of such varieties as Hendersoni, Aurea Regina, Argentea Regina, Madeiriensis, Hodginsi, and Shepherdi, for these hollies are in great demand, as indeed they should be, for nothing can be finer in the pleasure grounds of a mansion than well-developed hollies. Trees for town planting, such as limes and sycamores, are grown on a big scale, the situation and soil of Brinkley Nursery being well adapted to the production of good growth and fine fibrous roots.

At Micklebarrow, the other branch nursery, it was very noticeable that all the golden and variegated shrubs and conifers attain exceptional brilliance, Cupressus Lawsoniana lutea, for instance, being brighter in colour and more elegant in appearance than usually seen. C. Lawsoniana argentea, the exceedingly handsome C. Lawsoniana Westermanni, with its distinct gold-tipped growths, and C. Lawsoniana alba spica, of conical habit were all beautifully coloured.

It is at Micklebarrow that the bulk of the roses are grown. Walking between the vast breadths of maidens in all the latest and best varieties, the first point that impressed one was that the average in budding successes was extremely high, there being row after row with scarcely a failure. Space limits forbid mention of many varieties, but a few that have proved themselves so particularly successful during this cold, wet season deserve notice. Edu Meyer, with its amber and coppery-red tints, was one of the first to be noticed, its colour being so charming, and its habit so free. Most people love a rich crimson rose, and several of very deep and glowing shades, included Chateau de Clos Vougeot, a beautiful variety despite the unhandy name; and Florence Haswell Veitch, vivid crimson shaded with scarlet. This is one of the newer roses, and has rendered a good account of itself this season. J. B. Clarke is more widely known because older, and it has proved itself a capital town rose. A few other roses were noted which make excellent bedders in town gardens, among which probably none can excel La Tosca, with its abundance of flesh and shell-pink flowers. Mrs. Wakefield Christie Miller, is another that Mr. Merryweather speaks of as deserving of inclusion in every collection; Rayon d'Or is also one of his special favourites, as indeed it must be with all who see it growing and flowering as it does in the Micklebarrow Nurseries. Charlotte Klemm, one of the best and most brilliant of the China section, flowered as though in competition for the production of the greatest quantity of blooms, and that is the kind of rose we want for bedding purposes. It has, however, a serious rival in the charming little polyantha named Jessie, which is one of Messrs. Merryweather's own introductions, and is grown in thousands, producing a truly glorious effect in the mass. We might easily go on naming roses that are deserving of the highest praise, but there remains so much else to write of. The pears, for instance, at Micklebarrow were, even on quite young trees, hanging in great quantities, and there were loganberries, plums, and bush fruits in thousands. A very choice collection of the finest lilacs and also of thorns will doubtless be largely drawn upon during the coming season, and another important feature of this nursery is the big collection of choice rhododendrons, which do extremely well in the natural soil, as also do the hardy heaths.

There is still the Home Nursery to deal with, and this alone would provide material for a very long article, although it may be said that a good deal of the same classes of stock was seen here as in the outlying branches. It is, however, in the Home Nursery that most of the pot plants are grown, and an important item is the collection of ivies. These have been worked up for years, and almost every variety worth having may be found at Southwell. Lee's Silver, and Silver Gem, Dentata aurea, with its handsome foliage, and the immense-leaved Rægneriana are but a few, and perhaps the finest varieties. Wistarias, too, are largely and well grown, W. multijuga being highly esteemed and strongly recommended. There is a good general collection of herbaceous and alpine plants, not consisting of the rarities that appeal only to specialists, but the most serviceable for the borders and rockeries in gardens where a good display of bloom is aimed at. One ought to dilate upon the roses here also, for there are the climbers, the Pernetianas, hybrid rugosas, and indeed the good old H.P.'s, to say nothing of the novelties as yet grown under glass. Along the roadside, too, there is a capital series of beds cut out in well-kept grass, each filled with one variety, and every bed a delight. This notice may well conclude with a word about the remarkable new damson known as The Merryweather. This invaluable fruit has already been illustrated and described in these columns, and the good opinion formed upon first acquaintance was confirmed by the excellent crop of large, handsome fruit not only on the original tree, now some years old, but even on two-year-old trees in the nursery lines, where tree after tree was cropped in the most remarkable manner—remarkable because with the ordinary damson one never expects or hopes to see fruit until the tree is a good many years old.

# SOME GOOD ROSES FOR STANDARDS.

In the past we had but few roses really suited for culture in standard form, as compared with the number now available.

It is not only the grand heads that can be readily formed by the climbing polyantha and Wichuraiana sections that have so vastly improved our standards, but we have a number of free-growing hybrid teas that soon form capital heads, and have the additional merit of being free and continuous in flowering.

To take a few of the Wichuraianas first. All of us know what beautiful heads Dorothy Perkins and its sports make, carrying long festoons of blossoms upon the lengthy rods formed the previous season, and never failing us if these growths are well matured. But grand as are the weeping standards, especially when grown upon extra tall stems, they have the great defect of only presenting us with one really good crop of blossoms during the season. The exceptions to this rule are Miss Alice Garnier and the original species, mostly spoken of as the type, which remain in bloom until severe frost stops flower production.

In such varieties as Gruss an Teplitz, Papillon. Trier, Allister Stella Gray, Perpetual Thalia, William Allen Richardson, Perle des Neiges, Madame Hector Leuillot, Madame Alfred Carrière, Gruss an Zabern, Celine Forestier, and Billiard et Barré produce good-sized heads that are full of flowers from early in July until frosts set in, and it is these which, except where weepers are wanted, afford us the most satisfying of standards.

A few of the best teas and their hybrids may also be mentioned. General MacArthur, Lady Ashtown, Viscountess Folkestone, Madame Ravary, Nance Christy, La Tosca, Gustave Grunerwald, and Augustine Guinoisseau being some of the best. These do not make quite such large heads as the last-named set, but are so free in growth and flowering as to retain the vitality so necessary among roses that are grown in standard form. I would limit a selection from the tea-scented section to the following: Corallina, Mrs. B. R. Cant, Madame Jean Dupuy, Marie Van Houtte, Molly Sharman Crawford, and Souvenir de Pierre Notting. Of the hybrid perpetuals, Ben Cant, Duke of Edinburgh, General Jacqueminot, Mrs. John Laing, Ulrich Brunner, Tom Wood, Dupuy Jamain, Frau Karl Druschki, and Mrs. R. G. Sharman Crawford are the most reliable.

I trust this list may be a help to intending planters, and will close with advising a more thorough preparation of the soil than is generally given for standards, more especially when planting them singly by carriage drives or upon the lawn.

A. P.

## STERILISATION OF SOIL.

In your reply to "F. B., Yorkshire," page 695, you there state that the sterilisation of the soil is distinctly beneficial, but the methods by which it can be the most satisfactorily carried out by the general body of cultivators require further investigation, and with this statement I am in full agreement. Perhaps it may be of interest to know the method we have adopted here, as the soil was so infested with eelworms that cucumbers, melons, tomatoes, and many other things were complete failures before half the season was over, owing to the destruction of their roots by the pest. As other means tried, such as soil fumigants, carbon bisulphide, etc., failed to prove satisfactory, we tried steaming in the following way:

A strong pitch pine chest, or tank, was made and connected to the injector pipe of the boiler used for driving the dynamo of the electric light installation. The tank is made of 2¼-inch plank of the following dimensions, inside measurement, viz., length 6ft. 2in., width 2ft. 1in., depth 2ft. 3in.; the ends are grooved into the sides and held in position by four iron rods or long bolts across each end outside, with a ⅜in. thick iron plate to prevent the heads of bolts and nuts cutting into the wood. There are also four iron bolts going through from the top edge to the bottom with nuts underneath on each side. The bottom and both ends are bolted through in the same way to prevent any movement or opening of joints from the pressure of steam.

Inside in the angle formed by the bottom and sides a 2½in. square piece of wood is fixed, the full length of the tank, also across each end; these act as bearers to take a very loose-fitting false bottom. When this false bottom is in position there is then a clear space, or chamber, underneath. Into this space, or chamber, the steam pipe is brought in at one end, and the pipe is taken about a foot into this space. The false bottom is of ordinary inch-thick deal, but this I find is not stout enough to carry the weight of soil, and is bored with ⅜in. holes all over at six inches apart, these holes giving the steam free access to all parts of the soil. There is a very close-fitting lid for the top. The tank is fixed outside, and stands about a foot from the ground on two brick piers; there is a fall of an inch at the end opposite to where the steam pipe enters, and here a tap is fixed to draw off any water formed by the condensed steam. There is a length of 45 feet of 1-inch steam pipe from the boiler; this distance was unavoidable on account of other buildings. The work was done by a local engineer, and the cost, including brickwork, etc., was about £6.

The apparatus has now been in use nearly two years, and has proved a great success, as, since using the sterilised soil I have not lost a plant of any kind from an attack of eelworm. When using the tank we fill it with loam, leaf-soil, or whatever the material may be, leaving a space of four or five inches at the top, put on the lid, and turn on the steam at about 40lb. pressure. Now, whether the above is the most practical method of sterilisation I cannot say; but it answers our purpose. I know everyone has not the advntage of a steam engine for the purpose, but it would be most instructive if other correspondents would give their views and experience on the subject, as I think, when the value of sterilised soil is better known, the means will be found for effecting its sterilisation. I must not occupy further space, or I might state the difference it has made in the growth, etc., of many things under my charge.

H. Reynolds.

Scratby Hall, Great Yarmouth.

[We shall be pleased to publish any further particulars on the sterilisation of soil that Mr. Reynolds may consider of interest, and also the experience of other of our readers. Ed., "G.M."]

## SWEET PEAS FOR EXHIBITION.

It has been my good fortune to be fairly successful as an exhibitor of sweet peas during the present year, at Reigate, Eastbourne, Hayward's Heath, and the National Sweet Pea Society's exhibition, but, after all, there is not very much to be said or written about methods of cultivation. The use of common sense, a love for the flowers, and the power to profit by close observation of the plants' behaviour, are of far more value than any elaborate details of cultivation or manuring, slavishly followed.

Ours is a simple procedure. We sow the seeds in pots during the second week of October, and winter the stock in cold frames, affording ample ventilation in all but the severest weather. The plot that is to carry sweet peas is trenched three feet deep in November, and plenty of rotten stable manure, with a fair sprinkling of bone-meal, are mixed with the soil in the two lower spits.

We have to deal with a heavy clayey soil that assumes the consistency of putty when wet, and bakes as hard as bricks when dry. We have, therefore, to take every advantage of good soil conditions, and the sweet peas are planted out as soon after the middle of March as weather permits. Double rows are planted, a foot between each row, and five feet between each double row. The plants are set out a foot apart, three growths only being allowed to extend from each, and those are kept free from side growths.

No feeding is given until the sweet peas are nicely in flower, and then soot water and liquid from the farmyard are given freely, with an occasional top-dressing of some approved fertiliser. For supports we use tall sticks with an accompaniment of stout bamboo rods. Tying is regularly attended to, but this is not a very serious business when the single-stem method of cultivation is practised. Under these conditions large quantities of fine flowers, borne on good stems, are produced over a long period, and these are suitable alike for exhibition or home decoration.

F. C. Beale.

Haversbrack Gardens, Uckfield.

SWEET PEAS AS GROWN IN THE HAVERSBRACK GARDENS.

# SOME OF THE NEWER SWEET PEAS.

A year ago there were many people pessimistic enough to forecast the decline in popular favour of the sweet pea, but up to the present there is no evidence of decline, if one can judge by the number of enquiries received as to which varieties, both new and old, are the best to grow for 1913. Certainly, the practice of autumn sowing is very much more general than it was even two or three years ago, which goes to show that the results obtained from such sowings are quite satisfactory, and it is this fact, no doubt, that induces the Editor of the GARDENERS' MAGAZINE to give his readers matter now which two years ago would have been reserved until after Christmas.

SWEET PEA MRS. CUTHBERTSON.
A beautiful light pink variety, introduced by Messrs. Dobbie and Co., Edinburgh.

Generally speaking, sweet peas have done better this season than in 1911, consequently we have been better able to judge the merits of the varieties, many of which have proved even better than was anticipated. Considerable advance is still being made in the matter of new varieties, though there is nothing so outstanding as in some seasons. But we must remember that the number of good varieties and colours that have been recently introduced makes it a matter of some difficulty to secure really distinct novelties, so that we must be satisfied if new varieties are really improvements on existing ones, without being distinct in colour. As a good instance of this I would here mention Breadmore's Reselected Countess Spencer, which, as I anticipated, is a distinct advance on an old favourite, and has proved one of the best and most continuous bloomers, giving considerably larger flowers than the original stock. As I have mentioned more than once, there is considerable room for an improvement in the whites. White King (A. Dickson and Sons) may prove the variety we want, but this we cannot have until 1914. And we must also wait for Constance Hinton (Dr. Hinton); this variety, though giving a shade of pink in the standard of the young flowers, is, I think, decidedly an improvement, and is quite white enough to show in a collection, the size and quality of the blooms being quite up to exhibition standard. White Queen (G. Stark and Son) must be our stand-by until we can have the two previously mentioned, and even then this will want a lot of beating, as it is exceptionally vigorous, and gives four good flowers on the stem practically every time, and always well placed.

Among cream varieties Dobbie's Cream (Dobbie and Co.) must take a very high position, being a sturdy grower, and giving good solid-looking flowers, but even now it does not surpass the popular Clara Curtis, which is a little deeper in colour and a little more frilled.

Crimson Giant (B. W. Deal) is a very fine crimson variety, not so much waved as Sunproof Crimson, but of a distinct shade of colour and very large, though not one of the best to give four blooms on a stem.

Recent introductions in the bright rose section are a decided gain to cultivators, and Edith Taylor (Sydenham and Holmes) is, I should say, one of the best peas introduced for the past three or four years. A. A. Fabius (Alsen) and Aggie Elder (Breadmore) are identical; under either name it is a very fine pea, the colour, a brilliant rose, being equally effective for decoration and exhibition. Kathleen (B. W. Deal) is even brighter than the three above-named, and may be described as cerise. Having grown this for two years, I cannot speak too highly of it. The blooms are not of the largest size, but the plant is a good grower and is very floriferous, while the colour is striking from quite a distance. It does not turn, neither are the flowers damaged by the bad weather to any serious extent. Mr. B. Deal has a more waved form of this. Very fine also is Bertrand Deal (B. W. Deal), the flowers rose-mauve.

There are, again, several additions to the cream-pink section, but, being so closely alike in colour, it is a difficult matter to recommend them individually. Queen Mary (Messrs. E. W. King and Co.) one of last season's introductions, is a veritable giant, and for exhibition purposes it is excellent, and might be described as an improvement on Mrs. Routzahn, though not so prone to give double standards. Another exceptionally good pale cream-pink is Lilian (Holmes and Sydenham); in colour it is between Zarina and Mrs. Routzahn. It is a good grower, makes an excellent bunch, and, though not so large in the flower as Queen Mary, it has the advantage of keeping rather longer in stem. Lady Miller (Dobbie) is a very beautiful pea in this section, and will prove one of the most useful for decorative purposes.

In the darker shades of cream-pink Minnie Furnell (Alsen) is, I think, rather better than Doris Usher, the colour and size of flower being a little in advance of it. Wenvoe Beauty, a variety I saw at Cardiff, is the brightest and best of all this section, but as I understand it is not yet fixed enough to distribute, it seems almost premature to speak about it, but it is too good a variety to lose sight of.

In addition to the really decided or defined shades of pink, there are several others of equal beauty, such as Andrew Aiken (R. Bolton), Grace Darling (E. W. King), Juliet (B. W. Deal), Winifred Improved (B. W. Deal), Fair Maid Improved (G. Stark and Son), and Mrs. Stewart Champion (S. Bide and Sons), all of which are distinct from one another, and certainly, if not quite up to exhibition standard in size of flower, they are among the very best for delicate decorative schemes. Zarina is such a well-known and distinct variety that the mere mention of a good Spencer form of it should be sufficient; this waved form is one of Mr. Holmes' raising, and is being distributed by Mr. Robert Sydenham.

W. P. Wright (W. J. Unwin), though only distributed last year, has already made a name for itself as the very best pale blue. It is one of the strongest growers, and when the plants are in good order it is difficult to find a stem with only three blooms, fours or fives being the usual number. It is certainly an acquisition, especially for those who like delicate shades of colour. Amethyst (Sutton and Sons) I noted as being a very good variety, and, though not quite a self blue, it will, I think, prove a useful addition to this section, as will also the same firm's Southcote Blue, which, if somewhat smaller in the flower, is a better blue, and is very like a seedling of Mr. Holmes' that I grew this year.

Marks Tey (Dobbie and Co.), though not a blue, has a certain amount of this colour in it, being almost a blue and bronzy-red bicolor; it is very pleasing in the bunch, a giant in growth and in flower, and should make a good exhibition variety. A sweet pea that pleases me very much, both for garden decoration and exhibition purposes, is Loyalty (G. Stark and Son), a blue flake, but of such colour in the bunch that it is well worth growing, even in a small collection. There are several varieties quite near this, but just lacking in the shade of colour that makes it so commendable.

Agricola is one of Mr. Bolton's novelties that received the Award of Merit of the National Sweet Pea Society this year, and is a variety of large size, being white with a flush of lilac or pale violet, and for those who like these tinted peas it is the one variety to grow. Birdbrook (R. Bolton) is also a very fine sweet pea, and for form and size is probably the best of the year, but as it is a flake (finely veined chocolate on a white ground), it may not become so popular as some of the self colours.

There is not a great deal fresh to record among the scarlets. Most of last year's introductions have turned out well, my own choice being in favour of Scarlet Emperor, but I think it probable that Dobbie's Scarlet will prove to be a little larger in the flower, while Premier (G. Stark and Son) is quite distinct in colour. As a decorative variety True Lavender (Dobbie and Co.) will no doubt take a prominent place, the colour being exceptionally soft, while the same firm's selected stock of Lavender George Herbert should provide us with our best exhibition pea in that colour. R. F. Felton, one of Mr. Bolton's last season's introductions, is a grand sweet pea, in fact, one of the best for exhibition purposes, provided it is not disbudded too freely; as this is distinctly a rosy-lavender, I think there is room for both of these fine varieties.

Mrs. Cuthbertson (Dobbie and Co.), a pink and white bicolor, well sustains the good opinion formed of it last season, and is easily the strongest grower and best flower in its class, though, like R. F. Felton, it must not be overgrown.

The variety Thomas Stevenson has been seen in such form and in such quantity this past season that it needs no comment from me, except to say that it will be interesting to test the two stocks, Holmes' and Dobbie's, to see which is actually the best under general cultivation. There seems to be nothing to challenge this variety's position at the head of its colour class at present, though in the Earl Spencer section there are several varieties that are said to supersede those already in commerce. Melba (Dobbie and Co.) and Barbara (Holmes) are both good flowers, and seem likely to keep their position until some clever cross-fertiliser of the sweet pea gives them to us in sunproof form. There are signs that this is coming, as I have seen one or two seedlings that appear sunproof, but a summer like 1911 might dispel all our hopes.

Inspector (Dobbie and Co.) gives a great number of double standard flowers, consequently it appears very bright, and makes a good bunch; the colour is similar to that of Earl Spencer. King Alfred (Breadmore) is an exceptionally large orange-pink variety, and might be described as between Anglian Pink and Anglian Orange in colour. Lady Curzon (Breadmore) is a decided improvement on Menie Christie, but it is more of a bicolor than a self. Rose Diamond (Aldersey and Jones) is a very bright pea, very similar in colour to Inspector. Anglian Fairy (E. W. King and Co.) is another of those very delicate sweet peas so useful for decoration, and may best be described as a Sybil Eckford Spencer, but the colouring is even a little more subtle than in that variety, a shade of green being distinctly noticeable in it.

Coronation (R. Bolton) is a variety not quite so well-known as Charles Foster, Dorothy, and Prince George, but it is nevertheless very well worth growing; it pleases me even better than the two latter; the colour is apricot, with a touch of rose or pink in it. It is very pretty, and after a few hours in water it makes an exceptionally good bunch. Annabella Lee (Alsen) is very similar to Dorothy, but, as growing here, it does not shorten in the stem so quickly, and the flowers come rather better spaced, the last-named often coming very much in pairs and close together.

SWEET PEA BERTRAND DEAL.

A beautiful variety, with large flowers of a rose-mauve colour, introduced by Mr. B. W. Deal, Kelvedon.

The dark varieties are augmented each season, and the three most noticeable novelties are Brunette (Dobbie and Co.), a deep mahogany self, and very distinct; King Manoel (G. Stark and Son), a very deep maroon of large size; and Mrs. Cowdy (R. Bolton), best described as an improved Black Knight Spencer. Either of these three should prove a welcome addition to any collection.

There are a great many more varieties listed, but it is much safer to speak of those seen, and safer still to speak of those actually grown, and if I seem to have specially lauded any of the foregoing varieties it is because they have stood out so much in front of those that I have been growing them with for comparison, that they deserve it, and I certainly think that the foregoing list comprises the best of the varieties seen during the season of 1912.

Thomas Stevenson.

Woburn Place Gardens.

**French Beans.**—Where warm pits can be spared a good sowing of beans should be made to carry on a continuous supply of this most desirable vegetable. Where early marrows, melons, and cucumbers were previously grown, little else will be required beyond levelling the beds, and making them quite firm for the seeds. Sow the seeds in lines eighteen inches apart. If from any cause the pits are not yet available, sow the seeds in boxes, and plant out when ready. Sutton's Plentiful and Superlative are two excellent varieties for this mode of culture.—G. E.

SWEET PEA AGRICOLA.
A distinct variety, suffused lilac on a white ground, introduced by Mr. R. Bolton, Warton.

## SOWING SWEET PEAS.

The time has now arrived for preparing to sow sweet peas, for it is now generally acknowledged that autumn sowings are best. Two different methods are practised, one is to sow the seeds in the open in the positions they are to occupy during the forthcoming summer, and the other is the more modern system of sowing the seeds in pots.

### Sowing in the Open.

Generally speaking, sweet peas will withstand any amount of frost, and perhaps no better test was ever provided than that which obtained during the early spring of the present year. A field of sweet peas was sown last October, in light soil, and owing to the fine open autumn the plants grew quickly, and soon reached a height of four inches. During the spring the weather was very severe, and just over the hedge adjoining this field 33 degrees of frost were registered. The plants, on the whole, withstood this severe test well, not more than 5 per cent. of them failing. The varieties differed, however, in their constitution, some of the lighter colours, especially the salmons, were cut badly, while the blues and maroons did not suffer in the least. One well-known grower, who always practises autumn sowing outside in the open ground, informed me he had suffered severely from frost last spring, and had lost numbers of plants owing to their being too forward.

I do not recommend outdoor sowing in the autumn, and never practise it, but those who still believe in this method should prepare the quarters the plants are to occupy at once, deeply digging the site and incorporating with the soil at the time of trenching plenty of well-rotted farmyard manure. If the peas are to be grown in clumps or rows a day should be chosen for sowing when the soil is dry, and works well. Before sowing the seeds should be soaked in paraffin oil for four hours, as this prevents the mice eating them. When the plants appear above ground, a strict look-out must be kept for slugs, which are fond of the young shoots, and will soon clear them off; a good dusting of slaked lime and soot is a preventive, but the best cure is to catch the slugs at night by the aid of a good acetylene cycle lamp and destroy them. When the plants are well up they should be destroyed with bushy twigs. Black cotton wound round the twigs will keep off the birds. I would advise those who intend sowing sweet peas outside to choose a warm spot, and especially a light soil, for where the soil is heavy and retentive the seeds will often rot.

### Sowing in Pots.

This is the practice that now obtains generally among all the best growers, and it can be most relied on. Owing to the bad season, the number of seeds in the packets of the novelties will probably be fewer than usual. The best date to commence sowing will be about October 14. A heap of soil should be prepared consisting of three parts sandy loam and one part coarse sand passed through a half-inch sieve. I do not advise the use of leaf-soil for sowing sweet peas, as fungus often arises from the bits of rotten stick, and spreads over the surface of the pots, strangling the plants. Four-inch pots are best for sowing the seeds in, and they must be clean. Place about four pieces of crock in the bottom of each, and fill with the compost to within one inch of the top, making the soil firm; the seeds should be placed evenly on the surface about five seeds in a pot, and covered with half an inch of the compost. Every pot should be correctly labelled at the time of sowing. The batch should then be placed in a cold frame on an ash base. No water will be needed until the seeds have germinated, which will be in about three weeks.

When the seedlings are showing through the soil the pots should be examined, and if any seeds have not germinated and are found to be hard, the outer shell or covering of the seed should be chipped slightly with a sharp knife; the seed will then quickly expand and grow. The pots should at all times stand as close to the glass as possible, so that the young seedlings may be encouraged to make strong, sturdy growth. Fresh air must be admitted at all times in abundance, and whenever the weather is favourable the lights are best pulled right off. The only exception should be when heavy rains prevail, or severe frost. I have never known frost to kill the young plants in frames, even if the soil is frozen hard in the pots, but this is best prevented by covering the frames at night with mats. Sweet peas detest coddling, and heat applied in any way is very injurious. So soon as the sweet peas have attained the height of four inches they should be potted off singly, using 3in. pots and a sandy compost. The pots must be clean inside, or the plants will not turn out well when they are required for planting. After potting stand them back again in the cold frame and encourage them to grow steadily until the time arrives for planting them out.

Lewis Smith.

Norwich.

## POETAZ NARCISSI.

The extremely powerful and aromatic fragrance of the bunch-flowered or Tazetta narcissi put these free-flowering varieties out of court for pot culture in many homes and gardens, and it unfortunately often happens that bad weather, which leaves a solid one-flowered daffodil practically unharmed makes a sad mess of the heads of closely clustering blossoms of a Tazetta variety.

These two weaknesses, if one may so call them, are absent from the newer and finer Poetaz narcissi, though I must not be too emphatic concerning the weather-resisting capacity of the varieties, because, so far, I have grown but few of them freely out of doors. As pot plants, however, and for cultivation in fibre in fancy bowls, there are no daffodils easier to manage and more likely to give general satisfaction in the home or the conservatory. I suppose everyone understands that the title of Poetaz is a hybrid one, indicating that the origin of the race is due to a combination of Tazetta with Poet's daffodils. One might be forgiven for imagining that Poetaz commemorated a hero of some picturesque eastern fable.

There is no difficulty in cultivating these free-flowering, strong-growing, beautiful varieties. Ordinary methods suffice, though it is worth remembering that the pots should not be crowded with bulbs, and that hard forcing is not desirable, owing to the rapid growth made and the consequent liability of the stems and leaves to elongate unduly under the influence of much artificial heat. Other things being equal, the Poetaz daffodils will require rather more water than the trumpet and poeticus sorts. It is a good plan to give each spike a very slender stick and a couple of ties by way of support, because some damage may be quickly done if a pot or bowl full of unsupported spikes is moved quickly from place to place when the flowers are ready to expand or have fully opened.

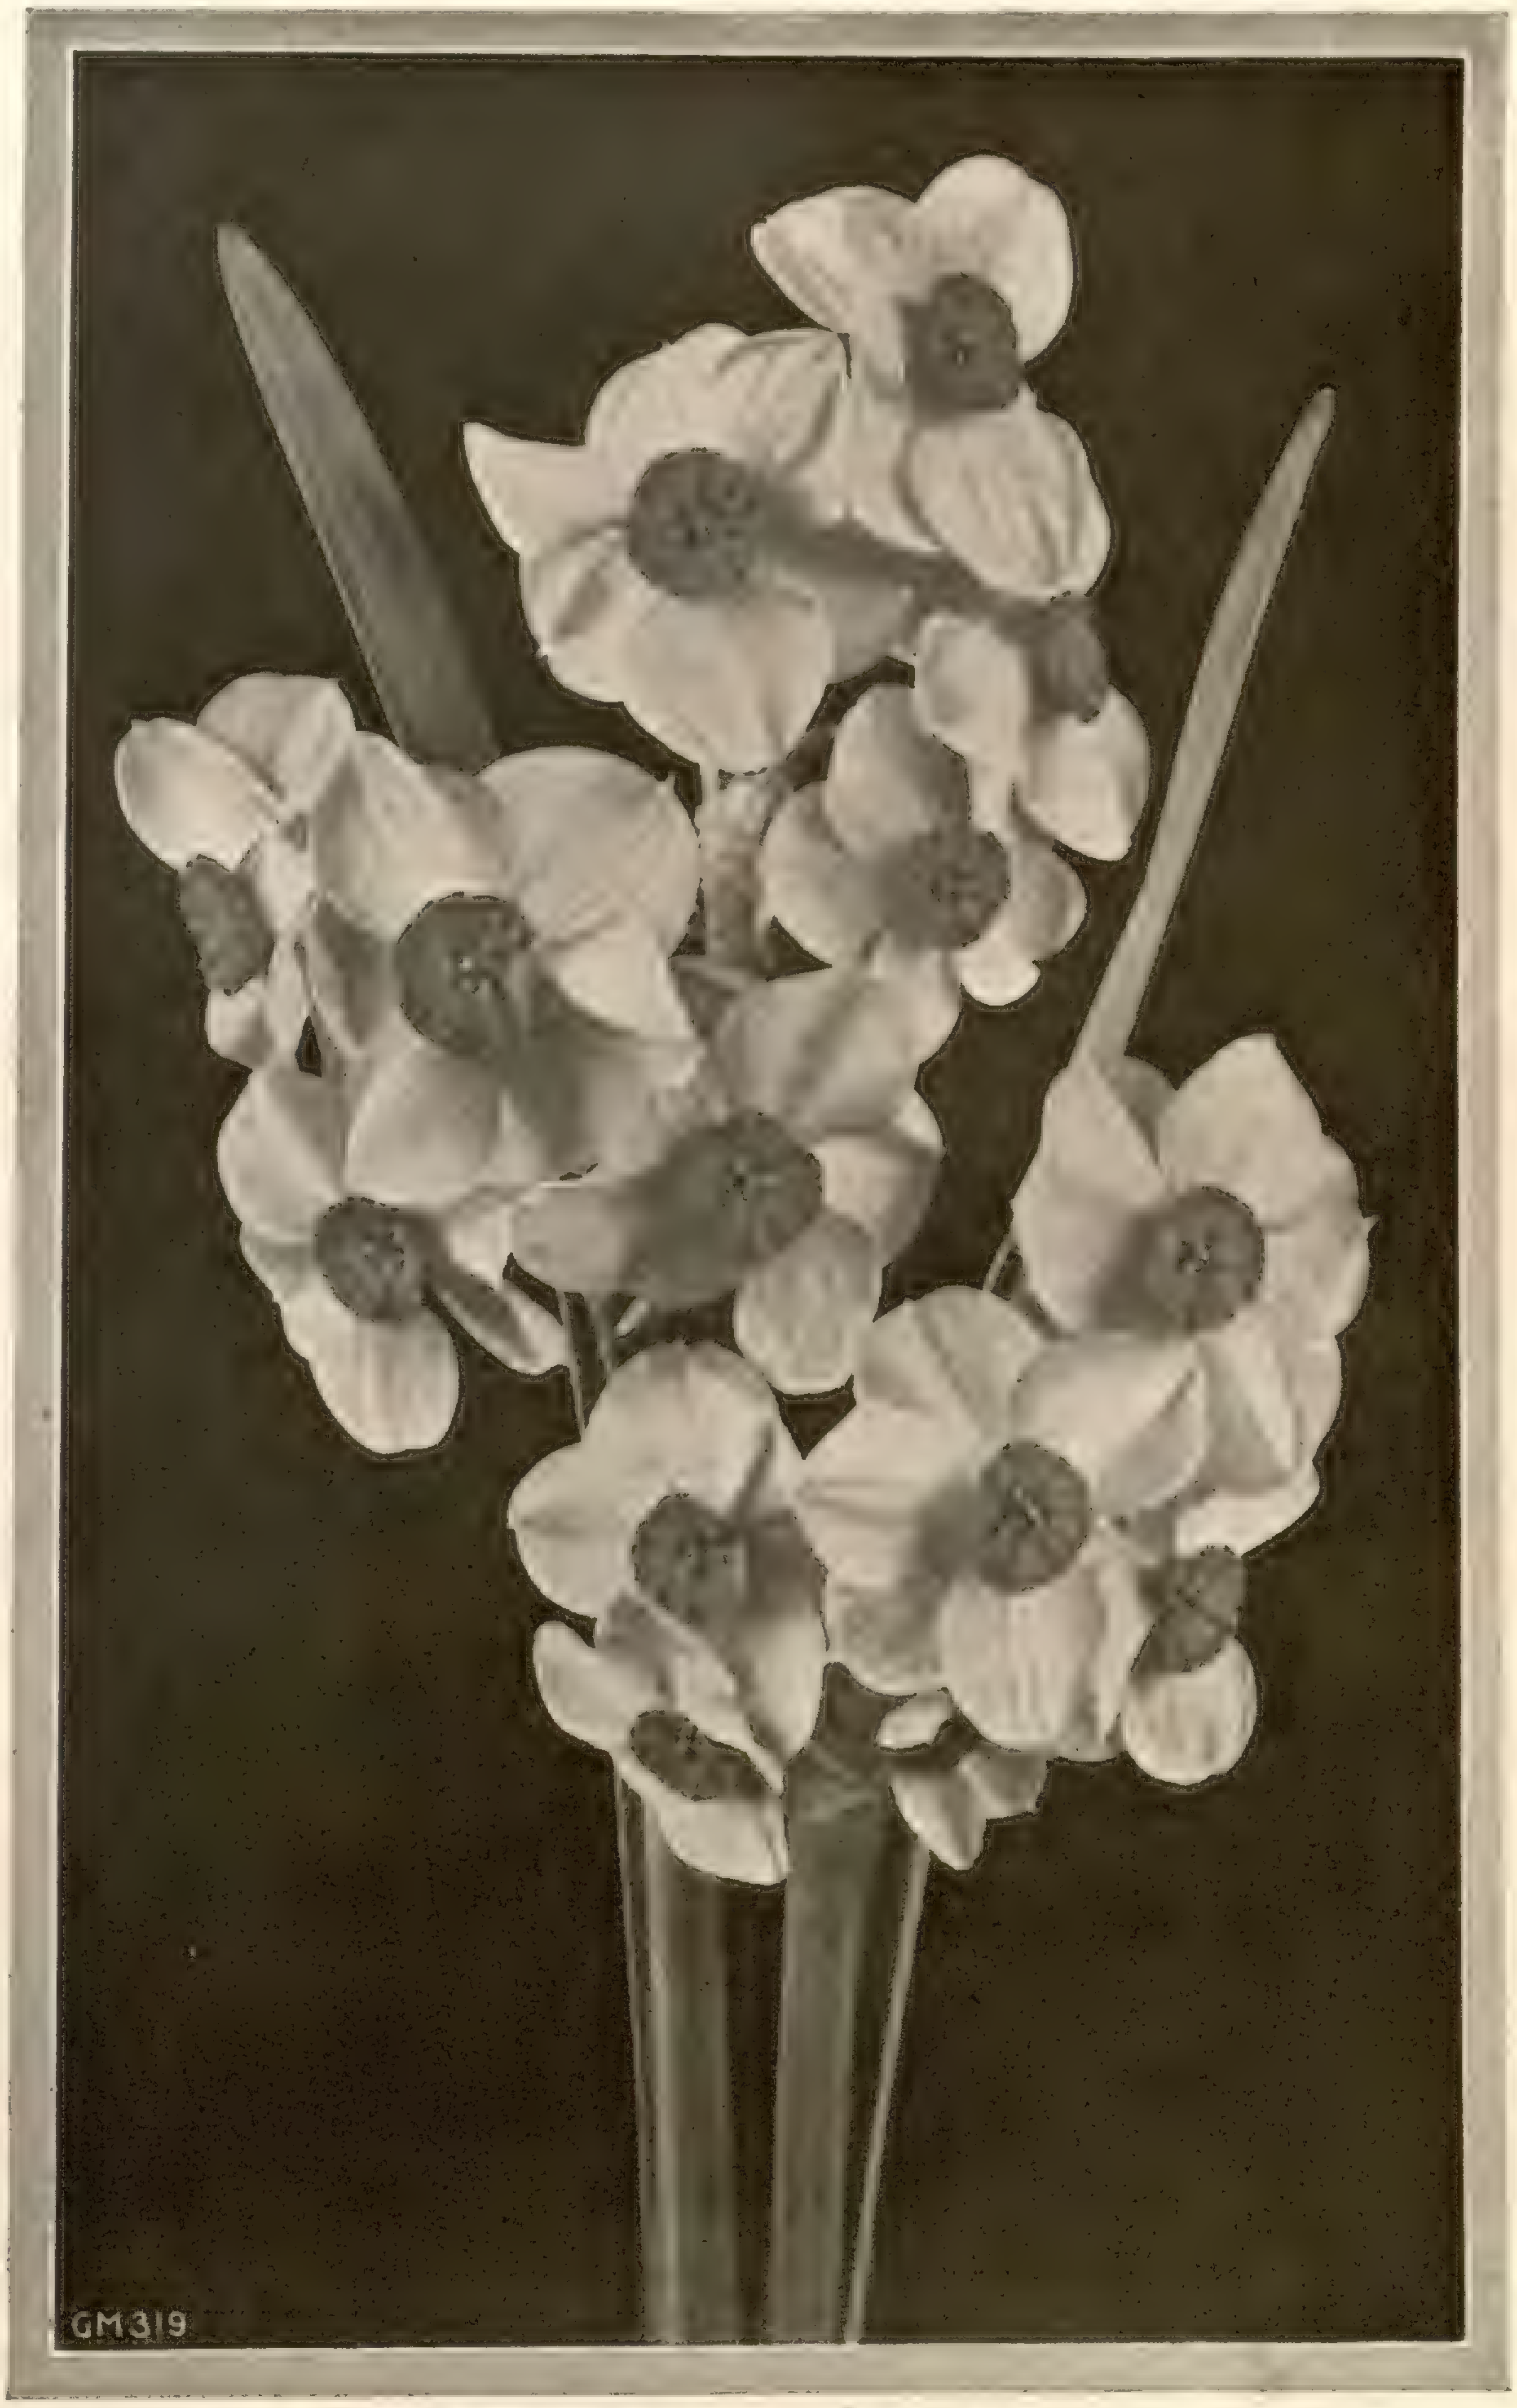
With very few exceptions, the Poetaz varieties are of Dutch origin, and the Messrs. Van der Schoot have been the leading raisers of this race. Mr. P. D. Williams has, however, produced a beautiful apricot-yellow, red-crowned variety named Scarlet Gem, but for the present I admire this afar, for the price is "too high for me, I cannot attain unto it." Mr. Engleheart is responsible for Orient, a beautiful variety with large white flowers, each with a red-edged crown. This is within reach, and so is Jaune à Merveille, the finest yellow variety, a rare beauty, carrying six or eight shapely blooms on a tall, stout stem. This is well illustrated herewith, from a photograph by Mr. G. W. Leak, representing spikes grown by Messrs. R. H. Bath, Lim., of Wisbech.

Three varieties that everyone ought to have, supposing they wish to grow Poetaz daffodils, are Aspasia, Elvira, and Klondyke. One cannot do better than make a start with these, whether on a large or small scale. Aspasia is white, with yellow crown, often grows 2ft. high, and its finely-formed flowers are borne in clusters of three or four. Elvira is of similar colouring, and has flowers of good size, particularly substantial and lasting. Klondyke is a yellow variety, producing large clusters of six or seven yellow, golden-crowned blooms. These three are cheap, and should make good subjects for bedding.

Other varieties, each possessing some good points, are Alsace, white and yellow, flowers large, usually in threes; Ideal, white, with deep yellow crown, generally six or seven flowers in a cluster; Irene, primrose, with orange crown, very free, a spike often carrying as many as nine flowers; Sunset, soft yellow, with orange crown, quite large for this race, and sometimes producing a cluster of six fine flowers; Triumph, white, with golden, frilled crown, flowers large, generally three together; and Lucia, deep yellow, with darker yellow crown.

This section will probably be greatly enlarged in the near future, though the present title may not prove accurately descriptive when the multi-flowered varieties are not only produced by crossing Tazetta with poeticus forms, but also Tazetta with the more substantial Barri and Leedsi varieties, and also re-crossing the present fine Poetaz sorts with such beautiful things as Homespun and Buttercup, for instance. At any rate, I for one have great faith in the future popularity of these bunch-flowered narcissi.

C. H. Curtis.



NARCISSUS JAUNE À MERVEILLE.
A fine Poetaz variety, with yellow, golden-crowned flowers, borne in clusters on stout spikes.

## WORK FOR THE WEEK.

### THE ORCHID HOUSES.

ONCIDIUMS.—The genus Oncidium is sure to be represented by plants in flower, no matter what the time of year, especially if well grown. One very pretty and useful species now in flower is O. obryzatum, its long and many-branched spikes carrying a large quantity of pretty golden-yellow flowers, spotted with light brown. The plants belonging to the O. crispum section, namely, O. Forbesi, O. curtum, O. Gardneri, O. Marshallianum, and O. crispum itself, are known by their rough, wrinkled pseudo-bulbs. O. Marshallianum produces its flowers during late spring and early summer, while the others display their beautiful sprays during late summer and autumn.

O. VARICOSUM ROGERSI.—Among the many beautiful and free-flowering members of this useful genus there is none that can excel O. varicosum Rogersi for autumn flowering. The flowers of all the kinds I have mentioned are showy, last a considerable time, are produced freely on erect, branching spikes, and therefore are desirable for any purpose; but the enormous number of blooms borne upon a single panicle taxes the plants very severely, and so weakens them that they take a very long time to recover. Owing to the cheapness of O. varicosum Rogersi, this is not of so much consequence as in the case of some others. In the case of rare and scarce varieties it is wise not to let them flower too often, taking care that the plants are in good health with plenty of roots, and thoroughly established when allowed to produce flowers. Even with established plants, care should be taken that the flower spikes are not allowed to remain upon the plants too long, and as soon as all the flowers are open the spikes should be removed.

CULTIVATION OF ONCIDIUMS.—These are best cultivated in shallow pans, suspended near the roof glass, where they may receive plenty of light and air, and be shaded from bright sunshine. In such conditions the growth will be hard and solid. They need a considerable amount of ventilation at this season, when the pseudo-bulbs are making up, as there are few orchids which more resent being grown in a confined, stuffy atmosphere. Close observation of the roots is the best guide as to the quantity of water the plants need at this season. Plants growing and rooting freely must have ample supplies of water whenever they become dry, and it will be noticed that the roots are most active at the time the flower spikes are forming. Many are now producing their flower spikes freely, and should be carefully guarded against injury from pests. All these oncidiums are best wintered in a well-ventilated structure, and those which have been grown in the cool house during the summer months will be better if removed to the cool end of the intermediate house, where the desired conditions can be maintained for them during the winter. After the flowers have faded the plants should be allowed to rest, and only sufficient water be given them to enable the pseudo-bulbs and leaves to keep plump and healthy.—J. T. BARKER, West Hill Gardens.

## STOVE PLANTS.

BEGONIA GLOIRE DE LORRAINE.—So useful and popular has this begonia and its sports become that we are inclined to wonder how we could do without them. They are indispensable plants for flowering during winter and spring, and, provided one has a clean, healthy stock, there need be no difficulty in having finely-flowered plants for at least six months in the year. The number of batches in various stages will, of course, be governed by the particular needs of the establishment, and the space at command. In our case the earliest batch is a small one, and they are the best of last year's plants shaken out and potted up last spring, and grown quietly all the summer. These are now fine specimens in 24's, and full of blossom. We have ceased to remove the buds from the first batch of young plants, and they will be available for decorative purposes in a few weeks. Other successional plants will have the flower buds pinched off for a while longer, and allowed to bloom as required. The latest batch should be as large as circumstance will allow, for perhaps these are the most useful of all, coming into bloom when there is a dearth of bright flowers. These should be potted at this time, unless they are to be kept in small pots to fit bowls, or other receptacles in the house. This procedure will induce them to make renewed growth, and but few flower buds. Buds that appear should be assiduously removed for some time to come to keep the plants growing freely and sturdily. Although this type of begonia revels in a humid atmosphere when in active growth, the structure should be kept ventilated throughout the day when fine, and a little top ventilation be left on during mild nights. This will ensure short-jointed and free-flowering growth. The earliest batches should be accorded special attention in this respect, and for preference they should be accommodated in a house having bottom ventilation near the hot-water pipes, as well as at the apex of the house. Continue to give periodical applications of liquid manure until the plants are in full flower, when only clear water should be given. Nothing is so safe and all-round reliable as liquid manure made from sheep or cow droppings, with a little soot added. Fowl or pigeon manure is also recommended, provided it has been laid aside for a few weeks before use, and then it should be well diluted.

OTHER WINTER-FLOWERING BEGONIAS, as Winter Cheer, Ensign, Julius, etc., should be kept growing freely on the same lines as for the Lorraine type, but I think more skill is required to grow them well. We find it is a good plan to occasionally change the stock of these varieties, and, if possible, procure them from a distance. An occasional mild fumigation with a nicotine compound will keep rust in check, if given in the early stages. In cases of a bad attack it is best to burn the whole of the affected plants, and get new stock. We had this pest badly in the variety Patrie last year, but a few young plants from another source enabled us to renew the stock, and now the batch is in rude health. Without doubt some varieties are more susceptible to rust than others.—H. T. MARTIN, Warren Wood Gardens.

## FRUITS UNDER GLASS.

STRAWBERRIES IN POTS.—Give the plants plenty of room, to allow sunshine and air to circulate freely about them, so that the crowns will be fully developed and well ripened by the end of the autumn. The bright, sunny weather which we have experienced for the past few weeks has had a marked effect upon the growth of the plants. The earliest potted batch will be benefited by occasional watering of liquid manure and soot-water, but avoid the use of chemical manures at this stage of their growth. Keep the plants free from weeds and decayed foliage, remove all runners and side growths as soon as they appear, and guard against dryness at the roots; but, at the same time, only give sufficient water. Keep the soil in a moist condition. Syringe the plants several times with a solution of soft soap and sulphur to ward off the attacks of red spider and mildew; lay the pots on their sides when performing this operation, so that the under-sides of the leaves are thoroughly syringed with the mixture. If worms are troublesome in the soil, they can be eradicated by using a weak solution of lime-water.

RENOVATING VINES.—Presuming that all the grapes have been cut, this is the best time to lift the roots of vines that are in an unsatisfactory condition. Before commencing operations a sufficient quantity of good soil must be made ready, so that the work can be carried out expeditiously; the compost should consist of good fibrous loam chopped up into small pieces (it should have been cut and stacked for at least six months), incorporate with the loam plenty of old mortar rubbish, wood-ashes, charcoal, and bone-meal; turn it over together several times, and allow it to remain in a heap for a few days previous to being used. When dealing with the roots and borders, commence by taking out a trench three feet wide, down to the drainage material. Cut off all the roots that are found in the trench, which should be a distance of from six to ten feet away, if space permits, from the base of the vine. Carefully remove the soil from among the roots with a garden fork, gradually working towards the main stem. Exercise great care as the work proceeds, so as not to injure the roots, which should be carefully tied together in loose bundles and covered with wet mats to prevent them from drying. When this work is finished, carefully examine the drainage, and if not satisfactory, take means to set this matter right; place the new soil under the roots, and lay these out so that they are not in a confused mass. The top roots should not be deeper than four inches from the finished surface when they have been covered with the new soil. Make the soil quite firm as the work proceeds, and when the filling in has been accomplished the whole border should be given sufficient tepid water to settle the soil. Mulch the surface with long litter, and where the foliage is in a good healthy condition, the leaves must be kept well syringed to prevent flagging; while some means must be adopted to shade the vines for a few weeks until they have recovered from the check.—HENRY R. FARMER, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

PHYGELIUS CAPENSIS.—For an autumn display this plant, sometimes known as the Cape Figwort, is very attractive. It grows about 3ft. high, and its rich scarlet flowers are produced in branching racemes at the ends of the shoots. It is quite hardy, but it succeeds best in a sheltered position. It prefers a light rich soil, and is propagated by cuttings, preferably from the base of the stems, as these are furnished with rootlets.

ZAUSCHNERIA CALIFORNICA. — The Californian Fuchsia is a lovely plant for autumn flowering, and is seen at its best during September. Its bright vermilion flowers are freely produced on erect stems, 15in. in height. It flourishes in sandy loam in the rock garden, but should be given a warm, sheltered position. It also grows successfully on an old wall when once established, and is best propagated from division of the roots or from seeds.

ANEMONE JAPONICA.—This is one of the most effective subjects at the present season, and the plants are producing an unusually bright display It is suitable for the herbaceous border or for planting in shrubberies, and it invariably succeeds best when not disturbed for a number of years. Rosea superba is a charming variety that should always be grown in addition to the white form.

COLCHICUMS. — These hardy bulbous plants contribute a bright display in the autumn, and, as the flowers open in succession, there is quite a long season of bloom. They are very effective growing among dwarf subjects in the rock garden, which is a better position for them than the flower border. They are probably seen at their best when naturalised in the grass, as the green forms a pleasing contrast and shows them to advantage. C. autumnale, with rosy-purple flowers, is well known. C. Parkinsoni is quite distinct, with singularly chequered markings on its violet-purple flowers. C. speciosum is a beautiful form, with large rosy-purple flowers, quite a foot above the ground. It prefers light sandy soil, and a fairly dry situation, exposed to full sunshine.

GENERAL WORK.—Take every care to keep the flower garden attractive and gay as long as possible. Upon the first sign of frost remove tender plants to a place of safety. Terrace plants, like agaves and bays, will need to be housed, and any other large specimens that are kept. All bedding plants that are required for another year must be stored in a cool pit where frost can be excluded. Most of the subjects will be potted up, and during bright days should be syringed regularly. Tuberous-rooted begonias should be carefully dried when lifted, and plants of Lobelia cardinalis must be boxed up and kept in a cool house, with very little water at the roots during the winter. Attend to all cuttings carefully, and give air when they are rooted, also pick off any decayed foliage that appears. Procure a supply of protecting material for different purposes. Where bulbs are grown, prepare the beds for them without delay. Those that are intended for naturalising in grass can be planted now; bold planting, comprising a large number of a variety in a group is the most effective method.—J. GARDNER, Batsford Park Gardens.

BIRMINGHAM CHRYSANTHEMUM SHOW.
BINGLEY HALL, NOVEMBER 5, 6, and 7, 1912.

Schedules now ready, and all particulars may be obtained on application to

ALFRED NOAKES,
Secretary,
148, Bristol Street,
Birmingham.

NATIONAL VEGETABLE SOCIETY'S SHOW
Will be Opened by the Earl of Clarendon, at 2 p.m., on October 2nd.
Schedules of classes and prizes offered at the Society's
GREAT EXHIBITION OF VEGETABLES
to be held in the Clarendon Hall, Watford, are now ready, and can be had on application to Hon. Sec., E. G. Quick, Kelmscott, Locket Road, Wealdstone, Harrow.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

## Royal Horticultural Society.

A very large exhibition was held at the Royal Horticultural Hall on Tuesday, September 24. Every available inch of space was filled, and not only was the display a large one, but it was a good one also. Orchids were not numerous, but hardy flowers, dahlias, roses, fruits, and vegetables were very fine. The series of competitive classes for vegetables added materially to the size and interest of the show. New roses, dahlias, chrysanthemums, and orchids were also of special interest.

### FLORAL COMMITTEE.

Roses were in great force. Messrs. Alex. Dickson and Sons, Newtownards, had a brave show of lovely autumn blooms, and in many cases the flowers were as fine as in summer. Chief interest centred in the new varieties, such as the yellow Mrs. Mackellar (A.M.), the dark crimson George Dickson (A.M.), Edward Bohane (A.M.), a lovely and shapely red rose; Lady Pirrie, Grace Molyneux, Mrs. Fred Straker, Red Letter Day, etc. Messrs. Wm. Paul and Son, Waltham Cross, staged a beautiful collection of roses, and set up charming displays of Pharisaer, Lyon, Corallina, Mrs. A. R. Waddell, Ophelia, Lady Downe, Mdme. Abel Chatenay, Juliet, A. R. Goodwin, Coronet, Joseph Hill, etc.

A fine exhibit of roses from Messrs. Frank Cant and Co., Braiswick, Colchester, consisted of bunches of the best autumn-flowering roses, and especially good were Mdme. Melaine Soupert, Mdme. Charles, Lady Hillingdon, Queen Mab, La Tosca, Lyon, Mdme. Antoine Mari, Mdme. Ravary, Ecarlate, Sulphurea, and A. R. Goodwin.

A very pretty exhibit of roses came from Messrs. Benjamin Cant and Co., Colchester, whose large stands of Mdme. Abel Chatenay, Mdme. Melaine Soupert, Jessie, Mdme. Falcot, Irish Elegance, La Tosca, Warrior, Lyon, and Gustave Nabonnand were very striking.

In the group of carnations from Messrs. Stuart Low and Co., Enfield, there were good bunches of Baroness de Brienen, Royal Purple, Carola, Rose Doré, and White Enchantress. A goodly selection of Michaelmas daisies, set up by Mr. H. J. Jones, Rycroft, Lewisham, was well disposed; good things shown were Flossy, Rosalind, Climax, Keston Blue, Mrs. Duncombe Mann, R. C. Pulling, Miss Parish, and Mr. S. T. Wright.

Messrs. Pipers, Bayswater, were represented by a collection of alpines, chiefly saxifrages in pots and pans. Messrs. Robert Veitch and Sons, Exeter, staged the blue Veronica Veitchi, Nerine Bowdeni, N. B. pallida, Cyrtanthus hybridus, Calceolaria Veitchi, Clematis nutans, Magnolia grandiflora Exmouth var., and other rare and beautiful things. Some capital sweet peas, shown by Messrs. Jarman and Co., Chard, were interesting, because they were from plants that had seeded, but which had grown away again as a result of moist weather, and flowered freely at the top of the sticks. Most popular sorts were represented, and the blooms were quite good.

Messrs. Jas. Veitch and Sons, Chelsea, exhibited some beautiful streptocarpuses, brilliant cannas, nerines, and ixoras, and flowers and plants of a very fine tritoma named Lord Roberts, with very large spikes of rich deep coral red flowers. Standard salvias from the same firm were very bright. Mr. W. Easlea, Eastwood, Essex, had a small exhibit of such charming roses as Lyon, Mdme. Melanie Soupert, Juliet, Mrs. David McKee, Lady Hillingdon, Marquise de Sinety, Gottfried Kellar, etc. Messrs. H. Cannell and Sons, Swanley, were represented by hardy flowers in great variety, but their sheaves of the golden Helianthus sparsifolius and of Helenium Riverton Gem were conspicuously good.

The early chrysanthemums exhibited by Messrs. W. Wells and Co., Merstham, included J. Bannister, Le Garonne, Crimson Polly, Verona, Roi des Blancs, Bronze Goacher, Polly, and Leli, all good varieties. Jean Carter, a new yellow single, gained an A.M. Framfield Early White, a fine large early white chrysanthemum from Mr. Norman Davis, Framfield, Sussex, also gained an A.M. Gladioli formed the chief attraction in the exhibit from Messrs. R. Wallace and Co., Colchester, and the purple-blue Baron Hulot was the most conspicuous variety, though the paler Claude Monet, and the fawn and buff hybrids from G. primulinus were attractive

Mr. Dixon, gardener to Mary Countess of Ilchester, Holland House, Kensington, showed a collection of berried sprays of cratægus, these forming a very interesting little exhibit. Mr. Amos Perry, Enfield, and Mr W. Ingwersen, South Croydon, each showed new Michaelmas daisies, the latter staging several double sorts, such as Colwall Beauty and Moonlight. Mr Gentle, Little Gaddesden, again showed his new scarlet pentstemon, Gaddesden Gem.

Messrs. William Cutbush and Son, Highgate, had a pretty exhibit of roses and carnations. Dwarf polyantha roses were used as a groundwork for tall stands of good autumn-flowering roses, and for fine bunches of Countess of Lathom, Lord Rothschild, and Edna, the latter a fine mauve-heliotrope variety. Messrs. R. W. Procter and Sons, Chesterfield, had a nice group of cut roses. Messrs. R. H. Bath, Lim., Wisbech, showed large sheaves of Martin Reed, a new bright yellow early chrysanthemum of great beauty.

A grand bank of hardy flowers from Mr. James Box, Lindfield, commanded attention for its effectiveness as well as for the variety and quality of its contents. Heleniums, phloxes, rudbeckias, delphiniums, a famous lot of early chrysanthemums, a fine lot of Cimicifuga simplex, and sheaves of Hollandia, princeps, America and White Excelsior gladioli were among the more striking features of this display. A very interesting collection of sprays of ornamental foliaged and berried shrubs, from Messrs. Paul and Son, Cheshunt, included Catalpa pulverulenta, Euonymus atropurpurea, Pyrus sorbus, Prunus Moseri, fl. pl., Rhus typhinia laciniata, golden elms, maples, etc.

Sweet peas that seemed to be unusually well waved were submitted by Messrs. Dobbie and Co., Edinburgh; the flowers were lovely in colour, size, and fragrance, and notably good were the bunches of May Campbell, Mrs. W. J. Unwin, Dobbie's Cream, Melba, Rosabelle, Countess Spencer, Elfrida Pearson, and Edrom Beauty. Splendid scabious and a rare collection of the best and newest collarette dahlias helped to make up a large and bright display. Messrs. Barr and Sons, Covent Garden, displayed a capital lot of gladioli and selections of Michaelmas daisies and early chrysanthemums.

Messrs. T. S. Ware, Lim., Feltham, had a great show of Michaelmas daisies, pæony-flowered dahlias in great variety, and cactus dahlias in all the colours of the rainbow save blue. Rather solidly banked were the gorgeous pæony-flowered dahlias from Messrs. Bakers, Wolverhampton; The Warrior, Codsall Gem, Mrs. T. A. Weston, Liberty, J. S. Brunton, and Germania were outstanding sorts. Mr. E. Dixon, Putney, showed hardy flowers, as did Messrs. G. and A. Clark, Dover, these latter having the graceful Cimicifuga simplex in full form. Choice ferns from Messrs. H. B. May and Sons, Edmonton, were a fine foil to the brilliant colours of dahlias, etc.

Mr. J. T. West, Brentwood, gained an A.M. for Useful and Johnny, a decorative and a pompon dahlia respectively; he made a rare blaze with pæony-flowered, decorative, and cactus dahlias, and among them all Brentwood Yellow was again conspicuously good. Collarette dahlias were boldly shown by Mr. James B. Riding, Chingford; these were backed by pæony-flowered sorts, and the collection also included Madame Leggrange, Madame C. Molin, Deputé Aynand, Meissonier, and Mons. C. Dupont, new anemone-centred varieties that suggest the possibilities of dahlias are not yet fully fathomed.

Messrs. J. Cheal and Sons, Crawley, made a splendid bank of colour with cactus, single, and pompon dahlias; among the former Harold Peerman, Red Admiral, Miss Stredwick, Mrs. Usmar, Ruby Grinstead, and Snowdon were very fine. Collarette, pæony-flowered cactus and decorative dahlias were boldly staged by Messrs. Carter, Page, and Co., London Wall; the same firm displayed a charming collection of violas, very clean and bright and fragrant, and also collections of antirrhinums and early chrysanthemums.

Mr. C. Turner, Slough, presented fine examples of Attraction, Eleanor, Delice, Yellow Colosse, Loveliness, and Mdme. Lumere, all large, decorative dahlias of great beauty, fine colour, and good size; besides these there were selections of pompon, show, collarette, and pæony-flowered dahlias in fine condition and variety.

Of considerable interest was the collection of capsicums shown by Mr. Thomas Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone; these were well grown and freely fruited, the most effective sorts being Chameleon, Early Dwarf Yellow, Bouquet, Mammoth, Yellow, Ruby King, Elephant's Trunk, Chinese Giant (a very large, stout, fruited form), Chinois, and the round berry-like Cerise.

### ORCHID COMMITTEE.

Mr. A. W. Metcalfe, gardener to Lady Wernher, Luton Hoo, Luton, brought up a beautiful lot of splendidly-grown orchids. The examples of Vanda cærulea were very fine, the spikes bold, many-flowered, and of lovely deep colour. Dendrobium formosum giganteum was equally good, while Cypripedium W. R. Lee, var. Lord Derby carried fifteen spikes, and Lælio-cattleya Bletchleyensis and L.-c. Dominiana were capital. From Messrs. Hassall and Co., Southgate, came a good set of plants of Cattleya Minucia, carrying beautiful mauve flowers; C. labiata, and C. Nestor were also shown.

Of quite outstanding merit was Odontoglossum Woodroffeæ (Rossi rubescens and Queen Alexandra) with brown and yellow sepals and petals, and a purple, yellow-based lip, shown by Mr. E. H. Davidson, Borlases, Twyford. This gained a F.C.C. The same exhibitor showed the bright Sophro-cattleya Dora, and numerous examples of Cattleya aurea. Messrs. Stuart Low and Co., Enfield, had a bright little exhibit of orchids, wherein Oncidium varicosum was prominent. Houlettia Brocklehurstiana, Cattleya Hardyana Enfieldense, Odontoglossum Uro Skinneri alba, and other good things were included.

The contribution from Messrs. J. and A. McBean, Cooksbridge, comprised a few pretty odontoglossums and odontiodas; conspicuously good was Cattleya Lord Rothschild albescens (A.M.), with white sepals and petals, and a golden lip with a few purple markings; and Cymbidium erythrostylum. Messrs. Charlesworth and Co., Haywards

Heath, submitted Cycnoches maculatum, Brasso-cattleya Maroniæ with a grand flower, Cattleya Rhoda, C. sirius, and Pilumna nobilis alba.

Zygopetalum maxillare var, Sanderiana with green sepals and petals and a white lip, secured an A.M. for Sir Trevor Lawrence, Bart. (grower, Mr. White), Burford Lodge, Dorking. An Award of Merit was granted to Odontoglossum Neptune (crispum x nebulosum) from Mons. H. Graive, St. Fascien, Saires, France. Lælio-cattleya Hastediana (L.-c. Henry Greenwood x C. Aurea), with a very deeply frilled, dark crimson-purple lip with gold veins, gained an A.M. for C. G. Phillips, Esq., The Glebe, Sevenoaks.

## FRUIT AND VEGETABLE COMMITTEE.

Finely-grown and most elegantly staged were the vegetables from Messrs. Sutton and Sons, Reading. Carrots, beet, and parsnips were wonderfully good, as though turned on a lathe; Ailsa Craig and Sutton's Globe were large and solid, while the useful Celeriac was distinctly ugly among the brilliant tomatoes and creamy cauliflowers. Celery and leeks and beans were capital, and the Chilian beet was of wonderful colour, and helped to increase the effectiveness of a grand exhibit. Mr. H. Hemsley, Crawley, entered the arena as an exhibitor of vegetables; he set up good samples of Factor potatoes, Gladstone peas, Defiance tomatoes, etc.

A splendid collection of apples and pears shown by Mr. R. C. Notcutt, Woodbridge, deserved special mention, as the fruits were very clean, bright, and of fine size. Jas. Grieve, Dr. Harvey, Chas. Ross, Lane's Prince Albert, Warner's King, Stirling Castle, Ribston Pippin, Frogmore Prolific, Newton Wonder, Peasgood's Nonsuch, Bismarck, Lord Derby, and Hollandbury were apples shown in the pink of condition. Mr. J. E. Peters, Menpes Fruit Farm, Purley, near Reading, sent large baskets of big fruits of Superlative, Hero of Lockinge, Ringleader, Universal, Emerald Gem, Royal Jubilee, and Sutton's Scarlet melons.

A very interesting collection of vegetables, staged by Messrs. Jas. Veitch and Sons, Chelsea, attracted considerable attention, because of its effectiveness and the merit of the subjects exhibited. Among many good things two novelties were conspicuous. One a new pebble-shaped white potato named Vitality, has been grown in Ireland, and in a crop of two tons there was not a single diseased tuber. The other novelty was an intermediate beet,, with roots six or eight inches long, and about 2½ inches in diameter for the whole of its length; the colour was superb. This, we understand, is a selection from the old round Egyptian, and is quite fixed.

A large contribution of vegetables from Messrs. James Carter and Co., Raynes Park, was finely arranged, and represented excellent varieties very well grown. Record and Ailsa Craig onions, Scarlet Emperor and Red Giant runner beans, Trailing White marrows, Holborn Marrow parsnips, aubergines, radishes, celery, cardoons, potatoes, turnips, peas, lettuces, cabbages, sprouts, cucumbers, etc., were all staged in capital condition, and proved a great attraction.

A collection of a hundred varieties of pears from Messrs. George Bunyard and Co., Maidstone, proved of great interest and educational value. In every case about a dozen and a-half even, clean, medium sized fruits were presented in baskets or on dishes. Many uncommon sorts were exhibited, but all the best sorts were on view, such as Conference, Potmaston Duchess,Beurre Fouqueray,Beurre Diel, Beurre Hardy, Doyenne du Comice, Louise Bonne of Jersey, Durondeau, Beurre Naghin, Marguerite Marillat, Mdme. Treyve, Fondante Thirriott, Triomphe de Vienne, Glou Morceau, Princess, Marie Louise, etc.

Messrs. Dobbie and Co., Edinburgh, displayed a beautiful lot of potatoes, clean, even, and in considerable variety, representing no fewer than fifty sorts. Red King, Climax, Sutton's Flourball, Crimson Beauty, Mr. Bresse, Exhibition Red Kidney, Herd Laddie, Eightyfold, Selected Russet, Purple Eyes, Pink Champion, and King Edward VII., provided an unusually good selection of coloured sorts, but, of course, white varieties of great merit were associated with them.

## CERTIFICATES AND AWARDS.

First Class Certificate.—To Odontoglossum Woodroffeæ, from Mr. E. H. Davidson, Borlases, Twyford.

Award of Merit.—To Odontoglossum Neptune, from Mons. Graive, St. Fuscien, Saires; to Lælio-cattleya Hastediana, from Mr. C. G. Phillips, The Glebe, Sevenoaks; to Zygopetalum maxillare Sanderiana, from Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking; to Cattleya Lord Rothschild albescens, from Messrs. J. and A. McBean, Cooksbridge; to Chrysanthemum Joan Carter, from Messrs. W. Wells and Co., Merstham; to chrysanthemum Framfield Early White, from Mr. Norman Davis, Framfield, Sussex; to Tritoma John Benary, from Messrs. Jas. Veitch and Sons, Chelsea; to decorative dahlia Useful and pompon dahlia Johnny, from Mr. J. T. West, Brentwood; to cactus dahlias Jenny Wren and Mrs. Randle, from Messrs. J. Stredwick and Son, St. Leonards; to roses George Dickson, Mrs. Mackellar, and Edward Bohane, from Messrs. Alex. Dickson and Son, Newtownards; to rose Little Dorrit, from Messrs. Paul and Son, Cheshunt; and to apple Turner's Prolific, from Mr. Chas. Turner, Slough.

## MEDALS.

Gold.—To Messrs. Sutton and Sons, Reading, for vegetables; to Mr. R. C. Notcutt, Woodbridge, for apples and pears; and to Messrs. G. Bunyard and Co., Maidstone, for pears.

Silver-gilt Knightian.—To Messrs. Jas. Carter and Co., Raynes Park, for vegetables; to Messrs. Jas. Veitch and Sons, Chelsea, for vegetables; to Mr. Peters Menpes Fruit Farm, Purley, Reading, for melons.

Silver-gilt Flora.—To Lady Wernher (gardener, Mr. A. W. Metcalfe), Luton Hoo, Luton, for orchids.

Silver-gilt Banksian.—To Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. Frank Cant and Co., Braiswick, Colchester, for roses; to Messrs. Alex. Dickson and Sons, Newtownards, for roses; to Messrs. Dobbie and Co., Edinburgh, for sweet peas and scabious; to Messrs. Wm. Paul and Son, Waltham Cross, for roses; to Messrs. Dobbie and Co., Edinburgh, for potatoes.

Silver Knightian.—To Lady Wernher (gardener, Mr. Metcalfe), Luton Hoo, for apples and pears.

Silver Flora.—To Mr. Jas. Box Lindfield, for hardy flowers; to Messrs. J. Cheal and Sons, Crawley, for dahlias; to Messrs. H. B. May and Sons, Edmonton, for ferns; to Messrs. Jas. Veitch and Sons, Chelsea, for greenhouse flowers; to Messrs. Hassall and Co., Southgate, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids.

Silver Banksian.—To Messrs. W. Cutbush and Son Highgate, for roses and carnations; to Mr. H. J. Jones, Lewisham, for perennial asters; to Messrs. Carter Page and Co., London Wall, for dahlias, etc.; to Messrs. Paul and Son, Cheshunt, for cut shrubs; to Messrs. Pipers, Bayswater, for alpines; to Mr. J. B. Riding, Chingford, for dahlias; to Mr. Chas. Turner, Slough, for dahlias; to Messrs. R. Wallace and Co., Colchester, for gladioli, etc.; to Messrs. W. Wells and Co., Merstham, for chrysanthemums; to Mr. J. T. West, Brentwood, for dahlias; to Mary Countess of Ilchester (gardener, Mr. C. Dixon), for cratægus.

Bronze Flora.—To Messrs. Procter and Sons, Chesterfield, for roses.

Bronze Banksian.—To Messrs. S. Low and Co., Enfield, for carnations; to Messrs. Price and Fyfe, Lee, for chrysanthemums; to Messrs. T. S. Ware, Lim., Feltham, for dahlias; and to Messrs. Jarman and Co., Chard, for sweet peas

## VEGETABLE SHOW.

This addition to the meeting on Tuesday was evidently a source of attraction, for there were many new faces present, and the classes were discussed with the avidity one associates with a country show. The collections, taken as a whole, were very fine, and gave the last word as far as effective staging is concerned. The competition in the single dishes was most keen, and the vegetables throughout were of a high order of merit

The premier class for twelve distinct kinds of vegetables produced three entries, the first prize being awarded the Hon. Vicary Gibbs, Aldenham House, Elstree (gardener, Mr. E. Beckett), who put up a splendid display. Each kind was as nearly perfect as possible. Perhaps the best were Ailsa Craig onions, perfect models of the type, parsnip Tender and True, potatoes Windsor Castle, leek Prizetaker, cauliflower Early Giant, and pea Centenary. Mr. H. T. Tatham, Kendall Hall, Elstree (gardener, Mr. W. Gaiger), was second with fine examples of Student parsnips, Early Giant cauliflower, Prizetaker leeks, and Ailsa Craig onions. The peas were the only weak-looking dish. Mr. F. Barber, Brooks Cottage, Eynsford, was placed third. In a smaller class for nine kinds, Mr. W. H. Myers, Swanmore Park, Hants (gardener, Mr. G. Ellwood), secured first prize with a really fine exhibit. The leeks were simply wonderful, while Duke of Albany peas, Ideal potato, and Early Giant cauliflowers were a fine feature. Col. Cox, Harefield, Uxbridge (gardener, Mr. J. Orton), was placed second with typical exhibits of Premier onions, Standard Bearer celery, Prizewinner runner beans, and Duchess of Cornwall potato; while Mr. R. Staward, Panshanger Gardens, Hertford, was a very creditable third. There were four entries here.

The collections for six distinct kinds brought out six entrants. Mr. Brodie Henderson, Little Berkhampsted (gardener, Mr. H. Smith), led off with a clean, bright collection, the best dishes being Centenary peas in fine condition, Early Giant cauliflower, Ailsa Craig onions, and tomato Perfection. He was followed very closely by Mr. J. Kerr, Loudwater, Rickmansworth (gardener, Mr. T. Avery), who excelled with Premier onions and superb examples of Autumn Giant cauliflower. Miss E. L. Bradshaw, The Grange, Steeple Aston, Oxon, was a good third, while Mr. H. Keep, Aldermaston, Reading, brought up the rear.

There were four competitors for twelve distinct varieties of potatoes, and a fine exhibit they made, too The first prize was awarded Mr. R. McMurdie, Woburn Park, Weybridge (gardener, Mr. A. Basile), who staged some splendid tubers, the best being The Factor, Duchess of Cornwall, King Edward VII., Crimson Beauty, Purple Eyes, and Mr. Bresse. The second prize was awarded Mrs. E. H. Denison, Little Gaddesden, Berkhampsted (gardener, Mr. A. G. Gentle), who had very fine dishes of Excelsior, Herd Laddie, The Factor, Purple Eyes, and Emperor. The third prize went to Sir M. Turner, The Bedfords, Havering, Romford (gardener, Mr. A. Humphrey), who staged some good level dishes.

There were five competitors for six dishes, distinct, the first position being awarded to H. W. Henderson, Esq., Serge Hill, King's Langley (gardener, Mr. F. L. Pike), who staged fine examples of Chapman, Irish Hero, Factor, and Erin's Queen. Mr. W. Gaiger followed with larger samples, but they lacked the finish of the first-prize collection. Mr. E. Beckett had to be content with third place. The onions made a brave show, the first prize being won handsomely by Mr. G. Ellwood, who had fine clean examples of Ailsa Craig, Cocoanut, Magnum Bonum, Sutton's Perfection, Sutton's A1, and Cranston's Excelsior. Mr. E. Beckett was second with some huge bulbs; and Mr. R. S. Staward third.

There were three entries for a collection of salads in nine varieties, and a fine show they made, too. Mr. E. Beckett led off with lettuces, endive (in fine condition), tomato Satisfaction, Ideal cucumbers, and a fine mound of French Breakfast radishes. Mr. W. Gaiger was a capital second, while Mr. R.

# THE ROSE. The People's Flower. The National Flower.

**All Strong and Home-grown Plants. Every Garden must possess them.**

# "A GRAND FERTILIZER."

"The value of CLAY'S FERTILIZER needs but little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur growers are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."—NURSERYMAN AND SEEDSMAN, July 20, 1912.

CLAY'S LONDON FERTILIZER

TRADE MARK.

OLD YORK PAVING.—Old Granite Setts, Wood Paving Blocks, Secondhand Tanks, Rockery Burrs, Clinkers. Manure loaded into trucks, boats, or delivered by road. Large quantities always on hand. Apply, GEO. E. CLOKE, Contractor, Railway Wharf, Exeter Road, Brondesbury, N.W.

Staward brought up the rear The smaller collection of six kinds was contested by a similar number of exhibitors. Mr. G. Ellwood was first with nice even samples. Mr. H. Smith followed closely, while the Rev. L. C. Chalmers Hunt, Willian Rectory, Hitchin, was third.

Mr. E. Beckett was awarded first prize for six kinds of the minor vegetables, staging in an attractive manner salsify, scorzonera, egg plant, kohl rabi, celeriac, and fine capsicums. Mr. G. Ellwood was second.

The scarlet runner beans were a very fine class. Mr. G. Ellwood led off, followed by Mr. H. Keep, Mr. E. Beckett being third. The entries in the single dish classes were very numerous, especially in the classes, devoted to carrots, parsnips, Brussels sprouts, tomatoes, and cauliflowers. The chief prizewinners were Messrs. E. Beckett, A. G. Gentle, A. Basile, H. Smith, G. Ellwood, R. Staward, and W. Gaiger, who seemed to divide the honours pretty evenly between them.

### SCIENTIFIC COMMITTEE.

SEPTEMBER 12.

PRESENT.— Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Messrs. J. W. Odell, A. Worsley, J. Fraser, G. Wilson, E. M. Holmes, W. Hales, J. O'Brien, and F. J. Chittenden (hon. secretary).

ERICA CINEREA MALFORMED.—Mr. E. M. Holmes showed a specimen of Erica cinerea from Ringwood in which the corolla was divided to the base so that the flowers had the appearance of those of ling. He also showed a specimen from Studland in which the flowers were replaced by very numerous bracts almost as in the wheat-ear carnation.

MALFORMED ARMERIA.—Mr. A. W. Hill reported that he had examined the flowers sent to the last meeting in which the corolla was replaced by a calyx, so that there were two calyces, and had failed to find either fungus or mite present to account for it. It was suggested that something, such as eelworms, had attacked the roots.

SWEET PEA WITH PROLIFEROUS INFLORESCENCE.—Mr. Fraser showed an inflorescence of sweet pea which after flowering had elongated and produced leaves and flowers to the number of 14 in all.

LYSIMACHIA VULGARIS. — He also showed a shoot of Lysimachia vulgaris which had grown out of a shady position in a horizontal fashion, and the leaves had arranged themselves as in a shoot of polygonatum.

WATSONIA.—Mr. A. Worsley showed a specimen of Watsonia iridifolia which differed in some respects, but especially in its extreme robustness, from the variety O'Brieni (also called Ardeni). It was thought probable that it was merely a robust form of that variety.

MUSA BAKERI.—He also showed staminate flowers of Musa Bakeri from a plant raised by him from seed.

CERTIFICATE OF APPRECIATION.—The Council have awarded a Certificate of Appreciation to Mr. C. H. Hooper for his work in connection with pollination of hardy fruits.

SEEDS OF PARROT TULIPS.—Some fruits of Parrot tulips were sent from Sussex, but on examination the seeds contained were found to possess no embryo.

## National Chrysanthemum Society.

A well-attended meeting of the committee was held at Carr's Restaurant on Monday, September 23, Mr. T. Bevan presiding.

Arrangements were made for holding the annual dinner at the Holborn Restaurant on November 27. In connection with the conference to be held at Essex Hall on November 20, at 7 p.m., Dr. Russell, of Rothamstead, has consented to deliver an illustrated lecture on "Soil Sterilisation."

Some time was occupied in balloting for the judges for the exhibitions at the Crystal Palace. Mr. Bevan was elected to act as the society's delegate to attend the International Congress, to be held next spring in connection with the Ghent Quinquennial Exhibition. A statement of accounts showed a balance of £58 0s. 3d. on the right side.

## North of England Horticultural Society.

SEPTEMBER 18.

The meeting, with lecture, and small show, at the Queen's (Midland) Hotel, on the 18th inst., was a great success. The room was filled with a keenly-interested audience to hear a lecture on "Commercial and General Manures," by Mr. W. Dyke, F.R.H.S. Professor R. S. Seton, B.Sc., of Leeds University, was in the chair. The market growers, Leeds rhubarb growers, head gardeners, and fellows and members present were delighted with a collection of fruit (grapes, apples, pears, peaches, etc.), from Lady Nunburnholme, Water Priory (head gardener, Mr. F. Jordan), which was unanimously recommended a large gold medal; also gladioli from Mr. J. C. Fordy, Warkworth, Northumberland, which were accorded a vote of thanks and a cultural certificate. Gloxinias and coleus were admirably shown by the Rev. Gallacher, Hunslet Vicarage, in the heart of Leeds, and the award of a silver medal was made. First class certificates were conferred on collarette dahlias Prince John and Frogmore, from Messrs. Dobbie and Co., Edinburgh, and on chrysanthemum Crimson Polly, from Messrs. W. Wells and Co., Merstham, Surrey.

## Broughty Ferry Horticultural Association.

The ordinary monthly meetings were resumed on the evening of the 17th inst., when Mr. Thomas Wilson, Glamis Castle Gardens, gave an interesting and instructive lecture on "The Formation of Fruit Tree Borders." Dealing broadly with the general principles of fruit cultivation, the lecturer confined his remarks mostly to the formation of vinery borders. Of these he had much to say, both of his own method and in criticism of other methods adopted by men who, in their day and generation were considered experts in the art. Unfortunately, their formulæ were often followed with disastrous results when a simpler and less expensive method might have been carried out with success.

A prolonged discussion followed, and many questions were put and answered by the lecturer, who, on the call of the president, Mr. James Bethel, was cordially thanked for his communications.

The exhibits consisted of cut flowers of Primula japonica hybrida from Mr. George Masson, salpiglossis from Mr. Jas. Slater, collarette dahlias from Mr. Wm. Grant, and a stand of double begonias and a stand of cactus dahlias from Mr. David Keiller; the latter exhibitor was awarded the monthly prize for his exhibit.

The President then presented the silver medal won at the sweet pea exhibition by Mr. George Masson, and reported that the gold medal had been posted to the winner, Mr. McOmish, Crieff.

**Aster Saturn.**—We are informed by Messrs. G. Bunyard and Co. that this beautiful aster, of which an illustration was given in our issue of the 21st inst., was raised by Mr. Ernest Ballard, of Malvern—the raiser of Beauty of Colwall—who sold the stock to them.

"**Sweet Peas and Their Cultivation,**" by C. H. Curtis, is a compact and very readable Guide to the culture of this lovely and fragrant flower. Mr. Curtis, who is Hon. Secretary of the National Sweet Pea Society, deals fully and practically with its varieties, culture, and diseases. The book is well illustrated, and can be obtained from our publisher for 1s. 2d. (cloth 1s. 9d.), post free.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

PEACH CULTURE IN ONTARIO.—L. S., Manchester: Can you give me some idea of the prospects of peach culture in Canada, particularly in Ontario? I mean the general cost of production, and the returns.—The chief agent to the Ontario Government states that good peach land planted in Ontario costs from £50 per acre upwards; unplanted from £10 upwards. Trees will bear a commercial crop in the fourth year, and should last 15 years. Ontario produces 99 per cent. of all the peaches grown in Canada. No irrigation is needed, the rainfall being sufficient. The following are official figures giving particulars of the cost of establishing a peach orchard. Annual cost per acre of bearing trees: Spraying, manuring, pruning, and cultivating, £5 15s.; picking, packing, and packages, £10 17s. 10d.; hauling to station (depending somewhat on location), £1 0s. 8d.; total cost, £17 13s. 6d. The profits: 700 baskets of peaches (11 quarts), £71 18s. 4d.; less the expenditure, £17 13s. 6d.; total net profit per acre, £54 4s. 10d. In addition to this profit there is an annual advance in value of improved peach land, more than sufficient to pay interest on the investment.

BRITISH FERNS.—J. J., Ulverston: Kindly tell me whether there is a good modern book dealing with British ferns and their varieties.—"British Ferns and Their Varieties" is the title of a recent work by Mr. C. T. Druery, V.M.H.; it is freely illustrated, and published by Messrs. Routledge and Sons, at 7s. 6d.

THE TULIP MANIA OF 1637. — G. A. S. B., Elstree: Could you give me a brief account of the Tulip Mania or Tulip Swindle of 1637?—Accounts of the Tulip Mania are to be found in many old books devoted to the history of floriculture. Phillips, in his "Flora Historica," writes: "It was towards the middle of the seventeenth century that the rage for flowers, and particularly for tulips, was carried to such an excess, both in Holland and France, as to produce bankruptcy and ruin to many families; and we are told the Tulipomania, for so it was justly termed, was entered into with as much avidity for a time as the Mississippi and South Sea Schemes, which were attended with such ruinous consequences. It would be almost impossible for us to credit the extraordinary accounts handed down respecting the high prices given for tulips by the Dutch florists of that age, were we not acquainted with their gambling speculations in this bulb, which carried them to much greater excess than their real fondness for flowers. Betting to a ruinous amount was often made respecting the eventual superiority of promising seedling bulbs, and for the possession of breeders of high merit, from which fine seedlings might be expected, as large a sum was given as the fleetest race-horse of the British turf ever sold for. About the year 1636 this spirit of floral gambling was carried to such excess at Haarlem, that during three years it is said to have yielded to that city a sum not less than ten millions sterling, for the price of these bulbs rose higher than that of the most precious metal. For a single tulip, to which they had given the fine name of Semper Augustus, 4,600 florins, a beautiful new carriage, two horses, with harness, etc., were given; and another of the same kind

WEST'S PATENT GARDEN SUNDRIES have been invented during 30 years of practical experience. By better cultivation, and pleasure by which gardens are kept in order, their expense is doubly repaid. Samples and Illustrated Catalogue free. C. E. WEST, Higham Hill, London, N.E.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### The Vegetable Cult.

The exhibitions of vegetables that have been held within the past fortnight by the Royal Horticultural Society and the National Vegetable Society have been of special interest as evidence of the close attention that is being paid at the present time to the products of the kitchen garden, and of the immense advances that have been made within recent years both in the improvements of the various types and in cultural methods. Not a few of our readers will be able to call to mind the time when vegetables were regarded by many as of quite secondary importance in the economy of the garden, and a knowledge of their cultivation not being considered one of the most important points in the education of the gardener. They will also remember that when vegetables had a position given them in the schedule of some of the leading societies a tent was specially provided for their accommodation, that they might not come under the notice of those who were not directly interested in them. That they should not have been given special prominence was in no way surprising, for with but few exceptions they were staged without regard to tasteful effect, and in some instances in a decidedly rough manner. All this has now been changed, and the exhibition of vegetables, if not, as yet, developed into a fine art, has been so immensely improved that when adequately represented they form a feature remarkable alike for its interest and attractiveness. The improvement has, indeed, been so great that collections of vegetables staged by cultivators who are able to occupy prominent positions in keen contests afford object lessons that many exhibitors of plants and flowers might learn with advantage both to themselves and the exhibitions in which they take part. At the Royal Horticultural Society's show the vegetables were more or less closely associated with the flowers and ornamental plants, and instead of detracting from the general effect, as was often the case in the old days, they appreciably enhanced it. At the National Vegetable Society's exhibition at Watford, the exhibitors were able to show that a highly-attractive display can be produced with vegetables alone. The advance in cultural methods has been not less noteworthy than the improvement in the manner of presenting kitchen garden produce to public notice, and the adoption of methods by which the several kinds can be brought to the highest degree of perfection is an accomplishment of even greater importance than tasteful methods of staging. For a considerable period after the exhibition of vegetables became general, the opinion was held by many that splendidly-grown specimens which were seen at the exhibitions were not equal in table quality to similar kinds grown under ordinary methods of cultivation. Different views are now held upon this point, and it is generally conceded that vegetables which bring honours to cultivators are not necessarily coarse and indifferent in flavour, but, on the contrary, of high quality. Such finely-developed products as are seen at the leading exhibitions are not the result merely of heavy manurial applications to the quarters in which they are grown, but represent a method in which deep cultivation and the thorough working of the soil are essential details. While cultivators have made strenuous endeavour to increase the bulk and improve the quality of kitchen garden products, those who are engaged in the seed trade have been unremitting in their efforts to create new types and improve existing ones, and they have achieved so high a degree of success that it would be difficult to place a proper estimate on their accomplishments. No class of vegetables of any considerable importance could be mentioned that have not been greatly improved, and thereby rendered more valuable by cross fertilisation and selection. Not only have the several kinds been increased in productiveness, appearance, and quality, but some have had their seasons prolonged as the result of the persistent endeavour of those engaged in the growth and sale of seeds. Not only has this been the case, but by the adoption of more scientific methods of procedure, cultivators have now at their service seeds possessing greater powers of germination than that from which past generations of cultivators raised their crops, a fact which is specially brought into prominence in seasons following a year in which the climatic conditions were unfavourable to the production of really first-class seed crops. The National Vegetable Society has been too recently formed to have exercised a great influence upon the advances to which we have briefly referred, but it has, since it was established, done excellent work in the encouragement of high-class cultivation, and in stimulating increased interest in vegetables as articles of food. We regard the latter as an important part of its work, for while the consumption of vegetables has enormously increased of late years, it should, in the interest of the health of the nation, be much larger, especially among town dwellers. The holding of the society's exhibition this year outside the boundaries of the Metropolis was a new departure, taken chiefly with the

MR. RICHARD A. WITTY,
Secretary of the National Chrysanthemum Society.

object of bringing the society into closer touch with a large section of cultivators. This object has, we hope, been accomplished, as Watford is situated in a district in which vegetables are largely grown, but whether the financial results will justify the change we are not in a position to say at the time of writing. With regard to the the future of the society, we feel that, while it has achieved much success under present conditions, it should be placed on a broader basis, and this can only be accomplished by those who are deeply interested in vegetables contributing liberally to its financial resources, and in such manner that the committee will have increased freedom in dealing with the funds. The exhibition at Watford was unquestionably the best the society has yet held, and the members of the executive may be heartily congratulated on the highly gratifying results of their well-directed efforts.

---

**Mr. Richard A. Witty,** the able and genial secretary of the National Chrysanthemum Society, is an extremely popular man among horticulturists who frequent the N.C.S. exhibitions. Though the son of Mr. J. H. Witty, a well-known park and cemetery superintendent, Mr. R. A. Witty did not turn his attention to horticulture, either as a hobby or profession. He is a secretary par excellence and enjoyed an early training under Mr. Jas. Martin, the secretary of the Society of Incorporated Accountants. This followed an education at Christ's Hospital, where, besides knowledge, he acquired a spirit of sturdy independence. Mr. Witty is a member of a firm of accountants, and this year holds the important position of President of the Students' Society of Incorporated Accountants, after serving on the committee for a dozen years. About six years ago the National Chrysanthemum Society secured Mr. Witty's services as secretary, and, though it was a somewhat daring experiment to engage a man who protested that he had no knowledge of horticulture, the governing body has always felt that the experiment has been more than justified. Order, tact, a genial manner, a perfect knowledge of matters secretarial—these are the gifts, natural and acquired, that Mr. Witty possesses. He is justly proud of the fact that though the society has this year spent more money than ever before on literature for its members, and is offering a larger amount in prize money, more cash has been placed on deposit, and fewer members have had to be written off the books as "failed to pay subscription." These are signs of progress, and we hope they will increase and materialise under Mr. Witty's secretariat.

**Wisley Trials.**—The Council of the Royal Horticultural Society have made arrangements for the following fruits, flowers, and vegetables to be tried in the society's Wisley Gardens in 1912-13. Fruits: Autumn-fruiting strawberries, berry-bearing fruits other than currants, gooseberries, raspberries, and strawberries. Flowers: Antirrhinums, aquilegias, pyrethrums, gaillardias, violas, and bearded irises. Vegetables: Peas, early and mid-season potatoes, tomatoes, and turnips. Those who may be desirous of sending fruits, flowers, or vegetables for trial can obtain particulars on application to the Rev. W. Wilks, Vincent Square, Westminster, S.W., or Mr. S. T. Wright, Wisley Gardens, Ripley, Surrey.

**Gentian Cup Competition.**—The Council of the Royal Horticultural Society offer, on March 4 and 5 (subject to the general rules of the society, and the special regulations indicated below), a silver cup, known as the Gentian Cup, presented to them by Messrs. R. Wallace and Co. for the best exhibit by an amateur of alpine plants, including suitable bulbs and dwarf shrubs, in a space not exceeding 5ft. by 3ft. The use of stone is not absolutely necessary, but the judges will be instructed to favour its correct use, and the natural arrangement of the plants in connection therewith. The plants may be either in pots or lifted.

**Afforestation in the Black Country.**—Mr. P. E. Martineau, the organising secretary of the Midland Reafforestation Association, and, therefore, perfectly conversant with his subject, will give a lecture on the "Afforestation of the Black Country," illustrated with lantern slides, on the occasion of the monthly dinner and conversazione of the Horticultural Club, at the Hotel Windsor, Victoria Street, Westminster, on Tuesday, October 8. This is the first meeting of the autumn session; dinner at 6.30 p.m.

**Beckenham Horticultural Society.**—The winter session of this society will commence on Friday evening, the 11th inst., with a lecture on "Cross Breeding and Hybridisation," by Mr. E. H. Jenkins. The other lectures that have a place on the programme are: October 25, "Sweet Pea Cultivation," by Mr. T. Stevenson; November 8, "The Royal International Horticultural Exhibition," by Mr. J. Gregory; November 22, "Gardens of Roses," by Mr. George Gordon, V.M.H.; December 6, "Lime and its Uses," by Mr. C. T. F. Watts, B.Sc.; December 13, "Perpetual-flowering Carnations," by Mr. B. R. Leech; January 3, "Vegetables for Exhibition," by Mr. F. Phillips; January 17, "Orchid Culture," by Mr. J. Collier; January 31, "Life History of Flowering Plants and Ferns," by Mr. E. Gilmore; February 14, "Insecticides and Fungicides," by Mr. C. T. F. Watts, B.Sc.; February 28, "Single and Decorative Chrysanthemums," by Mr. H. J. Jones; March 14, "United Horticultural Benefit and Provident Society," by Mr. E. Burge, and "The Position of Gardeners," by Mr. J. Wright, V.M.H. The meetings of the society are held at the Church House, Beckenham, and the lectures, which are free, commence at 8 p.m., with the exception of that on Friday next, which commences at 7.30 p.m. The lectures on November 8 and 22 will be illustrated with lantern slides.

**Foreign Chrysanthemum Shows.**—This autumn shows will be held on the Continent as follows: Early chrysanthemums, Paris, October 10, Avignon, October 24; Montpellier, October 31 to November 4; Biarritz, October 24 to 27; Lille, November 9 to 14; Caen, October 31 to November 4; Angers, November 9 to 17; Vichy, November 7 to 10; Sens, November 9 and 11; Rosendael, November 9 to 11; Elbeuf, November 9 to 11; Paris (Great Autumn Show), November 8 to 17; Nantes, November 12 to 17.

**Sweet Pea Trials.**—Mr. Walter P. Wright asks us to state that owing to the increase in the number of sweet peas sent to him for trial he has decided to put his trials on a business footing for 1913, and organise an expert committee to assist him. Messrs. Aldersey and Marsden Jones, Mr. W. E. Alsen, Messrs. Bakers, Lim., Mr. Robert Bolton, Mr. E. Cowdy, Mr. B. Deal, Mr. F. G. Drew, Messrs. Faulkner and Aitkens, Miss Hemus, Mr. T. Duncan, Mr. T. H. Dipnall, Rev. D. D. Fraser, Messrs. Hobbies, Lim., Mr. J. A. Grigor, Mr. John Jones, Mr. J. Hall, Mr. H. H. Lees, Mr. Donald MacDonald, Rev. H. Mayall, Mr. J. H. Millard, Mr. H. A. Perkins, Messrs. Sutton and Sons, Mr. E. Tufnall, Mr. W. E. Usher, Mr. H. D. Tigwell, Mr. W. J. Unwin, Mr. H. E. Ward, Mr. H. J. Wright, Messrs. Webb and Sons, and Mr. T. A. Weston have already promised their co-operation. The trials will be conducted in the garden of Reading University in 1913.

**Sir W. T. Thiselton - Dyer, K.C.M.G., F.R.S.,** has been elected an Honorary Fellow of the Royal Society of South Africa.

**Gardeners and State Insurance.**—The State Insurance Commissioners have issued a circular stating that all persons coming under the provisions of the Insurance Act must join an approved society by October 26, or become Post Office contributors. Gardeners are among the very healthiest of workers, and this means less sickness, and a greater surplus at the end of three years for an approved society composed of horticulturists, therefore gardeners should carefully consider their own interests in this matter, and secure the best possible return that sevenpence per week will secure. We urge those gardeners who have not yet joined a society to at once obtain particulars of the United Horticultural Benefit and Provident Society, from Mr. Hill, 35, Alexandra Road, West Kensington.

**Ripening Peaches by Electricity.**—Mr. Thorne Baker, who has done excellent work in connection with the apparatus for the transmission of photographs by telegraph, is said to have been successful in ripening peaches by electricity. It is said that the peach on which the experiment was made was very green, and that after it had been subjected to a high-frequency current for a very short period, and left for a few minutes, the ripening effect was found to have penetrated nearly to the stone, and the flesh was luscious and juicy. The exposure of peaches to high-frequency current may result in some change in their condition, but whether the change will be such as to ensure the rich flavour characteristic of peaches ripened on the tree is another matter.

**Ghent Quinquennial Flower Show,** 1913.—Four years since the Royal Agricultural and Botanical Society of Ghent celebrated the one hundredth anniversary of its first flower show with an exhibition that was remarkable for its extent, interest, and beauty, and also for the great gathering of horticulturists from all parts of the world. Now, the executive is busily engaged in completing the arrangements for the quinquennial show which will be held from April 26 to May 4, 1913. The exhibition will be of the most comprehensive character, and in the 28 sections there are 841 classes, with the result that provisions are made for the adequate representation of the various subjects available for exhibition during the season of spring. The great importance and immense popularity of orchids among garden lovers is fully recognised by the provision in the schedule of 89 classes for them. The principal class for orchids, in which the competition is limited to amateurs, is that for a collection in which the premier award is a gold medal offered by the King of the Belgians. A similar class is provided for nurserymen, and in this the first prize is a work of art offered by Mr. Firmin Lambeau, the president of the Belgian Orchid Society. Azaleas, which for a long period have formed a magnificent feature of the Ghent quinquennials, have 55 classes devoted to them, and there should, as usual, be a brilliant display of these attractive flowers. The increased interest in Belgium in trees and shrubs distinguished by the beauty of their flowers is evidenced by the classes set apart for them being largely in excess of those provided on previous occasions. The quinquennial show will be held in conjunction with the International Exhibition, which takes place under the auspices of the City of Ghent in the park of the Citadel, and the plants will be arranged in the Palace of Horticulture which has been erected at a cost of 1,750,000 francs. The arrangements are being carried out by a small committee, of which M. Edgar Wastel is the president, and M. Lucien de Cock is the secretary. The schedule will be sent to horticulturists on applications addressed to the Secretary-General, Coupure 160, Ghent, Belgium.

**R.H.S. Orchid Conference.**—In conjunction with the exhibition of autumn-flowering orchids that will be held by the Royal Horticultural Society on November 5 and 6, there will be a conference on Wednesday, November 6, when papers on matters relating to orchids will be read and discussed. The conference will be held in the lecture room of the Horticultural Hall, Vincent Square, with Mr. J. Gurney Fowler in the chair, and will extend from 11 a.m. to 4 p.m., with an interval for luncheon, which will be obtainable at the hall. The following papers have been promised: "Some Epiphytical Orchids," by Mr. H. G. Alexander; "The Physiology of Fertilisation," by Professor Keeble; "The Application of Genetics to Orchid Breeding," by Major C. C. Hurst; "Albinism in Orchids," by Mr. R. G. Thwaites. As the seating accommodation of the lecture-room is limited, seats should be secured beforehand by application to the Secretary, R.H.S., Vincent Square, Westminster, S.W., who will be pleased to forward reserve seat tickets to those applying for them as far as the accommodation will allow.

**An International Horticultural Exhibition** will be held at New York in April next under the auspices of the Society of American Florists. The exhibition will be held in the Grand Central Palace, Lexington Avenue, New York, from April 5 to 11, 1913.

**Stripe in Sweet Peas.**—Writing with reference to the damage that is done in many instances by the disease of sweet peas caused by the fungus known as Thielavia basicola, a Newmarket correspondent directs attention to the great value of lime as a preventive of this disease. He states that, after discussing the question of manuring the land for sweet peas with a friend, he came to the conclusion that there was considerable danger in using farmyard manure very freely, and that an application of lime would be of value as a corrective of land which had in previous years been heavily manured. He accordingly decided to put the matter to a practical test, and, with reference to the experiment, he says: "This year (1912) I decided to experiment with my sweet peas. Being near a lime works, I procured some lime (dust), and divided my sweet pea land into several parts, treating each part differently. On one part ordinary farmyard manure was used, and on another lime and farmyard manure. On one piece lime only was applied in liberal quantities, and on one piece lime and charcoal were used. Lastly I grew some on land that had never grown sweet peas before this; but I did not apply anything at all to this, as it has always had rich farmyard manure, but had not been manured for two years, and had grown root crops and cabbages. Now for the result. On the part on which farm manure was used the disease was bad; where lime and manure were both used the disease was slight—about five plants were infected; where lime only was used a plant or two died; but where charcoal and lime were used, and also on the unmanured new land, there was no disease at all; so that, although the lime did not prevent the disease, yet I am certainly of opinion that lime to correct the sourness of the land is the right thing; but it is better still to give the land a rest from all leguminous plants, and to grow them on land that had not recently grown peas. I do not say that these measures will cure the disease, but hope these are steps in the right direction. I think we must look for prevention rather than cure, as there is no cure once the plant is attacked, it being difficult to catch it in time, as one cannot see the disease till it shows on the leaves, and then the mischief is done, as the roots are dead."

**The Shropshire Damson Crop** has this year been very heavy, and a correspondent informs us that upwards of one hundred tons were despatched by rail from Market Drayton on one day.

**He Wants the Earth.**—According to the "New York Tribune," one of the most unusual claims ever filed with a city department is that of Squire Herrick, at one time a well-known nurseryman, recently filed with the Cincinnati Park Commission. Herrick had leased his nursery on Price Hill to the commission which raised seedling trees and shrubs there. These were later transplanted in various city parks. Herrick now says that when the trees and shrubs were dug up some of his earth clung to the roots. He wants to be paid for the earth which was thus removed from his property. He says that during the last four years there must have been fifty-five cartloads of it, and asks two dollars a load.

---

## YELLOW ROSES FOR OUTDOOR CULTURE.

Since roses have been freely utilised for massing in the flower garden on much the same lines as the more beautiful of the tender bedders are massed, it has, until quite recently, been a matter of frequent comment that there are but few if any roses with yellow flowers that can be employed with any considerable degree of success for bedding purposes. For a very long time there have been yellow roses, and many of them of great beauty, but they have not possessed the qualities in a marked degree that constitute a bedding rose of the first class. A rose, to be really useful for the filling of beds in the flower garden, should be of moderate height, have a free-branching habit, bloom freely and continuously from June until October, and have flowers that are of fairly good quality and pleasing and effect in colour. Bedding roses should bear, excepting in colour, a close resemblance to that well-known and beautiful hybrid tea Caroline Testout. None of the older yellow roses possessed these essentials in a sufficient degree to justify their having a prominent position among the first-class bedding varieties. Probably Madame Hoste and Marie Van Houtte approached the most closely to the ideal bedding rose, but not close enough to admit of their being freely utilised in bedding schemes.

The activities of the raisers both at home and abroad have resulted in the introduction of a considerable number of yellow roses that have the promise of becoming of considerable value for arrangements in the flower garden in which each bed is devoted to one variety. The most noteworthy of the newer varieties is the much-talked-of Rayon d'Or, which was introduced to cultivation two years since. Last year, owing to the great heat and long-continued drought, it did not produce so striking an effect in the garden as one could wish, but this year it has grown freely and bloomed profusely, and fully substantiated its claims for consideration at the hands of rosarians. It may not be quite so perfect in growth as could be desired, but it has no serious defect in this respect, and its bright yellow flowers are produced so freely that the bed devoted to it has been one of the most effective of the rose beds in my garden. This season it should be planted largely, more especially in gardens where bedding roses find favour.

Another rose that should be freely planted where yellow-flowered varieties are appreciated is the Duchess of Wellington, which was introduced three years since, and has had time to become established. This differs considerably from the first-mentioned, and therefore does not come into competition with it. The growth is free-branching and erect, and the flowers are borne with great freedom, the buds are long and pointed, and the colour is rich saffron-yellow suffused with orange. The leaves are deep bronze-green, and present a most pleasing contrast to the rich yellow flowers. Lady Hillingdon, which was introduced two years since, is somewhat similar to the variety immediately preceding it, but it belongs to the tea-scented varieties. It has rather large, well-formed orange-yellow flowers and deep green foliage, the leaves bronze-crimson in the earlier stages. Free in flowering and rich in colour, it is very attractive during the greater part of the season. It appears to be somewhat variable in growth, for in some gardens in which the soil is rather light, as, for example, at Kew, the blooms have not been held up well, but on rather heavier soils the growths have been stout and the blooms erect. This variety should prove useful, not only for producing a bright effect in the flower garden, but for the supply of blooms and buds for indoor decorations.

Another variety with orange-yellow flowers that is of special interest at the present time is Sunburst, which received the National Rose Society's gold medal last month. This high award was made in consideration of its value for culture under glass, and was unquestionably well deserved. Whether it will be equally valuable for the flower garden has yet to be seen. It has a strong branching habit, is free in flowering, and the blooms are borne on stiff stems, and it should be useful in the flower garden; the promise is sufficient to justify it being planted with a view to determining this point in the course of next summer. Lady Pirrie, a hybrid tea that was distributed in 1910, is a charming decorative rose that should be freely planted. The flowers are rather large, of good form, and the colour apricot-yellow, red-salmon on the outside of the petals, a charming combination, but the yellow is not so prominent as in the preceding varieties. Lady Downe, one of last year's novelties, is a remarkably fine rose, the colour deep yellow suffused buff, and passing with age to pale yellow, and should be included in the roses purchased this season. Lady Greenall, also one of last year's introductions, is full of promise; the blooms are large and of good form, and are cream-white with orange-yellow in the centre and tinted with pink on the outside of the petals.

The effectively-coloured Marquise de Sinety brings us back to the really yellow roses, and must be mentioned as one of the best of the older roses of its colour. It has the merit of being free in flowering, and the blooms are of medium size, moderately full, and of a bright golden-yellow colour, suffused bronze-red. The growth is not sufficiently free-branching to justify it being included among bedding roses, but it is highly attractive when associated with other varieties in borders. R.

## NATIONAL CHRYSANTHEMUM SOCIETY.

The great central portion of the Crystal Palace was particularly gay on October 2 and 3, when the National Chrysanthemum Society held its first exhibition of the season. As compared with the early show of 1911, this was far ahead in size and quality, and chysanthemums were very much more in evidence. The competition was quite good in a large number of classes, and very many excellent blooms were staged, indeed the entries were far larger than has been the case for four years past. Non-competitive displays formed a considerable part of the exhibition, and as these were of varied character they added to the interest as well as the effectiveness of the show.

### OPEN CLASSES.

For a dozen Japanese blooms, distinct, Mr. Sargent, gardener to G. W. Wigg, Esq., Rockshaw, Merstham, came first with Eclipse, White Queen, Marie Loomes, Mrs. A. T. Miller, Reg. Vallis, and Beecham Keeling in fine form; Mr. Thomas Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone, a close second; and Mr. Martin Silsbury, Shanklin, Isle of Wight, third.

There were eight competitors in the class for six Japanese blooms distinct, and here Mr. G. Mileham, gardener to A. T. Miller, Esq., Emlyn House, Leatherhead, led with fine flowers of Mr. G. C. Kelly, Mrs. F. C. Stoop, Mrs. R. Luxford, Mrs. A. T. Miller, George Hemming, and White Queen; Mr. H. Runciman, Nightingale Lane, Wanstead, second, and Mr. T. J. Broom, gardener to Miss Langworthy, Gay's House, Holyport, third.

Mr. F. Brazier, Caterham, was the only exhibitor in the class for a display of chrysanthemums, cut or in pots, grouped with foliage and foliage plants. He staged a display of large sheaves of early varieties, and was awarded a second prize.

For a dozen bunches of outdoor-grown chrysanthemums, undisbudded, Mr. J. Bowness, Riverside Nursery, Busby, Glasgow, secured the first prize with a splendid set of Roi des Blancs, Loan's Crimson, Hector, Cream Perrier, Elstob Yellow, Goacher's Crimson, James Bateman, Durrington Gem, Caledonia, Mrs. J. Fielding, F. S. Richmond, and Loan's Pink. Second prize fell to Mr. J. Emberson, Grove Road Nursery, Walthamstow; and third to Mr. W. A. Collier, Headley, Epsom. There were three competitors in the class for a dozen bunches of outdoor-grown flowers, disbudded, and here Mr. J. Emberson led with very fresh, clean, and good-sized examples of Le Cygne, Almirante, Rio des Jaunes, Fee Parisienne, James Bateman, Countess, Cranfordia, Dolores, Perle Chatillonaise, Golden Queen of Earlies, and La Pactole. Mr. H. Dunkley, St. Peter's Avenue, Kettering, second, and Mr. J. Bowness, third.

Mr. F. Brazier, High Street, Caterham, led for a vase of early-flowering singles; Mr. G. Bowness second; and Mr. J. Emberson third. For a vase of singles, any colour but yellow or bronze, Mr. Emberson scored with Kitty Riches, a bright rose-pink; Mr. G. Bowness second. For a vase of singles grown out of doors, Mr. J. Emberson was again first-prize winner, Mr. Bowness following.

### AMATEURS.

The best half-dozen bunches of early outdoor chrysanthemums, not disbudded, were from Mr. H. Dunkley, who staged Polly, Roi des Blancs, Nina Blick, Goacher's Crimson, Fee Parisienne, and Jimmie; Mr. C. Fox, Linden Gardens, Tunbridge Wells, second; and Mr. D. B. Crane, Woodview, Highgate, third. For six bunches of disbudded flowers Mr. Dunkley gained second prize, and a similar award fell to Mr. D. B. Crane for six bunches of early pompon varieties, though why this failed to get the higher award did not appear.

There were four entrants in the class for six vases of early Japanese or decorative chrysanthemums, and here Mr. J. Emberson led with Roi des Jennes, Perle Chatillonaise, Countess, Dolores, Cranford Pink, and Le Pactole; Mr. G. Bowness, second; and Mr. R. B. Leech, gardener to J. C. Eno, Esq., Woodhall, Dulwich, third.

The best three blooms of any one Japanese chrysanthemum were fine specimens of Frances Joliffe, from Mr. A. Dunkley, gardener to the Rev. T. Sheepshanks, Stonelake House, Chudleigh, South Devon; Mr. T. Stevenson, second, with grand flowers of White Queen; and Mr. Sargent third with Mrs. R. Luxford; thirteen entries.

Mr. W. Webb, gardener to J. Chapman, Esq., Melrose, Lawrie Park, Sydenham; Mr. H. Dunkley, and Mr. C. Fox were successful in other amateur classes.

### DECORATIVE EXHIBITS.

In the open division the best table of wreaths, crosses, and other floral designs made in chrysanthemums was from Mr. A. H. Cole, Camberwell New Road, S.E.; a yellow harp, a pink and cream yacht, and a white and crimson wreath, were the leading features; Miss A. Fyfe, Grove Park Nursery, Lee, second.

Premier award for a table decoration of chrysanthemums fell to Mr. A. W. Trossell, 12, The Parade, Beckenham, for a light and pleasing design of yellow and bronzy flowers; Mrs. A. Robinson, Norhyrst Park Hill, Carshalton, second with a flatter arrangement.

Mr. T. W. Stevens scored for three epergnes of chrysanthemums; his centrepiece was filled with white and crimson flowers, and his side ones with yellow and bronze flowers; Mrs. A. Robinson second; and Mr. F. G. Bealing, Bassett, Southampton, third. Mr. J. Emberson was a capital first for a vase of single chrysanthemums, setting up a bold and bright exhibit of yellow, crimson, and bronze flowers; Mrs. A. C. Brown, Brookes Lodge, Reigate, second; and Mr. Thos. Stevenson, third.

In the open class for a vase of chrysanthemums for table decoration Mr. T. W. Stevens scored with a very light design in white and bronze flowers and berberis sprays; Mr. W. Webb second, and Mr. C. Fox third. First prize for a basket of chrysanthemums was awarded to Mr. L. Wheeler, The Gardens Woodhall, Dulwich, for a splendid arrangement of large, rich yellow and chestnut-crimson flowers associated, with croton leaves, berberis sprays, and fern fronds; Mr. J. Emberson, second; and Mrs. S. A. Cole, Addiscombe Avenue, Croydon, third.

Mr. R. Bugden, George Street, Gipsy Hill, led for a basket of autumn foliage and berries; and Mrs. A. R. Bide, Highlands, Farnham, was second.

In the amateurs' class for an epergne of chrysanthemums Mr. T. W. Stevens led with a very elegant design in yellow and bronze flowers, and tiny sprays of very small-leaved ampelopsis; Mr. C. Fox, second; and Mr. A. W. Trossell, third. In a special amateurs' class for table decorations Miss A. Bashford, Barrow Hedges Farm, Carshalton, led; with Mr. W. Webb and Mrs. A. MacMahon, Warlingham, Surrey, following in the order given.

### NEW VARIETIES.

First-class Certificates were awarded to Bob Pulling, a long-petalled, bright yellow Japanese variety, from Mr. H. J. Jones, Ryecroft Nursery, Lewisham; and to Mrs. Lloyd Wigg, a very big light-yellow Japanese variety from Messrs. W. Wells and Co., Merstham.

A Commendation was granted to Juliet, a fine rose-red market avriety of Japanese form, from Messrs. Cragg, Harrison, and Cragg, Merivale, Hounslow.

### NON-COMPETITIVE.

A bold exhibit of chrysanthemums, finely set up by Messrs. W. Wells and Co., Merstham, was neatly finished off with ferns, and the flowers were pleasingly associated with sprays of brilliant scarlet oak foliage. Popular early varieties were set up in great sheaves, but the most conspicuous item was a stand of six huge blooms of a new light-yellow Japanese variety named Mrs. Lloyd Wigg. In addition to the chrysanthemum group proper, the Merstham firm contributed Michaelmas daisies in good style, and a fine vase of Cimicifuga simplex. A splendid collection of choice ferns from Messrs. H. B. May and Sons, Edmonton, attracted much attention; exotics were chiefly shown, but the beautiful Adiantum capillus veneris imbricatum was also staged.

Messrs. Jas. Carter and Co., Raynes Park, had a most effective temple-like exhibit filled gracefully with selections of asters and dahlias, with asters and Michaelmas daisies banked around the base. A group of shrubs from Mr. David Russell, Brentwood, contained a lot of freely-berried pernettyas; he also showed a collection of apples and pears. A large and bright exhibit from Messrs. T. S. Ware, Lim., Feltham, included representative stands of the best pæony-flowered, giant decorative, cactus and pompon dahlias, as well as a selection of bright late-flowering perennial border flowers.

A goodly collection of fruits staged on a long table by Mr. E. Neal, gardener to J. A. Nix, Esq., Tilgate, Crawley, consisted of fifty-six varieties of apples, forty-four varieties of pears, and six varieties of grapes. Nancy Jackson, Ecklinville, Egremont Russet, Hollandbury, Annie Elizabeth, Warner's King, Lord Derby, Charles Ross, Rival, Norfolk Beauty, and Cox's Orange Pippin were particularly good apples shown in this fine group. Crotons and autumn foliage were effectively used among the stands and dishes.

Mr. Norman Davis was represented by a large and quite artistic exhibit of chrysanthemums, Michaelmas daisies, etc., associated with ferns and autumn foliage. Tall stands of flowers were grouped in the centre and smaller ones around them, with outstanding tall designs towards the margin, over vases of early chrysanthemums. A few chrysanthemums of special interest were Framfield Early White, White Queen, David Ingamells, Perle Chatillonaise, Almirante, Cranfordia, and Belle Mauve. Mr. J. B. Riding, Chingford, again showed collarette dahlias, and for so late in the season these were in capital condition. Pæony-flowered varieties made a bold and bright background for the rest, and autumn foliage was used among the flowers. Two single varieties, i.e., Grenadier and Little Othello, the latter deep rich crimson with dark bronzy leafage, especially attracted our attention in this group.

A particularly large exhibit was put up in good style by Mr. H. J. Jones, Lewisham. In the middle was a bank of chrysanthemums, chiefly pot plants, and conspicuous varieties here were the yellow Bob Pulling and the chaste White Queen. Early varieties and berberis sprays made a pretty margin. At either end there were large stands of popular early chrysanthemums, and fine masses of specially good varieties of Michaelmas daisies. Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow, set up fine flowers in great bunches, of Cranfordia, Moneymaker, Betty Spark, Dolores, Juliet, Framfield Early White, and Cranford Pink chrysanthemums. Mr. A. H. Cole, Camberwell New Road, S.E., contributed a small group of well-developed chrysanthemum blooms.

### MEDALS.

Gold.—To Mr. Norman Davis, Framfield, Sussex; to Mr. H. J. Jones, Ryecroft, Lewisham; to Messrs. W. Wells and Co., Merstham; to Mr. Neal, gardener to J. A. Nix, Esq., Crawley.

Small Gold.—To Messrs. H. B. May and Sons, Edmonton; to Mr. D. Russell, Brentwood.

Silver Gilt.—To Messrs. James Carter and Co., Raynes Park; to Messrs. T. S. Ware, Lim., Feltham; to Mr. J. B. Riding, Chingford.

Large Silver.—To Messrs. Cragg, Harrison, and Cragg, Hounslow.

Small Silver.—To Mr. A. H. Cole, Camberwell New Road, S.E.

## NEW PLANTS, ETC.

### ODONTOGLOSSUM WOODROFFEÆ.

A fine new addition to the small section of O. Rossi hybrids. The plant is dwarf and bore two flowers of fair size. The sepals and petals are brown, with a purple tinge, and irregularly barred with yellow. The large flat lip is bright rose-purple, with a yellow base. The parents are O. Rossi rubescens and O. Queen Alexandra. We understand the hybrid was originally raised by Messrs. Charlesworth and Co. F.C.C., R.H.S., September 24. Mr. E. H. Davidson, Borlases, Twyford.

### ODONTOGLOSSUM NEPTUNE.

This hybrid is the result of crossing O. crispum with O. nebulosum, and though it shows considerable evidence of the latter's influence, the flowers are not so rounded as might have been expected. The colour is white, with brownish spots and a yellow base to the lip. A.M., R.H.S., September 24. Mons. H. Graire, St. Fuscien, Amiens.

### CATTLEYA LORD ROTHSCHILD ALBESCENS.

The small plant shown carried one large and very beautiful bloom, with sepals and petals nearly pure white, and a handsome lip almost wholly yellow, with some white shading and a few purple marks. A.M., R.H.S., September 24. Messrs. J. and A. McBean, Cooksbridge, Sussex.

### LÆLIO-CATTLEYA HASTEDIANA.

Cattleya aurea and Lælio-cattleya Henry Greenwood are the parents of L.-c. Hastediana, a hybrid that is chiefly remarkable for the size and colour of its lip. This organ is wide-spread, finely frilled, deep crimson-purple, with a paler margin, and veins of old gold in the base and throat. The sepals and petals are rosy-purple, and in size and pose do not compare favourably with the lips. A.M., R.H.S., September 24. Mr. C. G. Phillips, The Glebe, Sevenoaks.

### ZYGOPETALUM MAXILLARE SANDERIANA.

A free-flowering orchid, carrying several showy flowers on erect stout spikes. The sepals and petals are green and make a fine setting for the rounded white lip, which has a rose-purple base or disk. A distinct and useful variety. A.M., R.H.S., September 24. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

### ROSES.

George Dickson. A very fine dark crimson rose, with broad petals that make up a massive bloom. Shapely and of fine substance, this is a distinctly good variety. A.M., R.H.S., September 24. Messrs. Alex. Dickson and Sons, Newtownards, co. Down.

Mrs. Mackellar.—A large and beautiful H.T. rose, very fragrant and distinct. The form is rather globular, the petals of unusual breadth and size. The colour is yellow, of a soft and yet bright shade that is very effective. This should prove a splendid garden rose as well as a useful exhibition variety. A.M., R.H.S. Messrs. Alex. Dickson and Sons, Newtownards.

Little Dorrit.—A very pretty rose, already described and illustrated in these columns (see p. 724). A.M., R.H.S., September 24. Messrs. Paul and Son, Cheshunt.

NEW H.T. ROSE EDWARD BOHANE.

Flowers bright red-crimson. A.M., R.H.S., September 24. Messrs. Alex. Dickson and Sons, Newtownards.

Edward Bohane. A beautiful H.T. rose of great size and substance. The petals recurve slightly at the tips and are very broad. A massive rose of rich rose-red colour, flushed with crimson-scarlet. A.M., R.H.S., September 24. Messrs. Alex. Dickson and Sons, Newtownards.

### DAHLIAS.

Gigantic.—A large cactus dahlia, with incurving tips to its long, narrow florets. The soft old gold colouring fades to pink from the centre outwards. F.C.C., N.D.S., September 17. Messrs. J. Stredwick and Son, St. Leonards.

George Schofield.—A very neat, fair-sized cactus dahlia, with incurving tips. The colour is pink, paler at the tips, but the centre of the flower is yellow. F.C.C., N.D.S., September 17. Messrs. J. Stredwick and Son, St. Leonards.

Useful.—A very distinct decorative dahlia, and one that we hope is the forerunner of a good race of garden varieties. The flowers are three to four inches across, double, but not heavy or globular, shapely, and borne erect on stiff, foot-long stems. The variety is very free-flowering, and the blooms rise well above the foliage. The colour is purplish mauve. A.M., R.H.S., F.C.C., N.D.S., September 24. Mr. J. T. West, Tower Hill, Brentwood.

Johnny.—A capital pompon variety, very neat and shapely. Colour deep maroon-crimson. F.C.C., N.D.S., September 17; A.M., R.H.S., September 24. Mr. J. T. West, Tower Hill, Brentwood.

Jenny Wren.—A charming medium sized cactus variety, with pink incurving florets and a yellow centre. F.C.C., N.D.S., and A.M., R.H.S., September 24. Messrs. J. Stredwick and Son, St. Leonards.

Mrs. Randle.—A large cactus dahlia of rich pink colour, with lighter shading. F.C.C., N.D.S., and A.M., R.H.S., September 24. Messrs. J. Stredwick and Son, St. Leonards.

### ODONTIODA MARGARITA.

A pretty hybrid between Odontoglossum Madrense and Cochlioda Noetzliana. The flowers are of medium size, soft scarlet, with rose-purple shading. A.M., R.H.S., September 24. Mons. H. Graire, Amiens.

### KNIPHOFIA JOHN BENARY.

A handsome and stately variety with large brilliant red flowers borne erect on stout 4ft. stems. A splendid addition. It has also been shown as Kniphofia Lord Roberts. A.M., R.H.S., September 24. Messrs. J. Veitch and Sons, Chelsea.

### PENTSTEMON MRS. F. FULFORD.

A handsome and stately variety with large flowers of a deep and rich red hue. A.M., R.H.S., September 24. Mr. Fulton, Tarbolton.

---

**Anchusa italica Opal.**—I observe an enquiry in the Gardeners' Magazine as to the origin of this anchusa, which as you rightly say in your reply, is quite distinct. The pale blue form known as Opal and introduced by Mr. B. Ladhams, Shirley, originated in the vicar's garden in Swanmore as a chance seedling. As a border plant it deserves extended cultivation, growing freely and flowering abundantly. To see the great difference between this and the dark blue form known as the Dropmore variety, which I have grown under the name of superba, the two varieties should be planted side by side in the same border. Well-grown plants of each will reach 6ft. high, and, when furnished with several main stems, which spread outwards as they grow, each one will produce a brilliant display of colour that lasts a long time in the summer. The plants should be replenished every two years, as, when they reach that age, they are apt to decay at the crown. Every piece of its thong-like roots, two inches in length, will, if placed in sandy soil in the spring, quickly grow into a vigorous plant.—E. Molyneux, Swanmore, Hants.

## DWARF POLYANTHA ROSES.

It is not surprising that the dwarf polyantha roses should have come to the front so rapidly, for they are not only very free in growth and bloom, but can be depended upon not to break away from a compact, and yet uncrowded growth. So many roses that would otherwise be good bedders are apt to throw out an occasional long growth, which detracts from the general effect. In the dwarf polyanthas, however, we can keep them almost as uniform as begonias, etc

Nor does it appear that one season suits them better than another, for during the past, trying summer they were quite unaffected. Even now our plants are in bloom, sufficiently so to produce a bright effect.

How very free and useful these are for bedding may be imagined when I state that spring-grafted plants of the present year, which were turned out of thumb-pots during the end of April, have been a mass of blossom since early in July. They have the merit also of doing well upon their own roots, and so are much less expensive in proportion to many others.

Both in beds, or edgings to others, also beneath standards, in lieu of other subjects than roses, they are most suitable. Some of the prettiest effects I have seen during the past summer were beds of dwarf polyanthas, having short standards of the same section in the centre They form good heads, and they look somewhat larger when raised a little from the ground in this way.

As pot plants, too, it would be difficult to improve upon these, their usefulness being enhanced by the length of time their large trusses remain in flower. So constant blooming are they that plants which have been forced under glass will come on rapidly, and give an excellent summer and autumn display if turned out after flowering and due hardening off. Still, I would prefer to partly ripen off the best of them in the usual way of treating pot roses, as this would tend to better results when forced again early in the year.

Dwarf polyantha roses do not seem very particular as to soil, but I have found a rich, light loam suit them best. Not having so much growth to support as the stronger growers, they thrive in shallow soils that are unsuited for the general run of roses, and this is another point in their favour.

With the planting season now close upon us, a list of some of the best may be of service, and I will select them alphabetically, for it would indeed be difficult to place them in order of merit, except in the case of some special colours.

Aennchen Muller has immense trusses of bright rose-coloured flowers, with the peculiarly twisted petals of a miniature cactus dahlia. In bloom from June until weather stays it. It is one of our earliest.

Anne Marie de Montravel is pure white; the flowers small, but very full. A profuse bloomer, and one of the sweetest-scented.

Aschenbrödel contains a touch of blood-red among its clear peach colouring, and has a salmon-orange centre. One of the best for massing.

Boskoop Baby is comparatively new, but it promises to be the best of the clear China rose colours. It is wonderfully free-blooming and sweet-scented.

Cecile Brunner, a blush, shaded with pale pink and a yellowish centre, is one of the best shaped, and charming for buttonholes.

Canarienvogel gives a very distinct and striking colouring with its golden-yellow, orange, rose, and purple blooms. A combination that takes the eye at once.

Eugénie Lamesch has peculiar growth and very shining foliage. It is one of the dwarfest, and always upright. Seldom more than fifteen inches high, and with bunches of flowers shaped like a ranunculus. Orange when first opening, turning to pale yellow and carmine later on.

Floçon de Neige is a great favourite here because it is even freer in blooming than the rest. It is a very aptly named rose, but not so well suited to cut from as the others, the petals falling in a shower when touched.

Gloire des Polyanthas has very tiny, but perfectly-formed flowers of deep rose, with a much lighter base. Very much used for bedding.

Jessie, although almost new, has made a great impression, because it is not only one of the brightest—a deep rosy-scarlet—but keeps its colour so clear up to the last. It is very good and bright under glass, and has no fault as regards growth and freedom in blooming.

Katherine Zeimet is one of the purest of whites, of good form, and borne in very large trusses. Certainly one of the best.

Kleiner Alfred is one of the dwarfest roses I am acquainted with; seldom reaching a foot high, but free flowering and interesting in quite tiny pots. The colour is a rich combination of bronze-yellow, and red.

Léonie Lamesch grows somewhat after the style of Eugénie Lamesch, but is much stronger. The flowers, too, are only from one to five in a truss, each resembling a miniature zinnia. Coppery-red, shaded with orange and a tinge of terra-cotta at the margins. A most striking rose, and one of the best to last.

Madame N. Levavasseur was extensively grown when first introduced, and is good still; but others have ousted it because of the indifferent way it keeps it colour, which is rosy-crimson at first, quickly fading off to a dull and dead-looking purple-red.

Maman Levavasseur, a seedling from the former, and with similar habit, has been styled Baby Dorothy. This has much the same colouring as Dorothy Perkins, and keeps clear. Quite a good variety, but too often confused with the other because of its similarity in name. It is very dwarf and free, reminding one of a large truss of the well-known Dorothy Perkins.

Mrs. W. H. Cutbush has the same habit, but I think the colour is clearer and not quite so deep. A very beautiful rose for bedding.

Orleans Rose is a rather stronger grower than most of the dwarf polyanthas carrying immense pyramidal trusses of vivid rosy-crimson flowers. Certainly one of the best both for beds or pots.

Perle d'Or has the habit of throwing up a strong shoot now and again, which rather spoils a small bed, but these growth are invariably ended by extra large trusses of flower and well spread out. It is one of the most distinct roses grown, and two or three of its beautifully formed nankeen-yellow and deep orange flowers are grand for the coat. There is no need to spoil the truss, for the blooms can be selected without sacrificing the unopened buds.

Phyllis resembles Mrs. W. H. Cutbush so much in every way, except being brighter, as to need no further description.

Schneewittchen is a clear ivory-white, with large golden stamens, upon candelabra-shaped trusses or bunches. It is often only semi-double, but very effective, and one of the sweetest-scented roses grown. A. P.

# RENOVATION OF OLD FRUIT TREES.

What an extraordinary number of old, worn-out fruit trees there are in country gardens and orchards! One only needs to take a walk along a country road and through an old-world village or hamlet, where sweet-scented gardens and green, grass-grown orchards peep at one through hedge-gaps; there you see these relics of a glorious past, lichen-covered, cankered, gnarled, and twisted in all their picturesque futility. For they are not fruit-bearing trees, these old specimens. They take up room that might very well be occupied with a nice, healthy, and clean-limbed young bush or standard tree, a heavy cropper of fine quality fruit, and a better monument to the skill and patient attention of the grower than the disease-choked specimen so commonly encountered. Of course, there is a certain amount of sentiment in relation to these old trees; they may have certain historical associations, so alluring to the owner of the garden or orchard, that he or she refuses to have them destroyed, or even tampered with in any way. No matter that they produce fruit no larger than crab apples, and very few and far between at that! The sentiment is there, and the tree remains. It is forgotten that it may spread the spores of the disease, which cankers and twists its branches into every conceivable shape, to other parts and other gardens, where an effort is being made to grow healthy, sound fruit trees.

## Grafting.

It need hardly be said that not all of these trees are past being renovated. Some, no doubt, should be chopped down and consigned to a fiery death; others can be so far renovated that they will bear fruit of a tolerably good quality, if not in great quantity. The writer has many times been requested to play the part of renovator, and in the course of the work many special points of interest have been noted. One thing is certain: it is a fallacy to suppose that old, worn-out, and half-decayed trees can be brought into any satisfactory state of fruitfulness by grafting. In almost every instance where such an attempt has been made, it has been noticed in after years that the graft, which, perhaps, may have made a strong, healthy growth, has eventually suffered a reaction when it has attained large dimensions, for the action of the branches was so vigorous that it put too great a strain upon the root system below, which, in turn, upset the balance of the tree. Now, it may be supposed that by heading back these strong-growing branches, the strain on the root-growth would be removed, or at least lightened somewhat, and new roots would develop to counterbalance the increasing vigour of the branches above. In a good soil overlying a fine, friable subsoil it may certainly be expected that such relief could be granted to the roots, provided, of course, the tree was comparatively healthy at the outset, and was growing on a good crab or vigorous apple stock. Indeed, I have noticed such excellent results in more than one instance —but not many more than one.

## Root-pruning.

Always, in speaking of the renovation of old, worn-out fruit trees, one inclines to thoughts of root-pruning. No doubt, the root action of many of these old trees would set up a decided improvement, calculated to benefit the whole tree, if it were taken in hand by a skilful root-pruner. The work requires careful attention, and a considerable amount of experience before it can be performed properly. In the case of young trees on crab and pear stocks, it will be noticed that, where they are growing in tolerably good loamy soil, an excessive amount of woody growth will be developed at the expense of the fruiting spurs, and it will then be necessary to root-prune so as to keep the trees compact and dwarf. The root-pruning of all fruit trees is best performed just after the fall of the leaf, or so long as the soil remains sufficiently warm to encourage the development of new fibrous rooting growths from the cut surfaces of the tap-roots. In the case of an old tree that is evidently in need of renovation of some kind or another, a trench must be taken out round the tree at a distance of three feet or more away from the stem, or just underneath the extending tips of the side branches. The age and habit of the tree must always be taken into consideration when doing this work, for in old trees the roots will be found to extend very far under the surface of the ground. Usually it is advisable to do only half the tree one year, taking out a semi-circular trench for this purpose, and completing the work in the following season. There is not so severe a check to the roots when the work is done in two seasons in this manner as when it is completed in one operation.

Care needs to be exercised in severing the thick tap roots that are exposed in the open trench; some misguided individuals I have noticed vigorously hacking away at them with the blunt edge of a spade. This is not the correct way to root-prune a fruit tree. A special pruning saw should be obtained for large, thick roots, and after severing these, the ends should be pared off as smoothly as possible with a sharp pruning knife. When the trench is first opened one may be at a loss to know how to dispose of the innumerable fibrous roots that are in the way of the root-pruner. The best way to manage these is to tie them up carefully to the ball of soil surrounding the roots, securing them firmly out of the way with a few wooden pegs.

That root-pruning is advantageous to old, partially worn-out fruit trees there can be no doubt, but it must be admitted that the operation is not always attended with the best results. It is problematical whether the tree will recover from the shock, but it is certain that the mechanical effect of the soil at the surface of the ground will have much to do in determining the success of root-pruning. A finely-pulverised surface soil, porous and light, and well permeated by air and moisture, will encourage rooting more than anything else; and it is advisable, where the soil is of a heavy and tenacious character, to lighten it by the addition of several barrowloads of good leafmould, mixed with sand, or some old potting compost. Of course, root-pruning is productive of very excellent results sometimes. Usually the first beneficial effects may be noted in the spring following the autumn when the work is performed. Leaf action will then assume an added vigour, and there will be an abundance of buds and spurs where formerly woody growth held full sway.

## Pruning.

The pruning of fruit trees is not a simple operation; neither the amateur nor the commercial fruit-frower finds it an easy matter to prune his trees in the best possible fashion. Sometimes, unfortunately, fruit trees are cut down so carelessly, and with such a wanton use of the knife, that their vitality and constitution have been practically ruined. The fruit-bearing capacities of these ill-treated trees have, of course, suffered unduly, and in many instances they have become actually barren or the fruit has been so small that it has been scarcely worth gathering. Usually, it will be noticed, that in the case of clean, healthy trees, this careless system of pruning is productive of a crowded, clustering mass of fruiting spurs along the extension of the thick, woody branches. To remedy this state of affairs, all that is necessary is to saw off the branches so as to leave, as nearly as possible, the young shoots of a previous year's growth regularly disposed over the tree at intervals of 10 or 12 inches. These young shoots, so disposed after the pruning saw has been at work, will produce plenty of buds in the following season, and a very fair crop of fruit may be relied upon, whether it be apples, pears, or plums.

Bad pruning very quickly reflects itself in the disposition of the fruiting spurs. For example, fifteen to twenty-year-old espalier or pyramid trees sometimes exhibit the effects of this unskilful treatment in the shape of thick, crowded clusters of fruit spurs grouped in a mass at the ends of branches. Plenty of bloom will, of course, make its appearance, but the very abundance of this bloom will impair the strength of the spurs considerably, and put a stop to their fruitfulness. Here, in such cases, the renovator must set to work and thin out the fruiting spurs, and remove all those that only produce a woody growth. Also he will remove part of the terminal shoots and spurs each season so as to bring back into their proper position those shoots which have grown away from the parent stem.

J. C. N.

# CHRYSANTHEMUMS.

## Lifting Plants from Open Borders.

In these days great quantities of cut flowers are required for the embellishment of rooms, corridors, and entrances of mansions and villas.

Soon the time will come when the gardener will have to depend chiefly on forced flowers, and the majority of these are expensive to produce. The chrysanthemum is not an expensive plant to grow, and it yields great quantities of beautiful flowers which last for a long time in a fresh condition. Specimens grown in pots yield many blossoms, and they are especially valuable for placing in greenhouses and conservatories, both as pot plants and for the supply of cut blooms. But where there are many plants now showing buds in plantations in the garden—it may be, in the vegetable quarters—some of them should be lifted and be replanted under glass to supplement the supply of flowers provided by the pot-grown plants.

Very little trouble attaches to the housing of these border plants, which will yield a rich harvest of blooms from October to December. The borders of peach houses are ideal places for chrysanthemums; the latter require abundance of air and a cool temperature, such as is afforded in a peach house at this season of the year. The inexperienced cultivator should carefully lift the plants, having, about one hour previously, well watered the soil, so that as much of it as possible may be lifted with the roots. It is a mistake to over-crowd, but the leaves of one specimen may touch those of another. Do not dig up, or in any way disturb the soil, but place the roots and adhering soil of the plants on it, and then add fresh soil to make a finished covering to the roots. Water at once, and then not too frequently, giving just sufficient to keep the leaves quite fresh.

Geo Garner.

## SOME CHOICE FLOWERING SHRUBS.

### Desfontainea spinosa.
